Mr. Ivar Ridgeway  
California Regional Water Quality Control Board, Los Angeles Region  
320 West 4th Street, Suite 200  
Los Angeles, California 90013  
[LAMS42012@waterboards.ca.gov](mailto:LAMS42012@waterboards.ca.gov)  
[rpurdy@waterboards.ca.gov](mailto:rpurdy@waterboards.ca.gov)  
[iridgeway@waterboards.ca.gov](mailto:iridgeway@waterboards.ca.gov)

Dear Mr. Ridgeway:

The City of Agoura Hills ("City") submits the following comments to the Los Angeles Regional Water Quality Control Board's ("Regional Board") Tentative Order No. R4-2012-xxx, NPDES Permit No. CAS004001) ("Permit"). The LA Permit Group has submitted comments regarding the Permit which the City joins and incorporates herein. The City reserves the right to make additional legal comments on the Permit prior to the close of the public hearing to adopt the Permit and at the public hearing itself.

On behalf of the City of Agoura Hills, we hereby submit the following initial comments on the Permit:

**1. The Time Provided to Review the Permit Is Insufficient and Denies Permittees Due Process of Law**

The period provided to review and comment on the Permit has been unreasonably short given the breadth of the Permit. Beginning on March 28, 2012, Regional Board staff issued a series of Staff Working Proposals pertaining to key sections of the Permit. Regional Board staff has used their Staff Working Proposal workshops as a justification for the hurried manner in which the Permit was developed. The same justification was used by the Executive Director in denying the LA Permit Group's request for a time extension.

This justification, however, fails for several reasons. First, Regional Board staff gave the permittees only a few weeks to comment on each of the Staff Working Proposals. Furthermore, the Regional Board staff did not respond to any comments, leaving permittees to guess at which requirements would be incorporated into the Permit. Seeing the Permit in its entirety and having the opportunity to understand how each of the sections and programs work together is imperative in order for permittees to fully understand the Permit provisions and to prepare comments.

Second, despite all the working proposals, workshops, and meetings, the permittees are left with a Permit that cannot be complied with from the first day the Permit goes into effect, due to the Receiving Water Limitation (RWL) and the Waste Load Allocations (WLA) requirements that could subject the permittees to third party lawsuits.

We believe the Regional Board wants a review process that is open and transparent. Providing permittees only forty-five (45) days to comment makes this impossible. To develop and provide relevant and meaningful comments, each permittee must first:

- Read a 500 page Permit;
- Study the 500 page Permit to understand how the provisions work together;
- Compare it to the last Permit;
- Evaluate the resource needs to comply with the Permit;
- Determine the fiscal and organizational impacts on City services, which requires coordination with several City departments;
- Conduct technical and legal review of the Permit and prepare comments;
- Present information to and gather feedback from the City Council. Staff needs time to conduct a thorough review of the items listed above, prior to presenting them to the City Council; and
- Prepare written comments.

To ensure a proper review of the Permit, the City hereby requests an extension of 180 working days to include a Revised Tentative Permit to be released with a 45-day comment period. The intent of a Revised Tentative Permit is to ensure the permittees have the opportunity to review any changes made to the existing draft and provide comments prior to the Permit adoption hearing. Additionally, this extension request will resolve a conflict our city management and officials have with the current September 6-7, 2012 hearing date, which overlaps with the annual League of Cities conference in San Diego.

The extreme speed with which the Permit is being circulated and reviewed and proposed to be adopted amounts to a denial of the City's due process rights and is contrary to state and federal law. By denying the permittees a meaningful opportunity to review and comment on a Permit that so drastically affects the permittees' rights and finances, the Regional Board has denied the permittees due process rights under state and federal law. *See Spring Valley Water Works v. San Francisco*, 82 Cal. 286 (1890) (reasonable notice and opportunity to be heard are essential elements of "due process of law," whatever the nature of the power exercised.) Furthermore, under the Clean Water Act, a reasonable and meaningful opportunity for stakeholder participation is mandatory. *See, e.g., Arkansas Wildlife Fed'n v. ICI Ams.*, 29 F.3d 376, 381 (8th Cir. 1994) ("the overall regulatory scheme affords significant citizen participation, even if the state law does not contain precisely the same public notice and comment provisions as those found in the federal CWA.") For the reasons stated above, the Permit does not satisfy the Clean Water Act standard and violates the City's due process rights.

## **2. The Permit Should Be Revised to Provide that Implementation of BMPs is Sufficient to Constitute Compliance with the Permit**

Permittees should be able to achieve compliance with the Permit through a best management practice (“BMP”) based iterative approach. Regional Board staff has previously indicated that it would not create a permit for which permittees would be out of compliance from the very first day the Permit goes into effect. This necessarily means the Permit cannot require immediate strict compliance with water quality standards. Yet the Fact Sheet states that a party whose discharge “causes or contributes” to an exceedance of a water quality standard is in violation of the Permit, even if that party is implementing the iterative process in good faith. *See* Fact Sheet at pp. F-35-38. These positions are incompatible and effectively render the iterative approach meaningless.

As written, the Permit requires that all discharges to receiving waters must immediately meet water quality standards to avoid violating the Permit. This presents an impossible standard for permittees to meet, especially given the fact that thirty-three (33) TMDLs have been incorporated into the Permit. This means that numerous water bodies that currently do not meet water quality standards will be governed by the Permit and permittees will be subject to potential liability immediately. Even for TMDLs for which the Regional Board issues time scheduling orders, such orders will not protect a permittee from third-party lawsuits for measured exceedances, based on the Permit’s current language. Even if such lawsuits are unfounded, the legal costs to defend such suits are enormous. For this same reason, final wasteload allocations should not be incorporated into the Permit, especially where we are dealing with TMDLs that have been rushed through due to the *Browner* consent decree with the understanding that they would be refined over time with reopeners as new information becomes available.

A BMP-based approach should be utilized in the Permit, as outlined in EPA’s November 12, 2010 Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on those WLAs.” (“EPA Memorandum”). *See also* 40 C.F.R. § 122.44(k).

To accomplish this purpose, the City supports using the receiving water limitation language proposed by CASQA, which is similar to the language in the Draft Caltrans Permit. Otherwise, cities are potentially vulnerable to third party lawsuits such as those brought against the City of Stockton and the County of Los Angeles by third parties within the last five years.

Furthermore, the EPA Memorandum is clear that an increased reliance on numerics should be coupled with the “disaggregation” of different storm water sources within permits. *See* EPA Memorandum at pp. 3-4. The Permit currently aggregates multiple sources of storm water runoff while additionally imposing numeric standards. This will result in a system whereby the innocent will be punished alongside the guilty for numeric standard exceedances. The Regional Board should not allow this inequitable and legally unjustifiable result to occur.

Another reason for adopting a BMP-based approach is the fact that new and existing conditionally exempt non-stormwater discharges may also contribute to measured exceedances. This inequitable result means the exempt discharges may nonetheless contribute to permittee liability.

### **3. The Permit Improperly Intrudes Upon the City's Land Use Authority in Violation of the Tenth Amendment of the U.S. Constitution**

To the extent that this Permit relies on federal authority under the Clean Water Act to impose land use regulations and dictate specific methods of compliance, it violates the Tenth Amendment of the U.S. Constitution. Furthermore, to the extent the Permit requires a municipal permittee to modify its city ordinances in a specific manner, it also violates the Tenth Amendment. According to the Tenth Amendment:

“The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.”

Article XI, section 7 of the California Constitution California also guarantees municipalities the right to “make and enforce within [their] limits all local police, sanitary and other ordinances and regulations not in conflict with general laws.” *See also City of W. Hollywood v. Beverly Towers*, 52 Cal. 3d 1184, 1195 (1991). Furthermore, the United States Supreme Court has held that the ability to enact land use regulations is delegated to municipalities as part of their inherent police powers to protect the public health, safety, and welfare of its residents. *See Berman v. Parker*, 348 U.S. 26, 32-33 (1954). Because it is a constitutionally conferred power, land use powers cannot be overridden by State or federal statutes.

Even so, both the Clean Water Act and the Porter-Cologne Act provisions regarding NPDES permitting do not indicate that the Legislature intended to preempt local land use authority. *Sherwin Williams Co. v. City of Los Angeles*, 4 Cal. 4th 893 (1993); *California Rifle & Pistol Assn. v. City of West Hollywood*, 66 Cal. App. 4th 1302, 1309 (1998) (Preemption of police power does not exist unless “Legislature has removed the constitutional police power of the City to regulate” in the area); *see* Water Code §§ 13374 and 13377 and 33 U.S.C. § 1342 (b)(1)(B).

If the Permit is adopted, the City believes that this Permit could establish the Regional Board as a “super municipality” responsible for setting zoning policy and requirements throughout Los Angeles County. The prescriptive and one-size-fits-all nature of this policy will ensure that any resident or business challenging the conditions set forth in this Permit would not only sue the municipality charged with implementing these requirements, but would also have to sue the Regional Board itself to obtain the requested relief. The City does not believe this is the intent of the Regional Board. Rather than adopting programs that dictate the precise method of compliance, the Regional Board should collaborate with the City and other permittees to develop a range of model programs that each municipality could then modify and adopt according to its own individual circumstances.

### **4. The Permit Constitutes an Unconstitutional Unfunded Mandate**

The Permit contains mandates imposed at the Regional Board's discretion that are unfunded and go beyond the specific requirements of either the Clean Water Act or the EPA's regulations implementing the Clean Water Act, and thus exceed the “Maximum Extent Practicable” (“MEP”) standard. Accordingly, these aspects of the Permit constitute non-federal state mandates. *See City of Sacramento v. State of California*, 50 Cal. 3d 51, 75-76 (1990). Indeed, the Court of Appeals has previously held that NPDES permit requirements imposed by the Regional Board under the Clean Water and Porter-Cologne Acts can constitute state mandates

subject to claims for subvention. *County of Los Angeles v. Commission on State Mandates*, 150 Cal. App. 4th 898, 914-16 (2007).

The Permit goes beyond federal law, as the Permit is at least twice as long, and in some cases, three times as long as other MS4 permits developed by other Regional Boards in the State of California, such as the Lahontan Regional Board and the Central Valley Regional Board, not to mention permits developed by EPA. This means that either some Regional Boards are failing to impose federally mandated requirements pursuant to the Clean Water Act, or the more likely explanation is that the Regional Board is imposing requirements that go beyond federal law.

#### **A. The Permit's Minimum Control Measure Program is an Unfunded State Mandate**

The Permit's Minimum Control Measure program ("MCM Program") qualifies as a new program or a program requiring a higher level of service for which state funds must be provided. The particular elements of the MCM Program that constitute unfunded mandates are:

- The requirements to control, inspect, and regulate non-municipal permittees and potential permittees (Permit at pp. 38-40);
- The public information and participation program (Permit at pp. 58-60);
- The industrial/commercial facilities program (Permit at p. 63);
- The public agency activities program (Permit at pp. 56-63); and
- The illicit connection and illicit discharge elimination program (Permit at pp. 106-109).

The MCM Program requirement that the permittees inspect and regulate other, non-municipal NPDES permittees is especially problematic and clearly constitutes an unfunded mandate. (*See, e.g.*, Permit at pp. 38-40.) These are unfunded requirements which entail significant costs for staffing, training, attorney fees, and other resources. Notably, the requirement to perform inspections of sites already subject to the General Construction Permit is clearly excessive. Permittees would be required to perform pre-construction inspections, monthly inspections during active construction, and post-construction inspections. The requirements of this Permit exceed past permits, meaning that the Regional Board is requiring a higher level of service than in prior permits.

Furthermore, there are no adequate alternative sources of funding for inspections. User fees will not fully fund the program required by the Permit. Cal. Gov't Code, § 17556(d). NPDES permittees already pay the Regional Water Quality Control Boards fees that cover such inspections in part. It is inequitable to both cities and individual permittees for the Regional Board to charge these fees and then require cities to conduct and pay for inspections without providing funding.

#### **B. The Receiving Water Body Requirements Render the Permit an Unfunded Mandate**

If strict compliance with state water quality standards in receiving water bodies is required—including state water quality standard-based wasteload allocations—in the MS4 itself or at outfall points and in receiving water bodies, the entire Permit will constitute an unfunded mandate because such a requirement clearly exceeds both the Federal standard and the

requirements of prior permits, despite the fact no funding will be provided. *See Building Industry Assn. of San Diego County v. State Water Resources Control Bd.*, 124 Cal. App. 4th 866, 873, 884-85 (2004) (though the State and Regional Boards may require compliance with California state water quality standards pursuant to the Clean Water Act and state law, these requirements exceed the Federal Maximum Extent Practicable standard.)

**C. The City Does Not Necessarily Have the Requisite Authority to Levy Fees to Pay for Compliance With the Order**

The ability to fund the Permit through bond measures or tax increases does not render the Permit's program ineligible for a subvention claim because such funding mechanisms are contingent upon voter approval, in some cases requiring supermajority votes. *Howard Jarvis Taxpayers Assoc. v. City of Salinas*, 98 Cal. App. 4th 1351 (2002). The money available from other sources is both too speculative and limited to cover all or even some of the costs imposed by the Permit. Such speculative funding sources cannot count as viable sources of funding so as to preclude a subvention claim. Cal. Gov't Code, § 17556(f). Furthermore, even if some portions of the Permit's programs can be covered by user fees, these fees will not come close to covering all such costs, meaning permittees' general funds will have to be utilized to cover substantial portions of these costs. Cal. Gov't Code, § 17556(d) (the ability to charge fees only defeats a subvention claim where the fees are sufficient to fully fund the program.)

**5. The Permit's Monitoring Program Exceeds the Requirements of Law**

The Permit's Receiving Water Monitoring Program is improper for going well beyond the scope of monitoring requirements authorized under Water Code Sections 13267 and 13383. The relevant portion of Water Code Section 13267 states:

“(b) (1) In conducting an investigation . . . the regional board may require that . . . any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports.”

The Regional Board's failure to conduct and communicate the requisite cost-benefit analysis pursuant to the monitoring requirements in the Permit constitutes an abuse of discretion. Water Code §§ 13267 and 13225(c).

The relevant portions of Water Code Section 13383 state:

“(a) The . . . regional board may establish monitoring, inspection, entry, reporting, and recordkeeping requirements . . . for any person who discharges, or proposes to discharge, to navigable waters. . . .

(b) The . . . or the regional boards may require any person subject to this section to establish and maintain monitoring equipment or methods, including, where

appropriate, biological monitoring methods, sample effluent as prescribed, and provide other information as may be reasonably required.”

The Permit goes far beyond a requirement that a permittee “monitor” the effluent from its own storm drains. The Permit’s Receiving Water Monitoring Program seems to require a complete hydrogeologic model found in the receiving water body, which will in many cases be miles away from many of the individual permittees’ jurisdictions. To the extent the Permit requires individual permittees to compile information beyond their jurisdictional control, they are unauthorized. Although Water Code Section 13383(b) permits the Regional Board to request “other information”, such requests can only be “reasonably” imposed. Cal. Water Code § 13383(b). The information requested by the Regional Board is unreasonable. It is not just limited to each individual copermitttee’s discharge. Rather, the Permit requires copermitttees to analyze discharges and make assumptions regarding factors well beyond their individual boundaries. This is not reasonable, and is therefore not permitted under Water Code Sections 13225, 13267, and 13383. It is equally unreasonable to require the monitoring of authorized or unknown discharges. *See* Permit at p. 108.

**6. The Permit Exceeds the Regional Board’s Authority by Requiring the City to Enter into Contracts and Coordinate With Other Copermitttees**

The Regional Board cannot require the City to enter into agreements or coordinate with other copermitttees. The requirements that permittees engage in interagency agreements (Permit at p. 39) and coordinate with other copermitttees as part of their stormwater management program (Permit at p. 56-58) are unlawful and exceed the authority of the Regional Board. The Regional Board lacks the statutory authority to mandate the creation of interagency agreements and coordination between permittees in an NPDES Permit. *See* Water Code §§ 13374 and 13377. The Permit creates the potential for City liability in circumstances where the permittee cannot ensure compliance due to the actions of third party state and local government agencies over which the City has no control. Such requirements are not reasonable regulations, and thus violate state law. *Communities for a Better Environment v. State Water Resources Control Bd.*, 132 Cal. App. 4th 1313, 1330 (2005) (regulation pursuant to NPDES program must be reasonable.)

**7. The Permit Fails to Consider Economic Impacts As Required by Water Code Sections 13000 and 13241**

The Regional Board’s failure to adequately consider the economic impacts of the Permit, as required by Water Code Sections 13000 and 13241, render the Permit invalid. Water Code Section 13241 requires the Regional Board to include “[e]conomic considerations” with its consideration of the Permit. As demonstrated above, the Regional Board is incorrect in its assertion that consideration of economics is not required in this Permit. *See* Permit at pp. 24-25. Because, as demonstrated above, the Permit requires new and higher levels of service in numerous key regards, consideration of economic factors is necessary. *City of Burbank v. State Water Resources Control Bd.*, 35 Cal. 4th 613, 618, 627 (2005).

The alleged facts in the economic consideration section of the Fact Sheet misrepresent the permittees’ data and fail to consider the economic impact of new, costly aspects of the Permit.

The Fact Sheet's open skepticism of municipal financial reports is troubling, and indicates the Regional Board has not taken permittees' actual expenses seriously.

It is also premature and improper to assume that permittees will obtain funding from proposed ballot measures and other sources of funding which have not even been approved, much less voted on by the public. See Fact Sheet at pp. F-142-43. If the Regional Board wants to rely on initiatives, such as the Los Angeles County Flood Control District's Water Quality Funding Initiative, as sources of funding to offset the costs of storm water management, it should delay its public hearing and approval of the Permit until after the voters have actually voted on such initiatives. Otherwise, if such initiatives fail to pass, the copermitees will be left to implement the Permit's requirements without the funds to do so. Even if the Water Quality Funding Initiative is approved by the voters, the funds generated by the Initiative would not even be available until 2014 – well after the deadline for a majority of the compliance deadlines set forth in the Permit. Moreover, the Water Quality Initiative will not cover all the costs imposed on all permittees by the Permit.

The Permit also fails to consider the significant additional costs that TMDLs will impose. The incorporation of TMDLs and the massive expansion of monitoring requirements in the Permit, which also trigger the need for additional inspectors, will inevitably cause the copermitees' costs to skyrocket. Furthermore, speculations about what people may be willing to pay for cleaner water and social benefits from clean water have no real effect on cities' bottom lines. Finally, the Permit fails to account fully for all the expenses that implementing minimum control measures will impose. For all these reasons, the consideration of economic impact is entirely lacking, which violates state law.

#### **8. The Permit's Imposition of Joint and Joint and Several Liability for Violations is Contrary to Law**

The Permit appears to improperly impose joint liability and joint and several liability for water quality based effluent limitations and receiving water exceedances. It is both unlawful and inequitable to make a permittee liable for the actions of other permittees over which it has no control. A party is responsible only for its own discharges or those over which it has control. *Jones v. E.R. Shell Contractor, Inc.*, 333 F. Supp. 2d 1344, 1348 (N.D. Ga. 2004). Because the City cannot prevent another permittee from failing to comply with the Permit, the Regional Board cannot, as a matter of law, hold the City jointly or jointly and severally liable with another permittee for violations of water quality standards in receiving water bodies or for TMDL violations. Under the Water Code, the Regional Board issues waste discharge requirements to "the person making or proposing the discharge." Cal. Water Code § 13263(f). Enforcement is directed towards "any person who violates any cease and desist order or cleanup and abatement order . . . or . . . waste discharge requirement." Cal. Water Code § 13350(a). In similar fashion, the Clean Water Act directs its prohibitions solely against the "person" who violates the requirements of the Act. 33 U.S.C. § 1319. Thus, there is no provision for joint liability under either the California Water Code or the Clean Water Act.

Furthermore, joint liability is proper only where joint tortfeasors act *in concert* to accomplish some common purpose or plan in committing the act causing the injury, which will generally never be the case regarding prohibited discharges. *Kesmodel v. Rand*, 119 Cal. App. 4th 1128,

1144 (2004); *Key v. Caldwell*, 39 Cal. App. 2d 698, 701 (1940). For any such discharge, it would be unlawful to impose joint liability and especially joint and several liability. The issue of imposing liability for contributions to “commingled discharges” of certain constituents, such as bacteria, is especially problematic because there is no method of determining who has contributed what to an exceedance.

For receiving water body exceedances, the Permit should specify that the burden is on the Regional Board to show that any permittee’s discharge caused or contributed to that exceedance. Requiring permittees to prove they did not cause or contribute an exceedance is both inequitable and unlawful. Permittees should not be required to prove they did not do something when the Regional Board has failed to raise even a rebuttable presumption that the contamination results from a particular permittee’s actions. *See* Cal. Evid. Code § 500; *Sargent Fletcher, Inc. v. Able Corp.*, 110 Cal. App. 4th 1658, 1667-1668 (2003).

\*\*\*\*\*

The City is dedicated to the protection and enhancement of water quality. The City, however, has other functions that require funding as well. If this Permit is adopted as proposed, even in the best case scenario, spending cuts to other crucial services such as police, fire, and public works are certain. The permittees’ dwindling general funds simply cannot take the financial hit the Permit is poised to impose on them. The City believes a more measured approach is necessary, especially regarding how compliance in this Permit is achieved.

As public agencies, all parties involved in the NPDES permitting process have the obligation to carry out their duties in a responsible, realistic, and reasoned manner. Requirements that tether public agencies to impractical positions are counterproductive and violate our sacred charge as representatives of the people. The City is committed to working with the State and Regional Boards in order to achieve our mutual goals and looks forward to engaging in a constructive dialogue with Regional Board staff on these issues.

Sincerely,

Greg Ramirez,  
City Manager for the City of Agoura Hills

Los Angeles, CA 90013

**RE: COMMENTS ON THE DRAFT NPDES PERMIT FOR MS4 DISCHARGES WITHIN THE  
LOS ANGELES COUNTY FLOOD CONTROL DISTRICT**

Dear Mr. Ridgeway:

Thank you for the opportunity to provide comments on the Tentative Draft NPDES MS4 Permit for the Los Angeles Region.

The City of Arcadia understands and appreciates the need to develop a NPDES Permit that provide measures to improve and protect water quality in the Los Angeles region; however, the City strongly feels that the Permit implementation activities must be effective, efficient and sustainable. As an active participant of the Los Angeles Permit Group, the City supports the comments separately submitted by the LA Permit Group.

We also request the Board reconsider the request previously made by the City and the Los Angeles Permit Group to extend the comment period from 45 days to 180 days to ensure that City staff has a reasonable opportunity to review the 500-page Permit and both understand and comment on the wide-ranging requirements, liabilities and fiscal impacts on the City. This process already has been years in the making, so extending the comment period will not cause undue prejudice and should result in a better final Permit.

If you have any questions regarding this matter, please contact Vanessa Hevener, Environmental Services Officer at (626) 305-5327.

Sincerely,

Tom Tait  
Public Works Services Director

[rpurdy@waterboards.ca.gov](mailto:rpurdy@waterboards.ca.gov)  
[iridgeway@waterboards.ca.gov](mailto:iridgeway@waterboards.ca.gov)

Dear Mr. Ridgeway:

The City of Artesia ("City") submits the following comments to the Los Angeles Regional Water Quality Control Board's ("Regional Board") Tentative Order No. R4-2012-xxx, NPDES Permit No. CAS004001 ("Permit"). The LA Permit Group has submitted comments regarding the Permit which the City joins and incorporates herein. The City reserves the right to make additional legal comments on the Permit prior to the close of the public hearing to adopt the Permit and at the public hearing itself.

On behalf of the City of Artesia, we hereby submit the following initial comments on the Permit:

**1. The Time Provided to Review the Permit Is Insufficient and Denies Permittees Due Process of Law**

The period provided to review and comment on the Permit has been unreasonably short given the breadth of the Permit. Beginning on March 28, 2012, Regional Board staff issued a series of Staff Working Proposals pertaining to key sections of the Permit. Regional Board staff has used their Staff Working Proposal workshops as a justification for the hurried manner in which the Permit was developed. The same justification was used by the Executive Director in denying the LA Permit Group's request for a time extension.

This justification, however, fails for several reasons. First, Regional Board staff gave the permittees only a few weeks to comment on each of the Staff Working Proposals. Furthermore, the Regional Board staff did not respond to any comments, leaving permittees to guess at which requirements would be incorporated into the Permit. Seeing the Permit in its entirety and having

the opportunity to understand how each of the sections and programs work together is imperative in order for permittees to fully understand the Permit provisions and to prepare comments.

Second, despite all the working proposals, workshops, and meetings, the permittees are left with a Permit that cannot be complied with from the first day the Permit goes into effect, due to the Receiving Water Limitation (RWL) and the Waste Load Allocations (WLA) requirements that could subject the permittees to third party lawsuits.

We believe the Regional Board wants a review process that is open and transparent. Providing permittees only forty-five (45) days to comment makes this impossible. To develop and provide relevant and meaningful comments, each permittee must first:

- Read a 500 page Permit;
- Study the 500 page Permit to understand how the provisions work together;
- Compare it to the last Permit;
- Evaluate the resource needs to comply with the Permit;
- Determine the fiscal and organizational impacts on City services, which requires coordination with several City departments;
- Conduct technical and legal review of the Permit and prepare comments;
- Present information to and gather feedback from the City Council. Staff needs time to conduct a thorough review of the items listed above, prior to presenting them to the City Council; and
- Prepare written comments.

To ensure a proper review of the Permit, the City hereby requests an extension of 180 working days to include a Revised Tentative Permit to be released with a 45-day comment period. The intent of a Revised Tentative Permit is to ensure the permittees have the opportunity to review any changes made to the existing draft and provide comments prior to the Permit adoption hearing. Additionally, this extension request will resolve a conflict our city management and officials have with the current September 6-7, 2012 hearing date, which overlaps with the annual League of Cities conference in San Diego.

The extreme speed with which the Permit is being circulated and reviewed and proposed to be adopted amounts to a denial of the City's due process rights and is contrary to state and federal law. By denying the permittees a meaningful opportunity to review and comment on a Permit that so drastically affects the permittees' rights and finances, the Regional Board has denied the permittees due process rights under state and federal law. *See Spring Valley Water Works v. San Francisco*, 82 Cal. 286 (1890) (reasonable notice and opportunity to be heard are essential elements of "due process of law," whatever the nature of the power exercised.) Furthermore, under the Clean Water Act, a reasonable and meaningful opportunity for stakeholder participation is mandatory. *See, e.g., Arkansas Wildlife Fed'n v. ICI Ams.*, 29 F.3d 376, 381 (8th Cir. 1994) ("the overall regulatory scheme affords significant citizen participation, even if the state law does not contain precisely the same public notice and comment provisions as those found in the federal CWA.") For the reasons stated above, the Permit does not satisfy the Clean Water Act standard and violates the City's due process rights.

## 2. **The Permit Should Be Revised to Provide that Implementation of BMPs is Sufficient to Constitute Compliance with the Permit**

Permittees should be able to achieve compliance with the Permit through a best management practice (“BMP”) based iterative approach. Regional Board staff has previously indicated that it would not create a permit for which permittees would be out of compliance from the very first day the Permit goes into effect. This necessarily means the Permit cannot require immediate strict compliance with water quality standards. Yet the Fact Sheet states that a party whose discharge “causes or contributes” to an exceedance of a water quality standard is in violation of the Permit, even if that party is implementing the iterative process in good faith. *See* Fact Sheet at pp. F-35-38. These positions are incompatible and effectively render the iterative approach meaningless.

As written, the Permit requires that all discharges to receiving waters must immediately meet water quality standards to avoid violating the Permit. This presents an impossible standard for permittees to meet, especially given the fact that thirty-three (33) TMDLs have been incorporated into the Permit. This means that numerous water bodies that currently do not meet water quality standards will be governed by the Permit and permittees will be subject to potential liability immediately. Even for TMDLs for which the Regional Board issues time scheduling orders, such orders will not protect a permittee from third-party lawsuits for measured exceedances, based on the Permit’s current language. Even if such lawsuits are unfounded, the legal costs to defend such suits are enormous. For this same reason, final wasteload allocations should not be incorporated into the Permit, especially where we are dealing with TMDLs that have been rushed through due to the *Browner* consent decree with the understanding that they would be refined over time with reopeners as new information becomes available.

A BMP-based approach should be utilized in the Permit, as outlined in EPA’s November 12, 2010 Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on those WLAs.” (“EPA Memorandum”). *See also* 40 C.F.R. § 122.44(k).

To accomplish this purpose, the City supports using the receiving water limitation language proposed by CASQA. Otherwise, cities are potentially vulnerable to third party lawsuits such as those brought against the City of Stockton and the County of Los Angeles by third parties within the last five years.

Furthermore, the EPA Memorandum is clear that an increased reliance on numerics should be coupled with the “disaggregation” of different storm water sources within permits. *See* EPA Memorandum at pp. 3-4. The Permit currently aggregates multiple sources of storm water runoff while additionally imposing numeric standards. This will result in a system whereby the innocent will be punished alongside the guilty for numeric standard exceedances. The Regional Board should not allow this inequitable and legally unjustifiable result to occur.

Another reason for adopting a BMP-based approach is the fact that new and existing conditionally exempt non-stormwater discharges may also contribute to measured exceedances. This inequitable result means the exempt discharges may nonetheless contribute to permittee liability.

### **3. The Permit Improperly Intrudes Upon the City's Land Use Authority in Violation of the Tenth Amendment of the U.S. Constitution**

To the extent that this Permit relies on federal authority under the Clean Water Act to impose land use regulations and dictate specific methods of compliance, it violates the Tenth Amendment of the U.S. Constitution. Furthermore, to the extent the Permit requires a municipal permittee to modify its city ordinances in a specific manner, it also violates the Tenth Amendment. According to the Tenth Amendment:

“The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.”

Article XI, section 7 of the California Constitution also guarantees municipalities the right to “make and enforce within [their] limits all local police, sanitary and other ordinances and regulations not in conflict with general laws.” *See also City of W. Hollywood v. Beverly Towers*, 52 Cal. 3d 1184, 1195 (1991). Furthermore, the United States Supreme Court has held that the ability to enact land use regulations is delegated to municipalities as part of their inherent police powers to protect the public health, safety, and welfare of its residents. *See Berman v. Parker*, 348 U.S. 26, 32-33 (1954). Because it is a constitutionally conferred power, land use powers cannot be overridden by State or federal statutes.

Even so, both the Clean Water Act and the Porter-Cologne Act provisions regarding NPDES permitting do not indicate that the Legislature intended to preempt local land use authority. *Sherwin Williams Co. v. City of Los Angeles*, 4 Cal. 4th 893 (1993); *California Rifle & Pistol Assn. v. City of West Hollywood*, 66 Cal. App. 4th 1302, 1309 (1998) (Preemption of police power does not exist unless “Legislature has removed the constitutional police power of the City to regulate” in the area); *see* Water Code §§ 13374 and 13377 and 33 U.S.C. § 1342 (b)(1)(B).

If the Permit is adopted, the City believes that this Permit could establish the Regional Board as a “super municipality” responsible for setting zoning policy and requirements throughout Los Angeles County. The prescriptive and one-size-fits-all nature of this policy will ensure that any resident or business challenging the conditions set forth in this Permit would not only sue the municipality charged with implementing these requirements, but would also have to sue the Regional Board itself to obtain the requested relief. The City does not believe this is the intent of the Regional Board. Rather than adopting programs that dictate the precise method of compliance, the Regional Board should collaborate with the City and other permittees to develop a range of model programs that each municipality could then modify and adopt according to its own individual circumstances.

### **4. The Permit Constitutes an Unconstitutional Unfunded Mandate**

The Permit contains mandates imposed at the Regional Board's discretion that are unfunded and go beyond the specific requirements of either the Clean Water Act or the EPA's regulations implementing the Clean Water Act, and thus exceed the “Maximum Extent Practicable” (“MEP”) standard. Accordingly, these aspects of the Permit constitute non-federal state mandates. *See City of Sacramento v. State of California*, 50 Cal. 3d 51, 75-76 (1990). Indeed, the Court of Appeals has previously held that NPDES permit requirements imposed by the Regional Board under the Clean Water and Porter-Cologne Acts can constitute state mandates

subject to claims for subvention. *County of Los Angeles v. Commission on State Mandates*, 150 Cal. App. 4th 898, 914-16 (2007).

The Permit goes beyond federal law, as the Permit is at least twice as long, and in some cases, three times as long as other MS4 permits developed by other Regional Boards in the State of California, such as the Lahontan Regional Board and the Central Valley Regional Board, not to mention permits developed by EPA. This means that either some Regional Boards are failing to impose federally mandated requirements pursuant to the Clean Water Act, or the more likely explanation is that the Regional Board is imposing requirements that go beyond federal law.

#### **A. The Permit's Minimum Control Measure Program is an Unfunded State Mandate**

The Permit's Minimum Control Measure program ("MCM Program") qualifies as a new program or a program requiring a higher level of service for which state funds must be provided. The particular elements of the MCM Program that constitute unfunded mandates are:

- The requirements to control, inspect, and regulate non-municipal permittees and potential permittees (Permit at pp. 38-40);
- The public information and participation program (Permit at pp. 58-60);
- The industrial/commercial facilities program (Permit at p. 63);
- The public agency activities program (Permit at pp. 56-63); and
- The illicit connection and illicit discharge elimination program (Permit at pp. 106-109).

The MCM Program requirement that the permittees inspect and regulate other, non-municipal NPDES permittees is especially problematic and clearly constitutes an unfunded mandate. (*See, e.g.,* Permit at pp. 38-40.) These are unfunded requirements which entail significant costs for staffing, training, attorney fees, and other resources. Notably, the requirement to perform inspections of sites already subject to the General Construction Permit is clearly excessive. Permittees would be required to perform pre-construction inspections, monthly inspections during active construction, and post-construction inspections. The requirements of this Permit exceed past permits, meaning that the Regional Board is requiring a higher level of service than in prior permits.

Furthermore, there are no adequate alternative sources of funding for inspections. User fees will not fully fund the program required by the Permit. Cal. Gov't Code, § 17556(d). NPDES permittees already pay the Regional Water Quality Control Boards fees that cover such inspections in part. It is inequitable to both cities and individual permittees for the Regional Board to charge these fees and then require cities to conduct and pay for inspections without providing funding.

#### **B. The Receiving Water Body Requirements Render the Permit an Unfunded Mandate**

If strict compliance with state water quality standards in receiving water bodies is required—including state water quality standard-based wasteload allocations—in the MS4 itself or at outfall points and in receiving water bodies, the entire Permit will constitute an unfunded mandate because such a requirement clearly exceeds both the Federal standard and the

requirements of prior permits, despite the fact no funding will be provided. *See Building Industry Assn. of San Diego County v. State Water Resources Control Bd.*, 124 Cal. App. 4th 866, 873, 884-85 (2004) (though the State and Regional Boards may require compliance with California state water quality standards pursuant to the Clean Water Act and state law, these requirements exceed the Federal Maximum Extent Practicable standard.)

### **C. The City Does Not Necessarily Have the Requisite Authority to Levy Fees to Pay for Compliance With the Order**

The ability to fund the Permit through bond measures or tax increases does not render the Permit's program ineligible for a subvention claim because such funding mechanisms are contingent upon voter approval, in some cases requiring supermajority votes. *Howard Jarvis Taxpayers Assoc. v. City of Salinas*, 98 Cal. App. 4th 1351 (2002). The money available from other sources is both too speculative and limited to cover all or even some of the costs imposed by the Permit. Such speculative funding sources cannot count as viable sources of funding so as to preclude a subvention claim. Cal. Gov't Code, § 17556(f). Furthermore, even if some portions of the Permit's programs can be covered by user fees, these fees will not come close to covering all such costs, meaning permittees' general funds will have to be utilized to cover substantial portions of these costs. Cal. Gov't Code, § 17556(d) (the ability to charge fees only defeats a subvention claim where the fees are sufficient to fully fund the program.)

### **5. The Permit's Monitoring Program Exceeds the Requirements of Law**

The Permit's Receiving Water Monitoring Program is improper for going well beyond the scope of monitoring requirements authorized under Water Code Sections 13267 and 13383. The relevant portion of Water Code Section 13267 states:

“(b) (1) In conducting an investigation . . . the regional board may require that . . . any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports.”

The Regional Board's failure to conduct and communicate the requisite cost-benefit analysis pursuant to the monitoring requirements in the Permit constitutes an abuse of discretion. Water Code §§ 13267 and 13225(c).

The relevant portions of Water Code Section 13383 state:

“(a) The . . . regional board may establish monitoring, inspection, entry, reporting, and recordkeeping requirements . . . for any person who discharges, or proposes to discharge, to navigable waters. . . .”

(b) The . . . or the regional boards may require any person subject to this section to establish and maintain monitoring equipment or methods, including, where appropriate, biological monitoring methods, sample effluent as prescribed, and provide other information as may be reasonably required.”

The Permit goes far beyond a requirement that a permittee “monitor” the effluent from its own storm drains. The Permit’s Receiving Water Monitoring Program seems to require a complete hydrogeologic model found in the receiving water body, which will in many cases be miles away from many of the individual permittees’ jurisdictions. To the extent the Permit requires individual permittees to compile information beyond their jurisdictional control, they are unauthorized. Although Water Code Section 13383(b) permits the Regional Board to request “other information”, such requests can only be “reasonably” imposed. Cal. Water Code § 13383(b). The information requested by the Regional Board is unreasonable. It is not just limited to each individual copermitee’s discharge. Rather, the Permit requires copermitees to analyze discharges and make assumptions regarding factors well beyond their individual boundaries. This is not reasonable, and is therefore not permitted under Water Code Sections 13225, 13267, and 13383. It is equally unreasonable to require the monitoring of authorized or unknown discharges. *See* Permit at p. 108.

**6. The Permit Exceeds the Regional Board’s Authority by Requiring the City to Enter into Contracts and Coordinate With Other Copermitees**

The Regional Board cannot require the City to enter into agreements or coordinate with other copermitees. The requirements that permittees engage in interagency agreements (Permit at p. 39) and coordinate with other copermitees as part of their stormwater management program (Permit at p. 56-58) are unlawful and exceed the authority of the Regional Board. The Regional Board lacks the statutory authority to mandate the creation of interagency agreements and coordination between permittees in an NPDES Permit. *See* Water Code §§ 13374 and 13377. The Permit creates the potential for City liability in circumstances where the permittee cannot ensure compliance due to the actions of third party state and local government agencies over which the City has no control. Such requirements are not reasonable regulations, and thus violate state law. *Communities for a Better Environment v. State Water Resources Control Bd.*, 132 Cal. App. 4th 1313, 1330 (2005) (regulation pursuant to NPDES program must be reasonable.)

**7. The Permit Fails to Consider Economic Impacts As Required by Water Code Sections 13000 and 13241**

The Regional Board’s failure to adequately consider the economic impacts of the Permit, as required by Water Code Sections 13000 and 13241, render the Permit invalid. Water Code Section 13241 requires the Regional Board to include “[e]conomic considerations” with its consideration of the Permit. As demonstrated above, the Regional Board is incorrect in its assertion that consideration of economics is not required in this Permit. *See* Permit at pp. 24-25. Because, as demonstrated above, the Permit requires new and higher levels of service in numerous key regards, consideration of economic factors is necessary. *City of Burbank v. State Water Resources Control Bd.*, 35 Cal. 4th 613, 618, 627 (2005).

The alleged facts in the economic consideration section of the Fact Sheet misrepresent the permittees' data and fail to consider the economic impact of new, costly aspects of the Permit. The Fact Sheet's open skepticism of municipal financial reports is troubling, and indicates the Regional Board has not taken permittees' actual expenses seriously.

It is also premature and improper to assume that permittees will obtain funding from proposed ballot measures and other sources of funding which have not even been approved, much less voted on by the public. See Fact Sheet at pp. F-142-43. If the Regional Board wants to rely on initiatives, such as the Los Angeles County Flood Control District's Water Quality Funding Initiative, as sources of funding to offset the costs of storm water management, it should delay its public hearing and approval of the Permit until after the voters have actually voted on such initiatives. Otherwise, if such initiatives fail to pass, the copermitees will be left to implement the Permit's requirements without the funds to do so. Even if the Water Quality Funding Initiative is approved by the voters, the funds generated by the Initiative would not even be available until 2014 – well after the deadline for a majority of the compliance deadlines set forth in the Permit. Moreover, the Water Quality Initiative will not cover all the costs imposed on all permittees by the Permit.

The Permit also fails to consider the significant additional costs that TMDLs will impose. The incorporation of TMDLs and the massive expansion of monitoring requirements in the Permit, which also trigger the need for additional inspectors, will inevitably cause the copermitees' costs to skyrocket. Furthermore, speculations about what people may be willing to pay for cleaner water and social benefits from clean water have no real effect on cities' bottom lines. Finally, the Permit fails to account fully for all the expenses that implementing minimum control measures will impose. For all these reasons, the consideration of economic impact is entirely lacking, which violates state law.

#### **8. The Permit's Imposition of Joint and Joint and Several Liability for Violations is Contrary to Law**

The Permit appears to improperly impose joint liability and joint and several liability for water quality based effluent limitations and receiving water exceedances. It is both unlawful and inequitable to make a permittee liable for the actions of other permittees over which it has no control. A party is responsible only for its own discharges or those over which it has control. *Jones v. E.R. Shell Contractor, Inc.*, 333 F. Supp. 2d 1344, 1348 (N.D. Ga. 2004). Because the City cannot prevent another permittee from failing to comply with the Permit, the Regional Board cannot, as a matter of law, hold the City jointly or jointly and severally liable with another permittee for violations of water quality standards in receiving water bodies or for TMDL violations. Under the Water Code, the Regional Board issues waste discharge requirements to "the person making or proposing the discharge." Cal. Water Code § 13263(f). Enforcement is directed towards "any person who violates any cease and desist order or cleanup and abatement order . . . or . . . waste discharge requirement." Cal. Water Code § 13350(a). In similar fashion, the Clean Water Act directs its prohibitions solely against the "person" who violates the requirements of the Act. 33 U.S.C. § 1319. Thus, there is no provision for joint liability under either the California Water Code or the Clean Water Act.

Furthermore, joint liability is proper only where joint tortfeasors act *in concert* to accomplish some common purpose or plan in committing the act causing the injury, which will generally never be the case regarding prohibited discharges. *Kesmodel v. Rand*, 119 Cal. App. 4th 1128, 1144 (2004); *Key v. Caldwell*, 39 Cal. App. 2d 698, 701 (1940). For any such discharge, it would be unlawful to impose joint liability and especially joint and several liability. The issue of imposing liability for contributions to “commingled discharges” of certain constituents, such as bacteria, is especially problematic because there is no method of determining who has contributed what to an exceedance.

For receiving water body exceedances, the Permit should specify that the burden is on the Regional Board to show that any permittee’s discharge caused or contributed to that exceedance. Requiring permittees to prove they did not cause or contribute an exceedance is both inequitable and unlawful. Permittees should not be required to prove they did not do something when the Regional Board has failed to raise even a rebuttable presumption that the contamination results from a particular permittee’s actions. *See Cal. Evid. Code § 500; Sargent Fletcher, Inc. v. Able Corp.*, 110 Cal. App. 4th 1658, 1667-1668 (2003):

\*\*\*\*\*

The City is dedicated to the protection and enhancement of water quality. The City, however, has other functions that require funding as well. If this Permit is adopted as proposed, even in the best case scenario, spending cuts to other crucial services such as police, fire, and public works are certain. The permittees’ dwindling general funds simply cannot take the financial hit the Permit is poised to impose on them. The City believes a more measured approach is necessary, especially regarding how compliance in this Permit is achieved.

As public agencies, all parties involved in the NPDES permitting process have the obligation to carry out their duties in a responsible, realistic, and reasoned manner. Requirements that tether public agencies to impractical positions are counterproductive and violate our sacred charge as representatives of the people. The City is committed to working with the State and Regional Boards in order to achieve our mutual goals and looks forward to engaging in a constructive dialogue with Regional Board staff on these issues.

Sincerely,

Justine Menzel  
Deputy City Manager  
City of Artesia

Kevin G. Ennis, esq.

July 23, 2012

Mr. Ivar Ridgeway  
320 W. 4th Street, Suite 200  
Los Angeles, CA 90013  
(213) 620-2150

Subject: Tentative MS4 Order Comments

Dear Mr. Ridgeway:

The City of Baldwin Park is pleased to submit the attached comments for your consideration in re: Order No. R4-2012-XXXX NPDES Permit No. CAS004001.

Please note that the City also supports comments submitted to you from the Los Angeles Stormwater Permit (LASP) group. The City's comments are intended to be complimentary and more specific to the issues raised in the LASP group letter. The City's comment letter also contains additional issues not addressed in the LASP group letter.

Thank you for the opportunity to submit comments on this very important matter. Should you have any questions, please feel free to call me.

Sincerely,

Vijay Singhal  
Chief Executive Officer

1. **Numeric Water Quality Based Effluent Limitations (WQBELs) applied to dry and wet weather Total Maximum Daily Load (TMDLs) waste load allocations (WLAs) and to stormwater and non-stormwater municipal action levels (MALs) are not authorized under federal stormwater regulations and are not in keeping with State Water Resources Control Board (State Board) water quality orders (WQOs).**

The tentative order specifies that: *Each Permittee shall comply with applicable WQBELs as set forth in Part VI.E of this Order, pursuant to applicable compliance schedules.* The tentative order specifies two categories of WQBELs, one for USEPA adopted TMDLs and one for Regional Board/State adopted TMDLs. Regarding USEPA adopted TMDLs, it appears that BMP-WQBELs may be used to meet TMDL WLAs in the receiving water. For Regional Board/State-adopted TMDLs, the tentative order specifies a different compliance method: meeting a “numeric” WQBEL which is derived directly from the TMDL waste load allocation. For example, the wet weather numeric WQBEL for dissolved copper for the Los Angeles River is 17 ug/l.

- a. Issue: *Regional Board staff is premature in requiring any kind of WQBEL because no exceedance of any TMDL WLA at the outfall has occurred.* This is because outfall monitoring is not a requirement of the current MS4 permit or previous MS4 permits.

The Regional Board’s setting of WQBELs – any WQBEL – to translate the TMDL WLA for compliance at the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.”*

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit’s fact sheet. According to USEPA’s NPDES Permit Writers’ Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and*

*explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>1</sup>*

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis -- a consequence of the fact that no outfall monitoring has been required of the Regional Board either in the current or previous MS4 permits for Los Angeles County. Outfall monitoring is a mandatory requirement under federal regulations at CFR 40 §122.22, §122.2 and §122.26. CFR 40 §122.22(C)(3) requires effluent and ambient monitoring:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

"Effluent monitoring," according to Clean Water Act §502, is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2, defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

Conclusion: Because Regional Board staff has not required outfall monitoring, it could have not have detected an excursion above a water quality standard (includes TMDL WLAs). Therefore, it could not have conducted a reasonable potential analysis and, as further consequence, cannot require compliance with a WQBEL (numeric or BMP-based) or with any TMDL or MAL until those burdens have been met.

Recommended Correction: Eliminate all reference to comply with WQBELs until outfall monitoring and a reasonable potential analysis have been performed.

---

<sup>1</sup>United States Environmental Protection Agency, *NPDES Permit Writers' Manual*, September, 2010, page 6-30.

- b. Issue: Even if Regional Board staff conducted outfall monitoring and detected an excursion above a TMDL WLA and performed the requisite reasonable potential analysis, it cannot require a numeric WQBEL strictly derived from the TMDL WLA.

USEPA's 2010 guidance memorandum mentions that numeric WQBELs are permissible only if feasible.<sup>2</sup> This conclusion was reinforced by a memorandum from Mr. Kevin Weiss, Water Permits Division, USEPA (Washington D.C.). He explains:

*Some stakeholders are concerned that the 2010 memorandum can be read as advising NPDES permit authorities to impose end-of-pipe limitations on each individual outfall in a municipal separate storm sewer system. In general, EPA does not anticipate that end-of-pipe effluent limitations on each municipal separate storm sewer system outfall will be used frequently. Rather, the memorandum expressly describes "numeric" limitations in broad terms, including "numeric parameters acting as surrogates for pollutants such as stormwater flow volume or percentage or amount of impervious cover." In the context of the 2010 memorandum, the term "numeric effluent limitation" should be viewed as a significantly broader term than just end-of-pipe limitations, and could include limitations expressed as pollutant reduction levels for parameters that are applied system-wide rather than to individual discharge locations, expressed as requirements to meet performance standards for surrogate parameters or for specific pollutant parameters, or could be expressed as in-stream targets for specific pollutant parameters. Under this approach, NPDES authorities have significant flexibility to establish numeric effluent limitations in stormwater permits.<sup>3</sup>*

Reading the 2010 USEPA memorandum, together with Mr. Weiss's memorandum, creates the inescapable conclusion that (1) numeric WQBELs are permissible if "feasible" and (2) numeric WQBELs cannot be construed to only mean strict effluent limitations at the end-of-pipe (outfall) but more realistically must include surrogate parameters and other variants as well. Regional Board staff failed to examine alternative numeric WQBELs, along with BMP WQBELs, as a consequence of not conducting the appropriate analysis.

In any case, the feasibility of numeric WQBELs, whether strictly derived from TMDL WLAs or of the surrogate parameter type, the State Water Resources Control Board has determined that numeric effluent limitations are not feasible. In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require "strict compliance" with water quality standards through numeric effluent*

<sup>2</sup>Memorandum from James A. Hanlon, Director, Office of Waste Management, Revisions to the November 22, 2002 Memorandum *Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, November 12, 2010, page

<sup>3</sup>Memorandum from Kevin Weiss, Water Permits Division, USEPA (Washington D.C.), March 17, 2011.

*limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

The State Board’s decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Conclusion: The Regional Board does not have the legal authority to require numeric WQBELs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

- c. Issue: There cannot be a WQBEL to attain a dry weather TMDL WLA nor a WQBEL that addresses a non-stormwater municipal action level (MAL).

The foundation for this argument lies in the federal limitation of non-stormwater discharges to the MS4 – not from or through it as the tentative order concludes. Federal stormwater regulations only prohibit discharges to the MS4 and limits outfall monitoring to stormwater discharges. This is explained in greater detail under 4. *Non-stormwater Discharge Prohibitions.*

Conclusion: Regional Board does not have the legal authority to compel compliance with dry weather WQBELs or non-stormwater MALs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

2. The tentative order has altered Receiving Water Limitation (RWL) language causing it to be overbroad and inconsistent with RWL in the current MS4 permit, the Ventura MS4 permit, State Board WQO 99-05, the draft Caltrans MS4 permit, and RWL language recommended by CASQA.

- a. Issue: The proposed RWL language changes the “exceedance” determinant from water quality standards and objectives to receiving water limitations, thereby increasing the stringency of the requirement. The tentative order RWL version reads: *Discharges from the MS4 that cause or contribute to the violation of **receiving water limitations** are prohibited.*

Compare this with what is in the current MS4 permits for Los Angeles and Ventura Counties:

*Discharges from the MS4 that cause or contribute to a violation of **water quality standards** are prohibited.*

Whereas standard RWL language limits water quality standards to what is in the basin plan, and includes water quality objectives (relates to waters of the State), the tentative order uses revised language that replaces water quality standards with the following receiving water limitation criteria:

*Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38.*

It is unclear why Regional Board staff has removed water quality standards, which is a USEPA and State Board requirement, and replaced them with the more global receiving water limitation language that include additional compliance criteria (e.g., “or federal regulations including but not limited to 40 CFR § 131.38”). Other “federal regulations” could include CERCLA (Comprehensive Environmental Remediation and Compensation Liability Act).

Enlarging the scope of the RWL from water quality standards to a universe of other regulatory requirements exceeds RWL limitation language established in State Board WQO 99-05, a precedential decision. The order bases compliance on discharge prohibitions and receiving water limitations on the *timely implementation of control measures and other action in the discharges in accordance with the SWMP (stormwater management plan) and other requirements of the permit's limitations.* It goes on to say that if exceedances of water quality standards or water quality objectives, collectively referred to as water quality standards

continues, the SWMP shall undergo an iterative process to address the exceedances. It should be noted that this language was mandated by USEPA.

It should be noted that the draft Caltrans MS4 permit is scheduled for adoption in September, as well as CASQA, proposes RWL language that is in keeping with WQO 99-05.

Conclusion: Regional Board does not have the legal authority to re-define RWL language to the extent it is proposing.

Recommended Correction: Replace RWL contained in the tentative order with the CASQA model or with language contained in the draft Caltrans MS4 permit.

- b. Issue: By eliminating water quality standards, the tentative order has created a separate compliance standard for TMDLs and for non-TMDLs. Standard RWL language in other MS4 permits designates the SWMP<sup>4</sup> as the exclusive determinant for achieving water quality standards in the receiving water. Since TMDLs are enhanced water quality standards, the SWMP (or in this case the SQMP) should enable compliance with TMDLs. Instead, the tentative order specifies compliance through implementation plans – including plans that were discussed in several State/Regional Board adopted TMDLs (e.g., the Los Angeles River Metals TMDL). The absence of water quality standards also creates a separate compliance standard for non-TMDLs. According to Regional Board staff, minimum control measures (MCMs) which make up the SQMP, are intended to meet non-TMDLs pollutants. Unclear is what defines non-TMDL pollutant. If there are no water quality standards referenced in the RWL then what are the non-TMDL pollutants that the MCMs are supported to address?

There is no authority under federal stormwater regulations to comply with any criterion other than water quality standards. The RWL language called-out in WQO 99-05, which was in response to a USEPA directive, makes it clear that water quality standards represent the only compliance criteria, not an expanded definition of receiving water limitations that exclude such criteria.

MS4 permits throughout the State include TMDL WLAs. None of them, however, has created a compliance mechanism that excludes water quality standards as a means of attaining them. Further, the State Board has, through the draft Caltrans MS4 permit and the draft Phase II MS4 permit, articulated its policy on compliance with water quality standards:

---

<sup>4</sup>USEPA and federal stormwater regulations use stormwater management program whereas the Los Angeles County MS4 permit uses stormwater quality management plan (SQMP). In effect they are the same. They consist of 6 core programs that must be implemented through MS4 permit.

they are to be met through the implementation of stormwater management programs. Equally noteworthy is that State Board has not created a dual standard for dealing with TMDLs and non-TMDLs. This is an obvious consequence of its adherence to WQO 99-05.

With regard to implementation plans contained in TMDLs, the Regional Board has no legal authority to include them into the MS4 permit. This issue discussed in greater detail later in these comments.

Conclusion: The tentative order must be revised to restore water quality standards in RWL language and, by extension, enable compliance with TMDLs and other water quality standards through the SQMP/MCMs.

Recommended Correction: Revise the tentative order to eliminate any reference to complying with anything else except water quality standards through the SQMP; and, therewith, eliminate any reference to complying with implementation plans contained in State/Regional Board TMDLs.

**3. The tentative order does not include the iterative process, a mechanism that is integral to RWL language which serves to achieve compliance with water quality standards.**

- a. Issue: The absence of the iterative process disables a safeguard to protect permittees against unjustifiably strict compliance with water quality standards – or in this case the expanded definition of receiving water limitations -- that is a requisite feature in all MS4 permits issued in California. The tentative order circumvents the iterative process by creating an alternative referred to as the adaptive/management process which is only available to those permittees that opt for a watershed management program.

Despite the fact RWL language in MS4 permits since the 90's have provided a description of an iterative process (the BMP adjustment mechanism), the term "iterative process" has only recently been specifically mentioned in them. The absence of this term resulted in the 9<sup>th</sup> Circuit Court Appeal's conclusion in *NRDC v. Los Angeles County Flood Control District* that there is no "textual support" in the current MS4 permit for the existence of an iterative process. This resulted in the court's conclusion that the LACFCD had exceeded water quality standards in the hardened portions of the Los Angeles and San Gabriel Rivers. More recent MS4 permit's issued in the State contain clear references to the iterative process.

Notwithstanding the absence of water quality standards in the tentative order, the iterative process must be included as required by Water Quality Orders 2001-15 and 2009-0008, wherein the State Board made it clear that: we will

generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.

Moreover, both the draft Caltrans MS4 permit and the draft Phase II MS4 permit contain references to the iterative process. The draft Caltrans MS4 permit refers to the iterative process in two places: finding 20, Receiving Water Limitations and in the Monitoring Results Report. Finding 20 states:

*The effect of the Department’s storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs).<sup>5</sup>*

Under the Monitoring Results Report section, the draft Caltrans MS4 permit reiterates the iterative process within the context of the following: *The MRR shall include a summary of sites requiring corrective actions needed to achieve compliance with this Order, and a review of any iterative procedures (where applicable) at sites needing corrective actions.*<sup>6</sup>

The draft Phase II MS4 references the iterative process in two places, in finding 35 and under its definition of MEP. Finding 35 states:

*This Order modifies the existing General Permit, Order 2003-0005-DWQ by establishing the storm water management program requirements in the permit and defining the minimum acceptable elements of the municipal storm water management program. Permit requirements are known at the time of permit issuance and not left to be determined later through iterative review and approval of Storm Water Management Plans (SWMPs).*

The draft Phase II MS4 permit also acknowledges the iterative process through the definition of maximum extent practicable (which is also included in the draft Caltrans MS4 permit), to the following extent:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP*

<sup>5</sup>See draft Caltrans MS4 permit (Tentative Order No. 2012-XX-DWQ NPDES No. CAS000003), page 10.

<sup>6</sup>Ibid., page 35.

*development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the "iterative approach."<sup>7</sup>*

It should be clearly understood that the State Board is articulating clear policy on the iterative process through these two draft MS4 permits and that they must be followed by Regional Boards as subordinate jurisdictions.

Conclusion: The Regional Board has no authority to alter the iterative process/procedure by making a revised and diluted version of it available only to those MS4 permittees that wish to opt for watershed management program participation. Quite the contrary, the Regional Board is legally compelled to make the iterative process, as described herein, an undeniable requirement in the tentative order.

Recommended Correction: Regional Board staff should incorporate the iterative process into the tentative order in the findings section and in the RWL section. It should also be referenced again under a revised MEP definition.

**4. The tentative order incorrectly articulates the non-stormwater discharge prohibition to the MS4 to include discharges from and through it.**

- a. Issue: The tentative order mentions prohibiting non-stormwater discharges not only to the MS4 but from and through it as well. Federal regulations did not authorize the non-stormwater discharge prohibition to go beyond "to" the MS4. This is a serious issue because extending the prohibition from or through the MS4 would subject non-stormwater discharges (including dry weather TMDL WLAs and non-stormwater municipal action levels) to pollutant limitations at the outfall.

The tentative order attempts to justify interpreting federal stormwater regulations to mean that non-stormwater discharges are prohibited not only to the MS4 but from it and through it as well by: (1) incorrectly stating the Clean Water Act §402(p)(B)(ii) of the Clean Water Act requires permittees effectively prohibit non-storm water discharges into

---

<sup>7</sup> See State Water Resources Control Board Water Quality Order No. XXXX-XXXX-DWQ, NPDES General Permit No. CASXXXXXX, page

watercourses (means receiving waters) as well as to the MS4; and (2) a misreading of Federal Register Volume 55, No. 222, 47990 (federal register) which contains an error with regard to the non-stormwater discharge prohibition.

§402(p)(B)(ii) does not (as the tentative order's fact sheet asserts) include watercourses, which according to Regional Board staff, means waters of the State and waters of the United States, both of which lie outside of the MS4. The original text of §402(p)(B)(ii) actually reads as follows: *Permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."*<sup>8</sup> There is no mention of watercourses.

The tentative order's fact sheet also relies on the afore-cited federal register which states: *402(p)(B)(3) requires that permits for discharges from municipal storm sewers require the municipality to "effectively prohibit" non-storm water discharges from the municipal storm sewer.* The fact sheet is correct about this. The problem is that the federal register is wrong here. It confuses 402(p)(B)(3), which addresses stormwater (not non-stormwater) discharges from the MS4, with 402(p)(B)(2), which once again prohibits non-stormwater discharges to the MS4. It should be noted that in the same paragraph above the defective federal register language, it says that ... *permits are to effectively prohibit non-storm water discharges to the municipal separate storm sewer system.*

In any case, this issue has been resolved since the federal register was published in November of 1990. All MS4 permits in the United States issued by USEPA prohibit non-stormwater discharges only to the MS4. USEPA guidance, such as the *Illicit Discharge Detection and Elimination: A Guidance Manual* bases investigation and monitoring on non-stormwater discharges being prohibited to the MS4. And, with the exception of Los Angeles Regional Board MS4 permits, MS4 permits issued by other Regional Boards also limit the MS4 discharge prohibition to the MS4. Beyond this, the draft Caltrans MS4 permit and draft Phase II MS4 permits also limit the non-stormwater prohibition to the MS4.

**Conclusion:** The Regional Board does not have the legal authority to extend the non-stormwater discharge prohibition from or through the MS4.

**Recommended Correction:** Revise the non-stormwater discharge prohibition to be limited to the MS4 only and delete all requirements that are based on the prohibition from or through the MS4. This includes the non-stormwater prohibition that is linked to CERCLA.

---

<sup>8</sup>Municipal storm sewers is a truncated version of municipal separate stormwater system (MS4).

5. **The tentative order proposes to incorporate TMDL implementation plans, schedules, and monitoring requirements without legal authority.**

- a. Issue: Placing Regional Board/State Board TMDLs into the MS4 would result in serious consequences for permittees. For one thing, permittees subject to TMDLs that contain an implementation schedule with compliance dates for interim waste load allocations that have not been met, based on Los Angeles County mass emissions station or other data (e.g., from the Coordinated Monitoring Plan for the Los Angeles River Metals TMDL), will be in automatic non-compliance once the MS4 permit takes effect.

The tentative order proposes a safeguard in this event: coverage under a time schedule order (TSO). Essentially, a TSO is an enforcement action authorized under Porter-Cologne, the State's water code. The problem is that the Regional Board, at its discretion, could issue a clean-up and abatement order that could link permittees in the Dominguez Channel, Los Angeles River, and San Gabriel River Watersheds to the remediation of the Los Angeles and Long Beach Harbors which are currently CERCLA sites (caused by DDT, pesticides, metals, which are considered toxics, and other pollutants). Furthermore, the TSO, which is a State enforcement action, will not help with respect to a federal violation because of preemption. An exceedance will expose subject permittees to third party litigation under the Clean Water Act. NRDC would be able to take the matter straight to federal court.

In any case, the Regional Board has no legal authority under the Clean Water Act to incorporate implementation plans, schedules, or monitoring requirements into the MS4 permit. CWA §402(p)(B)(iii) simply states that controls are required *to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.* The application of this provision is limited to: (1) the implementation of BMPs specified in a stormwater management plan appropriated through the six core programs; and (2) outfall monitoring. Monitoring, as mentioned earlier, is limited to outfall and ambient monitoring. Ambient monitoring, which is receiving water-based, has been assumed by the Regional Board and is funded through a stormwater ambient monitoring program (SWAMP) surcharge on the annual MS4 permit fee. Federal stormwater regulations mention nothing about TMDL implementation plans and schedules in an MS4 permit.

In fact, the Regional Board/State Board TMDL implementation plans, implementation schedules, and monitoring should be voided and prevented

from being placed into the MS4 permit because (1) they set compliance determinant in the receiving water instead of the outfall; and (2) although the TMDL monitoring program requirements specify ambient monitoring that is to be performed by MS4 permittees, including Caltrans, the Regional Board has approved plans that treat wet weather monitoring as ambient monitoring, even though they are mutually exclusive. The Clean Water Act definition of ambient monitoring is the:

*Natural concentration of water quality constituents prior to mixing of either point or nonpoint source load of contaminants. Reference ambient concentration is used to indicate the concentration of a chemical that will not cause adverse impact to human health.*

The natural concentration of water quality constituents can only mean the state of a receiving water when it is not raining. This is further supported by the phrase "prior to mixing of either point or non-point source load of contaminants," which can only mean stormwater discharges from an outfall. In other words, stormwater discharges from an outfall cannot be mixed with a receiving water during a storm event because the ambient condition would be lost. Outfall monitoring of stormwater discharges is evaluated against the ambient condition of pollutant constituents in the receiving water for the ostensible purpose of determining its pollutant contribution.

Conclusion: The tentative order lacks the legal authority to include TMDL implementation plans, schedules, or monitoring plans adopted as basin plan amendments. No permittee, subject to any TMDL that requires an implementation plan, schedule, or monitoring plan can be compelled to comply with any of them. Further, even if it were legally permissible for these TMDL elements to be incorporated into the MS4 permit, no permittee could be placed into a state of non-compliance because the legitimate compliance point is in the outfall. Because no outfall monitoring has occurred, no violation could arise and, therefore, there would be no need for a TSO.

Recommended Correction: Eliminate requiring TMDL implementation plans, schedules, and monitoring to be incorporated into the tentative order.

**6. The tentative order contains references to the federal Comprehensive Environmental Remediation Compensation and Liability Act (CERCLA) that would make them additional regulatory requirements.**

- a. Issue: The non-stormwater discharge prohibition under the tentative order states:

*Non-storm water discharges through an MS4 are prohibited unless authorized under a separate NPDES permit; authorized by USEPA*

*pursuant to Sections 104(a) or 104(b) of the federal comprehensive Environmental Response, Compensation and Liability Act (CERCLA).*

At first blush, the CERCLA provision appears innocuous. But what if non-stormwater discharge is not authorized under CERCLA? Conceivably the MS4 permittee could be held responsible for those discharges. And because CERCLA is referenced in the MS4 permit, it could become a potential third party litigation issue. The inclusion of the CERCLA provision is even more suspect when considering that no other MS4 in the State contains such a reference. Beyond this, how would a permittee know if a discharge is one covered under CERCLA?

Conclusion: CERCLA is an unnecessary reference in the MS4 permit and has the potential to expose permittees to third party litigation. Further, the non-stormwater discharge prohibition only "to" the MS4 makes this issue academic. A permittee's only responsibility is to prohibit impermissible non-stormwater to the MS4, not through or from it; or to require the discharger to obtain permit coverage.

**7. The tentative order, under the effluent limitations section, contains technical effluent based limitations (TBELs) which typically are not included in MS4 permits and, in this particular case, does not appear to be purposeful.**

- a. Issue: Part IV.A.1 of the tentative order states that TBELs shall reduce pollutants in storm water discharges from the MS4 to the maximum extent practicable (MEP).

It is not clear as to the reason for including TBELs into the tentative order because they are generally not required of Phase MS4 permits. TBELs are referenced in the tentative order, but are not found under section 402(p), which addresses storm water, nor anywhere else in federal regulations. It is a term used to collectively refer to best available technologies, but again not in 402(p).

TBEL is a term USEPA uses to denote the following: (1) Best Practical Control Technology Currently Available (BPT); (2) Best Conventional Pollutant Control Technology (BCT); and (3) Best Available Technology Economically Achievable (BAT). Since these provisions were established prior to stormwater provisions of the CWA §402(p), they were applied to industrial waste-water discharges (including construction activity which is an industrial category sub-set). A clarifier connected to the sewer system is a type of TBEL. POTWs are subject to TBELs example primary and secondary treatment.

According USEPA guidance:

*WQBELs are designed to protect water quality by ensuring that water quality standards are met in the receiving water. On the basis of the requirements of Title 40 of the Code of Federal Regulations (CFR) 125.3(a), additional or more stringent effluent limitations and conditions, such as WQBELs, are imposed when TBELs are not sufficient to protect water quality.*<sup>9</sup>

Since the MS4 permit proposes WQBELs (adapted to meet water quality standards at the outfall), it would appear that TBELs are irrelevant. In essence, the proposed WQBELs is an admission from Regional Board staff that TBELs are not sufficient to protect water quality.

Please note that the draft Caltrans and Phase II MS4 permits do not reference TBELs.

Conclusion: Clarification is needed to determine the purpose of referencing TBELs in the tentative order.

Recommended Correction: Either provide clarification and a justification requiring TBELs given that the tentative order requires WQBELs, a more stringent requirement. If clarification or justification cannot be provided, the TBEL provision should be removed.

## **8. Minimum Control Measures (MCMs)**

a. Issue: Generally, MCMs should not be detailed in the tentative order. Instead, specific BMPs and other information should be placed in the Stormwater Quality Management Plan (SQMP), which is the case under the current MS4 permit. Federal guidance specifies that the core programs are to be implemented through the SQMP as a means of meeting water quality standards. More importantly, placing the specifics in the SQMP makes it easier to revise. If specific BMPs remain in the tentative order, and they are in error or need to be revised (e.g., to set BMP-WQBELs), a re-opener would be required. For example, in Part I. *Facility Information, Table 2.*, the permittee contact information is out of date. It would be better to place this and other detailed information in the SQMP where it can be updated regularly without having to re-open the permit.

b. Issue: SUSMP

The tentative order replaces the Development Planning/SUSMP with Planning and Land Development Program. However, the SUSMP is mandated through a precedent-setting WQO issued by the State Board. Nothing in the order's fact sheet provides an explanation of why the SUSMP needs to be replaced. So doing would incur an unnecessary cost

---

<sup>9</sup>NPDES Permit Writers' Manual, September, 2010, page 5-40.

to revise the SQMP and SUSMP guidance materials. This is not to suggest that the Regional Board may not, in the final analysis, have the legal authority to change the SUSMP to its MCM equivalent. Nevertheless, it would be helpful from an administrative convenience standpoint to explain the need for the change in the fact sheet. It could be argued that the low impact development (LID) techniques have been successfully implemented through the SUSMP program for over five years.

- c. Issue: Retrofitting existing developments through the Land Use Development Program is not authorized under federal stormwater regulations. CFR 40 122.26 only authorizes retrofitting with respect to flood control devices which is to be explained in the MS4 permit as the following indicates:

*A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible.*

- d. Issue: The MCMs in the tentative order require off-site infiltration for groundwater recharge purposes. The tentative order is a stormwater permit, not a groundwater permit. As mentioned, 402(p)(3)(iii) of the Clean Water Act:

*Permits ... shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.*

The use of other infiltration controls that do not promote groundwater recharge have already demonstrated effectiveness in significantly reducing pollutants to the maximum extent practicable (MEP). Requiring infiltration anywhere for the purpose of recharging groundwater exceeds the scope of the MS4 since infiltrating to such an extent would add costs to the developer or permittee without significantly improving pollutant removal performance. Further, this requirement is unwarranted and premature because of the absence of outfall monitoring data that would demonstrate the need for groundwater-recharge oriented infiltration controls to address water quality standards and TMDLs vis-à-vis their intended purpose of protecting beneficial uses in a receiving water.

Conclusion: Requiring infiltration controls to facilitate groundwater recharge is not authorized under federal stormwater regulations. Further, many permittees are situated upstream of spreading grounds and other macro-infiltration basins that would obviate the need for this requirement.

Recommended Correction: Eliminate this requirement from the order.

**9. The Maximum Extent Practicable (MEP) definition needs to be revised to reflect is updated definition found in the draft Phase II MS4 permit and in the draft Caltrans MS4 permit.**

- a. Issue: The order's MEP reference is a carry-over from the 2001 MS4 permit. A great deal has happened over the decade to warrant an update. Fortunately, the State Board, through the draft Phase II and Caltrans MS4 permits, has revised the MEP definition to be in keeping with current realities. To that end it has proposed the following definition:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the "iterative approach."<sup>10</sup>*

Conclusion: The order's MEP is out of data and inconsistent with State Board policy.

Recommended Correction: Replace order's MEP definition with the above-mentioned language.

**10. The tentative order inappropriately includes the Middle Santa Ana River Bacteria TMDL.**

- a. Issue: It should be abundantly clear that the Regional Board cannot accept a TMDL adopted by another jurisdiction for implementation through the MS4 permit unless the Board includes into its basin plan as an

---

<sup>10</sup>Op. Cit., page 35.

amendment. This argument has been raised by legal counsel for the City of Claremont.

Conclusion: The Regional Board lacks legal authority to incorporate the Middle Santa Ana River bacteria TMDL into the proposed order.

Recommended Correction: Eliminate the requirement.

**11. Tentative order incorrectly asserts that its provisions do not constitute unfunded mandates under the California Constitution.**

- a. Issue: Contrary to what the order asserts, it contains provisions that exceed federal requirements in several places, thereby creating potential unfunded mandates. They include: (1) requiring wet and dry weather monitoring in the receiving water; (2) requiring numeric WQBELs; (3) requiring compliance with TMDL-related implementation plans, schedules, and monitoring; (4) requiring the non-stormwater discharge prohibition to include through and from the MS4; (5) revising the receiving water limitation language to include overbroad compliance requirements; (6) requiring groundwater recharge; and (7) monitoring for non-TMDL constituents at completed development project sites.

Conclusion: The order patently proposes requirements that create unfunded mandates.

Recommended Correction: Delete all of the aforementioned requirements that exceed federal regulations.

**END COMMENTS**

---

**Comments Regarding Los Angeles MS4 Tentative Order No. R4-2012-XXXX  
NPDES PERMIT NO. CAS004001 (issue date unspecified)  
Attachment E: Monitoring and Reporting Plan**

---

1. Receiving Water Monitoring

The purpose of receiving water monitoring is to:

- a. *Determine whether the receiving water limitations are being achieved,*
- b. *Assess trends in pollutant concentrations over time, or during specified conditions,*
- c. *Determine whether the designated beneficial uses are fully supported as determined by water chemistry, as well as aquatic toxicity and bioassessment monitoring.*

Receiving water monitoring is to be performed at various in-stream stations.

At issue is "a" because it serves to determine compliance with receiving water limitations. The Regional Board has no legal authority to compel compliance with receiving water limitations through in-stream monitoring. Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) clearly indicates:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

According to Clean Water Act §502, effluent monitoring is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2 defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

In short, effluent monitoring in a receiving water because cannot be required because it lies outside the bounds of the outfall.

Regarding monitoring purposes “b” and “c” no argument is raised here provided that it is understood that assessing trends in pollution concentrations would be: (1) limited to ambient water quality monitoring; and (2) permittees shall be not responsible for funding such monitoring. With respect to the latter, the Regional Board’s surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.

*Recommended Corrective Action:* Delete 1(a) and make it clear that 1(b) and (c) relate to ambient monitoring that is not the responsibility of MS4 permittees.

## 2. Stormwater Outfall Based Monitoring

The purpose of stormwater outfall based monitoring – including TMDL monitoring – is to:

- a. *Determine the quality of a Permittee’s discharge relative to municipal action levels, as described in Attachment G of this Order,*
- b. *Determine whether a Permittee’s discharge is in compliance with applicable wet weather WQBELs derived from TMDL WLAs,*
- c. *Determine whether a Permittee’s discharge causes or contributes to an exceedance of receiving water limitations.*

Insofar as “a” is concerned, outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to replace TMDL WLAs as alternatives to addressing receiving water quality. As noted in the National Research Council Report to USEPA:

*The NSQD (Pitt et al., 2004) allows users to statistically establish action levels based on regional or national event mean concentrations developed for pollutants of concern. The action level would be set to define unacceptable levels of stormwater quality (e.g., two standard deviations from the median statistic, for simplicity). Municipalities would then routinely monitor runoff quality from major outfalls. **Where an MS4 outfall to surface waters consistently exceeds the action level, municipalities would need to demonstrate that they have been implementing the stormwater program measures to reduce the discharge of pollutants to the maximum extent practicable.** The MS4 permittees can demonstrate the rigor of their efforts by documenting the level of implementation through*

*measures of program effectiveness, failure of which will lead to an inference of noncompliance and potential enforcement by the permitting authority*

Instead of following the above Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs if necessary.

Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.

*Recommended Correction:* Either require substitution of TMDLs with MALs or eliminate MALs entirely.

As for stormwater outfall monitoring purpose "b", such monitoring cannot be used to determine compliance with **wet weather WQBELs based on TMDL WLAs** for the following reasons:

1. The wet-weather WQBEL is based on a TMDL WLA in the receiving water that is non-ambient. As mentioned, federal regulations only require ambient monitoring in the receiving water, which by definition can never be deemed the same as wet weather monitoring. They are mutually exclusive. Regional Board staff has also incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a "numeric effluent limitation." Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board's clear opposition to numeric effluent limitations.

In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require "strict compliance" with water quality standards through numeric effluent limitations," and instead "we will continue to follow an iterative approach, which seeks compliance over time" with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

2. The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Regarding purpose "b" it should also be noted that the Regional Board's setting of WQBELs to translate the TMDL WLA in the receiving water to the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.*

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit's fact sheet. According to USEPA's NPDES Permit Writers' Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>1</sup>*

---

<sup>1</sup>United States Environmental Protection Agency, NPDES Permit Writers' Manual, September, 2010, page 6-30.

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis.

Complicating the performance of a reasonable potential analysis is the absence of (1) outfall monitoring data; and (2) ambient water quality standards. Though federal regulations require monitoring at the outfall, the Regional Board has not required it up until now. Even if outfall monitoring data were available to determine whether pollutants concentrations in the discharge exceeded the water quality standard is not possible. This is because, as mentioned earlier, TMDL WLAs are not expressed as ambient standards. A TMDL is an enhanced water quality standard. As noted in the National Research Council's *Assessing the TMDL Approach to Water Quality Management*, a report commissioned by the United States Congress in 2001:

*... EPA is obligated to implement the Total Maximum Daily Load (TMDL) program, the objective of which is attainment of ambient water quality standards through the control of both point and nonpoint sources of pollution.*

*Recommended Correction:* Eliminate this requirement.

Regarding purpose "c", the determinant for a water quality standard exceedance is in the discharge from the outfall – not in the receiving water. The use of numeric WQBELs – though incorrectly defined and established in this instance – represents the compliance standard in discharges from the outfall. Adding a second compliance determinant in the receiving water is unnecessary and is not authorized under federal stormwater regulations because the receiving water lies outside the scope of the MS4.

*Recommended Corrective Action:* Eliminate this requirement.

### **3. Non-storm water outfall based monitoring**

The purposes of this type of monitoring are as follows:

- a. *Determine whether a Permittee's discharge is in compliance with applicable dry weather WQBELs derived from TMDL WLAs.*
- b. *Determine whether a Permittee's discharge exceeds non-storm water action levels, as described in Attachment G of this Order,*
- c. *Determine whether a Permittee's discharge contributes to or causes an exceedance of receiving water limitations,*

d. *Assist a Permittee in identifying illicit discharges as described in Part VI.D.9 of this Order.*

Regarding "a," This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.

*Recommended Correction:* Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the ICDDE program.

Withy regard to "b", see previous responses regarding MALs and the limitation of non-stormwater discharge prohibit to the MS4.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.

Regarding "c", as mentioned, non-stormwater discharges cannot by applied to receiving water limitations because of they are only prohibited to the MS4, not from or through it.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.

Regarding "d", this requirement is reasonable and in keeping with federal regulations with the exception that the identification of illicit discharges must adhere to the field screening requirements in CFR 40 §122.26. No non-stormwater discharge monitoring shall occur unless flow is first discovered at the outfall. This would trigger the implementation of additional requirements that the tentative order does not include.

#### **4. New Development/Re-development effectiveness monitoring**

The purpose of this requirement is a dubious and is not authorized under federal stormwater regulations as it relates to monitoring. To begin with, requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4's pollution contribution relative to exceeding ambient water quality standards. Without the determination of statistically significant exceedances of water quality standards, detected at the

outfall, the imposition of runoff infiltration requirements is arbitrary. Further, there is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.

Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines "effectiveness" -- effective relative to what standard? It is also not clear how such monitoring is to be performed.

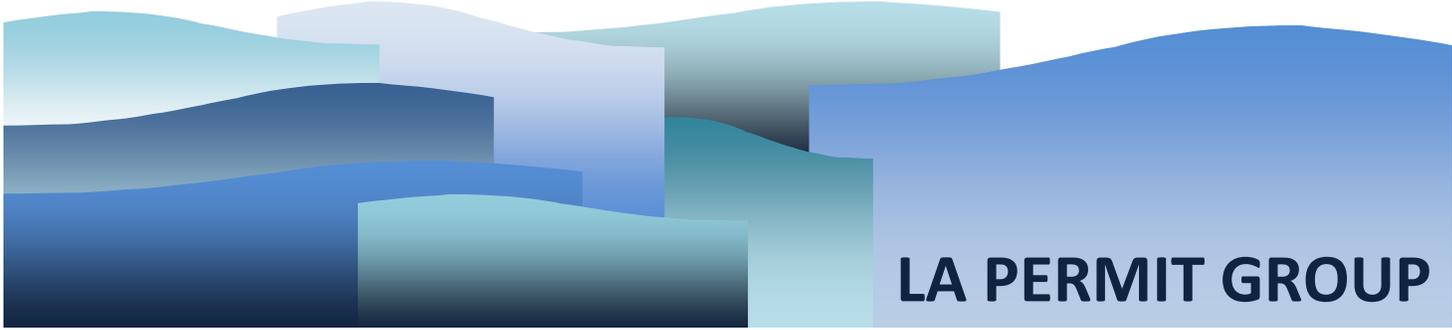

*Recommended Correction:* Delete this requirement.

The MRP of the tentative order proposes regional studies *"to further characterize the impact of the MS4 discharges on the beneficial uses of the receiving waters. Regional studies shall include the Southern California Stormwater Monitoring Coalition (SMC) Regional Watershed Monitoring Program (bio-assessment), sediment monitoring for Pyrethroid pesticides, and special studies as specified in approved TMDLs (see Section XIX TMDL Reporting, below)."*

Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board's SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County's mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.

END COMMENTS

**SUBJECT: Comments on the Draft NPDES Permit (Draft Order), Order No. R4-2012-XXXX; NPDES Permit NO. CAS004001, for MS4 Dischargers within the Los Angeles County Flood Control District**

The LA Permit Group (LAPG) appreciates the opportunity to provide comments on the subject Draft Order for the Los Angeles region. The Los Angeles Permit Group is a consortium of municipalities that was formed to ensure Los Angeles' stormwater is managed properly, both for flood control and water quality protection (LA Permit Group agencies list provided in Exhibit A).

The LA Permit Group was formed, to accomplish several important objectives, including:

- Promoting constructive collaboration and problem-solving between the regulated community (municipalities) and the Los Angeles Regional Water Quality Control Board (LARWQCB);
- Assisting in development of a new NPDES Permit that is capable of integrating the protection of water quality with other watershed objectives in a cost-effective and science-based manner;
- Focusing limited municipal resources on implementation of water quality protection activities that are efficient, effective and sustainable.

Over 62 Los Angeles County municipalities have actively participated in the effort to develop negotiations points and provide comments throughout the MS4 NPDES Permit development process. Comments and negotiations points are developed by each of the LA Permit Group's four Technical Sub-Committees (Development Programs, Reporting & CORE Programs, Monitoring, and TMDLs), which are then approved by the LA Permit Group. The group's consensus is represented by the Negotiations Committee. This comment letter and accompanying exhibits reflect a collaborative effort to develop a permit that will lead to water quality protection in a cost effective manner. We have a number of major and minor concerns with the Draft Order. Our comments are organized around the following major issues:

- Receiving Water Limitations
- TMDLs
- Monitoring
- MCMs
- Watershed Management Program
- Cost Implications

Our recommendations for each issue are noted in **bold** in this letter and our detailed comments on the Draft Order are provided in the Exhibits to this letter (Exhibit B).

We also want to note that the Draft Order contains a number of errors and inconsistencies. This is not surprising given the sheer magnitude of the draft document, which is the basis for our multiple requests for more time to review the more than 500 pages of Permit. As stated in our letter dated July 2, 2012 (incorporated in this letter as attached – Exhibit C) and in Public Comments at the July 12, 2012 Regional Board Meeting, the comment deadline of July 23, 2012 is far too short to address all the potential issues and concerns. On several occasions, the Regional Board staff has used the Staff Working Proposal process and workshops as a justification for the expeditious manner in which the Draft Order was developed and the curtailed 45-day public comment period. This justification is misplaced for several reasons:

- Each Staff Working Proposal was issued with only a few weeks for stakeholders to provide comments on what may be considered the most significant increase in public effort to address water quality issues in the past 20 years;
- Although we provided comments on the working proposal, it is unclear to us how the Regional Board staff addressed our comments. In some cases changes were made and other cases no changes were made. In both cases no explanation was provided. As a result we have attached our previous comment letters for the record (Exhibit D);
- By rolling out different working proposals at different times it was difficult to understand how the key provisions interacted with each other. It was only after the full draft Order was issued did we see the interaction (or lack of interaction) of the provisions;
- It is the LA Permit Group's goal to cooperatively develop the MS4 Permit to support the Regional Board's policy goal of a permit that would reduce the need for litigation. This goal is important to us as we believe that good policy and regulations are those that are developed reasonably, that Permittees are capable of complying with. Even though we have worked hard and in good faith with Regional Board staff to try to develop a Permit that is protective of water quality in a cost-effective and science-based manner, the draft Order places the Permittees in a very vulnerable position for not immediately complying with water quality standards (see our discussion below regarding Receiving Water Limitations);
- It is also important to note that stormwater managers have an obligation to adequately inform other municipal departments, legal counsel, city management and elected officials on the fiscal impact of this draft Order. The time to properly evaluate the Permit, assess its financial, legal, and personnel impacts, and inform our cities cannot be accomplished in the 45 day review period; and
- We have also heard from many cities that their executives and elected officials had registered for the League of California Cities Conference on September 5-7, 2012, months prior to the Permit adoption hearing notice. We request that the adoption hearing be rescheduled after September 6-7, 2012 to allow for elected officials and executive of the Permitted agencies to attend the hearing; it is imperative that the adoption hearing be scheduled at a time that municipal decision makers have the opportunity to attend and provide comments at the hearing.

It is essential that municipalities be given an additional 180 days to review the Permit and develop alternatives for the substantial issues found in this Draft Order. Based on the issues listed above and as communicated in our July 2<sup>nd</sup> letter and at the July 12<sup>th</sup> Regional Board meeting, we request that the our appeal for additional time be reconsidered. This could be accomplished by an additional review of a tentative Order before an adoption hearing is held.

### ***Receiving Water Limitations***

As previously outlined in our 05/14/12 comment letter on the working proposal, the Receiving Water Limitations (RWL) language in the Draft Order creates a liability to the municipalities that is unnecessary and counterproductive. We have the following significant concerns with the RWL language included in the Draft Order:

- Recent court decisions have created a new interpretation of the RWL that creates a liability for the Permittees without a commensurate increase in protection of water quality.
- The RWL as written is not a federal requirement so it is not necessary to maintain the current language.
- The RWL as written is contradictory to the Watershed Management Program.
- Alternative approaches are available to address the concerns and maintain the intent of the language in the approach; we request that RWQCB utilize this alternative language.

We feel that the RWL as included in not necessary and does not support the improvement of water quality as discussed in more detail below.

### **Creation of Unwarranted Liability**

The proposed language for the receiving water limitations provision is almost identical to the language that was litigated in the 2001 Permit. On July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.*<sup>1</sup> (*NRDC v. County of LA*) that determined that a municipality is liable for Permit violations if its discharges cause or contribute to an exceedance of a water quality standard. This represents a fundamental change in interpretation of policy and contrasts sharply with the Board's own understanding as expressed in a 2002 letter from then-Chair Diamond answering questions about the 2001 MS4 Permit in which she articulated this collective understanding that a violation of the Permit would occur only when a municipality fails to engage in good faith effort to implement the iterative process to correct the harm<sup>2</sup>. In light of the 9<sup>th</sup> Circuit's decision and based on the significant monitoring efforts being conducted by other municipal stormwater entities, municipal stormwater Permittees would be considered to be in non-compliance with their NPDES Permits. Accordingly, municipal stormwater Permittees will be exposed to considerable vulnerability, even though municipalities have little control over the sources of pollutants that create the vulnerability. Basically, the draft Order language again exposes the municipalities to enforcement action (and third party law suits) even when the municipality is engaged in an adaptive management approach to address the exceedance.

---

<sup>1</sup> No. 10-56017, 2011 U.S. App. LEXIS 14443, at \*1 (9th Cir., July 13, 2011).

<sup>2</sup> January 30, 2002. Letter from Francine Diamond, Chair, Los Angeles Regional Water Quality Control Board

The LA Permit Group would like to more fully address Board Member Glickfeld's question raised at the May 3rd workshop about how the RWL language as currently written puts cities in immediate non compliance, either individually or collectively. As noted above, significant monitoring by other MS4s in the state had demonstrated that MS4 discharges pose water quality issues and with the proposed outfall monitoring detailed in the Draft Order we would expect the runoff characteristics to be similar to other MS4 discharges in the State. As the RWL language is currently written, municipalities cannot cause or exceed water quality standards in the basin plan as soon as this Permit is adopted. While the Regional Board staff has noted that enforcement action is unlikely if the Permittees are implementing the iterative process, the reality is that municipalities are immediately vulnerable to third party lawsuits in addition to enforcement action by the Regional Board. This is in fact what happened to the City of Stockton. The City of Stockton was sued by a third party for violations of the cause/contribute prohibition even though the City was implementing a comprehensive iterative process with specific pollutant load reduction plans. This was a series of pollutants not covered by a TMDL, but that dealt with water quality exceedances. Cities will have no warning or time to react to any water quality exceedances, but still be vulnerable to third party lawsuits even when cities are diligently working to address the pollutants of concern. This will be disastrous public policy, creating a chilling effect on productive storm water programs. Also in the Santa Monica Bay, cities were sent Notices of Violation that, in essence, stated that all cities in the watershed were guilty until they proved their innocence when receiving water violations were found, in some cases miles away. The "cause and contribute" language was quoted prominently in those NOVs as justification for why the Regional Board could take such action.

It is inherently unfair and poor public policy to put cities in non-compliance on day one of the Permit without the opportunity for the cities to develop a plan of action, develop source identification, and implement a plan to address the concern. With the very recent legal interpretation that fundamentally changes how these Permits have been traditionally implemented, please understand that adjusting the Receiving Water Limitations language is a critical issue. Again, the receiving water limitation language must be modified to allow for the integrated approach (iterative/adaptive management) to address numerous TMDLs and non-TMDL water quality problems within the watershed based program in a systematic way. This is a fair and constructive approach to meet water quality standards.

### **Receiving Water Limitation Language as Written is Not Required under Federal Law**

We believe Federal Law does not require that the RWL language be written as presented in the Tentative Permit. Based on the language presented in other Permits throughout the United States, the proposed language is not the only option. The RWL provision as crafted in the contested 2001 Los Angeles permit is unique to California. Recent USEPA developed Permits (e.g. Washington D.C.<sup>3</sup>) do not contain similar limitations. Thus, we would submit that the decision to include such a provision and the structure of the provision is a State policy and therefore an opportunity exists for the Regional and State Boards to reaffirm the iterative process as the preferred approach for long-term water quality improvement.

### **Receiving Water Limitation Language as Written is Contradictory to the Watershed Management Program**

Beyond the legal/liability aspect of the RWLs we would submit that in a practical sense the RWL, as currently written, does not support the Permit's goal of protecting water quality and works against the Watershed Management Program proposal. On the one hand, the municipalities will develop watershed management

---

<sup>3</sup> NPDES Permit No. DC0000221, October 7, 2011, issued by USEPA Region 3.

programs that are based on the highest priority water quality issues within the watershed. Consistent with the Draft Order provision for the Watershed Management Program, we would expect the focus to be on TMDLs and the pollutants associated with those TMDLs. However, under the current RWL working proposal, the municipality will need to direct their resources to any and all pollutants that may cause or contribute to exceedances of water quality standards. Based on a review of other municipal outfall monitoring results in the State, there will be occasional exceedances of other non-TMDL pollutants (e.g. aluminum, iron, etc.). These exceedances may only occur once every 10 storms, but according to the current RWL proposal the municipalities must address these exceedances with the same priority as the TMDL pollutants. The LA Permit Group views this as unreasonable and ineffective use of limited municipal resources.

**We have requested that this language be revised on several occasions including written comments, workshop comments, and meetings with staff; however this issue has not yet been resolved in the Tentative Permit. An explanation is requested as to why this language remains as presented in the Draft Order is requested. Alternative Approaches are Available to Address Concerns.**

The RWL language is a critical issue for municipalities statewide and has been highlighted to the State Water Resources Control Board for consideration. Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue.

The California Association of Stormwater Quality (CASQA) has developed draft language that we feel should be used in lieu of the current language. The language provides specificity in compliance and subjects Permittees who are not engaged in good faith in the iterative process to enforcement without unnecessary and counterproductive liability for the majority of Permittees who are diligently implementing stormwater programs. We feel that the CASQA language maintains the intent of the current RWL while addressing the concerns outlined above.

**Recommendation: Develop Receiving Water Limitation language consistent with the California Association of Stormwater Quality language that was submitted in a comment letter on Caltrans Permit (Exhibit E) and on the Statewide Phase II Permit which defines action thresholds, an iterative/adaptive management process, and avoids unnecessary liability.**

### ***Total Maximum Daily Loads***

As outlined in our May 12, 2012 comment letter on the TMDL working proposal, the incorporation of TMDL WLAs into the Tentative Permit is of critical importance to the LASP. **WLAs should be incorporated using a BMP-based approach that includes an iterative approach to attain the WLAs and provides flexibility to the Permittees to address the complexities of addressing multiple TMDLs within a watershed.** The best mechanism to achieve water quality standards is by implementing BMPs, evaluating their effectiveness and implementing additional BMPs as necessary to meet TMDL WLAs. Without this process, and due to the requirement in the Draft Order to meet numeric values, our ability to effectively implement BMPs is hampered by the legal issues associated with Permit compliance.

The Draft OrderDraft Order proposes to incorporate more TMDLs than any other Permit in California issued to date. As a result, the manner in which the TMDLs are incorporated into the Permit is a critical issue to the LA Permit Group and will likely set a significant precedent for future MS4 Permits.

The rate of development of TMDLs in the Los Angeles Region was unparalleled in California, and likely the nation. A settlement agreement necessitated the much accelerated time schedule for these TMDLs. The TMDLs were developed based on the information available at the time, not the best information to identify or solve the problem. As a result, the sophistication of the TMDLs vary widely, meaning that not all TMDLs are created equal regarding knowledge of the pollutant sources, confidence in the technical analysis, availability of control measures sufficient to address the pollutant targets, etc. Additionally, the majority of the TMDLs were developed with the understanding that monitoring, special studies, and other information would be gathered during the early years of the TMDL implementation to refine the TMDLs. As such, many MS4 dischargers were told during TMDL adoption that any concerns they may have over inaccuracies in the TMDL analysis would be addressed through a TMDL reopener. The recent experience with the Santa Monica Bay Beaches Bacterial TMDL reopener demonstrates just how difficult, if not impossible, obtaining serious reconsideration of established TMDLs, irrespective of the weight of evidence presented. The proposed method of incorporating TMDL waste load allocations (WLAs) as outlined in the Draft OrderDraft Order does not effectively allow for addressing this phased method of implementing TMDLs; nor does it recognize the time, effort and complexities involved in addressing MS4 discharges; and places municipalities into non-compliance risk.

We recognize and appreciate that TMDLs must be incorporated in such a way as to require action to improve water quality. However, the Permit should recognize the articulated goal of many of the TMDLs to be adaptive management documents, using the iterative approach to achieve the goals, and consider the challenges of trying to address the non-point nature of stormwater. As such, it is imperative to have flexibility in selecting an approach to address the TMDLs and the time frame by which to implement the approach. We would like to thank Board staff for providing the opportunity to submit an implementation schedule and BMPs in context of a Watershed Management Plan to attain EPA TMDL WLAs. The same flexibility is also necessary to address Regional Board adopted TMDLs.

The LA Permit Group would submit that the Regional Board staff is making two policy decisions that have massive financial impacts to the region (studies show in the range of billions of dollars) with regards to incorporating TMDLs into a stormwater NPDES Permit:

- The inclusion of numeric effluent limitations for final TMDL WLAs.
- The use of time schedule orders to address Regional Board adopted TMDLs for which the compliance points have passed.

### **Numeric Effluent Limitations for Final TMDL WLAs**

The LA Permit Group opposes the incorporation of final WLAs solely as numeric effluent limitations in the proposed Permit language. Although staff has discretion to include numeric limits where feasible, it is not required and the use of numeric limits results in contradictions and compliance inconsistencies with the rest of the Permit requirements. Court decisions (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)<sup>4</sup>), State Board orders (Order WQ 2009-0008, In the Matter of the Petition of County of Los

---

<sup>4</sup> See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

Angeles and Los Angeles County Flood Control District, at p. 10)<sup>5</sup> have affirmed that WLAs can be incorporated as non-numeric effluent limitations.

Under 40 CFR Section 122.44 (k), the Regional Board may impose BMPs for control of storm water discharges in lieu of numeric effluent limitations when numeric limits are infeasible. It states that best management practices may be used to control or abate the discharge of pollutants when numeric effluent limitations are infeasible. In 2006, the State Board convened Blue Ribbon Panel made recommendations to the State Water Resources Control Board concluding that it was not feasible to incorporate numeric limits into Permits to regulate storm water, and at best, there could be some action level to focus on problematic drainage sheds<sup>6</sup>. Very little has changed in the technology and the feasibility of controlling storm water pollutants since 2006. What has changed is that a legally compelled, long list of TMDLs has been adopted in the LA Region in a very short time period. The draft stormwater Permit for CalTrans also states “Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 Code of Federal Regulations section 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water Permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP. To assist in determining if the BMPs are effectively achieving MEP standards, this Order requires effluent and receiving water monitoring. The monitoring data will be used to determine the effectiveness of the applied BMPs and to make appropriate adjustments or revisions to BMPs that are not effective.” The LAPG requests similar consideration as the Draft Order is a much more variable and complicated MS4 than CalTrans.

Additionally, during the May 3, 2012 MS4 Permit workshop, Regional Board staff seemed to indicate that the basis for incorporating the final WLAs as numeric effluent limitations is EPA’s 2010 memorandum pertaining to the incorporation of TMDL WLAs in NPDES Permits<sup>7</sup>. This memorandum (which is currently being reconsidered by U.S. EPA) states that “EPA recommends that, *where feasible*, the NPDES permitting authority *exercise its discretion* to include numeric effluent limitations as necessary to meet water quality standards” (emphasis added). This statement highlights the basic principle that the Regional Board has discretion in how WLAs are incorporated into a MS4 Permit. Regional Board staff commented during the workshop that staff have evaluated data and have determined numeric effluent limitations are now feasible. However, no information refuting the Blue Ribbon Panel report recommendations has been provided that demonstrates how the appropriateness of using strict numeric limits was determined and why these limits are considered feasible now even though historically both EPA and the State have made findings that developing numeric limits was likely to be infeasible.

Given the discretion available to Regional Board staff and the variability among the TMDLs with respect to understanding of the pollutant sources, confidence in the technical analysis, and availability of control measures sufficient to address the pollutant targets, **it is critical to use non-numeric water quality based**

---

<sup>5</sup> “[i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California’s NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board’s findings *supporting either the numeric or non-numeric* effluent limitations contained in the permit.” (Order WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)

<sup>6</sup> Storm Water Panel Recommendations to the California State Water Resources Control Board “The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities. June 19, 2006.

<sup>7</sup> U.S. EPA, *Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, Memorandum from U.S. EPA Director, Office of Wastewater Management James A. Hanlon and U.S. EPA Director, Office of Wetlands, Oceans, and Watershed Denise Keehner (Nov. 10, 2010).

**effluent limitations for final WLAs in this Permit.** The proposed Watershed Management Program will require quantitative analysis to select actions that will be taken to achieve TMDL WLAs. For the entire length of the TMDL compliance schedule, Permittees will be required to demonstrate compliance with interim WLAs by implementing actions that they have estimated to the best of their knowledge will result in achieving the WLAs and water quality standards. However, unless final WLAs are also expressed in this Permit as action-based water quality based effluent limitations, and if instead strict numeric limits are required for final WLAs, then, at the specified final compliance date, no matter how much the Permittee has done, no matter how much money has been spent, no matter how close to complying with the numeric values, no matter what other sources outside the Permittees' control have been identified and quantified, and no matter what other information has been developed and submitted to the Regional Board, the Permittee will be considered out of compliance with the Permit requirements. Furthermore, because of the structure established in this Permit, the Regional Board staff will have to consider all Permittees in this situation as being out of compliance with the Permit provisions if the strict numeric limits have not been met, regardless of the actions taken previously. This approach is inconsistent with the goals of good public policy, fair enforcement, fiscal responsibility and holding Permittees responsible only for discharges over which they have individual control.

#### **TMDLs Where Compliance Date Has Already Occurred**

The LA Permit Group is also concerned with the major policy decision related to the use of Time Schedule Orders for Regional Board adopted TMDLs for which the compliance date has already occurred prior to the approval of the NPDES Permit. There is a fundamental problem with the TMDL process whereby new information is not being incorporated into TMDLs. The ideal phased TMDL implementation process whereby dischargers can collect information, submit it to the Regional Board, and obtain revisions to the TMDL requirements to address data gaps and uncertainties has not occurred. As evidenced by the number of overdue Permits, the workload commitments of Regional Board staff are significant and TMDL reopeners seldom occur. Because the majority of the TMDLs have not been incorporated into Permit requirements until now, MS4 Permittees have been put in the position of trying to comply with TMDL requirements without knowing how compliance with those TMDLs would be determined and without knowing when or if promised considerations of modifications to the TMDL would occur. So Permittees would be expected to be in immediate compliance with new Permit provisions irrespective of most precedent, guidance regarding incorporation of TMDLs into MS4 Permits, and irrespective of what actions Permittees have taken to try and meet the TMDL requirements. This is neither fair nor consistent as requesting a TSO would place a Permittee in immediate non-compliance with the Permit and expose the Permittee to risk of third party lawsuits.

The LA Permit Group strongly believes that the adaptive management approach envisioned during TMDL development, whereby TMDL reopeners are used to consider new monitoring data and other technical information to modify the TMDLs, including TMDL schedules as appropriate, is the most straightforward way to address past due TMDLs. The Regional Board should use the reopener as an opportunity to adjust the implementation timelines to reflect the practical and financial reality faced by municipalities. Final WLAs should be delayed until serious reconsideration of the data that established the TMDLs so that the TMDLs can reflect information gathered during the implementation period. This will allow critically important data to be utilized to selectively modify time schedules in the TMDLs. Final compliance with TMDL Permit conditions should not occur prior to these additional TMDL reconsiderations. Additionally, the Permit should reflect any modifications to the TMDL schedules made through the reopener process, either through a delay in the issuance of the Permit until the modified TMDLs become effective, or by using its discretion to establish a specific compliance process for these TMDLs in the Permit. Providing for compliance with these TMDLs

through implementation of BMPs defined in the watershed management plans as we have requested for all other TMDLs is a feasible, fair and consistent way to achieve this goal.

#### **Recommendation:**

- **Provide a provision which requires that a TMDL be reconsidered in light of information that was not available when the TMDL was developed before the final WLAs become effective.** Whenever the reconsideration has been completed, the Permit should be reopened to make changes to any wasteload allocation, time schedules, and other pertinent information.
- **Translate WLAs into WQBELs, expressed as BMPs.**
- **State that the implementation of the BMPs using an iterative process will place the Permittee into compliance with the MS4 Permit.**
- **Provide for four compliance options for both interim and final WLAs:**
  - **Implement Actions/BMPs consistent with Watershed Management Program**
  - **Compliance at the outfall (end of pipe)**
  - **Compliance in the receiving water (river, creek, ocean)**
  - **No direct discharges**
- **Allow for the adaptive management approach to be utilized for TMDL compliance, consistent with the timelines identified in the Watershed Management Programs.**

#### **Monitoring**

The proposed monitoring program requirements have significantly increase compared to our current required efforts. Although we understand the need for monitoring to support the Permit, we believe there are number of issues within the MRP that need to more fully vetted and discussed. These issues include:

- **Receiving water monitoring should be consistent with SWAMP protocols including the requirement that ambient monitoring be conducted two days following a storm event.** Currently the receiving water monitoring is proposed to be conducted during storm events. Such an approach will not support the need to assess the receiving water quality consistent with the SWAMP approach that is used as the basis for 303(d) listing.
- **The focus and scope of non-stormwater monitoring is not commensurate with the environmental issues associated with dry weather flows.** We believe the non-stormwater monitoring should be to help identify illicit discharges and not for assessing the multitude of objectives noted in the MRP, II.E.a – c. Furthermore we would submit that the MS4s should focus its non-stormwater monitoring on discharges “into” our MS4 and not on discharges “through” or from our MS4s that may cause or contribute to exceedances of water quality standards. This is consistent with CWA section 402(p)(B).
- Regarding regional studies (MRP XI.A – B), the LAPG would submit that these studies should be conducted by the Regional or State Board. But if the Permit does require special studies, **the Permit needs to establish the mechanism/option for Permittees to participate in the studies without having to conduct the studies on an individual basis.** Furthermore, the Regional Board should be the agency to lead and coordinate these studies. The MRP appears to read that each and every Permittee must conduct the regional studies.
- **Toxicity monitoring should be limited to the receiving water only and not at the outfalls.** It’s important to establish whether is a toxicity issue in the receiving water before conducting this

expensive monitoring at the outfalls. Furthermore, recent Department of Pesticide Regulations<sup>8</sup> has severely limited the use of pyrethroid based pesticides, thus calling into question the need for expensive toxicity monitoring, especially at outfalls. And finally, should a study be deemed necessary, the Regional Board should lead this study.

- Insufficient time is allotted to prepare Coordinated Integrated Monitoring Plans (CIMP). Since the monitoring for TMDLs should continue per the TMDL schedules, the Permittees should be allowed sufficient time to prepare the CIMPs. To prepare a CIMP the Permittees will need more than a Letter of Intent to proceed. **We recommend that the Draft Order be modified to allow 12 months to submit a Memorandum of Agreement to participate in a CIMP and 24 months to submit the complete CIMP.** The time required to award the monitoring contract is 3 months, at least 6 months are needed to obtain Los Angeles County Flood Control Encroachment Permits, thus at least 9 months is needed before commencing monitoring.

### ***Minimum Control Measures***

In order to further water quality improvements, the Permit needs to set clear goals, while allowing flexibility with the programs and BMPs implemented. This is accomplished through integrated watershed planning and monitoring. This strategy has been requested by the LA Permit Group as it will allow Permittees to look at the larger picture and develop programs and BMPs based on addressing multiple pollutants. In doing so, limited local resources can be concentrated on the highest priorities. The LA Permit Group has on numerous occasions expressed our support of a watershed based approach to stormwater management. It would appear from a read of Provision VI.C.1.a (page 45) that the Board also supports this approach. We believe the opportunity for a municipality to customize the MCMs to reflect the jurisdiction's water quality conditions is absolutely critical if municipalities are to develop and implement stormwater programs that will result in environmental improvement. **We, however, suggest that the Permit ultimately establish criteria that will be used to support any customization of MCMs.** The criteria should be comprehensive but flexible. We suggest some flexibility in the criteria because the management of pollutants in stormwater is a challenging task and that the science and technology to help guide customizing MCMs are still developing. Furthermore, the municipal stormwater performance standard to reduce pollutants to the maximum extent practicable is not well defined and will depend on a number of factors<sup>9</sup>. This constraint, as well as USEPA position<sup>10</sup> that the iterative process is the basis for good stormwater management, supports the need to provide flexibility in defining the criteria for customizing MCMs. **Also, for clarification, the terms of adaptive management approach and the iterative approach need to be defined as equivalent and that they can be used interchangeably.**

### **Timeline for Implementation**

The Draft Order does not provide adequate and reasonable timelines for the start-up and implementation of the Minimum Control Measure requirements. For example, the Draft Order in provision VI.D.1.b.i requires the majority of MCMs to begin within 30 days, unless otherwise noted in the order. There are a number of new/enhanced provisions and it is fair to say that there will be a transition period between the time the Permit becomes effective and the time that the municipalities will have to modify their current stormwater management programs to be in compliance with the new Permit provisions. At the same time, consideration should be given to the time required to develop watershed based "customized" programs. The LA Permit

<sup>8</sup> [http://www.cdpr.ca.gov/docs/legbills/rulepkgs/11-004/text\\_final.pdf](http://www.cdpr.ca.gov/docs/legbills/rulepkgs/11-004/text_final.pdf).

<sup>9</sup> See E. Jennings 2/11/93 memorandum to Archie Mathews, State Water Resources Control Board.

<sup>10</sup> See Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 FR 43761 (Aug. 26, 1996).

Group requests that the Regional Board provide a revised timeline for implementation and phasing-in of the Minimum Control Measure requirements. **We request that the Permit allow a 12 month time schedule to transition from our current efforts to the new and enhanced MCMs requirements.**

### **Shifting of State Responsibility to the MS4**

The Draft Order shifts much of the State responsibilities regarding the State's General s for Construction and Industrial Activities to the municipalities. These new responsibilities have significant financial responsibilities on the permittees (ex. plan reviews, inspections time, reporting, enforcement, etc.). This is especially true for the Statewide General Construction Activities Permit (GCASP) and Provision VI.D.7. A few examples of where the Draft Order either shifts the responsibility or actually exceeds the requirements of the GCASP are listed below:

- Maintaining a database that overlaps with the States' own SMARTS database. Asking Permittees to collect the same data adds unnecessary time and expense with no benefit to water quality;
- Requiring the quantification of soil loss is redundant with the GCASP and adds additional MS4 costs.
- **Inspections will be increased by more than 200% and are redundant since the State should be responsible for implementation of its own permit particularly in light of the fact that the State collects a permit fee for implementation.**

**Those elements that shift State responsibility should be eliminated and the MCMs should be coordinated with other state and federal requirements, with particular attention to GCASP and General Industrial Activities Permit requirements.**

### **MCMs Should Reflect Effective Current Efforts**

The LA Permit Group understands that the new Permit must reflect current understanding of stormwater management and water quality issues. Where the current stormwater management effort is assessed to be inadequate, then additional efforts are warranted. However, when current efforts are assessed to be adequate for protecting water quality, then the MCMs should reflect current efforts. One significant area where the LA Permit Group believes that the current effort is protective of water quality is in the new development program. The City and County of Los Angeles as well as the City of Santa Monica have developed and adopted Low Impact Development ordinances and significant work, technical analysis, and public input have gone into the development of these ordinances. Each of these ordinances required tailoring of standards to address the unique characteristics of their city (ex. size, land uses, soils, groundwater, watershed(s), hydrology, etc.). **The Permit should reference the type of program and flexibility needed to accommodate the unique and vastly varying characteristics throughout the County.** Instead of providing detailed information in the text of the Permit, the LID provisions should outline general requirements of the program, and the details should be contained in a technical guidance manual. This point was reiterated by several speakers at the April 5, 2012 workshop, including BIA. Ultimately, it may be more constructive if the Regional Board created a template for the Permittees to use.

### **New Development MCM**

Notwithstanding our comments above, the LA Permit Group has a number of concerns with the New Development provision of the MCMs. While the LA Permit Group has concerns and need for clarification with the other MCMs we find the New Development MCM the most challenging and unsupportable. The provision is difficult to follow and the BMP selection hierarchy is confusing and at times in conflict. We have provided specific comments on this provision but it suffice to say that the LA Permit Group believes this provision should be redrafted. We have significant concerns with the following parts of the New Development MCM:

- Storm design criteria
- Alternative compliance option offsite mitigation
- Treatment control performance benchmarks
- BMP tracking and inspection
- BMP specificity and guidance
- Hydromodification

#### *Storm Design Criteria*

The Draft Order in Provision D.6.c.i (page 70) requires the developer to retain the stormwater quality design volume as calculated by either the 0.75 inch storm or the 85<sup>th</sup> percentile 24 hour storm whichever is greater. We take exception to the requirement to select the largest calculated volume. In all Permits to date in California these two design criteria were judged to be equivalent. **We recommend that the Draft Order be modified to specify that the two criteria are equivalent.** In fact, the current stormwater 2001 Permit for Los Angeles County includes four design criteria to choose from for the stormwater volume. The additional effort to assess every project to choose between two equivalent design criteria makes little sense and adds cost to any project. We recommend that the developer be allowed to choose between the two criteria without the need to calculate the largest.

#### *Alternative Compliance Option - Offsite Mitigation*

The Draft Order goes into great detail discussing an alternative compliance option to full on- site retention of the design storm volume. The alternative option takes the form of an offsite mitigation project. As currently structured it is highly unlikely that anyone will opt for this alternative compliance option. Probably the biggest hurdle for developers to overcome if they are to pursue offsite mitigation is the requirements that they must treat the project site runoff to the levels identified in Table 11. This combined with the requirement that the offsite mitigation project must be equivalent in pollutant load reduction as the original project site equates to the developer removing essentially twice as much pollutant loads as he would had accomplished on the project site had the site been able to retain the load onsite originally. This is inherently unfair. **We would recommend that the developer be required to remove only the pollutant loads that would have been removed at the project site at the mitigation site and if the mitigation site cannot meet that load reduction then the developer can implement treatment controls at the project site for the remaining differential.** Such an approach is fair and will be more readily accepted by the development community than the current proposal.

#### *Treatment Control Performance Benchmarks*

The concept of establishing benchmarks for post construction BMPs was initially developed in the 2009 Ventura MS4 Permit. However, there is a significant different between the Permits. The Ventura County's NPDES MS4 Permit requires the project developer to determine the pollutant of concern(s) for the development project and use this pollutant as the basis for selecting a top performing BMP. In the case of the Draft Order, there is no determination of the pollutant of concern for the development project. Instead post construction BMPs must meet all the benchmarks established in Table 11. Unfortunately, no one traditional post construction BMP (non-infiltration BMPs) is capable of meeting all the benchmarks and thus the developer will not be able to select a BMP. **We recommend that provision VI.D.6.c.iv.(1)(a) (page 74) be modified so that the selection of post construction BMPs is consistent with the Ventura Permit and is based**

**on the development site's pollutant of concern(s) and the corresponding top performing BMP(s) that can meet the Table 11 benchmarks.**

#### *BMP Tracking and Inspection*

In the Draft Order provision VI.D.6.d the Permittees are being required to track and inspect post construction BMPs including LID measures. The provision does allow that such effort can be addressed by the project developer but even with this consideration the provision is onerous for city staff as this would still require significant staff time (ex. plan reviews, data entry, letter preparation and enforcement, etc.). This is especially true for LID measures which if planned and designed correctly will include a large number of measures (planter boxes, infiltration trenches, swales, etc.) on every site. Furthermore most of the LID measures will be infiltration type measures which are difficult to inspect and should be only inspected in wet weather when one can ascertain that the LID measures are operating correctly. This inspection concept when taken to the extreme will mean that municipalities will be inspecting LID measures all over the community and only during rain events. This is just flat unreasonable and cost prohibitive for the municipality. Furthermore, the cost for implementation (e.g. inspection, monitoring, enforcement, etc.) are not shown to be commensurate with any corresponding improvement in water quality. **We recommend that the tracking and inspection of post construction BMPs be limited to only the conventional BMPs (e.g. detention basins, wetlands, etc.); alternatively require the MS4 to spot check a limited number of LID measures to ascertain how well they are operating.**

#### *BMP Specificity*

The Draft Order in Attachment H provides detail specifications for biofiltration and bioretention BMPs. The LA Permit Group believes that such specificity, although well intended, is counterproductive. Such specificity is equivalent to a wastewater NPDES Permit specifying the grain size in the multimedia filtration unit. It is more appropriate to establish the performance standard for the BMP and to allow the MS4 to develop design specifications to meet the standard. **We recommend that Attachment H be removed and a provision be established that establishes a collaborative approach to promote a technical guidance manual that would include the design specifications for bioretention/biofiltration.**

#### *Hydromodification*

The LAPG would submit that it is premature to change the hydromodification criteria, specifically the interim criteria. In our current 2001 order, Permittees were required to develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study. **We believe it more constructive to keep with the previously developed hydromodification criteria and not revised it for the interim until the final criteria can be developed by the State.** A change now and then one later on just adds confusion to the development process and creates additional work for a limited or non-existent water quality improvement. The effort under the 2001 Permit should be sufficient until such time the final criteria are developed.

#### **Public Agency MCM**

The Draft Order identifies a number of requirements for public agency MCMs. Our detailed comments are attached, but there are two issues we want to highlight here. First is provision VI.D.8.h.vii (page 102) which specifies additional trash BMPs regardless of whether the area is subject to a trash TMDL. We take exception to this approach, as the MCM requires prioritization, cleaning and inspection of catch basins as well as street sweeping and other management control measures to address trash at public events. And then even if the

Municipality is controlling trash through these control measures, the Municipality must still install trash excluders (see page 102 regarding “additional trash management practices”). This makes little sense and **the LA Permit Group would submit that if the initial control measures are successful, then the “additional trash management practices” are unnecessary (as evident by the lack of a TMDL).**

The second issue pertains to provision VI.D.8.d (page 94) regarding retrofitting opportunities. Provision VI.D.8.d.i requires that the MS4 develop an inventory of retrofit opportunities within the public right of way but then in provision VI.D.8.d.ii, the Draft Order requires the Permittees screen existing area of development. Furthermore in provision VI.D.8.d.iii the MS4 must prioritize all existing areas of development. Reading these provisions in whole would seem to indicate that the MS4 must identify all potential retrofit sites (private or publically owned) and to prioritize the sites. This is a contentious issue and should be addressed carefully. Stormwater regulations (40 CFR 122.26.(d)(2)(iv)(4) requires consideration of retrofitting opportunities, but the consideration is limited to flood management projects (i.e. public right of way) and does not require consideration of private areas. **We recommend that for this Permit term that the retrofit provision (i.e. inventory, screening, and prioritization) be limited to public right of ways lands only.**

### **ID/IC MCM**

The Draft Order identifies a number of provisions that are fundamental to an Illicit Connection/Illegal Discharge program. These provisions include

- III. Discharge Prohibition,
- VI.A.2 Standard Provisions – Legal Authority,
- VI.D. 9 IC/ID Elimination Program,
- Attachments E, Monitoring and Reporting and
- Attachment G Non-stormwater Action Levels.

When combined, the ID/IC program will require a significant effort and not always effective. We have provided specific comments on these provisions in the Exhibit to this letter but we would like to highlight two of the more significant issues. First, is the magnitude of the dry weather monitoring being required. The TMDLs monitoring programs have already identified, to a large extent, a comprehensive non-stormwater monitoring program. **As such, the TMDL monitoring program should be the basis for the “non-stormwater outfall based monitoring program” and both should be identified in an Integrated Watershed Monitoring Program.**

The second issue pertains to the non-stormwater action levels established in Attachment G. One of the goals of establishing non-stormwater action levels is to assist Permittees in identifying illicit connections and/or discharges at outfalls. Exceedances of action levels can help Permittees prioritize and focus resources on areas that are having a real impact on water quality. Unfortunately, as currently drafted, the non-stormwater action levels do not accomplish this goal. The action levels established in the Draft Order are derived from Basin Plan, CTR, or COP water quality objectives. The non-stormwater action levels do not facilitate the consideration of actual impacts (e.g., excess algal growth), have no nexus to receiving water conditions, and do not address NAL issues unrelated to illicit discharges (e.g., groundwater). The action levels and the associated monitoring specified in the Monitoring and Reporting Program would require Permittees to investigate and address issues on an outfall-by-outfall basis, even if the receiving water is in compliance with all water quality standards. This will not assist Permittees in prioritizing resources on outfalls that are clearly having an impact on water quality. **We recommend that the Permit allow the Watershed Management Programs to guide the customization of the NALs based on the highest water quality priorities in each**

**watershed and to establish them at a level that would provide better assurance that illicit discharges can actually be found and not have every outfall become a high priority outfall.** If NALs are not established through the Watershed Management Programs, or Permittees should be required to use the default NALs and approach identified in Attachment G.

### ***Watershed Management Programs***

Overall, the LA Permit Group supports the Regional Board's proposed approach to address high priority water quality issues through the development and implementation of a Watershed Management Program. However, one of our biggest concerns continues not be addressed, is the Draft Order proposed timeline for developing the watershed management program(s). The Draft Order allows the municipalities only one year to develop a comprehensive watershed management program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate and run the models based on relevant data, draft the plans, and obtain necessary approvals from political bodies. As a comparison, the City of Torrance required two years to prepare a comprehensive water quality plan that addressed a suite of TMDLs, similar to what is being considered in the watershed management program. **We believe that it will require at least 24 months to develop a draft plan that is comprehensive, analytically supported, and implementable. Alternatively we would suggest a phased approach where some initial efforts (e.g. MOUs, retrofit inventory) could be completed and submitted within 12 months but allow 24 month timeline for the more complicated or resource intensive efforts.**

We also offer the following comments regarding the Watershed Management Program (our line item by line item review and comments are attached):

- The Draft Order seems to be silent on the critical issue of sources of pollutants outside the authority of MS4 Permittees (e. g. aerial deposition, upstream contributions, discharges allowed by another NPDES permit, etc.). **We request that Permittees be allowed to demonstrate that some sources are outside the Permittee's control and not responsible for managing or abating those sources.**
- **The Permit needs to clearly state that watershed management programs and the reasonable assurance analysis can be used for TMDL compliance purposes.**
- **The Permit should clarify that the adaptive management process is equivalent to the iterative process described in the Receiving Water Limitation provision and provide the legal justification for the adaptive management process.**
- More careful consideration should be given to the frequency and extent of the reporting and adaptive management assessments. The current Draft Order results in a significant annual effort and the LA Permit Group members question the value of such an effort. Current reporting appears to overwhelm Regional Board staff resources and has provided limited feedback to the municipalities. We believe that the reporting can be streamlined and that the jurisdictional and watershed reporting should be combined. **Furthermore, we recommend that the adaptive management process be applied every two years instead of the every year frequency noted in the Draft Order.**
- It is unclear how the current implementation of our stormwater program and TMDL compliance will be handled during the interim period before development of the watershed management program. For those entities that choose this path, **the LA Permit Group requests that current, significant efforts in our existing programs and implementation plans be allowed to continue while we evaluate new MCMs as part of the watershed management program.**

- **Consideration of the technical and financial feasibility of complying with water quality standards should be included in the watershed management program.**
- **The timing of revising the Watershed Management Programs is in conflict and confusing. There should only be one revision to the Watershed Management Program, and only when adaptive management/iterative process demonstrates that the modification is warranted.**
- **The adaptive management/iterative approach and timing should be consistent between individual Permittees (“jurisdictional watershed management program”) and the watershed management program.**

### ***Cost/Economic Implications***

Regarding fiscal resources, the LA Permit Group would like to reemphasize the limited parameters in which municipalities operate. The Draft Order (page 40) requires municipalities to exercise its authority to secure fiscal resources necessary to meet all of the requirements of the Permit. We have reservations as to whether this provision is legal given that it appears to violate the State Constitution, Article XVI, Section 18. That being said, Permittees have a limited amount of funds that are under local control. Any additional funds needed to raise money for stormwater programs would need to come from increased/new stormwater fees and grants. **New fees for stormwater are regulated under the State’s Prop 218 regulations, and require a public vote. Therefore, raising new fees is an item that is not under direct control of the municipalities – the Permit language should reflect this.** Furthermore, in addition to clean water, local resources are also directed to a number of health, safety and quality of life factors. Thus, all these factors need to be developed in balance with each other. This requires a strategic process and that will take time to get right. We request that the Regional Board develop the Permit conditions based on a reasonable timeframe in balance with the existing economy and other health, safety, regulatory and quality of life factors that local agencies are responsible for.

The LA Permit Group also wants to address the issue of whether or not these Permit requirements constitute an unfunded mandate. The Fact Sheet makes a unilateral statement that the Regional Board has determined that the Permit requirements do not exceed Federal requirements and therefore are not unfunded mandates. No back up information is provided to substantiate this claim. Our request is for the Regional Board to substantiate this statement for each section of the Permit. We also want to point out that the court decisions on unfunded mandates claims are still on appeal, and it is premature to conclude on the merits of the appeal.

As previously discussed at workshops, and in comment letters, and requested by many Board Members, the economic implications of the many proposed Permit requirements are of critical importance. It is also worth noting that the cost for complying with both the stormwater regulations and TMDL requirements should be carefully considered. This point is highlighted in the March 20, 2012 memo<sup>11</sup> from OMB to heads of executive departments and agencies (including USEPA) which clarified Presidential Executive Order 13563. This Order requires the agencies to take into account among other things, and to the extent practicable, the costs of cumulative regulations. This is particularly relevant for this Draft Order where we have the convergence of TMDLs and stormwater regulations. Although we have not had sufficient time to assess the cost for the new stormwater requirements, the County of Los Angeles has completed an analysis (using the Los Angeles County BMP Decision Support System model) to assess the effort required to implement low impact development retrofits throughout Los Angeles County to address all TMDLs and 303(d) listings. This model roughly estimated that, to meet these water quality standards, the area would have to spend between \$17 billion and

---

<sup>11</sup> Cass R. Sunstein, Executive Office of the President, OMB memorandum for the Heads of Executive Departments and Agencies regarding Cumulative Effects of Regulations, March 20, 2012.

\$42 billion. Los Angeles River Watershed Bacteria TMDL could cost up to \$5.4 billion for full, inclusive, implementation costs for that watershed alone for only one pollutant. Even if the Water Quality Funding Initiative passes (and it is far from guaranteed to pass), it would take a full 20 years dedicating the entire fund to the Los Angeles River Bacteria TMDL to pay for these requirements. It would require over 60 years paying for the larger estimate. In the fact sheet, Regional Board staff stated that the TMDL costs were considered during the TMDL adoption process. However, given Executive Order 13563, we would submit that the Board should consider all costs associated with the management of stormwater. With these types of economic implications, **it is critical that this Regional Board and their staff more carefully evaluate comments and provide additional, extended comment periods for these requirements.**

In closing, we thank you for the opportunity to comment on the Draft Order and we look forward to meeting with you to discuss our comments and to explore alternative approaches. However, we must reiterate the need for more time to review and analyze this Draft Order. In spite of the Regional Board staff statement<sup>12</sup> that there has been a myriad of opportunities to present our concerns and comments, we believe otherwise. The LAPG would submit that we have not had an opportunity to voice our concerns to the Regional Board members themselves as we have been limited (in some cases prevented) in responding to questions posed by the Board members during different workshops. Consequently, **we respectfully request that that the Board provide another complete second draft Tentative Order with an additional review period to allow Permittees to have at least a total of 180 days to discuss and review the full document.** We believe it important to review the entire draft Permit to better understand the relationship among the various provisions; this is especially true for the monitoring provision and its relationship to the watershed management program. We also believe that the Regional Board staff will be hard pressed to consider and respond to all the comments that will be submitted on the Draft Order. Thus, it is advantageous to all parties that more time is provided to craft a permit that is implementable and protective of water quality. We request the issues presented in our letter are resolved in a revised Permit draft. . Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,

Heather M. Maloney, Chair  
LA Permit Group

**Subject: Comment Letter – Draft NPDES Permit (Draft Order) for MS4 Dischargers within the Los Angeles County Flood Control District**

The City of Bell Gardens would like to take this opportunity to inform the Regional Board of our support of the attached comment letter from the LA Permit Group. The City of Bell Gardens has been actively participating in the LA Permit Group since it was formed in 2007. We are extremely proud of the efforts that the group has put in so far with regards to the new Los Angeles MS4 permit and we will continue to support and participate in the group throughout this entire process.

We would also like to inform the Regional Board of our support of the LA Permit Group's request to extend the review period of the draft order. We feel that the time given to review the draft order is not adequate to deliver the proper comments that will help both the MS4 dischargers and the Regional Board produce a permit that will be beneficial to everyone involved. Please take the time to give this request further consideration.

We would like to thank the Regional Board for the time and effort to review this letter and hope that a resolution regarding all these matters can be achieved soon.

Sincerely,

John Oropeza  
Assistant City Manager  
City of Bell Gardens

Comment		Doc. Reference		Comments	
No.	Page	Section	Apr-12	Jul-12	
1	General	General	Any TMDL, for which compliance with a waste load allocation (WLA) is exclusively set in the receiving water, shall be amended by a re-opener to also allow compliance at the outfall to allow that flexibility, or other end-of-pipe, that shall be determined by translating the WLA into non-numeric WQBELs, expressed as best management practices (BMPs). While the TMDL re-opener is pending, an affected Permittee shall be in compliance with the receiving water WLA through the implementation of permit requirements	Same comment	
2	17	Findings	Not clear on what "discharges from the MS4 for which they are owners and/or operators" means.	The Tentative Order, states " ... each Permittee shall maintain the necessary legal authority to control the contribution of pollutants to its MS4 and shall include in its storm water management program a comprehensive planning process that includes intergovernmental coordination, where necessary." If the MS4/catch basin is owned by the LACFCD, does this mean that the LACFCD needs to control the contribution of pollutants?	
3	pages 111 - 123 and Attachments K - R	TMDL	<p>Santa Monica Bay Beaches Bacteria TMDL (SMBBB TMDL) is currently being reconsidered. As part of that reconsideration, the summer dry weather targets must be revised to be consistent with the reference beach/anti-degradation approach established for the SMBBB TMDL and with the extensive data collected over that past seven years since original adoption of the SMBBB TMDL. This data clearly shows that natural and non-point sources result in 10% exceedances during dry weather. Data collected at the reference beach since adoption of the TMDL, as tabulated in Table 3 of the staff report of the proposed revisions to the Basin Plan Amendment, demonstrate that natural conditions associated with freshwater outlets from undeveloped watersheds result in exceedances of the single sample bacteria objectives during both summer and winter dry weather on approximately 10% of the days sampled.</p> <p>Thus the previous Source Analysis in the Basin Plan Amendment adopted by Resolution No. 02-004 which stated that "historical monitoring data from the reference beach indicate no exceedances of the single sample targets during summer dry weather and on average only three percent exceedance during winter dry weather" was incorrect and based on a data set not located at the point zero compliance location. Continued allocation of zero summer dry weather exceedances in the proposed Basin Plan Amendment is in direct conflict with the stated intent to utilize the reference beach/anti-degradation approach and ignores the scientifically demonstrated reality of natural causes and non-point sources of indicator bacteria exceedances.</p>	This is a critical issue that was not addressed in the recent reopener. The reference reach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included	
4	pages 111 - 123 and Attachments K - R	TMDL	Continued use of the zero summer dry weather exceedance level will make compliance with the SMBBB TMDL impossible for the Jurisdictional agencies. This is also in conflict with the intent of the Regional board as expressed in finding 21 of Resolution 2002-022 "that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas".	This is a critical issue that was not addressed in the recent reopener. The reference reach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included	
5	pages 111 - 123 and Attachments K - R	TMDL	The SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) was approved by the Regional Board staff and that CSMP should be incorporated into the TMDL monitoring requirements of the next MS4 Permit. The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week, thus it is highly confusing and misleading to refer to "daily monitoring". The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week.	The problem with sites monitored two days a week has not been corrected. Please provide clarification that this issue could be addressed and would supersede the TMDL if submitted in an integrated monitoring plan. This is critical for summer dry weather and 5-day per week sites.	

6	pages 111 - 123 and Attachments K - R	TMDL	This discussion in this section devoted to the SMBBB TMDL seems to create confusion regarding the meaning of the terms "water quality objectives or standards," "receiving water limitations," and "water quality-based effluent limitations". Water quality objectives or water quality standards are those that apply in the receiving water. Water Quality Effluent Based Limits apply to the MS4. So the "allowable exceedance days" for the various conditions of summer dry weather, winter dry weather, and wet weather should be referred to as "water quality-based effluent limitations" since those are the number of days of allowable exceedances of the water quality objectives that are being allowed for the MS4 discharge under this permit. While the first table that appears under this section at B.1 (b) should have the heading "water quality standards" or "water quality objectives" rather than the term "effluent limitations".	In effect the effluent limitations are stricter than the receiving water standards. This is inconsistent with law and creates a situation in which permittees are out of compliance at the effective date of this permit. Please adjust so that limits are consistent with standards and not exceeding standards.
7	pages 111 - 123 and Attachments K - R	TMDL	While it makes sense for the Jurisdictional Groups previously identified in the TMDLs to work jointly to carry out implementation plans to meet the interim reductions, only the responsible agencies with land use or MS4 tributary to a specific shoreline monitoring location can be held responsible for the final implementation targets to be achieved at each individual compliance location. An additional table is needed showing the responsible agencies for each individual shoreline monitoring location.	A table is still needed and should be developed. Perhaps referred to in this section but placed in the Watershed Management Plan and then approved by Executive Officer with the plan.
8	pages 111 - 123 and Attachments K - R	TMDL	The Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4 based on estimates from limited data on existing stormwater discharges which resulted in a waste load allocation for stormwater that is lower than necessary to meet the TMDL targets, in the case of DDT far lower than necessary. EPA stated that "If additional data indicates that existing stormwater loadings differ from the stormwater waste load allocations defined in the TMDL, the Los Angeles Regional Water Quality Control Board should consider reopening the TMDL to better reflect actual loadings." [USEPA Region IX, SMB TMDL for DDTs and PCBs, 3/26/2012]	Same comment
9	pages 111 - 123 and Attachments K - R	TMDL	In order to avoid a situation where the MS4 permittees would be out of compliance with the MS4 Permit if monitoring data indicate that the actual loading is higher than estimated and to allow time to re-open the TMDL if necessary, recommend as an interim compliance objective WQBELs based on the TMDL numeric targets for the sediment fraction in stormwater of 2.3 ug DDT/g of sediment on an organic carbon basis, and 0.7 ug PCB/g sediment on an organic carbon basis.	Same comment
10	pages 111 - 123 and Attachments K - R	TMDL	Although the Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4, they should be translated as WQBELs in a manner such that watershed management areas, subwatersheds and individual permittees have a means to demonstrate attainment of the WQBEL. Recommend that the final WLAs be expressed as an annual mass loading per unit area, e.g., per square mile. This in combination with the preceding recommendation for an interim WQBEL will still serve to protect the Santa Monica Bay beneficial uses for fishing while giving the MS4 Permittees time to collect robust monitoring data and utilize it to evaluate and identify controllable sources of DDT and PCBs.	Please clarify that this situation would be covered under the new provisions for USEPA established TMDLs opens the door for allowing Permittees to address this through their plans.
11	pages 111 - 123 and Attachments K - R	TMDL	The Machado Lake Trash WQBELs listed in the table at B.3 of Attachment N in the Tentative Order appear to have been calculated from preliminary baseline waste load allocations discussed in the July 11, 2007 staff report for the Machado Lake Trash TMDL, rather than from the basin plan amendment. In some cases the point source land area for responsible jurisdictions used in the calculation are incorrect because they were preliminary estimates and subsequent GIS work on the part of responsible agencies has corrected those tributary areas. In other cases some of the jurisdictions may have conducted studies to develop a jurisdiction-specific baseline generation rate. The WQBELs should be expressed as they were in the adopted TMDL WLAs, that is as a percent reduction from baseline and not assign individual baselines to each city but leave that to the individual city's trash reporting and monitoring plan to clarify.	Same comment

12	pages 111 - 123 and Attachments K - R	TMDL	<p>The WLAs in the adopted Machado Lake Trash TMDL were expressed in terms of percent reduction of trash from Baseline WLA with the note that percent reductions from the Baseline WLA will be assumed whenever full capture systems are installed in corresponding percentages of the conveyance discharging to Machado Lake. As discussed in subsequent city-specific comments, there are errors in the tributary areas originally used in the staff report, but in general, tributary areas are available only to about three significant figures when expressed in square miles. Thus the working draft should not be carrying seven significant figures in expressing the WQBELs as annual discharge rates in uncompressed gallons per year. The convention when multiplying two measured values is that the number of significant figures expressed in the product can be no greater than the minimum number of significant figures in the two underlying values. Thus if the tributary area is known to only three or four significant figures, and the estimated trash generation rate is known to four significant figures, the product can only be expressed to three or four significant figures.</p> <p>Thus there should be no values to the right of the decimal place and the whole numbers should be rounded to the correct number of significant figures.</p>	Same comment
13	pages 111 - 123 and Attachments K - R	TMDL	<p>The Machado Lake Nutrient TMDL provides for a reconsideration of the TMDL 7.5 years from the effective date prior to the final compliance deadline. Please include an additional statement as item C.3.c of Attachment N: "By September 11, 2016 Regional Board will reconsider the TMDL to include results of optional special studies and water quality monitoring data completed by the responsible jurisdictions and revise numeric targets, WLAs, LAs and the implementation schedule as needed."</p>	Same comment
14	pages 111 - 123 and Attachments K - R	TMDL	<p>Table C is not provided in the section on TMDLs for Dominguez Channel and Greater LA and Long Beach Harbors Toxic Pollutants. Please clarify and reference that Attachment D Responsible Parties Table RB4 Jan 27, 12 which was provided to the State Board and responsible agencies during the SWRCB review of this TMDL, and is posted on the Regional Board website in the technical documents for this TMDL, is the correct table describing which agencies are responsible for complying with which waste load allocations, load allocations and monitoring requirements in this VERY complex TMDL. Attachment D should be included as a table in this section of the MS4 Permit.</p>	Partially addressed--the table provided in the Tentative Order is not the detailed Attachment D which clarifies which agencies are responsible for which portions of the TMDL--need to include that table.
15	pages 111 - 123 and Attachments K - R	TMDL	<p>The Dominguez Channel and Greater LA and Long Beach Harbor Waters Toxic Pollutants TMDL provides for a reconsideration of the TMDL targets and WLAs. Please include an additional statement as item E.5 of Attachment N: "By March 23, 2018 Regional Board will reconsider targets, WLAs and LAs based on new policies, data or special studies. Regional Board will consider requirements for additional implementation or TMDLs for Los Angeles and San Gabriel Rivers and interim targets and allocations for the end of Phase II."</p>	Same comment
16	pages 111 - 123 and Attachments K - R	TMDL	<p>City of Hermosa Beach is only within one watershed, the Santa Monica Bay Watershed, and so should not be shown in italics as a multi-watershed permittee</p>	Addressed in Table K-3 of the Tentative Order but not in Table K-2 of the Tentative Order.
17	pages 111 - 123 and Attachments K - R	TMDL	<p>Recommend not listing specific water bodies in E.5.b.i.(1).(c) because then it risks becoming obsolete if new TMDLs are established for trash, or if they are reconsidered. Furthermore, it is not clear why Santa Monica Bay was left out of this list since the Marine Debris TMDL allows for compliance via the installation of for full capture devices.</p>	Not addressed, still don't know why Santa Monica Bay Marine Debris was not included in the list at E.5.b.i.(1).(c) but it is listed in E.5.a.ii and Attachment M Section B.
19	pages 111 - 123 and Attachments K - R	TMDL	N/A	Suggest wet weather compliance be partially defined by a design storm.

20	pages 111 - 123 and Attachments K - R	TMDL	N/A	<p>Regional Board staff has incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a "numeric effluent limitation." Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board's clear <del>opposition</del> reluctance to use numeric effluent limitations.</p> <p>In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: <i>we will generally not require "strict compliance" with water quality standards through numeric effluent limitations," and instead "we will continue to follow an iterative approach, which seeks compliance over time" with water quality standards.</i></p> <p>[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]</p> <p>More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:</p> <p><i>Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. <u>This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.</u></i></p> <p>The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the <i>Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.</i></p>
21	pages 111 - 123 and Attachments K - R	Table K-8	Please remove, in its entirety, the Santa Ana River TMDLs	Same comment
22	pages 111 - 123 and Attachments K - R	E.1.c	Permittees under the new MS4 permit (those in LA County) need to be able to separate themselves from Orange County cities. Since the 0.941 kg/day is a total mass limit, it needs to be apportioned between the two counties. Also, the MS4 permit needs to contain language allowing permittees to convert group-based limitations to individual permittee based limitations.	Same comment
23	111	E.2	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions.	Same comment
24	111	E.2.a.i	N/A	This provision creates confusion and inconsistency with the language in the rest of the permit. By stating that the permittee <b>shall</b> demonstrate compliance through compliance monitoring points, it appears to preclude determining compliance through other methods as outlined in other portions of the permit. This provision does not reference any of the other compliance provisions in the TMDL section, and could therefore be interpreted on its own as a separate compliance requirement. Additionally, the requirement to use the TMDL established compliance monitoring locations regardless of whether an approved TMDL monitoring plan or Integrated plan has been developed is not consistent with the goal of integrated monitoring outlined in the permit. This provision would be more appropriate as a monitoring and reporting requirement for the TMDL section with modified language such as "Monitoring locations to be used for demonstrating compliance in accordance with Parts VI.E.2.d or VI.E.2.e shall be established at compliance monitoring locations established in each TMDL or at locations identified in an approved TMDL monitoring plan or in accordance with an approved integrated monitoring program per Attachment E Part VI.C.5 (Integrated Watershed Monitoring and Assessment)."

25	112	E.2.b.iv	For "each Permittee is responsible for demonstrating that its discharge did not cause or contribute to an exceedance," how is this going to be possible? There is allowed non-storm water discharges, a commingled system, and the LA County region is practically urbanized (impervious landscape). Additionally, a gas tanker on local freeways often discharges onto freeway drains, which connect to MS4 permittee drains - the point here is a private party as the actual discharger should be held responsible and not the MS4 permittee. Lastly, the Construction General Permit cannot establish numeric limitations without the Regional/State Boards clearly demonstrating how compliance will be achieved - the MS4 permit is overly conditioned in terms of achieving compliance and subjects MS4 permittees to violations/enforcement, and given these circumstances, the Boards need to clearly demonstrate how compliance will be achieved.	Same comment
26	112	E.2.b.v.(2)	N/A	This provision should not require that the permittee demonstrate that the discharge from the MS4 <b>is treated</b> to a level that does not exceed the applicable water quality-based effluent limitation. Permittees may achieve the applicable WQBELs through means other than treatment and they should be able to demonstrate that their discharge does not exceed the applicable water quality-based effluent limitation through monitoring or other means than demonstration of treatment.
28	113	E.2.d.i.4.b.	Is this in effect setting a design storm for the design of structural BMPs to address attainment of TMDLs, or is it simply referring to SUSMP/LID type structural BMPs? If it is in effect setting a design storm, there needs to be some sort of exception for TMDLs in which a separate design storm is defined, e.g., for trash TMDLs where the 1-year, 1-hour storm is used.	This is not clarified, but it is still a problem as not all retrofit projects which might be used to address TMDLs may be able to handle the full 85th percentile 24-hour storm, there should be some provision for doing this through a combination of BMPs, e.g., LID plus retrofit.
29	114	E.2.e	Please add the language from interim limits E.2.d.4 a - c and EPA TMDLs to the Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations to ensure sufficient coordination between all TMDLs and the timelines and milestones that will be implemented in the Watershed Management Program.	Same comment
30	116	E.4.a	This provision states "A-Permittees shall comply immediately ... for which final compliance deadlines have passed pursuant to the TMDL implementation schedule." This provision is unreasonable. First, various brownfields/abandoned toxic sites exists, some of which were permitted to operate by State/Federal agencies - nothing has or will likely be done with these sites that contribute various pollutants to surface and sub-surface areas. Additionally, this permit is going to require a regional monitoring program - this program will yield results on what areas are especially prone to particular pollutants. Until these results are made known, MS4 Permittees will have a hard time knowing where to focus its resources and particularly, the placement of BMPs to capture, treat, and remove pollutants. For these reasons, this provision should be revised to first assess pollutant sources and then focus on compliance with BMP implementation.	Same comment
31	116-123	E.5	Please clarify that cities are not responsible for retrofiting.	Same comment
32	116-123	E.5.a - c	Recommend not listing specific waterbody/trash TMDLs here, but simply leave the reference to Attachments to identify the Trash TMDLs. Otherwise, this may have to be revised in the future. Again, Santa Monica Bay Marine Debris TMDL was not included in this list, it is unclear whether it was an oversight or intentional?	Same comment
33	116-123	E.5.b.ii.2	Define "partial capture devices", define "institutional controls". Permittees need to have clear direction of how to attain the "zero" discharges which will have varying degrees of calculations regardless of which compliance method is followed. Explain the Regional Board's approval process for determining how institution controls will supplement full and partial capture to attain a determination of "zero" discharge.	Same comment
34	116-123	E.5.b.ii.(4)	MFAC and TMRP should be an option available to the Los Angeles River.	Same comment
35	116-123	E.5.c.i.(1)	For reporting compliance based on Full Capture Systems, what is the significance of needing to know "the drainage areas addressed by these installations?" Unfortunately, record keeping in Burbank is limited to the location and size of City-owned catch basins. A drainage study would need to be done to define these drainage areas. As such, we do not believe this requirement serves a purpose in regards to full capture system installations and their intended function.	Same comment
36	Attachment L	D.3 a - c	Please change the Receiving Water Limitations for interim and final limits to the TMDL approved table. There should be no interpretation of the number of exceedance days based on daily for weekly sampling with, especially with no explanation of the ratio or calculations, and no discussion of averaging. Please revert to the original TMDL document.	The table was adjusted, but did not eliminate the interpretation of number of exceedance days that are not expressly completed in the Santa Clara River TMDL. Remove all interpretation of number of exceedance days other than what has been expressed in the original TMDL number of days of exceedances without interpretation or recalculation.

37	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For the Freshwater portion of the Dominguez Channel: There are no provisions for BMP implementation to comply with the interim goals. The wording appears to contradict Section E.2.d.i.4 which allows permittees to submit a Watershed Management Plan or otherwise demonstrate that BMPs being implemented will have a reasonable expectation of achieving the interim goals.	Same comment
38	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For Greater LA Harbor: Similar to the previous comment regarding this section. The Table establishing Interim Effluent Limitations, Daily Maximum (mg/kg sediment), does not provide for natural variations that will occur from time to time in samples collected from the field. Given the current wording in the proposed Receiving Waters Limitations, even one exceedance could potentially place permittees in violation regardless of the permittees level of effort. Reference should be made in this section to Section E.2.d.i.4 which will provide the opportunity for the Permittee to develop BMP-base compliance efforts to meet interim goals.	Same comment
39	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For the freshwater portion of the Dominguez Channel: the wording should be clarified. Section 5.a states that "Permittees subject to this TMDL are listed in Attachment K, Table K-4." Then the Table in Section E.2.b Table "Interim Effluent Limitations--- Sediment", lists all permittees except the Fresh water portion of the Dominguez Channel. For clarification purposes, we request adding the phase to the first row: "Dominguez Channel Estuary (below Vermont)"	Same comment
40	Attachment O, Page 3	C	For the LA River metals. Some permittees have opted out of the grouped effort. This section needs to detail how these mass-based daily limitations will be reapportioned.	Same comment
41	Attachment O, Page 7	D.4	Why are "Receiving Water Limitations" being inserted here? None of the other TMDLs seem to follow that format.	Same comment
42	Attachment P	TMDLs in the San Gabriel River WMA	It is the permittees understanding that the lead impairment of Reach 2 of the San Gabriel River has been removed. It should be removed from the MS4 permit.	Same comment

Document Name: **Watershed Management Program Section Draft Tentative Order - July 2012**

Agency/Reviewer: **LA Permit Group**

Comment	Doc. Reference		Comments	
No.	Page	Section	Apr-12	Jul-12
1	General	General	While it may be appropriate to have an overall design storm for the NPDES Permit and TMDL compliance, this element seems to address individual sites. Recommend developing more prominently in the areas of the Permit that deals with compliance that the overall Watershed Management Program should deal with the 85th percentile storm and that beyond that, Permittees are not held responsible for the water quality from the much larger storms. However, requiring individual projects to meet this standard is limiting as there may be smaller projects implemented that individually would not meet 85th percentile, but collectively would work together to meet that standard. Please clearly indicate cities are only responsible for the 85th percentile storm for compliance and that individual projects may treat more of less than number.	Changes were made but it is unclear that the overall program would be collectively only held to the 85th percentile storm if working in multiple areas, and individual sites only if the Watershed Management Program states that individual sites would be responsible.
2	46	Process	Please clarify that Permittees will only be responsible for continuing existing programs and TMDL implementation plans during the interim 18 month period while developing the Watershed Management Program and securing approval of those programs	Same comment
3	46-47	Table 9 and Process	Please allow 24 months for development of the Watershed Management Program to provide sufficient time for calibration and the political process to adopt these programs.	Same comment. However, there could be a phased approach in which a permittee could submit early actions within this timeline, while more time is offered for the resource intensive aspects.
4	46-53	various	The Table (TBD) on page 2 states implementation of the Watershed Program will begin upon submittal of final plan. Page 11, section 4 Watershed Management Program Implementation states each Permittee shall implement the Watershed Management Program upon approval by the Executive Officer. Page 13 section iii says the Permittee shall implement modifications to the storm water management program upon acceptance by the Executive Officer. All three of these elements should be consistent and state upon approval by the Executive Officer. The item on page 13 should be changed to reflect the Watershed Management Program, or clarify that the Watershed Management Program is the storm water management program.	Table 9 and Watershed Management Implementation are still inconsistent. The table says submittal and the Watershed Management Program Implementation states upon approval. Please make these consistent
5	47	Program Development	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions.	Same comment
6	48	3.a.ii	Pollutants in category 4 should not be included in this permit term, request elimination of any evaluation of category 4. Request elimination of category 3, as work should focus on the first two categories at this point	Thank you for removing category 4. Category 3 puts a burden on cities during this permit cycle. In the next permit term, when permittees have a better understanding of sources and location of the high priority pollutant additional actions may be warranted. At this time including category 3 adds an investigative burden that is unwarranted given the substantial increase in requirements and monitoring that are already included in this draft tentative order.
7	52	Reasonable Assurance Analysis	Reasonable assurance analysis and the prioritization elements should also include factors for technical and economic feasibility	Same comment
8	112	E.2.b.iii	For the "group of Permittees" having compliance determined as a whole, this should only be the case if the group of Permittees have moved forward with shared responsibilities (MOAs, cost sharing, a Watershed Management Program). It would not be fair to have one entity not be a part of the "group" and be the main cause of exceedances/violations.	In the Tentative Order, permittees must notify the Regional Board 6 months after the Order's effective date on whether it plans to participate in the development of a Watershed Management Program. Given this, a sub-watershed will not know whether all permittees will participate or not. It should also be noted that allowed non-stormwater discharges and other NPDES permit discharges may be the cause of exceedances/violations and not the "group of permittees."

1	37-38	All	Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue	There are several NPDES Permits, including the Caltrans Permit and others, that adjust the Receiving Water Limitation language in response to new interpretations. Currently, the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. LASP has provided the Regional Board staff with sample language. It is imperative that the Regional Board works with the State Board on this very important issue. It is critical that the LA draft tentative order Receiving Water Limitation language be adjusted to ensure cities working in good faith are not subject to enforcement and third party litigation.

1	13-26	Findings	several related		<p>Please add findings regarding the iterative process.</p> <p>The iterative process is a process of implementing, evaluating, revising, or adding new BMPs to attain water quality standards, including total maximum daily load (TMDL) waste load allocations (WLAs). The State Water Resources Control Board (State Board) has affirmed, in several precedential water quality orders (including WQ 99-05 and 2001-15), the inclusion of the iterative process in MS4 permits. As the State Board noted in WQ 2001-15:</p> <p>This Board has already considered and upheld the requirement that municipal storm water discharges must not cause or contribute to exceedances of water quality objectives in the receiving water. We adopted an iterative procedure for complying with this requirement, wherein municipalities must report instances where they cause or contribute to exceedances, and then must review and improve BMPs so as to protect the receiving waters.</p> <p>The iterative process goes hand-in-hand with the Receiving Water Limitation provision of this order, which is intended to address a water quality standard exceedance. An MS4 permit is a point source permit, which is defined by §40 CFR 122.2 to mean outfall or end-of-pipe. Attainment of a water quality standard in stormwater discharge is achieved in the effluent or discharge from the MS4 through the implementation of BMPs contained in a Stormwater Quality Management Plan (SQMP). If a water quality standard is frequently exceeded as determined by outfall monitoring relative to an ambient condition of the receiving water (during the 5-year term of the Order) the permittee shall be required to propose better-tailored BMPs to address the exceedance. The process includes determining (1) if the exceedances are statistically significant and if so, would require the permittee to (2) identify the source of the exceedance; and (2) propose new or intensified BMPs to be implemented in the next MS4 permit – unless the Executive Officer determines that a more immediate response is required.</p> <p>(continued from previous page) The iterative process does not apply to non-stormwater discharges. Section 402(p)(3)(B)(ii) of the Clean Water Act only prohibits non-stormwater discharges to the MS4 and not from it as is the case with stormwater discharges. This is because Congress set two standards for MS4 discharges: one stormwater and one for non-stormwater. As noted in WQO 2009-008, the Clean Water Act and the federal storm water regulations assign different performance requirements for storm water and non-storm water discharges. These distinctions in the guidance document, the Clean Water Act, and the storm water regulations make it clear that a regulatory approach for storm water - such as the iterative approach we have previously endorsed - is not necessarily appropriate for non-storm water.</p>

2	24 and Attachment F, Pages 146-149	Unfunded Mandates Section of Fact Sheet and Permit	several related	It is incorrect to assert an outcome on the unfunded mandates issue in a permit; this has nothing to do with protecting water quality. The unfunded mandates process has not completed a process and these assertions are opinion. Since the Fact Sheet is part of the permit, remove this section. There are many errors and incorrect assumptions, especially around the level of effort required for this permit when compared to the current permit, and the economic issues that are incorrect.
---	------------------------------------	--	-----------------	--

Comment	Doc. Reference		Comments
No.	Page	Section	Jul-12
1	General	General	It is appropriate to have an exemption for a Permittee from a violation of RWL and or WQBELs caused by a non-stormwater discharge from a potable water supply or distribution system not regulated by an NPDES permit but required by state or federal statute; this should clearly apply to all NPDES permits issued to others within, or flow through, the MS4 permittees jurisdiction. We would request that also included in this category should be emergency releases caused by water line breaks which are not necessary, but are unexpected and have to be dealt with as an emergency. MS4 permittees should be exempt from RWL or WQBEL violations associated with any permitted NPDES discharges that are effectively authorized by LARWQCB under the Clean Water Act.
2	General	General	Since it could take 6 months for an agency to decide if they want to join in the development of a Watershed Management Plan or just modify their current Stormwater Management Program to comply with the new permit MCMs, the implementation of the new MCMs should follow this timeline. In the interim the permittees will be required to continue implementing their current Stormwater Management Program.
3	26	A.	<p>RB staff proposed language requires the permittees to “prohibit non-stormwater discharges <b>through the</b> MS4 to receiving waters” except where authorized by a separate NPDES permit or conditionally. This prohibition is inconsistent with legal authority provisions in the federal regulations since 40 CFR 122.26(d)(1)(ii) which requires legal authority to control discharges <b>to</b> the MS4 but not <b>from</b> the MS4. Additionally, with respect to the definition of an illicit discharge at 40 CFR 122.26(b)(2), an illicit discharge is defined as “a discharge <b>to</b> the MS4 that is not composed entirely of stormwater”. In issuing its final rulemaking for stormwater discharges on Friday, November 16, 1990[1], USEPA states that:</p> <p><i>“Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT) and the Best Conventional Pollutant Control Technology (BCT) and where necessary, water quality-based controls), but permits for <b>discharges from</b> municipal separate storm sewer systems must require controls to the maximum extent practicable, and where necessary water quality-based controls, and must include a requirement to effectively prohibit non-stormwater <b>discharges into</b> the storm sewers.”</i></p> <p>This is further illuminated by the section on Effective Prohibition on Non- Stormwater Discharges[2]:</p> <p><i>“Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water discharges <b>into the storm sewers</b>. Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather, an ‘effective prohibition’ would require separate NPDES permits for non-storm water discharges to municipal storm sewers”</i></p> <p>The rulemaking goes on to say that the permit application:</p> <p><i>“requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems.”</i></p> <p>Nowhere in the rulemaking is the subject of prohibiting discharges from the MS4 discussed. Furthermore, USEPA provides model ordinance language on the subject of discharge prohibitions: <a href="http://www.epa.gov/owow/NPS/ordinance/mol5.htm">http://www.epa.gov/owow/NPS/ordinance/mol5.htm</a>. Section VII Discharge Prohibitions of this model ordinance provides discharge prohibition language as follows:</p> <p><i>“No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.”</i></p> <p>Thus we recommend that staff eliminate the “from” language at both Part III.A.1.a. and Part III.A.2.</p>
4	28	A.2.b.vi	The conditional exemption of street/sidewalk water is inconsistent with the requirement in the industrial/commercial MCM section that street washing must be diverted to the sanitary sewer. Sidewalk water should definitely be conditionally exempt, but so also should patios and pool deck washing. If street washing has to be diverted to the sanitary sewer for industrial/commercial facilities, then it should for all facilities and so should parking lot wash water as they are similar in their pollutant loads.
5	33-36, Table 8	Discharge Prohibitions	Enforcing NPDES permits issued for the various NSWDS referenced in this table should be the responsibility of the State/Regional Board, not the MS4 permittee. Therefore, it is inappropriate to include a condition that places a responsibility on the MS4 permittee to ensure requirements of NPDES permits are being implemented or effective in order for the pertaining NSWDC category to be exempt. Proper enforcement of the various NPDES permits mentioned in this table should ensure impacts from these discharges are negligible.

6	39	A.2.a.i	<p>Staff proposal states: "Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites."</p> <p>It appears the intent of this language is to transfer the State's inspection and enforcement responsibilities to municipalities through the MS4 permit. When a separate general NPDES permit is issued by the Regional or State Board it should be the responsibility of that agency collecting such permit fees to control the contribution of pollutants, not MS4 permittees.</p>
7	39	A.2.a.vii	<p>Staff proposal states: "Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Co-permittees."</p> <p>The intention of this statement is unclear and should be explained, and a definition of "shared MS4" should be provided. How would an inter-agency agreement work with an upstream and downstream agency? This is not practical - this agreement should have been done before the interconnection of MS4 systems occurred. An example of this agreement should be provided within the Permit. The permittee will not agree to the responsibility of an exceedance without first having evidence of the source and its known origin (in other words, an IC/ID is a private "culprit" and not the cause of the City).</p>
8	39	A.2.a.xi	<p>Staff proposal states: "Require that structural BMPs are properly operated and maintained."</p> <p>MS4 agencies can control discharges through an illicit discharge program, and conditioning new/redevelopment to ensure mitigation of pollutants. Unless the existing development private property owners/tenants are willing or in the process of retrofitting its property, the installation and O&amp;M of BMPs is not practical and cannot be legally enforceable against an entity that does not own or control the property, such as a municipal entity.</p>
9	39	A.2.a.xii	<p>Staff proposal states: "Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4."</p> <p>It is difficult, if not impossible, to accurately quantify the exact effectiveness of a particular set of BMP's in reducing the discharge of pollutants. Some discharges may be reduced over time given reductions in industrial activity, population in a particular portion of the community feeding into the MS4, or for other reasons not directly related to implementation of structural BMPs. Given that the County of LA is generally urbanized and thus impervious, a lethargic economic climate (meaning development and redevelopment is not occurring in an expeditious manner), and that several pollutants do not have known BMPs effective at removing/reducing the content (i.e., metals, toxics, pesticides), the effectiveness of BMPs should not be required and instead should only be used for research, development, and progress of BMP testing.</p>
10	40	A.2.b	<p>Staff proposal states: "Permittee must submit a statement certified by its chief legal counsel that the Permittee has the legal authority within its jurisdiction to implement... Each permittee shall submit this certification annually..."</p> <p>To sign this statement, chief counsel will have to analyze this 500 page Permit, analyze the municipal code, and prepare a statement as to whether actions can be commenced and completed in the judicial system. An annual certification is redundant and unnecessary in addition to being extraordinarily costly. At most, legal analysis should be done once during the Permit term. Otherwise, please delete this requirement.</p>
11	40	A.3	<p>The staff proposal includes a section on Fiscal Resources. Most MS4's do not have a storm water quality funding source, and even those that do have a funding source are not structured to meet the requirements of the proposed MS4 requirements (for instance, development funds may be collected to construct an extended detention basin, but not for street sweeping, catch basin cleaning, public right-of-way structural BMPs, etc).</p>
12	40	A.3.a	<p>Staff proposal states: "Each Permittee shall exercise its full authority to secure the fiscal resources necessary to meet all requirements of this Order"</p> <p>This sentence has no legally enforceable standard. What exactly does the exercise of "full authority" mean when the exercise of a city's right to tax comes with consequences and no guarantee of success? Municipal entities must adjust for a variety of urgent needs, some federally mandated in a manner that cannot be ignored. So, if we seek the fiscal resources to fund the programs required in the permit and the citizens say "No", then a municipality will have a limited ability to comply with "all requirements of this Order".. Can the language be changed to state: "Each permittee shall make its best efforts given existing financial and budget constraints to secure fiscal resources necessary to meet all requirements of this Order"?</p>
13	40	A.3.c	<p>Staff proposal states: "Each permittee shall conduct a fiscal analysis... to implement the requirements of this Order."</p> <p>Most MS4's do not have adequate funding to meet all requirements of the Tentative MS4 Permit. A Permit requirement to secure funding is overreach. Please delete this section.</p>
14	58	D.4.a.i.(2)	<p>Staff proposal states: "To measurably change the waste disposal and storm water pollution generation behavior of target audiences..."</p> <p>Define the method to be used to measure behavior change. As written, this requirement is vague and open to interpretation.</p>
15	60	D.4.d.i.(2).(b)	<p>Staff proposal states: "... including personal care products and pharmaceuticals)"</p> <p>The stormwater permit should pertain only to stormwater issues. Pharmaceuticals getting into waters of the US are typically a result of waste treatment processes. All references to pharmaceuticals should be removed from this MS4 permit.</p>
16	60	D.4.d.i.(3)	<p>The Regional Board assumes that all of the listed businesses will willingly allow the City to install displays containing the various BMP educational materials in their businesses. If the businesses do allow the installations then the City must monitor the availability of the handouts because the business will not monitor or keep the display full or notify the City when the materials are running out. If the business will not allow the City to display the educational material must we document that denial? Will that denial indicate that the City is not in compliance?</p>
17	63-66	D.5.d-f	<p>These sections pertain to inspecting critical source facilities where it appears the intent is to transfer the State's Industrial General Permit inspection and enforcement responsibilities to municipalities through the MS4 permit. We request eliminating these sections OR revise to exclude all MS4 permittee responsibility for NPDES permitted industrial facilities.</p>

19	67	D.6.a.i.(3)	The stated objective of mimicking the predevelopment water balance is not consistent with the requirement that the entire design storm be managed onsite. Please consider allowing subtracting the predevelopment runoff from the design volume or flow.
20	69	D.6.b.ii.(1).(a)	Please clarify whether this paragraph applies to what is existing on the site or what is being redeveloped.
21	70	D.6.c.i.(2).(b)	Consider removing the "whichever is greater" wording. The two methods are considered equivalent and the 85 <sup>th</sup> percentile was calculated to be the 0.75-inch for downtown Los Angeles. Currently, the 0.75-inch storm criterion has been used throughout the County for uniformity. While requiring the 85 <sup>th</sup> percentile to be used instead appears more technically appropriate, requiring calculating both criteria and using the greater value appears punitive.
22	70	D.6.c.i.(4)	Consider deleting this sentence since it is redundant with item VI.D.6.c.i.1 and green roofs are not feasible not only based on the provisions of this order but also due to regional climate and implementability considerations.
23	70	D.6.c.ii.(2)	Add "lack of opportunities for rainwater use" as one of the technical infeasibility criteria to acknowledge the fact that most of the type of development projects cannot utilize the captured volume of water.
24	72	D.6.c.iii.(1).(b). (ii)	The requirement for raised underdrain placement to achieve nitrogen removal is inconsistent with standard industry designs and is based on limited evidence that this change will improve nitrogen removal. Furthermore, by raising the underdrain, other water quality problems may result such as low dissolved oxygen and bacterial growth due to the septic conditions that will be created.
25	72	D.6.c.iii.(2).(b)	The requirement to provide treatment for the project site runoff when offsite mitigation is provided is punitive and unfair considering that an alternative site needs to be retrofitted to retain the equivalent volume. Please consider removing the on-site requirement when mitigation occurs in an offsite location.
26	72	D.6.c.iii.(4)	The conditions listed for offsite projects are overly restrictive. Also, considering legal and logistical constraints regarding offsite mitigation, this alternative is not very feasible.
27	75	Table 11	The concept of establishing benchmarks for post construction BMPs was initially developed in the 2009 Ventura MS4 permit. However there is a significant different between the permits. The Ventura County's NPDES MS4 permit requires the project developer to determine the pollutant of concern(s) for the development project and use this pollutant as the basis for selecting a top performing BMP. In the case of the Draft Order, there is no determination of the pollutant of concern for the development project. Instead post construction BMPs must meet all the benchmarks established in Table 11. Unfortunately, no one traditional post construction BMP (non-infiltration BMPs) is capable of meeting all the benchmarks and thus the developer will not be able to select a BMP. We recommend that provision VI.D.6.c.iv.(1)(a) (page 74) be modified so that the selection of post construction BMPs is consistent with the Ventura permit and is based on the development site's pollutant of concern(s) and the corresponding top performing BMP(s) that can meet the Table 11 benchmarks.
28	75	D.6.c.v.(1).(a). (i)	Erosion Potential (Ep) is not a widely used term in our region, and may not be the most appropriate term to be used as an indicator of the potential hydromodification impacts.
29	76	D.6.c.v.(1).(a). (iv)	The requirement for development of a new Interim Hydromodification Control Criteria is unnecessary considering there is already peak storm control requirements in the existing MS4 Permit and that the State Water Board is finalizing the statewide Hydromodification Policy.
30	77	D.6.c.v.(1).(c). (i).1	The requirement to retain on site the 95 <sup>th</sup> percentile storm is excessive and inconsistent with all other storm design parameters that appear in this order. It may also not be an appropriate storm in terms of soil deposits for the soil deprived streams such as Santa Clara Creek. Again, consider referring to the statewide policy for a consistent and technical basis of the hydromodification requirements.
31	80	D.6.d.i.1	The requirement of 180 days for the "Local Ordinance Equivalence" may be difficult to be met due to the typical processing and public review period for changes to local municipal codes. Consider revising this provision to require immediate start of this effort instead.
32	83	D.7.a.iii	MEP should be changed to BAT and BCT for consistency with the State's General Construction Permit (GCASP).
33	83	D.7.d	Consider introducing a minimum threshold for construction sites such as those for grading permits. As proposed, minor repair works or trivial projects will be considered construction projects and will unnecessarily be subject to these provisions.
34	83	Table 12	Some of the listed BMPs will not be applicable for all construction sites. Consider replacing the title of the Table 12 to "Applicable Set of BMPs for Construction Sites"
35	84-91	D.7.e-j	All these provisions refer to construction sites of greater than one acre. These sites are subject to the General Construction Permit provisions and within the authority of the State agencies. Towards ensuring compliance with these regulations, the State is collecting a significant fee that covers inspection and tracking of these facilities. We are disputing the need to establish an unnecessary parallel enforcement scheme for these sites. This is consistent with the RWQCB member(s) voice at one of the workshops.
36	84-91	D.7.g-j	Refer to the State's GCASP and its SWPPP requirements to avoid delicacy.
37	85	D.7.g.ii.(9)	There is no need to introduce a new term/document of Erosion and Sediment Control Plan for construction sites that are already subject to GCASP's SWPPP requirements.
38	87	Table 13	Delete. This table is the same as Table 12.
39	90	Table 17	The suggested inspections could not possibly be accommodated based on current resources because of the concurrent need to visit all sites. However, if the GCASP funding is transferred for locally-based enforcement, an increase number of inspections may be accommodated.
40	90	D.7.j.ii.(2).(a)	Consider deleting this requirement as being unnecessary. The placement of BMPs may not be needed based on the season of construction and the planned phases.
41	94	D.8.d	If there is a specific pollutant to address, retrofitting or any other BMP would best be accomplished through a TMDL, which is for the Permittees to determine rather than a prescribed blanket approach. As written, this is too broad of a requirement with unknown costs that is attempting to solve a problem before there is a problem. Please delete VI.D.8.d.
42	94	D.8.d.i	Staff proposal states: "Each Permittee shall develop an inventory of retrofitting opportunities that meets the requirements of this Part VI.8.D... The goals of the existing development retrofitting inventory are to address the impacts of existing development through regional or sub-regional retrofit projects that reduce the discharges of storm water pollutants into the MS4 and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards."  This process would require land acquisition, a feasibility analysis, no impacts to existing infrastructure, proper soils, and support of various interested stakeholders. Additionally, if a property or area is being developed/redeveloped, retrofitting the site for water quality purposes makes sense, but not for an area where no development/redevelopment is planned. Finally, the LID provisions have already included provisions for off-site mitigation, in which we recommend that regional water quality projects be considered in lieu of local-scale water quality projects that will prove difficult to upkeep, maintain, and replace, let alone have existing sites evaluated as feasible. For these reasons, this requirement should be removed.

43	95	D.8.d.v	Any retrofit activities should be the result of either an illicit discharge investigation or TMDL monitoring follow-up and will need to be addressed on a site-by-site basis. A blanket effort as proposed in a highly urbanized area is simply not feasible at this time.
44	96	D.8.e.ii	Staff proposal states: "Each Permittee shall implement the following measures for...flood management projects"  Flood management projects need to be clearly defined.
45	102	D.8.h.vii.(1)	This requirement appears to be an "end-run" around the lack of catch basin structural BMPs in areas not covered by Trash TMDLs. The requirement has the potential to be extraordinarily economically burdensome. If an area is NOT subjected to a Trash TMDL, then the need for any mitigation devices is baseless. The MS4 permit requirements should not circumvent nor minimize the CWA 303(d) process.
46	103	D.8.h.ix	Staff proposal requires: "Infiltration from Sanitary Sewer to MS4 / Preventive Maintenance...."  The State Water Board has implemented a separate permit for sewer maintenance activities. Additional sewer maintenance requirements are redundant and unnecessary. Please delete this requirement.
47	106-110	D.9	A definition of "outfall" is required for clarity. An "outfall" for purposes of "non-stormwater outfall-based monitoring program" should be defined as "major outfall" pursuant to Clean Water Act 40 CFR 122.26. Please revise each mention of "outfall" to read "major outfall" when discussing "non-stormwater outfall-based monitoring program".
48	107	D.9.b.i	Please revise the proposed language to "Permittee/Permittees shall develop written procedures for conducting investigations to identify the source of <b>suspected</b> illicit discharges, including procedures to eliminate the discharge once source is located." It is not known if a discharge is illicit until the investigation is completed.
49	107	D.9.b.iii.(1)	"Illicit discharges suspected of being sanitary sewage... shall be investigated first." ICID inspectors should be allowed to make the determination of which event should be investigated first. For example, a toxic waste spill or a truck full of gasoline spill should take precedence over a sewage spill. This requirement should be amended to the "most toxic or severe threat to the watershed" shall be investigated first.
50	Attachment A	Definitions	The Definition of: "Development", "New Development" and "Re-development" should be added. The definitions in the existing permit should be used:  <i>"Development" means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i>  <i>"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.</i>  <i>"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i>  The last of the three "routine maintenance" activities listed above should exclude projects related to existing streets since typically you are not changing the "purpose" of the street to carry vehicles and should not be altered.
51	Attachment A, Page 1	Definitions	The biofiltration definition limits the systems that allow incidental infiltration. Many municipal ordinances and established engineering practices will not allow even incidental infiltration if the planter boxes are located adjacent to a building structure. Thus, this definition will exclude the most common types of planter boxes which logically have to be placed next to the building to collect roof runoff. For this reason, consider allowing biofiltration to include planter boxes without incidental infiltration since they may be the only applicable BMPs.
52			Some small cities do not have digital maps. In the "General" category of Section 11, please provide a 1 year time schedule for cities to create digital maps OR provide the municipality the ability to develop comprehensive maps of the storm sewer system in any format.
53			Omit the comment, "Each mapped MS4 outfall shall be located using geographical positioning system (GPS) and photographs of the outfall shall be taken to provide baseline information to track operation and maintenance needs over time." This requirement is cost prohibitive and of little value because many City outfalls are underground and could not be accurately located or photographed. Photographs of outfalls in channels have little value since data required is already included on "As-Built" drawings. Geographic coordinates can easily be obtained using Google Earth or existing GIS coordinate systems.  "The contributing drainage area for each outfall should be clearly discernible..." The scope of this requirement would involve thousands of records of drainage studies. The Regional Board should be aware that this requirement would be very labor intensive, time consuming, and very costly.
54			Storm drain maps should show watershed boundaries which by definition provide the location and name of the receiving water body. Please revise (3) to read "The name of all receiving water bodies from those MS4 major outfalls identified in (1).
55			The LA Permit Group proposes "non-stormwater outfall-based monitoring program" to be flow based monitoring. Please revise item (4) of 11.c.i. to read "(4) monitoring flow of unidentified or authorized non-stormwater discharges, and..."
56			"Monitoring of unknown or authorized discharges" "Authorized" discharges are exempted or conditionally exempted for various reasons. Monitoring authorized discharges is monitoring for the sake of monitoring and offers no clear goal or water quality benefit. Please delete this requirement. If the source of a discharge is unknown, then monitoring may be used as an optional tool to identify the culprit.

[1] 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

[2] 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

Document Name: **Attachment E - Monitoring and Reporting Program Draft Tentative Order - July 2012**

Agency/Reviewer: **LA Permit Group**

Comment	Doc. Reference		Comments
No.	Page	Section	Jul-12
1	Multiple	Multiple	The use of the HUC-12 watershed for limits is a good start but there needs to be some flexibility in its use to insure that the HUC-12 truly reflects the actual watershed boundary.
2	Multiple	Multiple	The rain gages to be used for determining a wet versus dry weather day should be selected by the agencies and approved by the Regional Board. Since monitoring plans will be on a regional basis the use of 50% of County rain gages in a watershed may not be necessary. Plus, predictions do not necessarily use County rain gages.
3	Attachment E, Page 3	II.A.1	Omit as a primary objective to assess the "biological impacts" of discharges from the MS4. The MS4 Permit is to regulate water quality. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to assess biological impacts of discharges and to set water quality regulations to prevent adverse biological impacts. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
4	Attachment E, Page 4	II.E.1	<p>Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) indicates:</p> <p><i>The permit requires all <b>effluent</b> and <b>ambient</b> monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.</i></p> <p>The only definition of "ambient" monitoring is defined by SWAMP protocol as being 72 hours after a storm event.</p> <p>Regarding monitoring purposes "b" and "c" assessing trends in pollution concentrations should be: (1) limited to ambient water quality monitoring; and (2) Regional Board's surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.</p> <p><i>Recommended Corrective Action:</i> Clarify that RWL monitoring is only in the ambient condition as defined by SWAMP and that ambient monitoring is performed as part of the SWAMP and is not the responsibility of MS4 permittees.</p>
5	Attachment E, Page 4	II.E.1.c	Omit Item c. The MS4 Permit is to regulate water quality. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to "Determine whether the designated beneficial uses are fully supported as ...aquatic toxicity and bio-assessment monitoring." This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
6	Attachment E, Page 4	II.E.2.a	<p>Outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to monitor progress towards achieving TMDL WLAs that are expressed in the receiving water. Instead, Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs, if necessary.</p> <p>Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.</p> <p><i>Recommended Correction:</i> Either utilize MALs, in lieu of numeric WQBELs, to measure progress towards achieving TMDL WLAs expressed in the receiving water or eliminate MALs entirely.</p>
7	Attachment E, Page 4	II.E.3.a	<p>Regarding "a," This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.</p> <p><i>Recommended Correction:</i> Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the IC/ID program.</p>
8	Attachment E, Page 4	II.E.3.b	<p>With regard to "b", see previous responses regarding MALs and the limitation of the non-stormwater discharge prohibition to the MS4.</p> <p><i>Recommended Correction:</i> Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.</p>
9	Attachment E, Page 4	II.E.3.c	<p>Regarding "c", as mentioned, non-stormwater discharges cannot be applied to receiving water limitations because they are only prohibited to the MS4, not from or through it.</p> <p><i>Recommended Correction:</i> Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.</p>

10	Attachment E, Page 4	II.E.4	<p>Omit Item 4. Monitoring of Development/Re-development BMPs is the responsibility of the Developers. Requirements for monitoring Developer BMPs should be part of Section VI.D.6. <i>Planning and Land Development Program</i> and the responsibility of the Developer.</p> <p>The purpose of this requirement is not authorized under federal stormwater regulations as it relates to monitoring. Requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4's pollution contribution relative to exceeding ambient water quality standards. There is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.</p> <p>Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines "effectiveness" -- effective relative to what standard? It is also not clear how such monitoring is to be performed.</p> <p><i>Recommended Correction:</i> Delete this requirement.</p>
11	Attachment E, Page 5	II.E.5	<p>Omit Item 5. The MS4 Permit is to regulate discharges to receiving water. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to conduct Regional Studies for Southern California Monitoring Coalition, bio-assessment and Pyrethroid pesticides. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.</p> <p>Requiring 85 jurisdictions to conduct regional monitoring is duplicative and inefficient and should be conducted by a Regional authority.</p> <p>Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board's SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County's mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.</p>
12	Attachment E, Pages 5-6	III.F & G	Omit Items F. & G. Specifying Sampling Methods and Analytical Procedures in the permit adds unnecessary liability for Cities for work that is already described in USEPA Protocols and per approved TMDLs. These Items should be combined and state to follow USEPA Protocols or per approved TMDLs.
13	Attachment E, Page 6	III.H.3	There is a typo for Item 3. Item 3. should read "...requirements identified in Part XVIII.A.5. and Part XVIII.A.7 of this MRP."
14	Attachment E, Pages 7-8	IV.C.1	More time is needed to prepare Coordinated Integrated Monitoring Plans due to the number of agencies involved. Since existing monitoring programs will proceed as Coordinated Integrated Monitoring Plans are being prepared, then there is no need for accelerated schedules. Revise Item 1. to provide twelve (12) months for each Watershed Group to submit a Memorandum of Understanding to work with other agencies for a Coordinated Integrated Monitoring Plan. A letter of intent allows a Permittee to drop out of the process at any time and 12 months are required to process a Memorandum of Understanding with County and State agencies.
15	Attachment E, Page 8	IV.C.2	Revise Item 2. to require "Each Permittee not participating in a Coordinated Integrated Monitoring Plan to submit an Integrated Monitoring Plan..."
16	Attachment E, Page 8	IV.C.3	Revise to allow participating Permittees 24 months to submit a Coordinated Integrated Monitoring Plan. It will take a minimum of 12 months to process a Memorandum of Understanding with County and State agencies and that agreement is required before any Permittee will award a contract to a consultant to prepare a Coordinated Integrated Monitoring Plan. It takes 3 months to issue Request for Proposals and award a contract and then 9 months for a consultant to prepare a Coordinated Integrated Monitoring Plan. Since existing monitoring programs will proceed as Coordinated Integrated Monitoring Plans are being prepared, then there is no need for accelerated schedules.

17	Attachment E, Page 8	IV.C.5	Revise to allow 9 months after approval of an IMP or CIMP by the Executive Officer to commence monitoring. It takes 3 months to issue Request for Proposals and award a contract for monitoring. It takes an additional 6 months to obtain permits from the Los Angeles County Flood Control District to access monitoring locations on their systems.
----	-------------------------	--------	--

18	Attachment E, Page 8	IV.C.7	<p>Both the current permit shoreline monitoring program (CI-6948) and the SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) are being incorporated into the new permit. <b>The CI-6948 shoreline monitoring requirements, Section II.D – page T-11, is redundant to the CSMP.</b> All stations monitored in the CI-6948 are also monitored in the CSMP. Furthermore, the SMBBB TMDL specifies that the agencies are to select sampling frequency and the CSMP states that the agencies have selected weekly sampling frequency. However, CI-6948 requires several stations to be monitored up to 5 days per week and with the addition of the CSMP additional stations will be monitored two days per week.</p> <p>Paragraph II.D.b) of the CI-6948 shoreline monitoring section specifies that the sampling frequency at 28th Street (DHS 113), also SMB-5-2, and Herondo storm drain (DHS 115), also SMB-6-1, be increased to 5 times per week. Paragraph II.D.e) states that monitoring sites are to be monitored 5 days per week if the historical water quality is worse than the reference beach. However, no evidence was presented to the responsible agencies that this was the case for the SMB-5-2 or 6-1.</p> <p>An evaluation of historical data was presented by the Regional Board Staff Report for the reconsideration of the SMBBB TMDL dated May 2012. Further evaluation of this data shows that SMB-5-2 and SMB-6-1 should not be subject to the increase frequency for the following reasons:</p> <ol style="list-style-type: none"> <li>1. Of the 67 stations being monitored as part of the CSMP, SMB-5-2 and 6-1 are ranked 57 and 43 respectively in the percent of exceedances during the summer dry weather period.</li> <li>2. 37 stations being monitored only weekly or two days per week had a higher summer-dry weather exceedance percentage than SMB-6-1.</li> <li>3. The Reference Beach monitoring station (SMB-1-1) had a summer dry weather period exceedance percentage of 10.2% versus 6.9% and 3.2% for SMB-5-2 and 6-1, respectively.</li> <li>4. The Reference Beach monitoring station (SMB-1-1) had an average year-round exceedance percentage of 12.1% versus 14.6% and 11.4% for SMB-5-2 and 6-1, respectively. Although exceedance rate for SMB 5-2 is higher than the Reference Beach monitoring station based on year round results, it is lower during the critical summer-dry weather period.</li> <li>5. Of the 8 stations being monitored five days per week SMB-6-1 and 5-2 have the lowest summer dry weather period exceedance percentage (top 6 ranged from 40.9% to 8.5% compared to 6.9% and 3.2% for SMB-5-2 and 6-1).</li> </ol> <p>In addition, the inclusion of both the CI-6948 shoreline monitoring program and CSMP into the permit will result in 5 (SMB-5-1, 5-3, 5-5, 6-5, and 6-6) of the other 9 monitoring stations in SMBBB TMDL Jurisdictional Groups 5 and 6 being monitored 2 days per week which is not the case for any of the other CSMP stations.</p> <p>For all of the above reasons, the shoreline monitoring provisions of CI-6948 should be removed from the new permit monitoring program. However, at a minimum, paragraph D.1.b) should be removed and paragraph D.1.e).(1) should be modified to remove stations S13 (SMB-5-1), S14 (SMB-5-3) S15 (SMB-5-5), S17 (SMB-6-5) and S18 (SMB-6-6).</p> <p>The following is proposed wording modification to Attachment E, Section IV.C.7:</p> <p>“7. Monitoring requirements pursuant to Order No. 01-182, except Section D.1.b) is removed and Section D.1.e).(1) is modified to removed sites S13, S14, S15, S17 and S18 of the Monitoring and Reporting Program - CI-6948, shall remain in effect until the Executive Officer of the Regional Water Board approves a Permittee(s) IMP and/or CIMP plan(s).”</p>
19	Attachment E, Page 14	VI.C.1.b	Monitoring should be performed per approved IMP or CIMP or approved TMDL. The IMP and CIMP should identify rain gauges to use in the appropriate watershed.
20	Attachment E, Page 15	VI.C.1.d	Omit iv. The TMDLs will specify if TSS or SSC monitoring is required, otherwise sediments are needed for beach replenishment and the naturally occurring transport of sediments should not be regulated.
21	Attachment E, Page 15	VI.C.1.d	Omit vi. This imposing of State and Federal responsibilities on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
22	Attachment E, Page 15	VI.D.1.a	Omit the requirement for “One of the monitoring events shall be during the month with the historically lowest instream flows.” This data does not exist and it would be simpler to specify the historically driest month.
23	Attachment E, Page 15	VI.D.1.b	Revise item i. and ii. to simply be on days with no measurable rain. There are sufficient days of no measurable rain in Southern California and any rain event could result in isolated stormwater run off.
24	Attachment E, Page 16	VII.A	Revise the description to include database, “The IMP and/or CIMP plan(s) shall include a map <b>and/or database</b> of the MS4 to include the following information:” GIS maps all come with database(s) that include much of the required information.
25	Attachment E, Page 17	VIII.A.2.e	Include the option to monitor “upstream of the actual outfall or downstream of a political boundary”. Sometimes the best location to do monitoring is at the next manhole downstream from a city boundary.
26	Attachment E, Page 17	VIII.B.1.a	Omit “except aquatic toxicity, which shall be monitored once per year...”. This imposing of State and responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
27	Attachment E, Page 18	VIII.B.1.b	Omit Item ii. and iii. Monitoring should be performed per approved IMP or CIMP or approved TMDL.
28	Attachment E, Page 18	VIII.B.1.c	Omit Item iv. The TMDLs will specify if TSS or SSC monitoring is required, otherwise sediments are needed for beach replenishment and the naturally occurring transport of sediments should not be regulated.
29	Attachment E, Page 18	VIII.B.1.c	Omit vi. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
30	Attachment E, Page 19	IX.A.2	Include “natural flows” or “natural sources” as a potential source of non-storm water flow.
31	Attachment E, Page 22	IX.E.2	Revise last sentence to read, “100% of the outfalls <b>in the inventory</b> within 5 years...”

32	Attachment E, Page 22	IX.F.2	Omit the requirement to report to the Regional Board "within 30 days of determination" because there are too many report submittals that could lead to a Notice of Violation that will have no impact on water quality. Reporting source identifications in the annual report provides central location for submittals.
33	Attachment E, Page 23	IX.G.3 & 4	Outfalls not subject to dry weather TMDLs that have significant dry weather flows should have continuous flow monitoring done for a quarter with water quality sampling done once at the beginning of that time period. If the water quality sampling indicates pollutant concentrations that exceed water quality standards, then the IC/ID investigation procedures should begin. If no water quality standards are exceeded or the IC/ID investigation eliminates the source of pollutants, then that flow has been demonstrated NOT to cause or contribute to pollutant loading and should be stopped. To continue monitoring a site that is known NOT to cause or contribute to pollutant loading is a waste of resources and an un-funded mandate.
34	Attachment E, Page 24	X	This section should be moved to Section VI.D.6.d.iv. for clarity.
35	Attachment E, Page 25	XI	Omit this section. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform Pyrethroid and SCCWRP regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
36	Attachment E, Page 28	XII	Omit this section. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform aquatic toxicity regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
37	Attachment E, Page 38	XIV.I.1 & 2	It is not reasonable to force Permittees to make changes to approved Monitoring and Reporting Programs based on the whim of an "interested" party or "as deemed necessary by EO". This provides unlimited power to interested parties or EO. Recommend these items be revised to include a caveat that there would be no additional costs or as approved by Regional Board, to make those changes open and transparent.
38	Attachment E, Page 39	XIV.M	Omit section M. as it is redundant to section L.
39	Attachment E, Page 44	XVIII.A.5	Omit Items b. & c. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform aquatic toxicity regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
40	Attachment E, Pages 49-52	XIX.B	Only include schedules for IMP and CIMP for USEPA established TMDLs and revise those schedules to be 9 months for IMP and 24 months for CIMP. Having due dates for Monitoring and Reporting plans for IMP and CIMP past the due date established by the TMDL creates confusion.

Re: City of Claremont's Comments on Draft Tentative Order

Dear Mr. Ridgeway:

Best Best & Krieger ("BBK") serves as City Attorney for the City of Claremont. BBK submits these written comments on behalf of Claremont regarding the draft Los Angeles MS4 Tentative Order ("Draft Permit"). Claremont is a member of the LA Permit Group and joins in the comments submitted by that organization. Claremont writes separately to address an issue of unique importance to the City.

**Final Comments on the Draft Permit**

As the Regional Board is aware, the conditions of the Draft Permit, once adopted, will become legally enforceable requirements for Claremont. If there are future legal disputes about the meaning of the conditions, a court will review the Permit as it would review any contract or legal document. For these reasons, Claremont asks that the Regional Board listen closely to all of the concerns expressed by municipal dischargers, who are, in essence, contractual partners with the Regional Board when it comes to the Permit (albeit ones who cannot control the Regional Board's final Permit language). The Regional Board should only include provisions in the Permit that are precise and intended to create enforceable obligations that are well understood by all parties.

**Specific Concerns with the Draft Permit**

For Claremont, the need for precision and accuracy is particularly important with regard to the manner in which the Draft Permit attempts to address the Middle Santa Ana River Watershed Bacteria Indicator TMDL ("MSAR TMDL"). As Claremont has previously advised the Regional Board, the MSAR TMDL is not one that has been adopted by this Board. Rather, the MSAR TMDL was adopted by the Santa Ana Regional Board. The MSAR TMDL included Claremont, even though the City is not subject to the jurisdiction of that Board.

**BEST BEST & KRIEGER**  
ATTORNEYS AT LAW

Mr. Ivar Ridgeway  
July 23, 2012  
Page 2

In Section E and Attachment R of the Draft Permit, the Regional Board has compounded this error by only incorporating part of the MSAR TMDL as numeric effluent limitations applicable to Claremont. As written, the Draft Permit is thus contrary to the express language and stated intent of the MSAR TMDL, its implementation plan and the policy of the Santa Ana Regional Board. This error places Claremont in the untenable position of having the Los Angeles Regional Board apply a TMDL it did not adopt in a manner inconsistent with the language and stated intent of the Regional Board that did adopt the TMDL. On May 14, 2012, Claremont sent the Regional Board a letter objecting to the inclusion of MSAR TMDL in the Draft Permit. Claremont repeats and incorporates the objections set forth in the May 14, 2012 letter. A copy of the May 14, 2012 letter is attached. Claremont supplements its previous comments as set forth below.

Section E and Attachment R of the Draft Permit seek to establish the terms and conditions under which “applicable” TMDLs are included in the Permit as WQBELs. With regard to the MSAR TMDL, the Regional Board has erroneously included only a part of the TMDL in a manner inconsistent with the law and the facts.

As applied to the MSAR TMDL, Section E and Attachment R of the Draft Permit are actually inconsistent, rather than consistent, with the assumptions and requirements of the MSAR TMDL. Specifically, the Draft Permit only addresses one part of the MSAR TMDL and selectively applies only its numeric portion. It ignores the Santa Ana Regional Board’s express intent to allow dischargers to comply with the TMDL’s WLA through the submission and implementation of Comprehensive Bacterial Reduction Plans. In this way, the Regional Board has erred in its application of the TMDL.

Federal Regulations at 40 C.F.R. § 122.44.(d)(1)(vii)(B) state:

When developing water quality-based effluent limits under this paragraph *the permitting authority shall ensure that . . . Effluent limits* developed to protect a narrative water quality criterion, a numeric water quality criterion, or both, *are consistent with the assumptions and requirements of any available wasteload allocation* for the discharge prepared by the State and approved by EPA.

The MSAR TMDL sets numeric targets for Fecal Coliform and E. Coli bacteria in several of the tributaries to the Santa Ana River. The surface water closest to the City is Chino Creek Reach 2. The MSAR TMDL for Chino Creek Reach 2 is 180 Fecal Coliform organisms per 100 ml of water. Dry weather compliance must be achieved by 2015, and wet weather compliance must be achieved by 2025. In order to achieve these limitations within the allotted time, the

**BEST BEST & KRIEGER**  
ATTORNEYS AT LAW

Mr. Ivar Ridgeway  
July 23, 2012  
Page 3

MSAR TMDL has an implementation plan. The basic requirements of the implementation plan include the following:

- Develop and implement a Watershed-Wide Bacterial Indicator Water Quality Monitoring Program
- Develop and Implement Bacterial Indicator Urban Source Evaluation Plan (“USEP”).
- Develop a Comprehensive Bacteria Reduction Plan (“CBRP”) to address surface waters that exceed the applicable standard, and develop structural and non-structural BMPs to meet compliance by 2015 (for dry weather flows).
- Amend applicable MS4 permits and underlying documents to incorporate bacteria control mechanisms.
- Amend the Santa Ana Basin Plan to use E. Coli in place of Fecal Coliform as the compliance measure for the Rec-1 standard.

The public agencies subject to the MSAR TMDL formed a task force to implement the TMDL (the “TMDL Task Force”). Claremont has been a participating, funding member of the Task Force. The TMDL Task Force developed the USEP in 2007, and it was approved by the Santa Ana Regional Board in 2008. In June, 2011, the Riverside County and San Bernardino County members of the TMDL Task Force developed CBRPs for their respective jurisdictions. They were submitted to the Santa Ana Regional Board in June, 2011, and subsequently approved by the Santa Ana Regional Board.

The CBRPs require the dischargers to monitoring outfalls within their MS4 system, adopt ordinances to limit dry weather flows, and if necessary, construct structural BMPs to reduce bacteria discharges. The plans further state that compliance will be measured in the following ways:

- The water quality objectives are attained in the water bodies listed in the TMDL, and if not, the exceedances are not caused by controllable urban sources.
- Sampling Discharges from selected MS4 outfalls are compliant with dry weather waste load allocations and if not, the exceedances are not caused by controllable urban sources.

**BEST BEST & KRIEGER**  
ATTORNEYS AT LAW

Mr. Ivar Ridgeway  
July 23, 2012  
Page 4

- MS4 facilities are dry during dry weather or the discharger demonstrates that dry weather flows infiltrate before entering an impaired water body.

In approving the MSAR TMDL, the Santa Ana Regional Board expressly found that compliance with the BMP based implementation approach to be outlined in the CBRPs was an effective means of achieving the MSAR TMDL. This has been reiterated by the Santa Ana Regional Board with each subsequent MSAR TMDL related approval, including the approval of the CBRPs in February, 2012.

As noted, Claremont is an active member of the Task Force and has participated in the development of the CBRPs. Claremont intends to develop and implement a CBRP based on those already approved by the Santa Ana Regional Board as a means of achieving compliance with the MSAR TMDL. This is the approach outlined by the Santa Ana Regional Board in the Basin Plan Amendment adopting the MSAR TMDL, and it is the only approach that is *consistent with the assumptions and requirements* of the MSAR TMDL. Any other approach would conflict with the express terms of the TMDL and thereby violate Federal Regulations.

Attachment R of the Draft Permit must therefore be rewritten as follows:

- A. Middle Santa Ana River ("MSAR") Watershed Bacteria Indicator TMDL
  1. The final WQBELs for bacterial indicators under Dry Weather Conditions contained in this section shall be achieved no later than December 31, 2015. These final effluent limits shall be considered effective for enforcement purposes on January 1, 2016.
  2. The Final WQBELs for MSAR Bacterial Indicator TMDL under Dry Weather conditions shall be developed and implemented in the following manner:
    - a. The MSAR Permittees shall prepare for approval by the Santa Ana Regional Water Quality Control Board a Comprehensive Bacteria Reduction Plan (CBRP) describing, in detail, the specific actions that have been taken or will be taken to achieve compliance with the urban wasteload allocation under dry weather conditions (April 1st through October 31st) by December 31, 2015. The CBRP must include:

**BEST BEST & KRIEGER**  
ATTORNEYS AT LAW

Mr. Ivar Ridgeway  
July 23, 2012  
Page 5

- i. The specific ordinance(s) adopted to reduce the concentration of indicator bacteria in urban sources.
  - ii. The specific BMPs implemented to reduce the concentration of indicator bacteria from urban sources and the water quality improvements expected to result from these BMPs.
  - iii. The specific inspection criteria used to identify and manage the urban sources most likely causing exceedances of water quality objectives for indicator bacteria.
  - iv. The specific regional treatment facilities and the locations where such facilities will be built to reduce the concentration of indicator bacteria discharged from urban sources and the expected water quality improvements to result when the facilities are complete.
  - v. The scientific and technical documentation used to conclude that the CBRP, once fully implemented, is expected to achieve compliance with the urban wasteload allocation for indicator bacteria by December 31, 2015.
  - vi. A detailed schedule for implementing the CBRP. The schedule must identify discrete milestones to assess satisfactory progress toward meeting the urban wasteload allocations for dry weather by December 31, 2015. The schedule must also indicate which agency or agencies are responsible for meeting each milestone.
  - vii. The specific metric(s) that will be established to demonstrate the effectiveness of the CBRP and acceptable progress toward meeting the urban waste load allocations for indicator bacteria by December 31, 2015.
- b. The draft CBRP must be submitted to the Santa Ana Regional Water Quality Control Board no later than March 31, 2013. The Permittees may submit the plan individually, jointly or through a collaborative effort with other urban dischargers. The MSAR Permittees must submit the final version of the plan no

**BEST BEST & KRIEGER LLP**  
ATTORNEYS AT LAW

Mr. Ivar Ridgeway  
July 23, 2012  
Page 6

more than 90 days after receiving the comments from Santa Ana Regional Water Quality Control Board staff.

- c. Once approved by the Santa Ana Regional Water Quality Control Board, the CBRP shall be incorporated into this Order as the final WQBELs for indicator bacteria under Dry Weather Conditions. Based on BMP effectiveness analysis, the CBRP shall be updated, if necessary. The updated CBRP shall be implemented upon approval by the Regional Board.
3. In the event this Order is still in effect on December 31, 2025, and the Regional Board has not adopted alternative final water quality-based effluent limits for wet weather conditions by that date, then the urban wasteload allocations specified in the MSAR-TMDL for wet weather conditions (November 1st through March 31st) will automatically become the final numeric water quality-based effluent limits for the MSAR Permittees on January 1, 2026.

Thank you for your attention to this matter. If you have any questions or comments regarding the City's position on the MSAR TMDL and its incorporation into the Draft Permit, please do not hesitate to contact me.

Very truly yours,

Los Angeles Regional Water Quality Control Board  
320 West 4th Street, Suite 200  
Los Angeles, CA 90013

Re: City of Claremont's Written Comments on Working Proposal for the TMDL Provisions of the Los Angeles County MS4 Permit

Dear Ms. Purdy:

This letter is submitted on behalf of the City of Claremont ("City") in connection with the Los Angeles Regional Board's working proposal for the TMDL provisions of the Los Angeles County MS4 Permit. The focus of the City's written comments is on the manner in which the working proposal seeks to incorporate the Middle Santa Ana River Watershed Bacteria Indicator TMDL ("MSAR TMDL") as an enforceable requirement of the MS4 Permit. The City appreciates the opportunity to submit these written comments and looks forward to working with you to develop a mutually acceptable approach to the MSAR TMDL.

Before providing specific comments on the working proposal, it is important for the Regional Board to understand the City's position regarding the MSAR TMDL. As you know, the MSAR TMDL was adopted by the Santa Ana Regional Board in February of 2005. The City is not located within the jurisdiction of the Santa Ana Regional Board, and, therefore, the Basin Plan adopted by the Santa Ana Regional Board, including the MSAR TMDL, has no application to the City. (See Water Code § 13240 (providing that regional boards "shall formulate and adopt water quality control plans for all areas within the region.") (Emphasis added).)

Because the MSAR TMDL is not applicable to the City, significant legal concerns exist regarding the ability of the Los Angeles Regional Board to include the MSAR TMDL in the MS4 Permit without first going through the legally required Basin Plan amendment process to develop a bacteria TMDL that applies to the City. Since the Los Angeles Regional Board has not so amended its Basin Plan, the Board's legal authority to include the TMDL in the MS4 Permit is suspect. In making these comments, the City does not waive its legal objections to the application of the MSAR TMDL to it.

**BEST BEST & KRIEGER**  
ATTORNEYS AT LAW

Renee Purdy  
Section Chief of Regional Board  
May 14, 2012  
Page 2

Although the City preserves its legal options regarding the MSAR TMDL, the City recognizes that either the Los Angeles or Santa Ana Boards may have the authority, after following all legally required procedures, to extend the MSAR TMDL or similar requirements to the City in a legally enforceable way. For this reason, the City has been participating in the MSAR TMDL Task Force and might be willing to continue to participate in achieving the goals of the MSAR TMDL through the MS4 Permit under acceptable terms and conditions, as expressed in the comments below.

Subject to these caveats, the City has the following three comments on the TMDL provisions of the working proposal related to the MSAR TMDL:

1. The Regional Board should delete the final fecal coliform effluent limitations and receiving water limitations for both dry and wet weather. It is our understanding that the Los Angeles Regional Board's Basin Plan no longer uses fecal coliform as a fresh water Rec-1 objective. Therefore, the Board cannot include such an objective in the MS4 Permit. In addition, as noted in the working proposal, the Santa Ana Board is in the process of replacing the Rec-1 fecal coliform objective with an E. coli objective. Therefore, the final fecal coliform effluent limitations and receiving water limitations should be deleted.
2. The Regional Board should revise the provisions of Section G.1.d of the working proposal to allow the City to use the Comprehensive Bacteria Reduction Plans ("CBRPs") that have already been prepared for the MSAR TMDL and which have already been tentatively approved by staff at the Santa Ana Board. It makes little sense to require the City to "reinvent the wheel" on this issue. For this reason, the City recommends that Section G.1.d of the working proposal be revised to read as follows:

*Permittees may demonstrate compliance with the effluent limitations and receiving water limitations by complying with the Comprehensive Bacterial Reduction Plans prepared for the MSAR TMDL.*

3. The City would like the proposed Permit language to better reflect how the City's compliance will be measured. This is particularly important to the City because information prepared by the MSAR TMDL Task Force demonstrates that the City does not discharge stormwater or dry weather flows directly to the Chino Basin, including the San Antonio Channel. The City's contribution to flows occurs, if at all, only at the limited points where the City's MS4 connects with the City of Pomona's MS4. For this reason, the City would like to understand (and have the

**BEST BEST & KRIEGER**  
ATTORNEYS AT LAW

Renee Purdy  
Section Chief of Regional Board  
May 14, 2012  
Page 3

permit document) how the City's compliance will be measured. In the City's view, it would be in compliance with the effluent limitations if either (1) compliance existed at the outfall of any MS4 to which the City contributes; or (2) compliance existed at the point at which the City's MS4 connects to the City of Pomona's MS4. If either of these conditions existed, compliance would be obtained. Moreover, the City does not agree with the incorporation of the MSAR TMDL's Waste Load Allocation ("WLA") as a numeric effluent limitations. Particularly as applied to the City, the better approach would be to use a BMP-based approach to achieving compliance with the WLA.

The City appreciates the opportunity to submit these comments. We request the opportunity to discuss them with you and your team by phone or in person.

Very truly yours,

A handwritten signature in black ink, appearing to read 'SHAWN HAGERTY'.

[iridgeway@waterboards.ca.gov](mailto:iridgeway@waterboards.ca.gov)

Dear Mr. Ridgeway:

The City of Beverly Hills ("City") submits the following comments to the Los Angeles Regional Water Quality Control Board's ("Regional Board") Tentative Order No. R4-2012-xxx, NPDES Permit No. CAS004001 ("Permit"). The LA Permit Group has submitted comments regarding the Permit which the City joins and incorporates herein. The City reserves the right to make additional legal comments on the Permit prior to the close of the public hearing to adopt the Permit and at the public hearing itself.

On behalf of the City of Beverly Hills, we hereby submit the following initial comments on the Permit:

**1. The Time Provided to Review the Permit Is Insufficient and Denies Permittees Due Process of Law**

The period provided to review and comment on the Permit has been unreasonably short given the breadth of the Permit. Beginning on March 28, 2012, Regional Board staff issued a series of Staff Working Proposals pertaining to key sections of the Permit. Regional Board staff has used their Staff Working Proposal workshops as a justification for the hurried manner in which the Permit was developed. The same justification was used by the Executive Director in denying the LA Permit Group's request for a time extension.

This justification, however, fails for several reasons. First, Regional Board staff gave the permittees only a few weeks to comment on each of the Staff Working Proposals. Furthermore, the Regional Board staff did not respond to any comments, leaving permittees to guess at which requirements would be incorporated into the Permit. Seeing the Permit in its entirety and having the opportunity to understand how each of the sections and programs work together is imperative in order for permittees to fully understand the Permit provisions and to prepare comments.

Second, despite all the working proposals, workshops, and meetings, the permittees are left with a Permit that cannot be complied with from the first day the Permit goes into effect, due to the

Receiving Water Limitation (RWL) and the Waste Load Allocations (WLA) requirements that could subject the permittees to third party lawsuits.

We believe the Regional Board wants a review process that is open and transparent. Providing permittees only forty-five (45) days to comment makes this impossible. To develop and provide relevant and meaningful comments, each permittee must first:

- Read a 500 page Permit;
- Study the 500 page Permit to understand how the provisions work together;
- Compare it to the last Permit;
- Evaluate the resource needs to comply with the Permit;
- Determine the fiscal and organizational impacts on City services, which requires coordination with several City departments;
- Conduct technical and legal review of the Permit and prepare comments;
- Present information to and gather feedback from the City Council. Staff needs time to conduct a thorough review of the items listed above, prior to presenting them to the City Council; and
- Prepare written comments.

To ensure a proper review of the Permit, the City hereby requests an extension of 180 working days to include a Revised Tentative Permit to be released with a 45-day comment period. The intent of a Revised Tentative Permit is to ensure the permittees have the opportunity to review any changes made to the existing draft and provide comments prior to the Permit adoption hearing. Additionally, this extension request will resolve a conflict our city management and officials have with the current September 6-7, 2012 hearing date, which overlaps with the annual League of Cities conference in San Diego.

The extreme speed with which the Permit is being circulated and reviewed and proposed to be adopted amounts to a denial of the City's due process rights and is contrary to state and federal law. By denying the permittees a meaningful opportunity to review and comment on a Permit that so drastically affects the permittees' rights and finances, the Regional Board has denied the permittees due process rights under state and federal law. *See Spring Valley Water Works v. San Francisco*, 82 Cal. 286 (1890) (reasonable notice and opportunity to be heard are essential elements of "due process of law," whatever the nature of the power exercised.) Furthermore, under the Clean Water Act, a reasonable and meaningful opportunity for stakeholder participation is mandatory. *See, e.g., Arkansas Wildlife Fed'n v. ICI Ams.*, 29 F.3d 376, 381 (8th Cir. 1994) ("the overall regulatory scheme affords significant citizen participation, even if the state law does not contain precisely the same public notice and comment provisions as those found in the federal CWA.") For the reasons stated above, the Permit does not satisfy the Clean Water Act standard and violates the City's due process rights.

## **2. The Permit Should Be Revised to Provide that Implementation of BMPs is Sufficient to Constitute Compliance with the Permit**

Permittees should be able to achieve compliance with the Permit through a best management practice ("BMP") based iterative approach. Regional Board staff has previously indicated that it would not create a permit for which permittees would be out of compliance from the very first

day the Permit goes into effect. This necessarily means the Permit cannot require immediate strict compliance with water quality standards. Yet the Fact Sheet states that a party whose discharge “causes or contributes” to an exceedance of a water quality standard is in violation of the Permit, even if that party is implementing the iterative process in good faith. See Fact Sheet at pp. F-35-38. These positions are incompatible and effectively render the iterative approach meaningless.

As written, the Permit requires that all discharges to receiving waters must immediately meet water quality standards to avoid violating the Permit. This presents an impossible standard for permittees to meet, especially given the fact that thirty-three (33) TMDLs have been incorporated into the Permit. This means that numerous water bodies that currently do not meet water quality standards will be governed by the Permit and permittees will be subject to potential liability immediately. Even for TMDLs for which the Regional Board issues time scheduling orders, such orders will not protect a permittee from third-party lawsuits for measured exceedances, based on the Permit’s current language. Even if such lawsuits are unfounded, the legal costs to defend such suits are enormous. For this same reason, final wasteload allocations should not be incorporated into the Permit, especially where we are dealing with TMDLs that have been rushed through due to the *Browner* consent decree with the understanding that they would be refined over time with reopeners as new information becomes available.

A BMP-based approach should be utilized in the Permit, as outlined in EPA’s November 12, 2010 Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on those WLAs.” (“EPA Memorandum”). See also 40 C.F.R. § 122.44(k).

To accomplish this purpose, the City supports using the receiving water limitation language proposed by CASQA, which is similar to the language in the Draft Caltrans Permit. Otherwise, cities are potentially vulnerable to third party lawsuits such as those brought against the City of Stockton and the County of Los Angeles by third parties within the last five years.

Furthermore, the EPA Memorandum is clear that an increased reliance on numerics should be coupled with the “disaggregation” of different storm water sources within permits. See EPA Memorandum at pp. 3-4. The Permit currently aggregates multiple sources of storm water runoff while additionally imposing numeric standards. This will result in a system whereby the innocent will be punished alongside the guilty for numeric standard exceedances. The Regional Board should not allow this inequitable and legally unjustifiable result to occur.

Another reason for adopting a BMP-based approach is the fact that new and existing conditionally exempt non-stormwater discharges may also contribute to measured exceedances. This inequitable result means the exempt discharges may nonetheless contribute to permittee liability.

### **3. The Permit Improperly Intrudes Upon the City’s Land Use Authority in Violation of the Tenth Amendment of the U.S. Constitution**

To the extent that this Permit relies on federal authority under the Clean Water Act to impose land use regulations and dictate specific methods of compliance, it violates the Tenth

Amendment of the U.S. Constitution. Furthermore, to the extent the Permit requires a municipal permittee to modify its city ordinances in a specific manner, it also violates the Tenth Amendment. According to the Tenth Amendment:

“The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.”

Article XI, section 7 of the California Constitution California also guarantees municipalities the right to “make and enforce within [their] limits all local police, sanitary and other ordinances and regulations not in conflict with general laws.” *See also City of W. Hollywood v. Beverly Towers*, 52 Cal. 3d 1184, 1195 (1991). Furthermore, the United States Supreme Court has held that the ability to enact land use regulations is delegated to municipalities as part of their inherent police powers to protect the public health, safety, and welfare of its residents. *See Berman v. Parker*, 348 U.S. 26, 32-33 (1954). Because it is a constitutionally conferred power, land use powers cannot be overridden by State or federal statutes.

Even so, both the Clean Water Act and the Porter-Cologne Act provisions regarding NPDES permitting do not indicate that the Legislature intended to preempt local land use authority. *Sherwin Williams Co. v. City of Los Angeles*, 4 Cal. 4th 893 (1993); *California Rifle & Pistol Assn. v. City of West Hollywood*, 66 Cal. App. 4th 1302, 1309 (1998) (Preemption of police power does not exist unless “Legislature has **removed** the constitutional police power of the City to regulate” in the area); *see* Water Code §§ 13374 and 13377 and 33 U.S.C. § 1342 (b)(1)(B).

If the Permit is adopted, the City believes that this Permit could establish the Regional Board as a “super municipality” responsible for setting zoning policy and requirements throughout Los Angeles County. The prescriptive and one-size-fits-all nature of this policy will ensure that any resident or business challenging the conditions set forth in this Permit would not only sue the municipality charged with implementing these requirements, but would also have to sue the Regional Board itself to obtain the requested relief. The City does not believe this is the intent of the Regional Board. Rather than adopting programs that dictate the precise method of compliance, the Regional Board should collaborate with the City and other permittees to develop a range of model programs that each municipality could then modify and adopt according to its own individual circumstances.

#### **4. The Permit Constitutes an Unconstitutional Unfunded Mandate**

The Permit contains mandates imposed at the Regional Board’s discretion that are unfunded and go beyond the specific requirements of either the Clean Water Act or the EPA’s regulations implementing the Clean Water Act, and thus exceed the “Maximum Extent Practicable” (“MEP”) standard. Accordingly, these aspects of the Permit constitute non-federal state mandates. *See City of Sacramento v. State of California*, 50 Cal. 3d 51, 75-76 (1990). Indeed, the Court of Appeals has previously held that NPDES permit requirements imposed by the Regional Board under the Clean Water and Porter-Cologne Acts can constitute state mandates subject to claims for subvention. *County of Los Angeles v. Commission on State Mandates*, 150 Cal. App. 4th 898, 914-16 (2007).

The Permit goes beyond federal law, as the Permit is at least twice as long, and in some cases, three times as long as other MS4 permits developed by other Regional Boards in the State of

California, such as the Lahontan Regional Board and the Central Valley Regional Board, not to mention permits developed by EPA. This means that either some Regional Boards are failing to impose federally mandated requirements pursuant to the Clean Water Act, or the more likely explanation is that the Regional Board is imposing requirements that go beyond federal law.

#### **A. The Permit's Minimum Control Measure Program is an Unfunded State Mandate**

The Permit's Minimum Control Measure program ("MCM Program") qualifies as a new program or a program requiring a higher level of service for which state funds must be provided. The particular elements of the MCM Program that constitute unfunded mandates are:

- The requirements to control, inspect, and regulate non-municipal permittees and potential permittees (Permit at pp. 38-40);
- The public information and participation program (Permit at pp. 58-60);
- The industrial/commercial facilities program (Permit at p. 63);
- The public agency activities program (Permit at pp. 56-63); and
- The illicit connection and illicit discharge elimination program (Permit at pp. 106-109).

The MCM Program requirement that the permittees inspect and regulate other, non-municipal NPDES permittees is especially problematic and clearly constitutes an unfunded mandate. (*See, e.g.*, Permit at pp. 38-40.) These are unfunded requirements which entail significant costs for staffing, training, attorney fees, and other resources. Notably, the requirement to perform inspections of sites already subject to the General Construction Permit is clearly excessive. Permittees would be required to perform pre-construction inspections, monthly inspections during active construction, and post-construction inspections. The requirements of this Permit exceed past permits, meaning that the Regional Board is requiring a higher level of service than in prior permits.

Furthermore, there are no adequate alternative sources of funding for inspections. User fees will not fully fund the program required by the Permit. Cal. Gov't Code, § 17556(d). NPDES permittees already pay the Regional Water Quality Control Boards fees that cover such inspections in part. It is inequitable to both cities and individual permittees for the Regional Board to charge these fees and then require cities to conduct and pay for inspections without providing funding.

#### **B. The Receiving Water Body Requirements Render the Permit an Unfunded Mandate**

If strict compliance with state water quality standards in receiving water bodies is required—including state water quality standard-based wasteload allocations—in the MS4 itself or at outfall points and in receiving water bodies, the entire Permit will constitute an unfunded mandate because such a requirement clearly exceeds both the Federal standard and the requirements of prior permits, despite the fact no funding will be provided. *See Building Industry Assn. of San Diego County v. State Water Resources Control Bd.*, 124 Cal. App. 4th 866, 873, 884-85 (2004) (though the State and Regional Boards may require compliance with

California state water quality standards pursuant to the Clean Water Act and state law, these requirements exceed the Federal Maximum Extent Practicable standard.)

**C. The City Does Not Necessarily Have the Requisite Authority to Levy Fees to Pay for Compliance With the Order**

The ability to fund the Permit through bond measures or tax increases does not render the Permit's program ineligible for a subvention claim because such funding mechanisms are contingent upon voter approval, in some cases requiring supermajority votes. *Howard Jarvis Taxpayers Assoc. v. City of Salinas*, 98 Cal. App. 4th 1351 (2002). The money available from other sources is both too speculative and limited to cover all or even some of the costs imposed by the Permit. Such speculative funding sources cannot count as viable sources of funding so as to preclude a subvention claim. Cal. Gov't Code, § 17556(f). Furthermore, even if some portions of the Permit's programs can be covered by user fees, these fees will not come close to covering all such costs, meaning permittees' general funds will have to be utilized to cover substantial portions of these costs. Cal. Gov't Code, § 17556(d) (the ability to charge fees only defeats a subvention claim where the fees are sufficient to fully fund the program.)

**5. The Permit's Monitoring Program Exceeds the Requirements of Law**

The Permit's Receiving Water Monitoring Program is improper for going well beyond the scope of monitoring requirements authorized under Water Code Sections 13267 and 13383. The relevant portion of Water Code Section 13267 states:

“(b) (1) In conducting an investigation . . . the regional board may require that . . . any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports.”

The Regional Board's failure to conduct and communicate the requisite cost-benefit analysis pursuant to the monitoring requirements in the Permit constitutes an abuse of discretion. Water Code §§ 13267 and 13225(c).

The relevant portions of Water Code Section 13383 state:

“(a) The . . . regional board may establish monitoring, inspection, entry, reporting, and recordkeeping requirements . . . for any person who discharges, or proposes to discharge, to navigable waters. . . .

(b) The . . . or the regional boards may require any person subject to this section to establish and maintain monitoring equipment or methods, including, where appropriate, biological monitoring methods, sample effluent as prescribed, and provide other information as may be reasonably required.”

The Permit goes far beyond a requirement that a permittee “monitor” the effluent from its own storm drains. The Permit’s Receiving Water Monitoring Program seems to require a complete hydrogeologic model found in the receiving water body, which will in many cases be miles away from many of the individual permittees’ jurisdictions. To the extent the Permit requires individual permittees to compile information beyond their jurisdictional control, they are unauthorized. Although Water Code Section 13383(b) permits the Regional Board to request “other information”, such requests can only be “reasonably” imposed. Cal. Water Code § 13383(b). The information requested by the Regional Board is unreasonable. It is not just limited to each individual copermitttee’s discharge. Rather, the Permit requires copermitttees to analyze discharges and make assumptions regarding factors well beyond their individual boundaries. This is not reasonable, and is therefore not permitted under Water Code Sections 13225, 13267, and 13383. It is equally unreasonable to require the monitoring of authorized or unknown discharges. *See* Permit at p. 108.

**6. The Permit Exceeds the Regional Board’s Authority by Requiring the City to Enter into Contracts and Coordinate With Other Copermitttees**

The Regional Board cannot require the City to enter into agreements or coordinate with other copermitttees. The requirements that permittees engage in interagency agreements (Permit at p. 39) and coordinate with other copermitttees as part of their stormwater management program (Permit at p. 56-58) are unlawful and exceed the authority of the Regional Board. The Regional Board lacks the statutory authority to mandate the creation of interagency agreements and coordination between permittees in an NPDES Permit. *See* Water Code §§ 13374 and 13377. The Permit creates the potential for City liability in circumstances where the permittee cannot ensure compliance due to the actions of third party state and local government agencies over which the City has no control. Such requirements are not reasonable regulations, and thus violate state law. *Communities for a Better Environment v. State Water Resources Control Bd.*, 132 Cal. App. 4th 1313, 1330 (2005) (regulation pursuant to NPDES program must be reasonable.)

**7. The Permit Fails to Consider Economic Impacts As Required by Water Code Sections 13000 and 13241**

The Regional Board’s failure to adequately consider the economic impacts of the Permit, as required by Water Code Sections 13000 and 13241, render the Permit invalid. Water Code Section 13241 requires the Regional Board to include “[e]conomic considerations” with its consideration of the Permit. As demonstrated above, the Regional Board is incorrect in its assertion that consideration of economics is not required in this Permit. *See* Permit at pp. 24-25. Because, as demonstrated above, the Permit requires new and higher levels of service in numerous key regards, consideration of economic factors is necessary. *City of Burbank v. State Water Resources Control Bd.*, 35 Cal. 4th 613, 618, 627 (2005).

The alleged facts in the economic consideration section of the Fact Sheet misrepresent the permittees’ data and fail to consider the economic impact of new, costly aspects of the Permit. The Fact Sheet’s open skepticism of municipal financial reports is troubling, and indicates the Regional Board has not taken permittees’ actual expenses seriously.

It is also premature and improper to assume that permittees will obtain funding from proposed ballot measures and other sources of funding which have not even been approved, much less voted on by the public. See Fact Sheet at pp. F-142-43. If the Regional Board wants to rely on initiatives, such as the Los Angeles County Flood Control District's Water Quality Funding Initiative, as sources of funding to offset the costs of storm water management, it should delay its public hearing and approval of the Permit until after the voters have actually voted on such initiatives. Otherwise, if such initiatives fail to pass, the copermitees will be left to implement the Permit's requirements without the funds to do so. Even if the Water Quality Funding Initiative is approved by the voters, the funds generated by the Initiative would not even be available until 2014 – well after the deadline for a majority of the compliance deadlines set forth in the Permit. Moreover, the Water Quality Initiative will not cover all the costs imposed on all permittees by the Permit.

The Permit also fails to consider the significant additional costs that TMDLs will impose. The incorporation of TMDLs and the massive expansion of monitoring requirements in the Permit, which also trigger the need for additional inspectors, will inevitably cause the copermitees' costs to skyrocket. Furthermore, speculations about what people may be willing to pay for cleaner water and social benefits from clean water have no real effect on cities' bottom lines. Finally, the Permit fails to account fully for all the expenses that implementing minimum control measures will impose. For all these reasons, the consideration of economic impact is entirely lacking, which violates state law.

#### **8. The Permit's Imposition of Joint and Joint and Several Liability for Violations is Contrary to Law**

The Permit appears to improperly impose joint liability and joint and several liability for water quality based effluent limitations and receiving water exceedances. It is both unlawful and inequitable to make a permittee liable for the actions of other permittees over which it has no control. A party is responsible only for its own discharges or those over which it has control. *Jones v. E.R. Shell Contractor, Inc.*, 333 F. Supp. 2d 1344, 1348 (N.D. Ga. 2004). Because the City cannot prevent another permittee from failing to comply with the Permit, the Regional Board cannot, as a matter of law, hold the City jointly or jointly and severally liable with another permittee for violations of water quality standards in receiving water bodies or for TMDL violations. Under the Water Code, the Regional Board issues waste discharge requirements to "the person making or proposing the discharge." Cal. Water Code § 13263(f). Enforcement is directed towards "any person who violates any cease and desist order or cleanup and abatement order . . . or . . . waste discharge requirement." Cal. Water Code § 13350(a). In similar fashion, the Clean Water Act directs its prohibitions solely against the "person" who violates the requirements of the Act. 33 U.S.C. § 1319. Thus, there is no provision for joint liability under either the California Water Code or the Clean Water Act.

Furthermore, joint liability is proper only where joint tortfeasors act *in concert* to accomplish some common purpose or plan in committing the act causing the injury, which will generally never be the case regarding prohibited discharges. *Kesmodel v. Rand*, 119 Cal. App. 4th 1128, 1144 (2004); *Key v. Caldwell*, 39 Cal. App. 2d 698, 701 (1940). For any such discharge, it would be unlawful to impose joint liability and especially joint and several liability. The issue of

imposing liability for contributions to “commingled discharges” of certain constituents, such as bacteria, is especially problematic because there is no method of determining who has contributed what to an exceedance.

For receiving water body exceedances, the Permit should specify that the burden is on the Regional Board to show that any permittee’s discharge caused or contributed to that exceedance. Requiring permittees to prove they did not cause or contribute an exceedance is both inequitable and unlawful. Permittees should not be required to prove they did not do something when the Regional Board has failed to raise even a rebuttable presumption that the contamination results from a particular permittee’s actions. *See* Cal. Evid. Code § 500; *Sargent Fletcher, Inc. v. Able Corp.*, 110 Cal. App. 4th 1658, 1667-1668 (2003).

\*\*\*\*\*

The City is dedicated to the protection and enhancement of water quality. The City, however, has other functions that require funding as well. If this Permit is adopted as proposed, even in the best case scenario, spending cuts to other crucial services such as police, fire, and public works are certain. The permittees’ stagnant general fund revenues is increasingly challenged by escalating costs and service demand levels and cannot absorb the financial hit the Permit is poised to impose on them. The City believes a more measured approach is necessary, especially regarding how compliance in this Permit is achieved.

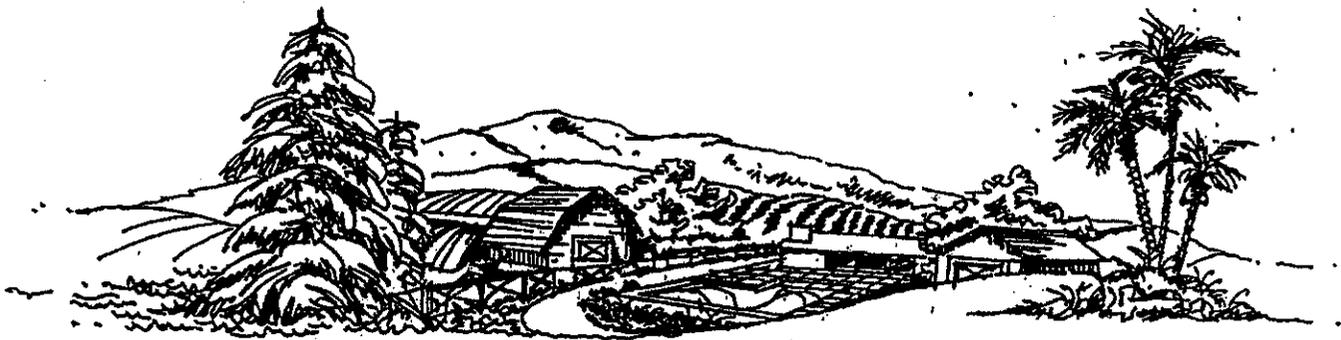

As public agencies, all parties involved in the NPDES permitting process have the obligation to carry out their duties in a responsible, realistic, and reasoned manner. Requirements that tether public agencies to impractical positions are counterproductive and violate our sacred charge as representatives of the people. The City is committed to working with the State and Regional Boards in order to achieve our mutual goals and looks forward to engaging in a constructive dialogue with Regional Board staff on these issues.

Sincerely,

Chris Theisen  
Assistant Director of Public Works & Transportation

**Subject: Comment letter – Draft NPDES Permit (Draft Order) for MS4 Dischargers within the Los Angeles County Flood Control District**

Dear Mr. Ridgeway and Ms. Purdy,

The City of Bradbury appreciates the opportunity to provide comments on the subject draft order for the Los Angeles region. Bradbury recognizes and appreciates the effort that the Regional Board staff has put into the development of the proposed Permit however, the City of Bradbury has serious concerns regarding the Draft Order as currently proposed.

Please note that the City also supports comments submitted to you by the Los Angeles Permit Group (LAPG). The City's comments are intended to be complimentary and more specific to the issues raised in the LAPG group letter.

**Comment Period for Draft NPDES Permit for MS4 Discharges and Timing of the Public Hearing**

As has been stated by others on multiple occasions, given just the sheer magnitude of the draft document, the City is requesting more time to review the more than 500 pages of permit. The comment deadline of July 23, 2012 is far too short to address all the potential issues, concerns and proper analysis of the impacts to the community of such important policy. This is the most significant program effecting water quality in the past 20 years and is vastly different from the previous permit; more time is needed to fully vet the implications this will have on small cities with limited staff and resources. Staff has an obligation and duty to adequately inform elected officials, legal counsel and city management regarding the fiscal and practical impacts of this draft order. The time to properly evaluate the permit, assess its financial, legal, and personnel impacts, and inform the City's elected officials cannot be accomplished in the 45 day review period. The City supports the request of the LAPG that the Regional Board provide another complete second draft and provide 180 days to review and comment.

Additionally, the scheduling conflict that exists with the Regional Board's Permit Adoption Hearing on the matter and the League of California Cities Conference on September 5-7, 2012, does not make this process open and transparent. City leaders have been scheduled to attend this Conference for more than half a year prior to the date announced on the hearing notice, and with such important issues at stake, it seems disingenuous to exclude them from the process. The City respectfully requests that the adoption hearing be rescheduled after September 5-7, 2012 to allow for elected officials of the permitted agencies to attend the hearing. Ensuring that city leaders and decision makers have the opportunity to attend and provide comments at the hearing is the right thing to do.

### **Receiving Water Limitations**

The Receiving Water Limitations language in the Draft Order creates an unwarranted liability to the cities that is unnecessary and counterproductive. The City feels that the Receiving Water Limitations is not necessary and does not support the improvement of water quality but increases the likelihood of small cities, such as Bradbury, having to waste limited resources to fight costly litigation instead of working on programs to improve water quality.

The City of Bradbury has significant concerns with the language included in the Draft Order:

1. Recent court decisions have created a new interpretation of the Receiving Water Limitations that creates a liability for the Permittees without a commensurate increase in protection of water quality.
2. The Receiving Water Limitations as written is not a federal requirement so it is not necessary to maintain the current language.
3. The Receiving Water Limitations as written is contradictory to the Watershed Management Program.
4. Alternative approaches are available to address the concerns and maintain the intent of the language in the approach and we request that RWQCB utilize this alternative language.

The City respectfully requests that the Receiving Water Limitation language be completely reconsidered in light of the numerous and varied issues that are outlined in the LASP comments. The City supports the recommendation to use the draft language that was developed by the California Association of Stormwater Quality (CASQA).

### **Cost/Economic Implications**

While Bradbury supports the overall efforts of water quality and environmental programs, the City has become increasingly concerned about the cost associated with the Mandates.

Contrary to the Draft Order, there are provisions that exceed federal requirements in several places, thereby creating potential unfunded State mandates. These include: (1) requiring wet and dry weather monitoring in the receiving water; (2) requiring numeric WQBELs; (3) requiring compliance with TMDL-related implementation plans, schedules, and monitoring; (4) requiring the non-stormwater discharge prohibition to include through and from the MS4; (5) revising the receiving water limitation language to include overbroad compliance requirements; (6) requiring groundwater recharge; and (7) monitoring for non-TMDL constituents at completed development project sites.

Further, the draft order (page 40) requires municipalities to exercise its authority to secure fiscal resources necessary to meet all of the requirements of the permit. Cities are limited greatly in their ability to raise funds for such expenditures. This provision may not be legal as it appears to violate the State Constitution, Article XVI, Section 18. Cities have a limited amount of funds and limited resources under local control. Any additional funds needed to raise money for stormwater programs would need to come from increased/new stormwater fees and grants. New fees for stormwater are regulated under the

State's Prop 218 regulations, and require a public vote; so, this is an item that is not under direct control of the local cities – but the voters of the State of California.

A budget survey was conducted by the Los Angeles River Watershed Management Committee in June of 2010 in order to determine the impacts of the proposed Bacteria TMDL; 21 watershed cities responded to the survey. Ninety percent (90%) of the cities have deficits in their General Fund budgets. Eighty-six percent (86%) of the cities have reduced city services, 50% have implemented hiring freezes, 25% have laid-off employees and this was all before the State took away cities Redevelopment Agencies. The State of California is in an economic crisis both in the private and public sectors and yet just this one TMDL (Bacteria) implementation costs for the City of Bradbury in excess of twice the City's limited General Fund Budget of \$810,000. The TMDL's estimated annual costs to Bradbury are \$1,456,000 for just the Bacteria TMDL in the LA River Watershed. Bradbury is also in the San Gabriel River Watershed.

Relying on the funding formula adopted by the cities to pay for the LA River Metals TMDL requirements, the City of Bradbury would need 180% of its current General Fund budget to pay for the TMDL's annual costs. That is impossible. Local resources are also directed to a number of health, safety and quality of life factors, such as Police and Fire. Thus, all these factors, health, safety, quality of life and clean water need to be developed in balance with each other.

While Bradbury may be the most dramatic case, the new costs will be difficult for any of these cities to absorb under the best of economic circumstances and is complicated by the current economic recession. The 2/3rds (Proposition 218) vote for storm water taxes is a difficult hurdle to overcome, so Bradbury would most likely be forced to cut existing services to afford the TMDL or consider even worse options. By this I mean the City would cease to exist - - placing a greater burden on the other cities and the County of Los Angeles.

While the City does not believe the Board's intent is to bankrupt cities, the simply fact of implementing many of these TMDL's without further consideration to their economic impact balanced with improved water quality, this is exactly what will happen around the San Gabriel Valley and throughout the State. We respectfully request the Board complete an economic analysis regarding the economic implications of the permit's implementation and work directly with the cities to find cost effective solutions to these issues affecting all of us.

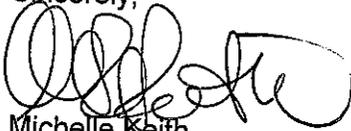

Further, as stated by the LAPG, the Fact Sheet contained in the Draft Order makes a unilateral statement that the Regional Board has determined that the permit requirements do not exceed Federal Requirements and therefore are not unfunded mandates. No back up information is provided to substantiate this claim. The City rejects the explanations contained within the Draft Order that pertain to economic implications, including the determination that this Draft Order does not qualify as an 'unfunded mandate' in the State of California. The City is in agreement with the numerous written and oral comments from many agencies that demonstrate that the Draft Order requirements are beyond the scope of Federal Regulations.

Our request is for the Regional Board to substantiate this statement for each section of the permit. The City would also like to refer that the court decisions on unfunded mandates claims are still on appeal and it is premature to conclude on the merits of the appeal.

The City of Bradbury strongly recommends that the State Board **not** adopt the Draft Order until a complete economic analysis has been done regarding the economic implications of the permit's implementation.

The City looks forward to working with the Regional Water Board and its staff on future revisions to the Draft Order. Please contact City Manager Michelle Keith at (626) 358-3218 if you have any questions regarding the information provided in this letter.

Sincerely,

Michelle Keith  
City Manager

LAMS42012@waterboards.ca.gov

Dear Mr. Ridgeway:

**COMMENTS ON THE DRAFT NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT FOR MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) DISCHARGES WITHIN THE LOS ANGELES COUNTY FLOOD CONTROL DISTRICT, INCLUDING UNINCORPORATED AREAS OF LOS ANGELES COUNTY, AND THE INCORPORATED CITIES THEREIN, EXCEPT THE CITY OF LONG BEACH (LOS ANGELES COUNTY MS4 PERMIT)**

**NPDES PERMIT NO. CAS004001**

Thank you for the opportunity to comment on the draft Los Angeles Basin National Pollutant Discharge Elimination System (NPDES) Permit for Municipal Separate Storm Sewer System (MS4) discharges. The City of Burbank (City) believes the following points are of relevance and should be taken into strong consideration when developing this permit:

- Municipalities have little or no control over the behavior of individuals who may intentionally or inadvertently contribute to storm water pollution through their actions e.g. littering, animal/pet droppings, illegal discharges and illicit connections to the storm drain system. While we believe permittees should institute non-structural and structural controls to prevent or control pollutants to the “maximum extent practicable”, permittees should not be responsible for the actions of which we have no control.

- At this time, there is no guarantee that the Los Angeles County Flood Control District's water quality funding initiative will be passed and approved by the property owners. Given this uncertainty and the current economic climate which has also affected the State Regional Water Quality Control Board programs and staffing, reasonable and achievable requirements are a must. The draft MS4 permit as currently written is not achievable and will subject permittees to violations, penalties, and fines. It should be noted that at this time, 3 cities in the State have filed for bankruptcy. This draft MS4 permit will lead to further filings. It should also be noted that the draft MS4 permit as currently written will not necessarily lead to improved water quality – for instance, meeting interim or final waste load allocations for a particular Total Maximum Daily Load (TMDL) at the outfall will not necessarily mean the receiving water's beneficial use criteria are being met – in other words, point sources<sup>1</sup> are not the only source of pollutants and yet this MS4 permit places a great burden on the permittees to meet stringent numeric standards without having first assessed the condition of the receiving water/watershed.
- The City believes that Provision V.A of the Draft MS4 Permit Tentative Order is contrary to the historical interpretation of established State Water Board policy and will create an inability for a regulated entity to comply. In wet weather, multiple constituents in storm water runoff from urban areas may exceed receiving water quality standards, thereby creating the potential for storm water discharges to cause or contribute to exceedances of standards in the receiving water itself. On July 13, 2011, the Ninth Circuit Court of Appeals in *NRDC vs. County of Los Angeles / Los Angeles County Flood Control District* found the defendants had caused or contributed to an exceedance of a water quality standard and therefore violated the Receiving Water Limitations, irrespective of the application of the iterative process. More recently, the City of Stockton was engaged in a good faith iterative process per the terms of its permit, but was nonetheless challenged by a third-party on the basis of the Receiving Water Limitations language. The City requests revision of Provision V.A to incorporate the California Stormwater Quality Association (CASQA) Receiving Water Limitations language (see Enclosure 1). We strongly support this language because it will enable regulated entities to focus and prioritize their resources on critical water quality issues and achieve environmental outcomes that are meaningful to the communities we serve. The City recognizes the need to continue to make significant progress toward attainment of water quality standards. However, we also believe that no regulatory benefit accrues from the Regional Board establishing permit provisions, such as Provision V.A, that result in the potential of immediate non-compliance for Permittees.

---

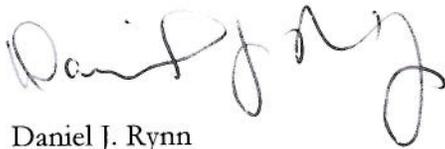

<sup>1</sup> Other sources include aerial deposition, legacy issues, bacteria regrowth within the waterbody, non-point source discharges, and natural sources.

- The Los Angeles Regional Water Quality Control Board (Regional Board) has held several workshops to present the various programs proposed in the draft MS4 permit. Most of these workshops have had the Regional Board staff present the main topics/programs to the Regional Board members, and have then opened up the floor for public comments for three minutes each. In short, the Regional Board members have asked questions of their staff and responses were given without much, if any consideration of the public's concerns. The process is frustrating for permittees in that our issues and concerns are not being adequately heard or addressed. The permittees represent their constituents when appearing before the Board, and we are concerned that various pressing concerns with this permit have yet to be heard. Requests have also been made to extend the comment period and postpone the Board hearing to allow more time for effective dialog between permittees and staff. Unfortunately these requests have been denied stating that a number of opportunities for engagement and comment have been provided and that the Board has directed staff to adhere to schedule to meet the September Board meeting. It should also be noted that the Ventura County MS4 permit was adopted by the Regional Board on May 7, 2009. The Ventura County MS4 permit was a cooperative effort involving co-permittee public entities, some environmental groups and Regional Board staff over a period greater than two years, with drafts of the permit made first available in December 2006.
- Provision II.F of the Draft MS4 Permit Tentative Order states "Pursuant to 40 CFR sections 122.26(d)(1)(ii) and 122.26(d)(2)(iv), each Permittee shall maintain the necessary legal authority to control the contribution of pollutants to its MS4 and shall include in its storm water management program a comprehensive planning process that includes intergovernmental coordination, where necessary." It should also be noted that Footnote 22 on page 37 of the Tentative Order states "Pursuant to 40 CFR § 122.26(a)(3)(vi), a Permittee is only responsible for discharges of storm water and non-storm water from the MS4 for which it is an owner or operator." However, Provision VI.E.5.b.i.(1)(c)(i) of the Tentative Order states "A Permittee shall be deemed in compliance with its final effluent limitation if it demonstrates that all drainage areas under its jurisdiction and/or authority are serviced by appropriate certified full capture systems as described in paragraph (1)(c)." In the 1937 Los Angeles County Flood Control Act, Item 11 of Section 28-2 states "*To remove, carry away and dispose of any rubbish, trash, debris or other inconvenient matter that may be dislodged, transported, conveyed or carried by means of, through, in, or along the works and structures operated and maintained hereunder and deposited upon the property of said district or elsewhere.*" The LA County Flood Control District lost its appeal recently in the lawsuit regarding exceedances at the Wardlow Mass Emission Monitoring Station. In the Decision, the Court explicitly stated that the Federal Clean Water Act does not address the source of pollutants, but rather that the owner of a point source discharge is legally responsible for the quality of the water leaving its outfall. Clearly, the District is legally responsible for any trash that enters its catch basins and the draft MS4 Permit Tentative Order must also make this distinction clear.

It is our hope that our comments help you improve and revise the MS4 permit from its current draft. We understand the great challenge the Regional Board has with meeting the requirements of the Clean Water Act. However, permittees are now challenged to provide traditional services to their residents and property owners, with permittees needing to carefully weigh the costs of regulatory change against the accrual of potential benefits associated with this region's MS4 permit.

Finally, the City has been participating in the LA Permit Group meetings and efforts, and is in strong support of the comments the LA Permit group has developed for this draft MS4 Permit.

Sincerely,

A handwritten signature in black ink, appearing to read "Daniel J. Rynn". The signature is fluid and cursive, with a large loop at the end.

Daniel J. Rynn

Assistant Public Works Director

Enclosure 1 – CASQA Model Receiving Water Limitations Language

# **ENCLOSURE 1**

## California Stormwater Quality Association®

*Dedicated to the Advancement of Stormwater Quality Management, Science and Regulation*

---

February 21, 2012

Mr. Charles Hoppin, Chair  
State Water Resources Control Board  
P.O. Box 100  
Sacramento, CA 95812-0100

**Subject: Receiving Water Limitation Provision to Stormwater NPDES Permits**

Dear Mr. Hoppin:

As a follow up to our December 16, 2011 letter to you and a subsequent January 25, 2012 conference call with Vice-Chair Ms. Spivy-Weber and Chief Deputy Director Jonathan Bishop, the California Stormwater Quality Association (CASQA) has developed draft language for the receiving water limitation provision found in stormwater municipal NPDES permits issued in California. This provision, poses significant challenges to our members given the recent 9th Circuit Court of Appeals decision that calls into question the relevance of the iterative process as the basis for addressing the water quality issues presented by wet weather urban runoff. As we have expressed to you and other Board Members on various occasions, CASQA believes that the existing receiving water limitations provisions found in most municipal permits needs to be modified to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but also allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. To that end, we have drafted the attached language in an effort to capture that intent. We ask that the Board give careful consideration to this language, and adopt it as 'model' language for use statewide.

Thank you for your consideration and we look forward to working with you and your staff on this important matter.

Yours Truly,

Richard Boon, Chair  
California Stormwater Quality Association

cc: Frances Spivy-Weber, Vice-Chair – State Water Board  
Tam Doduc, Board Member – State Water Board  
Tom Howard, Executive Director – State Water Board  
Jonathan Bishop, Chief Deputy Director – State Water Board  
Alexis Strauss, Director – Water Division, EPA Region IX

## CASQA Proposal for Receiving Water Limitation Provision

### D. RECEIVING WATER LIMITATIONS

1. Except as provided in Parts D.3, D.4, and D.5 below, discharges from the MS4 for which a Permittee is responsible shall not cause or contribute to an exceedance of any applicable water quality standard.
2. Except as provided in Parts D.3, D.4 and D.5, discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible, shall not cause a condition of nuisance.
3. In instances where discharges from the MS4 for which the permittee is responsible (1) causes or contributes to an exceedance of any applicable water quality standard or causes a condition of nuisance in the receiving water; (2) the receiving water is not subject to an approved TMDL that is in effect for the constituent(s) involved; and (3) the constituent(s) associated with the discharge is otherwise not specifically addressed by a provision of this Order, the Permittee shall comply with the following iterative procedure:
  - a. Submit a report to the State or Regional Water Board (as applicable) that:
    - i. Summarizes and evaluates water quality data associated with the pollutant of concern in the context of applicable water quality objectives including the magnitude and frequency of the exceedances.
    - ii. Includes a work plan to identify the sources of the constituents of concern (including those not associated with the MS4 to help inform Regional or State Water Board efforts to address such sources).
    - iii. Describes the strategy and schedule for implementing best management practices (BMPs) and other controls (including those that are currently being implemented) that will address the Permittee's sources of constituents that are causing or contributing to the exceedances of an applicable water quality standard or causing a condition of nuisance, and are reflective of the severity of the exceedances. The strategy shall demonstrate that the selection of BMPs will address the Permittee's sources of constituents and include a mechanism for tracking BMP implementation. The strategy shall provide for future refinement pending the results of the source identification work plan noted in D.3. ii above.
    - iv. Outlines, if necessary, additional monitoring to evaluate improvement in water quality and, if appropriate, special studies that will be undertaken to support future management decisions.
    - v. Includes a methodology (ies) that will assess the effectiveness of the BMPs to address the exceedances.
    - vi. This report may be submitted in conjunction with the Annual Report unless the State or Regional Water Board directs an earlier submittal.

- b. Submit any modifications to the report required by the State or Regional Water Board within 60 days of notification. The report is deemed approved within 60 days of its submission if no response is received from the State or Regional Water Board.
  - c. Implement the actions specified in the report in accordance with the acceptance or approval, including the implementation schedule and any modifications to this Order.
  - d. As long as the Permittee has complied with the procedure set forth above and is implementing the actions, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the State Water Board or the Regional Water Board to develop additional BMPs.
4. For Receiving Water Limitations associated with waterbody-pollutant combinations addressed in an adopted TMDL that is in effect and that has been incorporated in this Order, the Permittees shall achieve compliance as outlined in Part XX (Total Maximum Daily Load Provisions) of this Order. For Receiving Water Limitations associated with waterbody-pollutant combinations on the CWA 303(d) list, which are not otherwise addressed by Part XX or other applicable pollutant-specific provision of this Order, the Permittees shall achieve compliance as outlined in Part D.3 of this Order.
5. If a Permittee is found to have discharges from its MS4 causing or contributing to an exceedance of an applicable water quality standard or causing a condition of nuisance in the receiving water, the Permittee shall be deemed in compliance with Parts D.1 and D.2 above, unless it fails to implement the requirements provided in Parts D.3 and D.4 or as otherwise covered by a provision of this order specifically addressing the constituent in question, as applicable.

Subject: Comments on Los Angeles Municipal Separate Storm Sewer Tentative Order No. R4-2012-XXXX NPDES Permit No. CAS004001

---

Dear Mr. Ridgeway:

The City of Carson is pleased to submit the attached comments for your consideration in regard to Tentative Order No. R4-2012-XXXX NPDES Permit No. CAS004001.

Please note that the City also supports the comments submitted to you from the Los Angeles (LA) Permit Group. Many of our attached comments discuss additional issues not addressed in the LA Permit Group's letter; the remaining comments are complimentary and provide specificity to those issues raised in their letter.

Thank you for the opportunity to submit comments on this very important matter. Should you have any questions, please feel free to contact the City's Storm Water Quality Programs Manager, Patricia Elkins, at (310) 847-3529.

Sincerely,

A handwritten signature in black ink that reads "David C. Biggs".

**Comments from the City of Carson  
Regarding Los Angeles MS4 Tentative Order No. R4-2012-XXXX  
NPDES PERMIT NO. CAS004001 (issue date unspecified)  
Attachment E: Monitoring and Reporting Plan**

---

**1. Receiving Water Monitoring**

The purpose of receiving water monitoring is to:

- a. *Determine whether the receiving water limitations are being achieved,*
- b. *Assess trends in pollutant concentrations over time, or during specified conditions,*
- c. *Determine whether the designated beneficial uses are fully supported as determined by water chemistry, as well as aquatic toxicity and bioassessment monitoring.*

Receiving water monitoring is to be performed at various in-stream stations.

At issue is “a” because it serves to determine compliance with receiving water limitations. The Regional Board has no legal authority to compel compliance with receiving water limitations through in-stream monitoring. Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) clearly indicates:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

According to Clean Water Act §502, effluent monitoring is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2 defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

In short, effluent monitoring in a receiving water because cannot be required because it lies outside the bounds of the outfall.

Regarding monitoring purposes “b” and “c” no argument is raised here provided that it is understood that assessing trends in pollution concentrations would be: (1) limited to ambient water quality monitoring; and (2) permittees shall be not responsible for funding such monitoring. With respect to the latter, the Regional Board’s surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.

*Recommended Corrective Action:* Delete 1(a) and make it clear that 1(b) and (c) relate to ambient monitoring that is not the responsibility of MS4 permittees.

## **2. Stormwater Outfall Based Monitoring**

The purpose of stormwater outfall based monitoring – including TMDL monitoring -- is to:

- a. *Determine the quality of a Permittee’s discharge relative to municipal action levels, as described in Attachment G of this Order,*
- b. *Determine whether a Permittee’s discharge is in compliance with applicable wet weather WQBELs derived from TMDL WLAs,*
- c. *Determine whether a Permittee’s discharge causes or contributes to an exceedance of receiving water limitations.*

Insofar as “a” is concerned, outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to replace TMDL WLAs as alternatives to addressing receiving water quality. As noted in the National Research Council Report to USEPA:

*The NSQD (Pitt et al., 2004) allows users to statistically establish action levels based on regional or national event mean concentrations developed for pollutants of concern. The action level would be set to define unacceptable levels of stormwater quality (e.g., two standard deviations from the median statistic, for simplicity). Municipalities would then routinely monitor runoff quality from major outfalls. **Where an MS4 outfall to surface waters consistently exceeds the action level, municipalities would need to demonstrate that they have been implementing the stormwater program measures to reduce the discharge of pollutants to the maximum extent practicable.** The MS4 permittees can demonstrate the rigor of their efforts by documenting the level of implementation through*

*measures of program effectiveness, failure of which will lead to an inference of noncompliance and potential enforcement by the permitting authority*

Instead of following the above, Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs if necessary.

Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.

*Recommended Correction:* Either require substitution of TMDLs with MALs or eliminate MALs entirely.

As for stormwater outfall monitoring purpose “b”, such monitoring cannot be used to determine compliance with **wet weather WQBELs based on TMDL WLAs** for the following reasons:

1. The wet-weather WQBEL is based on a TMDL WLA in the receiving water that is non-ambient. As mentioned, federal regulations only require ambient monitoring in the receiving water, which by definition can never be deemed the same as wet weather monitoring. They are mutually exclusive. Regional Board staff has also incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a “numeric effluent limitation.” Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board’s clear opposition to numeric effluent limitations.

In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

2. The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Regarding purpose "b" it should also be noted that the Regional Board's setting of WQBELs to translate the TMDL WLA in the receiving water to the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.*"

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit's fact sheet. According to USEPA's NPDES Permit Writers' Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>1</sup>*

---

<sup>1</sup>United States Environmental Protection Agency, NPDES Permit Writers' Manual, September, 2010, page 6-30.

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis.

Complicating the performance of a reasonable potential analysis is the absence of (1) outfall monitoring data; and (2) ambient water quality standards. Though federal regulations require monitoring at the outfall, the Regional Board has not required it up until now. Even if outfall monitoring data were available to determine whether pollutants concentrations in the discharge exceeded the water quality standard is not possible. This is because, as mentioned earlier, TMDL WLAs are not expressed as ambient standards. A TMDL is an enhanced water quality standard. As noted in the National Research Council's *Assessing the TMDL Approach to Water Quality Management*, a report commissioned by the United States Congress in 2001:

*... EPA is obligated to implement the Total Maximum Daily Load (TMDL) program, the objective of which is attainment of ambient water quality standards through the control of both point and nonpoint sources of pollution.*

*Recommended Correction:* Eliminate this requirement.

Regarding purpose "c", the determinant for a water quality standard exceedance is in the discharge from the outfall – not in the receiving water. The use of numeric WQBELs -- though incorrectly defined and established in this instance -- represents the compliance standard in discharges from the outfall. Adding a second compliance determinant in the receiving water is unnecessary and is not authorized under federal stormwater regulations because the receiving water lies outside the scope of the MS4.

*Recommended Corrective Action:* Eliminate this requirement.

### **3. Non-storm water outfall based monitoring**

The purposes of this type of monitoring are as follows:

- a. *Determine whether a Permittee's discharge is in compliance with applicable dry weather WQBELs derived from TMDL WLAs.*
- b. *Determine whether a Permittee's discharge exceeds non-storm water action levels, as described in Attachment G of this Order,*
- c. *Determine whether a Permittee's discharge contributes to or causes an exceedance of receiving water limitations,*
- d. *Assist a Permittee in identifying illicit discharges as described in Part VI.D.9 of this Order.*

Regarding “a,” This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.

*Recommended Correction:* Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the ICDDE program.

Withy regard to “b”, see previous responses regarding MALs and the limitation of non-stormwater discharge prohibit to the MS4.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.

Regarding “c”, as mentioned, non-stormwater discharges cannot by applied to receiving water limitations because of they are only prohibited to the MS4, not from or through it.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.

Regarding “d”, this requirement is reasonable and in keeping with federal regulations with the exception that the identification of illicit discharges must adhere to the field screening requirements in CFR 40 §122.26. No non-stormwater discharge monitoring shall occur unless flow is first discovered at the outfall. This would trigger the implementation of additional requirements that the tentative order does not include.

#### **4. New Development/Re-development effectiveness monitoring**

The purpose of this requirement is a dubious and is not authorized under federal stormwater regulations as it relates to monitoring. To begin with, requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4’s pollution contribution relative to exceeding ambient water quality standards. Without the determination of statistically significant exceedances of water quality standards, detected at the outfall, the imposition of runoff infiltration requirements is arbitrary. Further, there is nothing in federal stormwater regulations that require monitoring on private or

public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.

Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines “effectiveness” -- effective relative to what standard? It is also not clear how such monitoring is to be performed.

*Recommended Correction:* Delete this requirement.

The MRP of the tentative order proposes regional studies “*to further characterize the impact of the MS4 discharges on the beneficial uses of the receiving waters. Regional studies shall include the Southern California Stormwater Monitoring Coalition (SMC) Regional Watershed Monitoring Program (bio-assessment), sediment monitoring for Pyrethroid pesticides, and special studies as specified in approved TMDLs (see Section XIX TMDL Reporting, below).*”

Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board’s SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County’s mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.

END COMMENTS

---

**Comments from the City of Carson  
Regarding Los Angeles MS4 Tentative Order No. R4-2012-XXXX  
NPDES PERMIT NO. CAS004001 (issue date unspecified)**

---

1. **Numeric Water Quality Based Effluent Limitations (WQBELs) applied to dry and wet weather Total Maximum Daily Load (TMDLs) waste load allocations (WLAs) and to stormwater and non-stormwater municipal action levels (MALs) are not authorized under federal stormwater regulations and are not in keeping with State Water Resources Control Board (State Board) water quality orders (WQOs).**

The tentative order specifies that: *Each Permittee shall comply with applicable WQBELs as set forth in Part VI.E of this Order, pursuant to applicable compliance schedules.* The tentative order specifies two categories of WQBELs, one for USEPA adopted TMDLs and one for Regional Board/State adopted TMDLs. Regarding USEPA adopted TMDLs, it appears that BMP-WQBELs may be used to meet TMDL WLAs in the receiving water. For Regional Board/State-adopted TMDLs, the tentative order specifies a different compliance method: meeting a “numeric” WQBEL which is derived directly from the TMDL waste load allocation. For example, the wet weather numeric WQBEL for dissolved copper for the Los Angeles River is 17 ug/l.

- a. Issue: *Regional Board staff is premature in requiring any kind of WQBEL because no exceedance of any TMDL WLA at the outfall has occurred.* This is because outfall monitoring is not a requirement of the current MS4 permit or previous MS4 permits.

The Regional Board’s setting of WQBELs – any WQBEL -- to translate the TMDL WLA for compliance at the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.”*

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit’s fact sheet. According to USEPA’s NPDES Permit Writers’ Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how*

*that information, or any applicable TMDL, was used to derive WQBELs and explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.*<sup>1</sup>

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis -- a consequence of the fact that no outfall monitoring has been required of the Regional Board either in the current or previous MS4 permits for Los Angeles County. Outfall monitoring is a mandatory requirement under federal regulations at CFR 40 §122.22, §122.2 and §122.26. CFR 40 §122.22(C)(3) requires effluent and ambient monitoring:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

“Effluent monitoring,” according to Clean Water Act §502, is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2, defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

Conclusion: Because Regional Board staff has not required outfall monitoring, it could have not have detected an excursion above a water quality standard (includes TMDL WLAs). Therefore, it could not have conducted a reasonable potential analysis and, as further consequence, cannot require compliance with a WQBEL (numeric or BMP-based) or with any TMDL or MAL until those burdens have been met.

---

<sup>1</sup>United States Environmental Protection Agency, *NPDES Permit Writers' Manual*, September, 2010, page 6-30.

Recommended Correction: Eliminate all reference to comply with WQBELs until outfall monitoring and a reasonable potential analysis have been performed.

- b. Issue: Even if Regional Board staff conducted outfall monitoring and detected an excursion above a TMDL WLA and performed the requisite reasonable potential analysis, it cannot require a numeric WQBEL strictly derived from the TMDL WLA.

USEPA's 2010 guidance memorandum mentions that numeric WQBELs are permissible only if feasible.<sup>2</sup> This conclusion was reinforced by a memorandum from Mr. Kevin Weiss, Water Permits Division, USEPA (Washington D.C.). He explains:

*Some stakeholders are concerned that the 2010 memorandum can be read as advising NPDES permit authorities to impose end-of-pipe limitations on each individual outfall in a municipal separate storm sewer system. In general, EPA does not anticipate that end-of-pipe effluent limitations on each municipal separate storm sewer system outfall will be used frequently. Rather, the memorandum expressly describes "numeric" limitations in broad terms, including "numeric parameters acting as surrogates for pollutants such as stormwater flow volume or percentage or amount of impervious cover." In the context of the 2010 memorandum, the term "numeric effluent limitation" should be viewed as a significantly broader term than just end-of-pipe limitations, and could include limitations expressed as pollutant reduction levels for parameters that are applied system-wide rather than to individual discharge locations, expressed as requirements to meet performance standards for surrogate parameters or for specific pollutant parameters, or could be expressed as in-stream targets for specific pollutant parameters. Under this approach, NPDES authorities have significant flexibility to establish numeric effluent limitations in stormwater permits.*<sup>3</sup>

Reading the 2010 USEPA memorandum, together with Mr. Weiss's memorandum, creates the inescapable conclusion that (1) numeric WQBELs are permissible if "feasible" and (2) numeric WQBELs cannot be construed to only mean strict effluent limitations at the end-of-pipe (outfall) but more realistically must include surrogate parameters and other variants as well. Regional Board staff failed to examine alternative numeric WQBELs, along with BMP WQBELs, as a consequence of not conducting the appropriate analysis.

In any case, the feasibility of numeric WQBELs, whether strictly derived from TMDL WLAs or of the surrogate parameter type, the State Water Resources Control Board has determined that numeric effluent

---

<sup>2</sup>Memorandum from James A. Hanlon, Director, Office of Waste Management, Revisions to the November 22, 2002 Memorandum *Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, November 12, 2010, page

<sup>3</sup>Memorandum from Kevin Weiss, Water Permits Division, USEPA (Washington D.C.), March 17, 2011.

limitations are not feasible. In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

The State Board’s decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Conclusion: The Regional Board does not have the legal authority to require numeric WQBELs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

- c. Issue: There cannot be a WQBEL to attain a dry weather TMDL WLA nor a WQBEL that addresses a non-stormwater municipal action level (MAL).

The foundation for this argument lies in the federal limitation of non-stormwater discharges to the MS4 – not from or through it as the tentative order concludes. Federal stormwater regulations only prohibit discharges to the MS4 and limits outfall monitoring to stormwater discharges. This is explained in greater detail under 4. *Non-stormwater Discharge Prohibitions.*

Conclusion: Regional Board does not have the legal authority to compel compliance with dry weather WQBELs or non-stormwater MALs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

2. **The tentative order has altered Receiving Water Limitation (RWL) language causing it to be overbroad and inconsistent with RWL in the current MS4 permit, the Ventura MS4 permit, State Board WQO 99-05, the draft Caltrans MS4 permit, and RWL language recommended by CASQA.**

- a. Issue: The proposed RWL language changes the “exceedance” determinant from water quality standards and objectives to receiving water limitations, thereby increasing the stringency of the requirement. The tentative order RWL version reads: *Discharges from the MS4 that cause or contribute to the violation of **receiving water limitations** are prohibited.*

Compare this with what is in the current MS4 permits for Los Angeles and Ventura Counties:

*Discharges from the MS4 that cause or contribute to a violation of **water quality standards** are prohibited.*

Whereas standard RWL language limits water quality standards to what is in the basin plan, and includes water quality objectives (relates to waters of the State), the tentative order uses revised language that replaces water quality standards with the following receiving water limitation criteria:

*Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38.*

It is unclear why Regional Board staff has removed water quality standards, which is a USEPA and State Board requirement, and replaced them with the more global receiving water limitation language that include additional compliance criteria (e.g., “or federal regulations including but not limited to 40 CFR § 131.38”). Other “federal regulations” could include CERCLA (Comprehensive Environmental Remediation and Compensation Liability Act).

Enlarging the scope of the RWL from water quality standards to a universe of other regulatory requirements exceeds RWL limitation language established in State Board WQO 99-05, a precedential decision. The order bases compliance on discharge prohibitions and receiving water limitations on the *timely implementation of control measures and other action in the discharges in accordance with the SWMP (stormwater*

*management plan) and other requirements of the permit's limitations.* It goes on to say that if exceedances of water quality standards or water quality objectives, collectively referred to as water quality standards continues, the SWMP shall undergo an iterative process to address the exceedances. It should be noted that this language was mandated by USEPA.

It should be noted that the draft Caltrans MS4 permit is scheduled for adoption in September, as well as CASQA, proposes RWL language that is in keeping with WQO 99-05.

Conclusion: Regional Board does not have the legal authority to re-define RWL language to the extent it is proposing.

Recommended Correction: Replace RWL contained in the tentative order with the CASQA model or with language contained in the draft Caltrans MS4 permit.

- b. Issue: By eliminating water quality standards, the tentative order has created a separate compliance standard for TMDLs and for non-TMDLs. Standard RWL language in other MS4 permits designates the SWMP<sup>4</sup> as the exclusive determinant for achieving water quality standards in the receiving water. Since TMDLs are enhanced water quality standards, the SWMP (or in this case the SQMP) should enable compliance with TMDLs. Instead, the tentative order specifies compliance through implementation plans – including plans that were discussed in several State/Regional Board adopted TMDLs (e.g., the Los Angeles River Metals TMDL). The absence of water quality standards also creates a separate compliance standard for non-TMDLs. According to Regional Board staff, minimum control measures (MCMs) which make up the SQMP, are intended to meet non-TMDLs pollutants. Unclear is what defines non-TMDL pollutant. If there are no water quality standards referenced in the RWL then what are the non-TMDL pollutants that the MCMs are supported to address?

There is no authority under federal stormwater regulations to comply with any criterion other than water quality standards. The RWL language called-out in WQO 99-05, which was in response to a USEPA directive, makes it clear that water quality standards represent the only compliance criteria, not an expanded definition of receiving water limitations that exclude such criteria.

MS4 permits throughout the State include TMDL WLAs. None of them, however, has created a compliance mechanism that excludes water

---

<sup>4</sup>USEPA and federal stormwater regulations use stormwater management program whereas the Los Angeles County MS4 permit uses stormwater quality management plan (SQMP). In effect they are the same. They consist of 6 core programs that must be implemented through MS4 permit.

quality standards as a means of attaining them. Further, the State Board has, through the draft Caltrans MS4 permit and the draft Phase II MS4 permit, articulated its policy on compliance with water quality standards: they are to be met through the implementation of stormwater management programs. Equally noteworthy is that State Board has not created a dual standard for dealing with TMDLs and non-TMDLs. This is an obvious consequence of its adherence to WQO 99-05.

With regard to implementation plans contained in TMDLs, the Regional Board has no legal authority to include them into the MS4 permit. This issue discussed in greater detail later in these comments.

Conclusion: The tentative order must be revised to restore water quality standards in RWL language and, by extension, enable compliance with TMDLs and other water quality standards through the SQMP/MCMs.

Recommended Correction: Revise the tentative order to eliminate any reference to complying with anything else except water quality standards through the SQMP; and, therewith, eliminate any reference to complying with implementation plans contained in State/Regional Board TMDLs.

**3. The tentative order does not include the iterative process, a mechanism that is integral to RWL language which serves to achieve compliance with water quality standards.**

- a. Issue: The absence of the iterative process disables a safeguard to protect permittees against unjustifiably strict compliance with water quality standards – or in this case the expanded definition of receiving water limitations -- that is a requisite feature in all MS4 permits issued in California. The tentative order circumvents the iterative process by creating an alternative referred to as the adaptive/management process which is only available to those permittees that opt for a watershed management program.

Despite the fact RWL language in MS4 permits since the 90's have provided a description of an iterative process (the BMP adjustment mechanism), the term "iterative process" has only recently been specifically mentioned in them. The absence of this term resulted in the 9<sup>th</sup> Circuit Court Appeal's conclusion in *NRDC v. Los Angeles County Flood Control District* that there is no "textual support" in the current MS4 permit for the existence of an iterative process. This resulted in the court's conclusion that the LACFCD had exceeded water quality standards in the hardened portions of the Los Angeles and San Gabriel Rivers. More recent MS4 permit's issued in the State contain clear references to the iterative process.

Notwithstanding the absence of water quality standards in the tentative order, the iterative process must be included as required by Water Quality Orders 2001-15 and 2009-0008, wherein the State Board made it clear that: we will generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.

Moreover, both the draft Caltrans MS4 permit and the draft Phase II MS4 permit contain references to the iterative process. The draft Caltrans MS4 permit refers to the iterative process in two places: finding 20, Receiving Water Limitations and in the Monitoring Results Report. Finding 20 states:

*The effect of the Department’s storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs).<sup>5</sup>*

Under the Monitoring Results Report section, the draft Caltrans MS4 permit reiterates the iterative process within the context of the following: *The MRR shall include a summary of sites requiring corrective actions needed to achieve compliance with this Order, and a review of any iterative procedures (where applicable) at sites needing corrective actions.<sup>6</sup>*

The draft Phase II MS4 references the iterative process in two places, in finding 35 and under its definition of MEP. Finding 35 states:

*This Order modifies the existing General Permit, Order 2003-0005-DWQ by establishing the storm water management program requirements in the permit and defining the minimum acceptable elements of the municipal storm water management program. Permit requirements are known at the time of permit issuance and not left to be determined later through iterative review and approval of Storm Water Management Plans (SWMPs).*

The draft Phase II MS4 permit also acknowledges the iterative process through the definition of maximum extent practicable (which is also included in the draft Caltrans MS4 permit), to the following extent:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the*

---

<sup>5</sup>See draft Caltrans MS4 permit (Tentative Order No. 2012-XX-DWQ NPDES No. CAS000003), page 10.

<sup>6</sup>Ibid., page 35.

*waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the “iterative approach.”<sup>7</sup>*

It should be clearly understood that the State Board is articulating clear policy on the iterative process through these two draft MS4 permits and that they must be followed by Regional Boards as subordinate jurisdictions.

Conclusion: The Regional Board has no authority to alter the iterative process/procedure by making a revised and diluted version of it available only to those MS4 permittees that wish to opt for watershed management program participation. Quite the contrary, the Regional Board is legally compelled to make the iterative process, as described herein, an undeniable requirement in the tentative order.

Recommended Correction: Regional Board staff should incorporate the iterative process into the tentative order in the findings section and in the RWL section. It should also be referenced again under a revised MEP definition.

4. **The tentative order incorrectly articulates the non-stormwater discharge prohibition to the MS4 to include discharges from and through it.**
  - a. Issue: The tentative order mentions prohibiting non-stormwater discharges not only to the MS4 but from and through it as well. Federal regulations did not authorize the non-stormwater discharge prohibition to go beyond “to” the MS4. This is a serious issue because extending the prohibition from or through the MS4 would subject non-stormwater discharges (including dry weather TMDL WLAs and non-stormwater municipal action levels) to pollutant limitations at the outfall.

---

<sup>7</sup> See State Water Resources Control Board Water Quality Order No. XXXX-XXXX-DWQ, NPDES General Permit No. CASXXXXXX, page 11

The tentative order attempts to justify interpreting federal stormwater regulations to mean that non-stormwater discharges are prohibited not only to the MS4 but from it and through it as well by: (1) incorrectly stating the Clean Water Act §402(p)(B)(ii) of the Clean Water Act requires permittees effectively prohibit non-storm water discharges into watercourses (means receiving waters) as well as to the MS4; and (2) a misreading of Federal Register Volume 55, No. 222, 47990 (federal register) which contains an error with regard to the non-stormwater discharge prohibition.

§402(p)(B)(ii) does not, as the tentative order's fact sheet asserts, include watercourses, which according to Regional Board staff, means waters of the State and waters of the United States, both of which lie outside of the MS4. The original text of §402(p)(B)(ii) actually reads as follows: *Permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."*<sup>8</sup> There is no mention of watercourses.

The tentative order's fact sheet also relies on the afore-cited federal register which states: *402(p)(B)(3) requires that permits for discharges from municipal storm sewers require the municipality to "effectively prohibit" non-storm water discharges from the municipal storm sewer.* The fact sheet is correct about this. The problem is that the federal register is wrong here. It confuses 402(p)(B)(3), which addresses stormwater (not non-stormwater) discharges from the MS4, with 402(p)(B)(2), which once again prohibits non-stormwater discharges to the MS4. It should be noted that in the same paragraph above the defective federal register language, it says that ... *permits are to effectively prohibit non-storm water discharges to the municipal separate storm sewer system.*

In any case, this issue has been resolved since the federal register was published in November of 1990. All MS4 permits in the United States issued by USEPA prohibit non-stormwater discharges only to the MS4. USEPA guidance, such as the *Illicit Discharge Detection and Elimination: A Guidance Manual* bases investigation and monitoring on non-stormwater discharges being prohibited to the MS4. And, with the exception of Los Angeles Regional Board MS4 permits, MS4 permits issued by other Regional Boards also limit the MS4 discharge prohibition to the MS4. Beyond this, the draft Caltrans MS4 permit and draft Phase II MS4 permits also limit the non-stormwater prohibition to the MS4.

Conclusion: The Regional Board does not have the legal authority to extend the non-stormwater discharge prohibition from or through the MS4.

---

<sup>8</sup>Municipal storm sewers is a truncated version of municipal separate stormwater system (MS4).

Recommended Correction: Revise the non-stormwater discharge prohibition to be limited to the MS4 only and delete all requirements that are based on the prohibition from or through the MS4. This includes the non-stormwater prohibition that is linked to CERCLA.

**5. The tentative order should not include detailed contact information for the Permittee that can and does change frequently such as in Table 2. Facility Information. A consultant's name should not be used.**

- a. Issue: Beginning on Page 1 of the order, Table 2. Facility Information includes Permittee (WDID) and Contact Information. In this table personnel names, titles, phone numbers and/or e-mails are indicated and will not likely remain the same for the duration of the permit.
- b. Issue: In many cases, a consultant name is indicated as the contact for a Permittee and this is inappropriate.
- c. The City of Carson contact personnel name is correct; however, the title is not.

Recommended Corrections: Delete all personnel references. Indicate only the Permittee, WDID #, mailing address, phone number and contact title (example: Director of Public Works). Otherwise, provide this information in another document as it does not belong in the tentative order. Please correct the title for Patricia Elkins to read, "Storm Water Quality Programs Manager."

**Subject: Comments on Tentative Order No. R4-2012-XXXX NPDES Permit No. CAS004001**

Dear Mr. Ridgeway:

The City of Covina is pleased to submit the attached comments regarding Tentative Order No. R4-2012-XXXX NPDES Permit No. CAS004001.

Please note that the City of Covina is also in support of the comment letter submitted by the Los Angeles Permit Group (LAPG), of which the City is an active participant, and incorporates the LAPG comments by reference (Attachment C). The City's comments are intended to be complimentary and more specific to the issues raised in the LASP group letter. The City's comment letter also contains additional issues not addressed in the LASP group letter.

Also, please replace the City of Covina's Facility Contact name listed in the Tentative Order with my name, Vivian Castro, Environmental Services Manager. The other contact information listed for the City, including my email, is correct.

Thank you for the opportunity to submit comments on this very important matter. Please direct any questions regarding this letter to me at (626) 384-5480.

Sincerely,

Vivian Castro  
Environmental Services Manager

FINAL

## CITY OF COVINA COMMENTS ON TENTATIVE ORDER NO. R4-2012-XXXX

1. **Numeric Water Quality Based Effluent Limitations (WQBELs) applied to dry and wet weather Total Maximum Daily Load (TMDLs) waste load allocations (WLAs) and to stormwater and non-stormwater municipal action levels (MALs) are not authorized under federal stormwater regulations and are not in keeping with State Water Resources Control Board (State Board) water quality orders (WQOs).**

The Tentative Order specifies that “*Each Permittee shall comply with applicable WQBELs as set forth in Part VI.E of this Order, pursuant to applicable compliance schedules.*” The Tentative Order specifies two categories of WQBELs, one for USEPA adopted TMDLs and one for Regional Board/State adopted TMDLs. Regarding USEPA adopted TMDLs, it appears that BMP-WQBELs may be used to meet TMDL WLAs in the receiving water. For Regional Board/State-adopted TMDLs, however, the Tentative Order specifies a different compliance method -- meeting a “numeric” WQBEL that is derived directly from the TMDL waste load allocation. For example, the wet weather numeric WQBEL for dissolved copper for the Los Angeles River is 17 ug/l.

- a. Issue: *Regional Board staff is premature in requiring any kind of WQBEL because no exceedance of any TMDL WLA at the outfall has occurred.* This is because outfall monitoring is not a requirement of the current MS4 permit or previous MS4 permits.

The Regional Board’s setting of WQBELs – any WQBEL – to translate the TMDL WLA for compliance at the outfall is premature. Regional Board staff does not appear to have performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.”*

No such reasonable potential analysis has been performed – despite that USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit’s fact sheet. According to USEPA’s NPDES Permit Writers’ Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and explain how the state’s anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>1</sup>*

The fact sheet accompanying the Tentative Order contains no reference to a reasonable potential analysis – a consequence of the fact that no outfall monitoring has been required of the Regional Board either in the current or previous MS4 permits for Los Angeles County.

---

<sup>1</sup>United States Environmental Protection Agency, *NPDES Permit Writers’ Manual*, September, 2010, page 6-30.

Outfall monitoring is a mandatory requirement under federal regulations at CFR 40 122.22, §122.2 and §122.26. CFR 40 §122.22(C)(3) requires effluent and ambient monitoring: *The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

“Effluent monitoring,” according to Clean Water Act §502, is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2, defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

Conclusion: Because Regional Board staff has not required outfall monitoring, it could have not have detected an excursion above a water quality standard (includes TMDL WLAs). Therefore, it could not have conducted a reasonable potential analysis and, as further consequence, cannot require compliance with a WQBEL (numeric or BMP-based) or with any TMDL or MAL until those burdens have been met.

Recommended Correction: Eliminate all reference to comply with WQBELs until outfall monitoring and a reasonable potential analysis have been performed.

- b. Issue: Even if Regional Board staff conducted outfall monitoring and detected an excursion above a TMDL WLA and performed the requisite reasonable potential analysis, it cannot require a numeric WQBEL strictly derived from the TMDL WLA.

USEPA’s 2010 guidance memorandum mentions that numeric WQBELs are permissible only if feasible.<sup>2</sup> This conclusion was reinforced by a memorandum from Mr. Kevin Weiss, Water Permits Division, USEPA (Washington D.C.). He explains:

*Some stakeholders are concerned that the 2010 memorandum can be read as advising NPDES permit authorities to impose end-of-pipe limitations on each individual outfall in a municipal separate storm sewer system. In general, EPA does not anticipate that end-of-pipe effluent limitations on each municipal separate storm sewer system outfall will be used frequently. Rather, the memorandum expressly describes “numeric” limitations in broad terms, including “numeric parameters acting as surrogates for pollutants such as stormwater flow volume or percentage or amount of impervious cover.” In the*

---

<sup>2</sup>Memorandum from James A. Hanlon, Director, Office of Waste Management, Revisions to the November 22, 2002 Memorandum Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs, November 12, 2010.

context of the 2010 memorandum, the term “numeric effluent limitation” should be viewed as a significantly broader term than just end-of-pipe limitations, and could include limitations expressed as pollutant reduction levels for parameters that are applied system-wide rather than to individual discharge locations, expressed as requirements to meet performance standards for surrogate parameters or for specific pollutant parameters, or could be expressed as in-stream targets for specific pollutant parameters. Under this approach, NPDES authorities have significant flexibility to establish numeric effluent limitations in stormwater permits.<sup>3</sup>

Reading the 2010 USEPA memorandum, together with Mr. Weiss’s memorandum, creates the conclusion that (1) numeric WQBELs are permissible if “feasible” and (2) numeric WQBELs cannot be construed to only mean strict effluent limitations at the end-of-pipe (outfall) but more realistically must include surrogate parameters and other variants as well. Regional Board staff failed to examine alternative numeric WQBELs, along with BMP WQBELs, as a consequence of not conducting the appropriate analysis.

In any case, the feasibility of numeric WQBELs, whether strictly derived from TMDL WLAs or of the surrogate parameter type, the State Water Resources Control Board has determined that numeric effluent limitations are not feasible. In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: “we will generally not require “strict compliance” with water quality standards through numeric effluent limitations’ and instead ‘we will continue to follow an iterative approach, which seeks compliance over time’ with water quality standards”.

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

The State Board’s decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities*.

Conclusion: The Regional Board does not have the legal authority to require numeric WQBELs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

---

<sup>3</sup>Memorandum from Kevin Weiss, Water Permits Division, USEPA (Washington D.C.), March 17, 2011.

- c. Issue: There cannot be a WQBEL to attain a dry weather TMDL WLA nor a WQBEL that addresses a non-stormwater municipal action level (MAL).

The foundation for this argument lies in the federal limitation of non-stormwater discharges to the MS4 – not from or through it as the Tentative Order concludes. Federal stormwater regulations only prohibit discharges to the MS4 and limits outfall monitoring to stormwater discharges. This is explained in greater detail under **4. Non-stormwater Discharge Prohibitions.**

Conclusion: The Regional Board does not have the legal authority to compel compliance with dry weather WQBELs or non-stormwater MALs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

2. **The Tentative Order has altered Receiving Water Limitation (RWL) language causing it to be overbroad and inconsistent with RWL in the current MS4 permit, the Ventura MS4 permit, State Board WQO 99-05, the draft Caltrans MS4 permit, and RWL language recommended by CASQA.**

- a. Issue: The proposed RWL language changes the “exceedance” determinant from water quality standards and objectives to receiving water limitations, thereby increasing the stringency of the requirement. The Tentative Order RWL version reads: *“Discharges from the MS4 that cause or contribute to the violation of **receiving water limitations** are prohibited.”*

Compare this with what is in the current MS4 permits for Los Angeles and Ventura Counties: *“Discharges from the MS4 that cause or contribute to a violation of **water quality standards** are prohibited.”*

Whereas standard RWL language limits water quality standards to what is in the basin plan, and includes water quality objectives (relates to waters of the State), the Tentative Order uses revised language that replaces water quality standards with the following receiving water limitation criteria:

*Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38.*

It is unclear why Regional Board staff has removed water quality standards, which is a USEPA and State Board requirement, and replaced them with the more global receiving water limitation language that include additional compliance criteria (e.g., “or federal regulations including but not limited to 40 CFR § 131.38”). Other “federal regulations” could include CERCLA (Comprehensive Environmental Remediation and Compensation Liability Act).

Enlarging the scope of the RWL from water quality standards to a universe of other regulatory requirements exceeds RWL limitation language established in State Board WQO

99-05, a precedential decision. The order bases compliance on discharge prohibitions and receiving water limitations on the *timely implementation of control measures and other action in the discharges in accordance with the SWMP (stormwater management plan) and other requirements of the permit's limitations*. It goes on to say that if exceedances of water quality standards or water quality objectives, collectively referred to as water quality standards continues, the SWMP shall undergo an iterative process to address the exceedances. It should be noted that this language was mandated by USEPA.

It should be noted that the draft Caltrans MS4 permit is scheduled for adoption in September, as well as CASQA, proposes RWL language that is in keeping with WQO 99-05.

Conclusion: Regional Board does not have the legal authority to re-define RWL language to the extent it is proposing.

Recommended Correction: Replace RWL contained in the Tentative Order with the CASQA model (Attachment B) or with language contained in the draft Caltrans MS4 permit.

- b. Issue: By eliminating water quality standards, the Tentative Order has created a separate compliance standard for TMDLs and for non-TMDLs. Standard RWL language in other MS4 permits designates the SWMP<sup>4</sup> as the exclusive determinant for achieving water quality standards in the receiving water. Since TMDLs are enhanced water quality standards, the SWMP (or in this case the SQMP) should enable compliance with TMDLs. Instead, the Tentative Order specifies compliance through implementation plans – including plans that were discussed in several State/Regional Board adopted TMDLs (e.g., the Los Angeles River Metals TMDL). The absence of water quality standards also creates a separate compliance standard for non-TMDLs. According to Regional Board staff, minimum control measures (MCMs) which make up the SQMP, are intended to meet non-TMDLs pollutants. Unclear is what defines non-TMDL pollutant. If there are no water quality standards referenced in the RWL then what are the non-TMDL pollutants that the MCMs are supported to address?

There is no authority under federal stormwater regulations to comply with any criterion other than water quality standards. The RWL language called-out in WQO 99-05, which was in response to a USEPA directive, makes it clear that water quality standards represent the only compliance criteria, not an expanded definition of receiving water limitations that exclude such criteria.

MS4 permits throughout the State include TMDL WLAs. None of them, however, has created a compliance mechanism that excludes water quality standards as a means of attaining them. Further, the State Board has, through the draft Caltrans MS4 permit and the draft Phase II MS4 permit, articulated its policy on compliance with water quality standards: they are to be met through the implementation of stormwater management programs. Equally noteworthy is that State Board has not created a dual standard for dealing with TMDLs and non-TMDLs. This is an obvious consequence of its adherence to WQO 99-05.

With regard to implementation plans contained in TMDLs, the Regional Board has no legal authority to include them into the MS4 permit. This issue discussed in greater detail later in these comments.

---

<sup>4</sup>USEPA and federal stormwater regulations use stormwater management program whereas the Los Angeles County MS4 permit uses stormwater quality management plan (SQMP). In effect they are the same. They consist of 6 core programs that must be implemented through MS4 permit.

Conclusion: The Tentative Order must be revised to restore water quality standards in RWL language and, by extension, enable compliance with TMDLs and other water quality standards through the SQMP/MCMs.

Recommended Correction: Revise the Tentative Order to eliminate any reference to complying with anything else except water quality standards through the SQMP; and, therewith, eliminate any reference to complying with implementation plans contained in State/Regional Board TMDLs.

**3. The Tentative Order does not include the iterative process, a mechanism that is integral to RWL language which serves to achieve compliance with water quality standards.**

- a. Issue: The absence of the iterative process disables a safeguard to protect permittees against unjustifiably strict compliance with water quality standards – or in this case the expanded definition of receiving water limitations – that is a requisite feature in all MS4 permits issued in California. The Tentative Order circumvents the iterative process by creating an alternative referred to as the adaptive/management process which is only available to those permittees that opt for a watershed management program.

Despite the fact RWL language in MS4 permits since the 90's have provided a description of an iterative process (the BMP adjustment mechanism), the term "iterative process" has only recently been specifically mentioned in them. The absence of this term resulted in the 9<sup>th</sup> Circuit Court Appeal's conclusion in *NRDC v. Los Angeles County Flood Control District* that there is no "textual support" in the current MS4 permit for the existence of an iterative process. This resulted in the court's conclusion that the LACFCD had exceeded water quality standards in the hardened portions of the Los Angeles and San Gabriel Rivers. More recent MS4 permit's issued in the State contain clear references to the iterative process.

Notwithstanding the absence of water quality standards in the Tentative Order, the iterative process must be included as required by Water Quality Orders 2001-15 and 2009-0008, wherein the State Board made it clear that: "we will generally not require "strict compliance" with water quality standards through numeric effluent limitations' and instead 'we will continue to follow an iterative approach, which seeks compliance over time' with water quality standards".

Moreover, both the draft Caltrans MS4 permit and the draft Phase II MS4 permit contain references to the iterative process. The draft Caltrans MS4 permit refers to the iterative process in two places: finding 20, Receiving Water Limitations and in the Monitoring Results Report. Finding 20 states:

*The effect of the Department's storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs).<sup>5</sup>*

Under the Monitoring Results Report section, the draft Caltrans MS4 permit reiterates the iterative process within the context of the following: *The MRR shall include a summary of sites*

---

<sup>5</sup>See draft Caltrans MS4 permit (Tentative Order No. 2012-XX-DWQ NPDES No. CAS000003), page 10.

requiring corrective actions needed to achieve compliance with this Order, and a review of any iterative procedures (where applicable) at sites needing corrective actions.<sup>6</sup>

The draft Phase II MS4 references the iterative process in two places, in finding 35 and under its definition of MEP. Finding 35 states:

*This Order modifies the existing General Permit, Order 2003-0005-DWQ by establishing the storm water management program requirements in the permit and defining the minimum acceptable elements of the municipal storm water management program. Permit requirements are known at the time of permit issuance and not left to be determined later through iterative review and approval of Storm Water Management Plans (SWMPs).*

The draft Phase II MS4 permit also acknowledges the iterative process through the definition of maximum extent practicable (which is also included in the draft Caltrans MS4 permit), to the following extent:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the "iterative approach."<sup>7</sup>*

It should be clearly understood that the State Board is articulating clear policy on the iterative process through these two draft MS4 permits and that they must be followed by Regional Boards as subordinate jurisdictions.

Conclusion: The Regional Board has no authority to alter the iterative process/procedure by making a revised and diluted version of it available only to those MS4 permittees that wish to opt for watershed management program participation. Quite the contrary, the Regional Board is legally compelled to make the iterative process, as described herein, an undeniable requirement in the Tentative Order.

---

<sup>6</sup>Ibid., page 35.

<sup>7</sup>See State Water Resources Control Board Water Quality Order No. XXXX-XXXX-DWQ, NPDES General Permit No. CASXXXXXX, page

Recommended Correction: Regional Board staff should incorporate the iterative process into the Tentative Order in the findings section and in the RWL section. It should also be referenced again under a revised MEP definition.

**4. The Tentative Order incorrectly articulates the non-stormwater discharge prohibition to the MS4 to include discharges from and through it.**

- a. Issue: The Tentative Order mentions prohibiting non-stormwater discharges not only to the MS4 but from and through it as well. Federal regulations did not authorize the non-stormwater discharge prohibition to go beyond “to” the MS4. This is a serious issue because extending the prohibition from or through the MS4 would subject non-stormwater discharges (including dry weather TMDL WLAs and non-stormwater municipal action levels) to pollutant limitations at the outfall.

The Tentative Order attempts to justify interpreting federal stormwater regulations to mean that non-stormwater discharges are prohibited not only to the MS4 but from it and through it as well by: (1) incorrectly stating the Clean Water Act §402(p)(B)(ii) of the Clean Water Act requires permittees effectively prohibit non-storm water discharges into watercourses (means receiving waters) as well as to the MS4; and (2) a misreading of Federal Register Volume 55, No. 222, 47990 (federal register) which contains an error with regard to the non-stormwater discharge prohibition.

§402(p)(B)(ii) does not (as the Tentative Order’s fact sheet asserts) include watercourses, which according to Regional Board staff, means waters of the State and waters of the United States, both of which lie outside of the MS4. The original text of §402(p)(B)(ii) actually reads as follows: *Permits for discharges from municipal storm sewers “shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers.”*<sup>8</sup> There is no mention of watercourses.

The Tentative Order’s fact sheet also relies on the afore-cited federal register which states: *402(p)(B)(3) requires that permits for discharges from municipal storm sewers require the municipality to “effectively prohibit” non-storm water discharges from the municipal storm sewer.* The fact sheet is correct about this. The problem is that the federal register is wrong here. It confuses 402(p)(B)(3), which addresses stormwater (not non-stormwater) discharges from the MS4, with 402(p)(B)(2), which once again prohibits non-stormwater discharges to the MS4. It should be noted that in the same paragraph above the defective federal register language, it says that ... *permits are to effectively prohibit non-storm water discharges to the municipal separate storm sewer system.*

In any case, this issue has been resolved since the federal register was published in November of 1990. All MS4 permits in the United States issued by USEPA prohibit non-stormwater discharges only to the MS4. USEPA guidance, such as the *Illicit Discharge Detection and Elimination: A Guidance Manual* bases investigation and monitoring on non-stormwater discharges being prohibited to the MS4. And, with the exception of Los Angeles Regional Board MS4 permits, MS4 permits issued by other Regional Boards also limit the MS4 discharge prohibition to the MS4. Beyond this, the draft Caltrans MS4 permit and draft Phase II MS4 permits also limit the non-stormwater prohibition to the MS4.

---

<sup>8</sup>Municipal storm sewers is a truncated version of municipal separate stormwater system (MS4).

Conclusion: The Regional Board does not have the legal authority to extend the non-stormwater discharge prohibition from or through the MS4.

Recommended Correction: Revise the non-stormwater discharge prohibition to be limited to the MS4 only and delete all requirements that are based on the prohibition from or through the MS4. This includes the non-stormwater prohibition that is linked to CERCLA.

**5. The Tentative Order proposes to incorporate TMDL implementation plans, schedules, and monitoring requirements without legal authority.**

- a. Issue: Placing Regional Board/State Board TMDLs into the MS4 would result in serious consequences for permittees. For one thing, permittees subject to TMDLs that contain an implementation schedule with compliance dates for interim waste load allocations that have not been met, based on Los Angeles County mass emissions station or other data (e.g., from the Coordinated Monitoring Plan for the Los Angeles River Metals TMDL), will be in automatic non-compliance once the MS4 permit takes effect.

The Tentative Order proposes a safeguard in this event: coverage under a time schedule order (TSO). Essentially, a TSO is an enforcement action authorized under Porter-Cologne, the State's water code. The problem is that the Regional Board, at its discretion, could issue a clean-up and abatement order that could link permittees in the Dominguez Channel, Los Angeles River, and San Gabriel River Watersheds to the remediation of the Los Angeles and Long Beach Harbors which are currently CERCLA sites (caused by DDT, pesticides, metals, which are considered toxics, and other pollutants). Furthermore, the TSO, which is a State enforcement action, will not help with respect to a federal violation because of preemption. An exceedance will expose subject permittees to third party litigation under the Clean Water Act. NRDC would be able to take the matter straight to federal court.

In any case, the Regional Board has no legal authority under the Clean Water Act to incorporate implementation plans, schedules, or monitoring requirements into the MS4 permit. CWA §402(p)(B)(iii) simply states that controls are required *to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.* The application of this provision is limited to: (1) the implementation of BMPs specified in a stormwater management plan appropriated through the six core programs; and (2) outfall monitoring. Monitoring, as mentioned earlier, is limited to outfall and ambient monitoring. Ambient monitoring, which is receiving water-based, has been assumed by the Regional Board and is funded through a stormwater ambient monitoring program (SWAMP) surcharge on the annual MS4 permit fee. Federal stormwater regulations mention nothing about TMDL implementation plans and schedules in an MS4 permit.

In fact, the Regional Board/State Board TMDL implementation plans, implementation schedules, and monitoring should be voided and prevented from being placed into the MS4 permit because (1) they set compliance determinant in the receiving water instead of the outfall; and (2) although the TMDL monitoring program requirements specify ambient monitoring that is to be performed by MS4 permittees, including Caltrans, the Regional Board has approved plans that treat wet weather monitoring as ambient monitoring, even though they are mutually exclusive. The Clean Water Act definition of ambient monitoring is the:

*Natural concentration of water quality constituents prior to mixing of either point or nonpoint source load of contaminants. Reference ambient concentration is used to indicate the concentration of a chemical that will not cause adverse impact to human health.*

The natural concentration of water quality constituents can only mean the state of a receiving water when it is not raining. This is further supported by the phrase “prior to mixing of either point or non-point source load of contaminants,” which can only mean stormwater discharges from an outfall. In other words, stormwater discharges from an outfall cannot be mixed with a receiving water during a storm event because the ambient condition would be lost. Outfall monitoring of stormwater discharges is evaluated against the ambient condition of pollutant constituents in the receiving water for the ostensible purpose of determining its pollutant contribution.

Conclusion: The Tentative Order lacks the legal authority to include TMDL implementation plans, schedules, or monitoring plans adopted as basin plan amendments. No permittee, subject to any TMDL that requires an implementation plan, schedule, or monitoring plan can be compelled to comply with any of them. Further, even if it were legally permissible for these TMDL elements to be incorporated into the MS4 permit, no permittee could be placed into a state of non-compliance because the legitimate compliance point is in the outfall. Because no outfall monitoring has occurred, no violation could arise and, therefore, there would be no need for a TSO.

Recommended Correction: Eliminate requiring TMDL implementation plans, schedules, and monitoring to be incorporated into the Tentative Order.

**6. The Tentative Order contains references to the federal Comprehensive Environmental Remediation Compensation and Liability Act (CERCLA) that would make them additional regulatory requirements.**

a. Issue: The non-stormwater discharge prohibition under the Tentative Order states:

*Non-storm water discharges through an MS4 are prohibited unless authorized under a separate NPDES permit; authorized by USEPA pursuant to Sections 104(a) or 104(b) of the federal comprehensive Environmental Response, Compensation and Liability Act (CERCLA).*

At first blush, the CERCLA provision appears innocuous. But what if non-stormwater discharge is not authorized under CERCLA? Conceivably the MS4 permittee could be held responsible for those discharges. And because CERCLA is referenced in the MS4 permit, it could become a potential third party litigation issue. The inclusion of the CERCLA provision is even more suspect when considering that no other MS4 in the State contains such a reference. Beyond this, how would a permittee know if a discharge is one covered under CERCLA?

Conclusion: CERCLA is an unnecessary reference in the MS4 permit and has the potential to expose permittees to third party litigation. Further, the non-stormwater discharge prohibition only “to” the MS4 makes this issue academic. A permittee’s only responsibility is to prohibit impermissible non-stormwater to the MS4, not through or from it; or to require the discharger to obtain permit coverage.

7. **The Tentative Order, under the effluent limitations section, contains technical effluent based limitations (TBELs) which typically are not included in MS4 permits and, in this particular case, does not appear to be purposeful.**

- a. Issue: Part IV.A.1 of the Tentative Order states that TBELs shall reduce pollutants in storm water discharges from the MS4 to the maximum extent practicable (MEP).

It is not clear as to the reason for including TBELs into the Tentative Order because they are generally not required of Phase MS4 permits. TBELs are referenced in the Tentative Order, but are not found under section 402(p), which addresses storm water, nor anywhere else in federal regulations. It is a term used to collectively refer to best available technologies, but again not in 402(p).

TBEL is a term USEPA uses to denote the following: (1) Best Practical Control Technology Currently Available (BPT); (2) Best Conventional Pollutant Control Technology (BCT); and (3) Best Available Technology Economically Achievable (BAT). Since these provisions were established prior to stormwater provisions of the CWA §402(p), they were applied to industrial waste-water discharges (including construction activity which is an industrial category sub-set). A clarifier connected to the sewer system is a type of TBEL. POTWs are subject to TBELs example primary and secondary treatment.

According USEPA guidance:

*WQBELs are designed to protect water quality by ensuring that water quality standards are met in the receiving water. On the basis of the requirements of Title 40 of the Code of Federal Regulations (CFR) 125.3(a), additional or more stringent effluent limitations and conditions, such as WQBELs, are imposed when TBELs are not sufficient to protect water quality.*<sup>9</sup>

Since the MS4 permit proposes WQBELs (adapted to meet water quality standards at the outfall), it would appear that TBELs are irrelevant. In essence, the proposed WQBELs is an admission from Regional Board staff that TBELs are not sufficient to protect water quality.

Please note that the draft Caltrans and Phase II MS4 permits do not reference TBELs.

Conclusion: Clarification is needed to determine the purpose of referencing TBELs in the Tentative Order.

Recommended Correction: Either provide clarification and a justification requiring TBELs given that the Tentative Order requires WQBELs, a more stringent requirement. If clarification or justification cannot be provided, the TBEL provision should be removed.

8. **Minimum Control Measures (MCMs)**

- a. Issue: Generally, MCMs should not be detailed in the Tentative Order. Instead, specific BMPs and other information should be placed in the Stormwater Quality Management Plan (SQMP), which is the case under the current MS4 permit. Federal guidance specifies that the core programs are to be implemented through the SQMP as a means of meeting water quality standards. More importantly, placing the specifics in the SQMP makes it easier to

---

<sup>9</sup>NPDES Permit Writers' Manual, September, 2010, page 5-40.

revise. If specific BMPs remain in the Tentative Order, and they are in error or need to be revised (e.g., to set BMP-WQBELs), a re-opener would be required. For example, in Part I. *Facility Information, Table 2.*, the permittee contact information is out of date. It would be better to place this and other detailed information in the SQMP where it can be updated regularly without having to re-open the permit.

b. Issue: SUSMP

The Tentative Order replaces the Development Planning/SUSMP with Planning and Land Development Program. However, the SUSMP is mandated through a precedent-setting WQO issued by the State Board. Nothing in the order's fact sheet provides an explanation of why the SUSMP needs to be replaced. So doing would incur an unnecessary cost to revise the SQMP and SUSMP guidance materials. This is not to suggest that the Regional Board may not, in the final analysis, have the legal authority to change the SUSMP to its MCM equivalent. Nevertheless, it would be helpful from an administrative convenience standpoint to explain the need for the change in the fact sheet. It could be argued that the low impact development (LID) techniques have been successfully implemented through the SUSMP program for over five years.

c. Issue: Retrofitting existing developments through the Land Use Development Program is not authorized under federal stormwater regulations. CFR 40 122.26 only authorizes retrofitting with respect to flood control devices which is to be explained in the MS4 permit as the following indicates:

*A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible.*

d. Issue: The MCMs in the Tentative Order require off-site infiltration for groundwater recharge purposes. The Tentative Order is a stormwater permit, not a groundwater permit. As mentioned, 402(p)(3)(iii) of the Clean Water Act:

*Permits ... shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.*

The use of other infiltration controls that do not promote groundwater recharge have already demonstrated effectiveness in significantly reducing pollutants to the maximum extent practicable (MEP). Requiring infiltration anywhere for the purpose of recharging groundwater exceeds the scope of the MS4 since infiltrating to such an extent would add costs to the developer or permittee without significantly improving pollutant removal performance. Further, this requirement is unwarranted and premature because of the absence of outfall monitoring data that would demonstrate the need for groundwater-recharge oriented infiltration controls to address water quality standards and TMDLs vis-à-vis their intended purpose of protecting beneficial uses in a receiving water.

Conclusion: Requiring infiltration controls to facilitate groundwater recharge is not authorized under federal stormwater regulations. Further, many permittees are situated

upstream of spreading grounds and other macro-infiltration basins that would obviate the need for this requirement.

Recommended Correction: Eliminate this requirement from the order.

**9. The Maximum Extent Practicable (MEP) definition needs to be revised to reflect is updated definition found in the draft Phase II MS4 permit and in the draft Caltrans MS4 permit.**

- a. Issue: The order’s MEP reference is a carry-over from the 2001 MS4 permit. A great deal has happened over the decade to warrant an update. Fortunately, the State Board, through the draft Phase II and Caltrans MS4 permits, has revised the MEP definition to be in keeping with current realities. To that end it has proposed the following definition:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the “iterative approach.”<sup>10</sup>*

Conclusion: The order’s MEP is out of data and inconsistent with State Board policy.

Recommended Correction: Replace order’s MEP definition with the above-mentioned language.

**10. Tentative Order incorrectly asserts that its provisions do not constitute unfunded mandates under the California Constitution.**

- a. Issue: Contrary to what the order asserts, it contains provisions that exceed federal requirements in several places, thereby creating potential unfunded mandates. They include: (1) requiring wet and dry weather monitoring in the receiving water; (2) requiring numeric WQBELs; (3) requiring compliance with TMDL-related implementation plans, schedules, and monitoring; (4) requiring the non-stormwater discharge prohibition to include through and from the MS4; (5) revising the receiving water limitation language to include overbroad compliance requirements; (6)

---

<sup>10</sup>Op. Cit., page 35.

requiring groundwater recharge; and (7) monitoring for non-TMDL constituents at completed development project sites.

Conclusion: The order patently proposes requirements that create unfunded mandates.

Recommended Correction: Delete all of the aforementioned requirements that exceed federal regulations.

**Section: V. Receiving Water Limitations**

No.	Page	Section	April 2012 Comment (LASP)	July 2012 Comment
1	37-38	All	Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue	There are several NPDES Permits, including the CalTrans Permit and others, that adjust the Receiving Water Limitation language in response to new interpretations. Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. LASP has provided the Regional Board staff with sample language. It is imperative that the Regional Board works with the State Board on this very important issue. It is critical that the LA draft Tentative Order Receiving Water Limitation language be adjusted to ensure cities working in good faith are not subject to enforcement and third party litigation.

**Section: VI. C. Watershed Management Programs**

No.	Page	Section	April 2012 Comment (LASP)	July 2012 Comment
1	48	3.a.ii	Pollutants in category 4 should not be included in this permit term, request elimination of any evaluation of category 4. Request elimination of category 3, as work should focus on the first two categories at this point.	Thank you for removing category 4. Category 3 puts a burden on cities during this permit cycle. In the next permit term, when permittees have a better understanding of sources and location of the high priority pollutant additional actions may be warranted. At this time including category 3 adds an investigative burden that is unwarranted given the substantial increase in requirements and monitoring that are already included in this draft Tentative Order.
2	46-53	Various	The Table (TBD) on page 2 states implementation of the Watershed Program will begin upon submittal of final plan. Page 11, section 4 Watershed Management Program Implementation states each Permittee shall implement the Watershed Management Program upon approval by the Executive Officer. Page 13 section iii says the Permittee shall implement modifications to the storm water management program upon acceptance by the Executive Officer. All three of these elements should be consistent and state upon approval by the Executive Officer. The item on page 13 should be changed to reflect the Watershed Management Program, or clarify that the Watershed Management Program is the storm water management program.	Table 9 and Watershed Management Implementation are still inconsistent. The table says submittal and the Watershed Management Program Implementation states upon approval. Please make these consistent

3	46-47	Table 9 and Process	Please allow 24 months for development of the Watershed Management Program to provide sufficient time for calibration and the political process to adopt these programs.	Same comment. However, there could be a phased approach in which a permittee could submit early actions within this timeline, while more time is offered for the resource intensive aspects.
4	47	Program Development	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees' authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions.	Same comment
5	52	Reasonable Assurance Analysis	Reasonable assurance analysis and the prioritization elements should also include factors for technical and economic feasibility.	Same comment
6	46	Process	Please clarify that Permittees will only be responsible for continuing existing programs and TMDL implementation plans during the interim 18 month period while developing the Watershed Management Program and securing approval of those programs.	Same comment
7	General	General	While it may be appropriate to have an overall design storm for the NPDES Permit and TMDL compliance, this element seems to address individual sites. Recommend developing more prominently in the areas of the Permit that deals with compliance that the overall Watershed Management Program should deal with the 85th percentile storm and that beyond that, Permittees are not held responsible for the water quality from the much larger storms. However, requiring individual projects to meet this standard is limiting as there may be smaller projects implemented that individually would not meet 85th percentile, but collectively would work together to meet that standard. Please clearly indicate cities are only responsible for the 85th percentile storm for compliance and that individual projects may treat more or less than number.	Changes made but unclear that the overall program would be collectively only held to the 85th percentile storm if working in multiple areas, and individual sites only if the Watershed Management Program states that individual sites would be responsible.

8	112	E.2.b.iii	For the "group of Permittees" having compliance determined as a whole, this should only be the case if the group of Permittees have moved forward with shared responsibilities (MOAs, cost sharing, a Watershed Management Program). It would not be fair to have one entity not be a part of the "group" and be the main cause of exceedances/violations.	In the Tentative Order, permittees must notify the Regional Board 6 months after the Order's effective date on whether it plans to participate in the development of a Watershed Management Program. Given this, a sub-watershed will not know whether all permittees will participate. It should also be noted that allowed non-stormwater discharges and other NPDES permit discharges may be the cause of exceedances/violations and not the "group of permittees."
---	-----	-----------	--	--

**VI. D. Minimum Control Measures**

No.	Page	Citation	Comment
<b>Discharge Prohibition</b>			
1	26	III.A.	<p>RB staff proposed language requires the permittees to "prohibit non-stormwater discharges <b>through the</b> MS4 to receiving waters" except where authorized by a separate NPDES permit or conditionally.</p> <p><a href="#">This may overstep the required legal authority provisions in the federal regulations since 40CFR122.26 (d)(1)(ii) requires legal authority to control discharges to the MS4 but not from the MS4. Additionally, with respect to the definition of an illicit discharge at 40CFR122.26(b)(2), an illicit discharge is defined as "a discharge to the MS4 that is not composed entirely of stormwater". In issuing its final rulemaking for stormwater discharges on Friday, November 16, 1990[1], USEPA states that:</a></p> <p><i>Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT) and the Best Conventional Pollutant Control Technology (BCT) and where necessary, water quality-based controls), but permits for <b>discharges from</b> municipal separate storm sewer systems must require controls to the maximum extent practicable, and where necessary water quality-based controls, and must include a requirement to effectively prohibit non-stormwater <b>discharges into</b> the storm sewers.</i></p> <p><a href="#">This is further illuminated by the section on Effective Prohibition on Non- Stormwater Discharges[2]:</a></p> <p><i>"Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water discharges <b>into the storm sewers</b>. Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather, an 'effective prohibition' would require separate NPDES permits for non-storm water discharges to municipal storm sewers"</i></p> <p>The rulemaking goes on to say that the permit application:</p> <p><i>"requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate</i></p>

			<p><i>storm sewer systems.”</i></p> <p>Nowhere in the rulemaking is the subject of prohibiting discharges <i>from</i> the MS4 discussed.</p> <p><u><a href="http://www.epa.gov/owow/NPS/ordinance/mol5.htm">Furthermore, USEPA provides model ordinance language on the subject of discharge prohibitions: http://www.epa.gov/owow/NPS/ordinance/mol5.htm. Section VII Discharge Prohibitions of this model ordinance provides discharge prohibition language as follows:</a></u></p> <p><i>No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.</i></p> <p>Thus we recommend that staff eliminate the “from” language at both Part III.A.1.a. and Part III.A.2.</p>
2			<p><i>No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.</i></p> <p>Thus we recommend that staff eliminate the “from” language at both Part III.A.1.a. and Part III.A.2.</p>
3	28	III.A.2.b.iv	<p>The conditional exemption of street/sidewalk water is inconsistent with the requirement in the industrial/commercial MCM section that street washing must be diverted to the sanitary sewer. Sidewalk water should definitely be conditionally exempt, but so also should patios and pool deck washing. If street washing has to be diverted to the sanitary sewer for industrial/commercial facilities, then it should for all facilities and so should parking lot wash water as they are similar in their pollutant loads.</p>
4	-	General	<p>It is appropriate to have an exemption for a Permittee from a violation of RWL and or WQBELs caused by a non-stormwater discharge from a potable water supply or distribution system not regulated by an NPDES permit but required by state or federal statute; this should clearly apply to all NPDES permits issued to others within, or flow through, the MS4 permittees jurisdiction. We would request that also included in this category should be emergency releases caused by water line breaks which are not necessary, but are unexpected and have to be dealt with as an emergency. MS4 permittees should be exempt from RWL or WQBEL violations associated with any permitted NPDES discharges that are effectively authorized by LARWQCB under the Clean Water Act.</p>
5	Table 8	General	<p>Enforcing NPDES permits issued for the various NSWDS referenced in this table should be the responsibility of the State/Regional Board, not the MS4 permittee. Therefore, it is inappropriate to include a condition that places a responsibility on the MS4 permittee to ensure requirements of NPDES permits are being implemented or effective in order for the pertaining NSWDS category to be exempt. Proper enforcement of the various NPDES permits mentioned in this table should ensure impacts from these discharges are negligible.</p>

<b>General</b>			
1	-	-	<p>The Definition of: "Development", "New Development" and "Re-development" should be added. The definitions in the existing permit should be used:</p> <p><b>"Development"</b> means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</p> <p><b>"New Development"</b> means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.</p> <p><b>"Redevelopment"</b> means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</p> <p>The last of the three "routine maintenance" activities listed above should exclude projects related to existing streets since typically you are not changing the "purpose" of the street to carry vehicles and should not be altered.</p>
<b>Legal Authority</b>			
1	38	A.2.a.i	<p>Staff proposal states: "Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites."</p> <p>It appears the intent of this language is to transfer the State's inspection and enforcement responsibilities to municipalities through the MS4 permit. When a separate general NPDES permit is issued by the Regional or State Board it should be the responsibility of that agency collecting such permit fees to control the contribution of pollutants, not MS4 permittees.</p>

2	39	A.2.a.vii	<p>Staff proposal states: "Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Co-permittees."</p> <p>The intention of this statement is unclear and should be explained, and a definition of "shared MS4" should be provided. How would an inter-agency agreement work with an upstream and downstream agency? This is not practical - this agreement should have been done before the interconnection of MS4 systems occurred. An example of this agreement should be provided within the Permit. The permittee will not agree to the responsibility of an exceedance without first having evidence of the source and its known origin (in other words, an IC/ID is a private "culprit" and not the cause of the City).</p>
3	39	A.2.a.xi	<p>Staff proposal states: "Require that structural BMPs are properly operated and maintained."</p> <p>MS4 agencies can control discharges through an illicit discharge program, and conditioning new/redevelopment to ensure mitigation of pollutants. Unless the existing development private property owners/tenants are willing or in the process of retrofitting its property, the installation and O&amp;M of BMPs is not practical and cannot be legally enforceable against an entity that does not own or control the property, such as a municipal entity.</p>
4	39	A.2.a.xii	<p>Staff proposal states: "Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4."</p> <p>It is difficult, if not impossible, to accurately quantify the exact effectiveness of a particular set of BMP's in reducing the discharge of pollutants. Some discharges may be reduced over time given reductions in industrial activity, population in a particular portion of the community feeding into the MS4, or for other reasons not directly related to implementation of structural BMPs. Given that the County of LA is generally urbanized and thus impervious, a lethargic economic climate (meaning development and redevelopment is not occurring in an expeditious manner), and that several pollutants do not have known BMPs effective at removing/reducing the content (i.e., metals, toxics, pesticides), the effectiveness of BMPs should not be required and instead should only be used for research, development, and progress of BMP testing.</p>
5	40	2.b	<p>Staff proposal states: Permittee must submit a statement certified by its chief counsel that the Permittee has the legal authority to implement... and submit this certification annually..."</p> <p>To sign this statement, chief counsel will have to analyze this 500 page Permit, analyze the municipal code, and prepare a statement as to whether actions can be commenced and completed in the judicial system. An annual certification is redundant and unnecessary in addition to being extraordinarily costly. At most, legal analysis should be done once during the Permit term. Otherwise, please delete this requirement.</p>

<b>Fiscal Resources</b>			
1	40	A.3	The staff proposal includes a section on Fiscal Resources. Most MS4's do not have a storm water quality funding source, and even those that do have a funding source are not structured to meet the requirements of the proposed MS4 requirements (for instance, development funds may be collected to construct an extended detention basin, but not for street sweeping, catch basin cleaning, public right-of-way structural BMPs, etc).
2	40	A.3.c	Staff proposal states: "Each permittee shall exercise its full authority to secure fiscal resources necessary to meet all requirements of this Order"  This sentence has no legally enforceable standard. What exactly does the exercise of "full authority" mean, when the exercise of a city's right to tax comes with consequences and no guarantee of success. Municipal entities must adjust for a variety of urgent needs, some federally mandated in a manner that cannot be ignored. So, if we seek the fiscal resources to fund the programs required in the permit and the citizens say "No", then a municipality will have a limited ability to comply with "all requirements of this Order".. Can the language be changed to state: "Each permittee shall make its best efforts given existing financial and budget constraints to secure fiscal resources necessary to meet all requirements of this Order"?
3	40	A.3.c	Staff proposal states: "Each permittee shall conduct a fiscal analysis... to implement the requirements of this order." Most MS4's do not have an adequate funding to meet all requirements of the Tentative MS4 Permit. A Permit requirement to secure funding is overreach. Please delete this section.
<b>Public Information and Participation Program</b>			
1	58	D.4.a.i	Staff proposal states: "To measurably change the waste disposal and stormwater pollution generation behavior of target audiences..."  Define the method to be used to measure behavior change. As written, this requirement is vague and open to interpretation.
2	60	D.4.d.i.(2).(b)	Staff proposal states: "... including personal care products and pharmaceuticals)"  The stormwater permit should pertain only to stormwater issues. Pharmaceuticals getting into waters of the US are typically a result of waste treatment processes. All references to pharmaceuticals should be removed from this MS4 permit.
3	60	D.4.d.i.(3)	The Regional Board assumes that all of the listed businesses will willingly allow the City to install displays containing the various BMP educational materials in their businesses. If the businesses do allow the installations then the City must monitor the availability of the handouts because the business will not monitor or keep the display full or notify the City when the materials are running out. If the business will not allow the City to display the educational material must we document that denial? Will that denial indicate that the City is not in compliance?

<b>Industrial/Commercial Facilities Program</b>			
1	63	D.5.d-f	These sections pertain to inspecting critical source facilities where it appears the intent is to transfer the State's Industrial General Permit inspection and enforcement responsibilities to municipalities through the MS4 permit. We request eliminating these sections OR revise to exclude all MS4 permittee responsibility for NPDES permitted industrial facilities.
2	63	D.5.e.i	Staff proposal states: "...in the event a Permittee determines that a BMP is infeasible, Permittee shall require implementation of similar BMPs..." Judging a BMP to be "infeasible or ineffective" is subjective. Please delete this requirement.
<b>Development Planning Program</b>			
1		General	Since it could take 6 months for an agency to decide if they want to join in the development of a Watershed Management Plan or just modify their current Stormwater Management Program to comply with the new permit MCMs, the implementation of the new MCMs should follow this timeline. In the interim the permittees will be required to continue implementing their current Stormwater Management Program.
2	67	D.6.a.i.3	The stated objective of mimicking the predevelopment water balance is not consistent with the requirement that the entire design storm be managed onsite. Please consider allowing subtracting the predevelopment runoff from the design volume or flow.
3	69	D.6.b.ii.1.a	Please clarify of this paragraph apply to what is existing on the site or what is proposed.
4	70	D.6.c.i.2	Consider removing the "whichever is greater" wording. The two methods are considered equivalent and the 85th percentile was calculated to be the 0.75-inch for downtown Los Angeles. Currently the 0.75-inch storm criterion has been used throughout the County for uniformity. While requiring the 85th percentile to be used instead appears more technically appropriate, requiring calculating both criteria and using the greater value appears punitive.
5	70	D.6.c.i.4	Consider deleting this sentence since it is redundant with item VI.D.6.c.i.1 and green roofs are not feasible not only based on the provisions of this order but also due to regional climate and implementability considerations.
6	70	D.6.c.ii.2	Add "lack of opportunities for rainwater use" as one of the technical infeasibility criteria to acknowledge the fact that most of the type of development projects cannot utilize the captured volume of water.
7	71	D.6.c.ii.1.b.ii	The requirement for raised underdrain placement to achieve nitrogen removal is inconsistent with standard industry designs and is based on limited evidence that this change will improve nitrogen removal. Furthermore by raising the underdrain, other water quality problems may result such as low dissolved oxygen and bacterial growth due to the septic conditions that will be created.
8	72	D.6.c.iii.2.b	The requirement to provide treatment for the project site runoff when an offsite mitigation is provided is punitive and unfair considering that an alternative site needs to be retrofitted to retrain the equivalent volume. Please consider removing on-site requirement when mitigation occurs in an offsite location.
9	72	D.6.c.iii.4	The conditions listed for offsite projects are overly restrictive. Also considering legal and logistical constraints regarding offsite mitigation, this alternative is not very feasible.

10	75	Table 11	The effluent concentration benchmarks for treatment BMPs will not be attainable since these values were selected from the median of the stormwater BMP database site. This costly requirement will result in constantly modifying BMPs without any chance of compliance.
11	75	D.6.c.v.1.a.i	Erosion Potential (Ep) is not a widely used term in our region, and may not be the most appropriate term to be used as an indicator of the potential hydromodification impacts.
12	76	D.6.c.v.1.a.iv	The requirement for development of a new Interim Hydromodification Control Criteria is unnecessary considering there is already peak storm control requirements in the existing MS4 Permit and that the State Water Board is finalizing the statewide Hydromodification Policy.
13	77	D.6.c.v.1.c.i	The requirement to retain on site the 95th percentile storm is excessive and inconsistent with all other storm design parameters that appear in this order. It may also not be an appropriate storm in terms of soil deposits for the soil deprived streams such as Santa Clara Creek. Again consider referring to the statewide policy for a consistent and technical basis of the hydromodification requirements.
14	80	D.6.d.i.1	The requirement of 180 days for the “Local Ordinance Equivalence” may be difficult to be met due to the typical processing and public review period for changes to local municipal codes.
15	A-1	Definitions	The biofiltration definition limits the systems that allow incidental infiltration. Many municipal ordinances and established engineering practices will not allow even incidental infiltration if the planter boxes are located adjacent to a building structure. Thus this definition will exclude the most common types of planter boxes which logically have to be placed next to the building to collect roof runoff. For this reason, consider allowing biofiltration to include planter boxes without incidental infiltration since they maybe the only applicable BMPs.
<b>Development Construction Program</b>			
1	83	D.7.a.iii	MEP should be changed to BAT and BCT for consistency with the State’s General Construction Permit (GCASP).
2	83	D.7.d	Consider introducing a minimum threshold for construction sites such as those for grading permits. As proposed, minor repair works or trivial projects will be considered construction projects and will unnecessarily be subject to these provisions.
3	83	Table 12	Some of the listed BMPs will not be applicable for all construction sites. Consider replacing the title of the Table 12 to “Applicable Set of BMPs for Construction Sites”
4	84	D.7.e-j	All these provisions refer to the construction sites of greater than one acre. These sites are subject to the General Construction Permit provisions and within the authority of the State agencies. Towards ensuring compliance with these regulations, the State is collecting a significant fee that covers inspection and tracking of these facilities. We are disputing the need to establish an unnecessary parallel enforcement scheme for these sites. This is consistent with the RWQCB member(s) voice at one of the workshops.
5	84	D.7.g-j	Refer to the State’s GCASP and its SWPPP requirements to avoid duplication or conflicts.
6	85	D.7.g.ii.9	There is no need to introduce a new term/document of Erosion and Sediment Control Plan for construction sites that are already subject to GCASP’s SWPPP requirements.
7	87	Table 13	Delete. This table is the same as Table 12.
8	90	Table 17	The suggested inspections could not be possibly accommodated based on current resources because of the concurrent need to visit all sites. However if the GACSP funding is transferred for locally-based enforcement, a reduced number of inspections may be accommodated. See item 4.

9	90	D.7.j.ii.2.a	Consider deleting this requirement as being unnecessary. The placement of BMPs may not be needed based on the season of construction and the planned phases.
<b>Public Agency Activities Program</b>			
1	94	D.8.d	If there is a specific pollutant to address, retrofitting or any other BMP would best be accomplished through a TMDL, which is for the Permittees to determine rather than a prescribed blanket approach. As written, this is too broad of a requirement with unknown costs that is attempting to solve a problem before there is a problem. Please delete this VI.C.10.d.
2	94	D.8.d	Staff proposal states: "Each Permittee shall develop an inventory of retrofitting opportunities that meets the requirements of this Part. The goals of the existing development retrofitting inventory are to address the impacts of existing development through retrofit projects that reduce the discharges of stormwater pollutants into the MS4 and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards."  This process would require land acquisition, a feasibility analysis, no impacts to existing infrastructure, proper soils, and support of various interested stakeholders. Additionally, if a property or area is being developed/redeveloped, retrofitting the site for water quality purposes makes sense, but not for an area where no development/redevelopment is planned. Finally, the LID provisions have already included provisions for off-site mitigation, in which we recommend that regional water quality projects be considered in lieu of local-scale water quality projects that will prove difficult to upkeep, maintain, and replace, let alone have existing sites evaluated as feasible. For these reasons, this requirement should be removed.
3	95	D.8.d.v	Any retrofit activities should be the result of either an illicit discharge investigation or TMDL monitoring follow-up and will need to be addressed on a site-by-site basis. A blanket effort as proposed in a highly urbanized area is simply not feasible at this time.
4	96	D.8.e.ii	Staff proposal states: "Each Permittee shall implement the following measures for flood management projects"  Flood management projects need to be clearly defined.
5	102	D.8.h.vii.1	This requirement appears to be an "end-run" around the lack of catch basin structural BMPs in areas not covered by Trash TMDLs. The requirement has the potential to be extraordinarily economically burdensome. If an area is NOT subjected to a Trash TMDL, then the need for any mitigation devices is baseless. The MS4 permit requirements should not circumvent nor minimize the CWA 303(d) process.
6	103	D.8.h.ix	Staff proposal requires: "Infiltration from Sanitary Sewer to MS4 / Preventive Maintenance...."  The State Water Board has implemented a separate permit for sewer maintenance activities. Additional sewer maintenance requirements are redundant and unnecessary. Please delete this requirement.
<b>Illicit Connection and Illicit Discharge Elimination Program</b>			
1	-	D.9	A definition of "outfall" is required for clarity. An "outfall" for purposes of "non-stormwater outfall-based monitoring program" should be defined as "major outfall" pursuant to Clean Water Act 40CFR 122.26. Please revise each mention of "outfall" to read "major outfall" when discussing "non-stormwater outfall-based monitoring program".

2	106	D.9.a	Some small cities do not have digital maps. In the "General" category of Section 11, please provide a 1 year time schedule for cities to create digital maps OR provide the municipality the ability to develop comprehensive maps of the storm sewer system in any format.
3	107	D.9.b.i.1	<p>Omit the comment, "Each mapped MS4 outfall shall be located using geographical positioning system (GPS) and photographs of the outfall shall be taken to provide baseline information to track operation and maintenance needs over time." This requirement is cost prohibitive and of little value because many City outfalls are underground and could not be accurately located or photographed. Photographs of outfalls in channels have little value since data required is already included on "As-Built" drawings. Geographic coordinates can easily be obtained using Google Earth or existing GIS coordinate systems.</p> <p>"The contributing drainage area for each outfall should be clearly discernable..." The scope of this requirement would involve thousands of records of drainage studies. The Regional Board should be aware that this requirement would be very labor intensive, time consuming, and very costly.</p>
4	107	D.9.b.iii	Storm drain maps should show watershed boundaries which by definition provide the location and name of the receiving water body. Please revise (3) to read "The name of all receiving water bodies from those MS4 major outfalls identified in (1).
5	108	D.9.c.i	The LA Permit Group proposes "non-stormwater outfall-based monitoring program" to be flow based monitoring. Please revise item (4) of 11., c. i. to read "(4) monitoring flow of unidentified or authorized non-stormwater discharges, and..."
6	108	D.9.c.i.4	"Monitoring of unknown or authorized discharges" "Authorized" discharges are exempted or conditionally exempted for various reasons. Monitoring authorized discharges is monitoring for the sake of monitoring and offers no clear goal or water quality benefit. Please delete this requirement. If the source of a discharge is unknown, then monitoring may be used as an optional tool to identify the culprit.
7	109	D.9.d.i	Please revise the proposed language to "Permittee/Permittees shall develop written procedures for conducting investigations to identify the source of <b>suspected</b> illicit discharges, including procedures to eliminate the discharge once source is located." It is not know if a discharge is illicit until the investigation is completed.
8	109	D.9.d.iii.1	"Illicit discharges suspected of sanitary sewage... shall be investigated first." ICID inspectors should be allowed to make the determination of which event should be investigated first. For example, a toxic waste spill or a truck full of gasoline spill should take precedence over a sewage spill. This requirement should be amended to the "most toxic or severe threat to the watershed" shall be investigated first.

**Section: VI. E. TMDLs**

No.	Page	Citation	April 2012 Comments	July 2012 Comments
1	pages 111 - 123 and Attachments K - R	TMDL	<p>Santa Monica Bay Beaches Bacteria TMDL (SMBBB TMDL) is currently being reconsidered. As part of that reconsideration the summer dry weather targets must be revised to be consistent with the reference beach/anti-degradation approach established for the SMBBB TMDL and with the extensive data collected over that past seven years since original adoption of the SMBBB TMDL. This data clearly shows that natural and non-point sources result in 10% exceedances during dry weather. Data collected at the reference beach since adoption of the TMDL, as tabulated in Table 3 of the staff report of the proposed revisions to the Basin Plan Amendment, demonstrate that natural conditions associated with freshwater outlets from undeveloped watersheds result in exceedances of the single sample bacteria objectives during both summer and winter dry weather on approximately 10% of the days sampled.</p>	<p>This is a critical issue that was not addressed in the recent reopener. Statement that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included.</p>
	pages 111 - 123 and Attachments K - R	TMDL	<p>(continued from above) Thus the previous Source Analysis in the Basin Plan Amendment adopted by Resolution No. 02-004 which stated that "historical monitoring data from the reference beach indicate no exceedances of the single sample targets during summer dry weather and on average only three percent exceedance during winter dry weather" was incorrect and based on a data set not located at the point zero compliance location. Continued allocation of zero summer dry weather exceedances in the proposed Basin Plan Amendment is in direct conflict with the stated intent to utilize the reference beach/anti-degradation approach and ignores the scientifically demonstrated reality of natural causes and non-point sources of indicator bacteria exceedances.</p>	<p>This is a critical issue that was not addressed in the recent reopener. The reference beach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included</p>

2	pages 111 - 123 and Attachments K - R	TMDL	Continued use of the zero summer dry weather exceedance level will make compliance the SMBBB TMDL impossible for the Jurisdictional agencies. This is also in conflict with the intent of the Regional board as expressed in finding 21 of Resolution 2002-022 "that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas".	This is a critical issue that was not addressed in the recent reopener. The reference beach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included
3	pages 111 - 123 and Attachments K - R	TMDL	The SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) was approved by the Regional Board staff and that CSMP should be incorporated into the TMDL monitoring requirements of the next MS4 Permit. The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week, thus it is highly confusing and misleading to refer to "daily monitoring". The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week.	The problem with sites monitored two days a week has not been corrected. Please provide clarification that this issue could be address and would supersede the TMDL if submitted in an integrated monitoring plan. This is critical for summer dry weather and 5-day per week sites.
4	pages 111 - 123 and Attachments K - R	TMDL	This discussion in this section devoted to the SMBBB TMDL seems to create confusion regarding the meaning of the terms "water quality objectives or standards, and "receiving water limitations" and "water quality-based effluent limitations". Water quality objectives or water quality standards are those that apply in the receiving water. Water Quality Effluent Based Limits apply to the MS4. So the "allowable exceedance days" for the various conditions of summer dry weather, winter dry weather and wet weather should be referred to as "water quality-based effluent limitations" since those are the number of days of allowable exceedances of the water quality objectives that are being allowed for the MS4 discharge under this permit. While the first table that appears under this section at B.1 (b) should have the	In effect the effluent limitations are stricter than the receiving water standards. This is inconsistent with law and creates a situation in which permittees are out of compliance at the effective date of this permit. Please adjust so that limits are consistent with standards and not exceeding standards.

			heading "water quality standards" or "water quality objectives" rather than the term "effluent limitations".	
5	pages 111 - 123 and Attachments K - R	TMDL	While it makes sense for the Jurisdictional Groups previously identified in the TMDLs to work jointly to carry out implementation plans to meet the interim reductions, only the responsible agencies with land use or MS4 tributary to a specific shoreline monitoring location can be held responsible for the final implementation targets to be achieved at each individual compliance location. An additional table is needed showing the responsible agencies for each individual shoreline monitoring location.	A table is still needed and should be developed. Perhaps referred to in this section but placed in the Watershed Management Plan and then approved by Executive Officer with the plan
6	pages 111 - 123 and Attachments K - R	TMDL	The Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4 based on estimates from limited data on existing stormwater discharges which resulted in a waste load allocation for stormwater that is lower than necessary to meet the TMDL targets, in the case of DDT far lower than necessary. EPA stated that "If additional data indicates that existing stormwater loadings differ from the stormwater waste load allocations defined in the TMDL, the Los Angeles Regional Water Quality Control Board should consider reopening the TMDL to better reflect actual loadings." [USEPA Region IX, SMB TMDL for DDTs and PCBs, 3/26/2012]	Same comment
7	pages 111 - 123 and Attachments K - R	TMDL	In order to avoid a situation where the MS4 permittees would be out of compliance with the MS4 Permit if monitoring data indicate that the actual loading is higher than estimated and to allow time to re-open the TMDL if necessary, recommend as an interim compliance objective WQBELs based on the TMDL numeric targets for the sediment fraction in stormwater of 2.3 ug DDT/g of sediment on an organic carbon basis, and 0.7 ug PCB/g sediment on an organic	Same comment

			carbon basis.	
8	pages 111 - 123 and Attachments K - R	TMDL	Although the Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4, they should be translated as WQBELs in a manner such that watershed management areas, subwatersheds and individual permittees have a means to demonstrate attainment of the WQBEL. Recommend that the final WLAs be expressed as an annual mass loading per unit area, e.g., per square mile. This in combination with the preceding recommendation for an interim WQBEL will still serve to protect the Santa Monica Bay beneficial uses for fishing while giving the MS4 Permittees time to collect robust monitoring data and utilize it to evaluate and identify controllable sources of DDT and PCBs.	Please clarify this situation would be covered under the new provisions for USEPA established TMDLs opens the door for allowing Permittees to address this through their plans
9	pages 111 - 123 and Attachments K - R	TMDL	The Machado Lake Trash WQBELs listed in the table at C.2.c) in the staff working proposal appear to have been calculated from preliminary baseline waste load allocations discussed in the July 11, 2007 staff report for the Machado Lake Trash TMDL, rather than from the basin plan amendment. In some cases the point source land area for responsible jurisdictions used in the calculation are incorrect because they were preliminary estimates and subsequent GIS work on the part of responsible agencies has corrected those tributary areas. In other cases some of the jurisdictions may have conducted studies to develop a jurisdiction-specific baseline generation rate. The WQBELs should be expressed as they were in the adopted TMDL WLAs, that is as a percent reduction from baseline and not assign individual baselines to each city but leave that to the individual city's trash reporting and monitoring plan to clarify.	Same comment
10	pages 111 - 123	TMDL	The WLAs in the adopted Machado Lake Trash TMDL were expressed in terms of percent reduction of trash from Baseline WLA with the	Same comment

	and Attachments K - R		note that percent reductions from the Baseline WLA will be assumed whenever full capture systems are installed in corresponding percentages of the conveyance discharging to Machado Lake. As discussed in subsequent city-specific comments, there are errors in the tributary areas originally used in the staff report, but in general, tributary areas are available only to about three significant figures when expressed in square miles. Thus the working draft should not be carrying seven significant figures in expressing the WQBELs as annual discharge rates in uncompressed gallons per year. The convention when multiplying two measured values is that the number of significant figures expressed in the product can be no greater than the minimum number of significant figures in the two underlying values. Thus if the tributary area is known to only three or four significant figures, and the estimated trash generation rate is known to four significant figures, the product can only be expressed to three or four significant figures.	
11			(continued from above) Thus there should be no values to the right of the decimal place and the whole numbers should be rounded to the correct number of significant figures.	
12	pages 111 - 123 and Attachments K - R	TMDL	The Machado Lake Nutrient TMDL provides for a reconsideration of the TMDL 7.5 years from the effective date prior to the final compliance deadline. Please include an additional statement as item: 3.c)(3)"By September 11, 2016 Regional Board will reconsider the TMDL to include results of optional special studies and water quality monitoring data completed by the responsible jurisdictions and revise numeric targets, WLAs, LAs and the implementation schedule as needed."	Same comment

13	pages 111 - 123 and Attachments K - R	TMDL	Table C is not provided in the section on TMDLs for Dominguez Channel and Greater LA and Long Beach Harbors Toxic Pollutants. Please clarify and reference that Attachment D Responsible Parties Table RB4 Jan 27, 12 which was provided to the State Board and responsible agencies during the SWRCB review of this TMDL, and is posted on the Regional Board website in the technical documents for this TMDL, is the correct table describing which agencies are responsible for complying with which waste load allocations, load allocations and monitoring requirements in this VERY complex TMDL. Attachment D should be included as a table in this section of the MS4 Permit.	Partially addressed--the table provided in the Tentative Order is not the detailed Attachment D which clarifies which agencies are responsible for which portions of the TMDL--need to include that table.
14	pages 111 - 123 and Attachments K - R	TMDL	The Dominguez Channel and Greater LA and Long Beach Harbor Waters Toxic Pollutants TMDL provides for a reconsideration of the TMDL targets and WLAs. Please include an additional statement as item: 4.e) "By March 23, 2018 Regional Board will reconsider targets, WLAs and LAs based on new policies, data or special studies. Regional Board will consider requirements for additional implementation or TMDLs for Los Angeles and San Gabriel Rivers and interim targets and allocations for the end of Phase II."	Same comment
15	pages 111 - 123 and Attachments K - R	TMDL	City of Hermosa Beach is only within one watershed, the Santa Monica Bay Watershed, and so should not be shown in italics as a multi-watershed permittee.	Same comment

16	113	E.2.d.i.1.	Recommend clarifying this item by incorporating the footnote into the text and modifying this item to read as follows: "There are no violations of the interim water quality-based effluent limitation for the pollutant(s) associated with a specific TMDL at the Permittee's applicable MS4 outfall(s) which may include: a manhole or other point of access to the MS4 at the Permittee's jurisdictional boundary, a manhole or other point of access to the MS4 at a subwatershed boundary that collects runoff from more than one Permittee's jurisdiction, or may be an outfall at the point of discharge to the receiving water that collects runoff from one or more Permittee's jurisdictions."	Same comment
17	113	E.2.d.i.4.b.	Is this in effect setting a design storm for the design of structural BMPs to address attainment of TMDLs, or is it simply referring to SUSMP/LID type structural BMPs? If it is in effect setting a design storm, there needs to be some sort of exception for TMDLs in which a separate design storm is defined, e.g., for trash TMDLs where the 1-year, 1-hour storm is used.	This is not clarified, but it is still a problem as not all retrofit projects which might be used to address TMDLs may be able to handle the full 85th percentile 24-hour storm, there should be some provision for doing this through a combination of BMPs, e.g., LID plus retrofit
18	pages 111 - 123 and Attachments K - R	TMDL	Recommend not listing specific water bodies in E.5.b.(c) because then it risks becoming obsolete if new TMDLs are established for trash, or if they are reconsidered. Furthermore, it is not clear why Santa Monica Bay was left out of this list since the Marine Debris TMDL allows for compliance via the installation of for full capture devices.	Not addressed, still don't know why Santa Monica Bay Marine Debris was not included in the list at E.5.b.(c) but it is listed in E.5.a.ii and Attachment M B.
19	116-123	E.5.a - c	Recommend not listing specific waterbody/trash TMDLs here, but simply leave the reference to Attachments to identify the Trash TMDLs. Otherwise this may have to be revised in the future. Again, Santa Monica Bay Marine Debris TMDL was not included in this list, not sure whether it was an oversight or intentional?	Same comment

20	17	Findings	Not clear on what "discharges from the MS4 for which they are owners and/or operators" means.	Please clarify. The Tentative Order, states " ... each Permittee shall maintain the necessary legal authority to control the contribution of pollutants to its MS4 and shall include in its storm water management program a comprehensive planning process that includes intergovernmental coordination, where necessary." If the MS4/catch basin is owned by the LACFCD, does this mean that the LACFCD needs to control the contribution of pollutants?
21	112	E.2.b.iv	For "each Permittee responsible for demonstrating that its discharge did not cause or contribute to an exceedance," how is this going to be possible? There's allowed non-storm water discharges, a commingled system, and the LA County region is practically urbanized (impervious landscape). Additionally, a gas tanker on local freeways often discharges onto freeway drains, which connect to MS4 permittee drains - the point here is a private party as the actual discharger should be held responsible and not the MS4 permittee. Lastly, the Construction General Permit cannot establish numeric limitations without the Regional/State Boards clearly demonstrating how compliance will be achieved - the MS4 permit is overly conditioned in terms of achieving compliance and subjects MS4 permittees to violations/enforcement, and given these circumstances, the Boards need to clearly demonstrate how compliance will be achieved.	Same comment
22	116	E.4.a	This provision states "A Permittee shall comply immediately ... for which final compliance deadlines have passed pursuant to the TMDL implementation schedule." This provision is unreasonable. First, various brownfields/abandoned toxic sites exists, some of which were permitted to operate by State/Federal agencies - nothing has or will likely be done with these sites that contribute various pollutants to surface and sub-surface areas. Additionally, this permit is going to require a regional monitoring program - this program will yield results on what areas are especially prone to particular pollutants. Until these results are made known, MS4 Permittees will have a hard time knowing where to focus	Same comment

			its resources and particularly, the placement of BMPs to capture, treat, and remove pollutants. For these reasons, this provision should be revised to first assess pollutant sources and then focus on compliance with BMP implementation.	
23	116-123	E.5.c.i(1)	For reporting compliance based on Full Capture Systems, what is the significance of needing to know "the drainage areas addressed by these installations?" Unfortunately, record keeping in Burbank is limited to the location and size of City-owned catch basins. A drainage study would need to be done to define these drainage areas. As such, we do not believe this requirement serves a purpose in regards to full capture system installations and their intended function.	Same comment
24	116-123	E.5	Please clarify that cities are not responsible for retrofitting	Same comment
25	114	E. 2. e	Please add the language from interim limits E.2.d.4 a - c and EPA TMDLs to the Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations to ensure sufficient coordination between all TMDLs and the timelines and milestones that will be implemented in the Watershed Management Program.	Same comment
26	Attachment L	D.3 a - c	Please change the Receiving Water Limitations for interim and final limits to the TMDL approved table. There should be no interpretation of the number of exceedance days based on daily for weekly sampling with, especially with no explanation of the ratio or calculations, and no discussion of averaging. Please revert to the original TMDL document.	The table was adjusted, but did not eliminate the interpretation of number of exceedance days that are not expressly completed in the Santa Clara River TMDL. Remove all interpretation of number of exceedance days other than what has been expressed in the original TMDL number of days of exceedances without interpretation or recalculation.
27	111	E.2	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions	Same comment

28	116-123	5.b.ii.2	Define "partial capture devices", define "institutional controls". Permittees need to have clear direction of how to attain the "zero" discharges which will have varying degrees of calculations regardless of which compliance method is followed. Explain the Regional Board's approval process for determining how institution controls will supplement full and partial capture to attain a determination of "zero" discharge.	Same comment
29	116-123	5.b.ii.(4)	MFAC and TMRP should be an option available to the Los Angeles River	Same comment
30	pages 111 - 123 and Attachments K - R	TMDL	Substantial comments have been submitted for the Reopener of the SMBBB. Rather than restate these comments, please address these comments in the MS4.	Same comment
31	Attachment O	3.a)1	For the LA River metals, some permittees have opted out of the grouped effort. This section needs to detail how these mass-based daily limitations will be reapportioned.	Same comment
32	Attachment O, page 7	4.d	Why are "receiving Water Limitations" being inserted here? None of the other TMDLs seem to follow that format.	Same comment
33	Attachment P	P1-8	It is the permittees understanding that the lead impairment of Reach 2 of the San Gabriel River has been removed. It should be removed from the MS4 permit.	Same comment
34	pages 111 - 123 and Attachments K - R	1.c	Permittees under the new MS4 permit (those in LA County) need to be able to separate themselves from Orange County cities. Since the 0.941 kg/day is a total mass limit, it needs to be apportioned between the two counties. Also, The MS4 permit needs to contain language allowing permittees to convert grouped-base limitations to individual permittee based limitations	Same comment
35	pages 111 - 123 and Attach	Table K 8	Please remove, in its entirety, the Santa Ana River TMDLs	Same comment

	ments K - R			
36	general	general	Any TMDL, for which compliance with a waste load allocation (WLA) is exclusively set in the receiving water, shall be amended by a re-opener to also allow compliance at the outfall to allow that flexibility, or other end-of-pipe, that shall be determined by translating the WLA into non-numeric WQBELs, expressed as best management practices (BMPs). While the TMDL re-opener is pending, an affected Permittee shall be in compliance with the receiving water WLA through the implementation of permit requirements	Same comment
37	Attachment N	N1 - N9	For the Freshwater portion of the Dominguez Channel: There are no provisions for BMP implementation to comply with the interim goals. The wording appears to contradict Section E.2.d.i.4 which allows permittees submit a Watershed Management Plan or otherwise demonstrate that BMPS being implemented will have a reasonable expectation of achieving the interim goals.	Same comment
38	Attachment N	N1-N9	For Greater LA Harbor: Similar to the previous comment regarding this section. The Table establishing Interim Effluent Limitations, Daily Maximum (mg/kg sediment), does not provide for natural variations that will occur from time to time in samples collected from the field. Given the current wording the proposed Receiving Waters Limitations, even one exceedance could potentially place permittees in violation regardless of the permittees level of effort. Reference should be made in this section to Section E.2.d.i.4 which will provide the opportunity for Permittee to develop BMP-based compliance efforts to meet interim goals.	Same comment

39	Attachment N	N1-N9	For the freshwater portion of the Dominguez Channel: the wording should be clarified. Section 5.a states that "Permittees subject to this TMDL are listed in Table C." Then the Table in Section C.5.b.2 Table "Interim Effluent Limitations—Sediment", lists all permittees except the Fresh water portion of the Dominguez Channel. For clarification purposes, we request adding the phase to the first row: "Dominguez Channel Estuary (below Vermont)"	Same comment
40	111	E.2.a.i	N/A	This provision creates confusion and inconsistency with the language in the rest of the permit. By stating that the permittee <b>shall</b> demonstrate compliance through compliance monitoring points, it appears to preclude determining compliance through other methods as outlined in other portions of the permit. This provision does not reference any of the other compliance provisions in the TMDL section and could therefore be interpreted on its own as a separate compliance requirement. Additionally, the requirement to use the TMDL established compliance monitoring locations regardless of whether an approved TMDL monitoring plan or Integrated plan has been developed is not consistent with the goal of integrated monitoring outlined in the permit. This provision would be more appropriate as a monitoring and reporting requirement for the TMDL section with modified language such as "Monitoring locations to be used for demonstrating compliance in accordance with Parts VI.E.2.d or VI.E.2.e shall be established at compliance monitoring locations established in each TMDL or at locations identified in an approved TMDL monitoring plan or in accordance with an approved integrated monitoring program per Attachment E, Part VI.C.5 (Integrated Watershed Monitoring and Assessment)."
41	112	E.2.b.v.(2)	N/A	This provision should not require that the permittee demonstrate that the discharge from the MS4 <b>is treated</b> to a level that does not exceed the applicable water quality-based effluent limitation. Permittees may achieve the applicable WQBELs through means other than treatment and they should be able to demonstrate that their discharge does not exceed the applicable water quality-based effluent limitation through monitoring or other means than demonstration of treatment.
42	pages 111 - 123 and Attachments K - R	pages 111 - 123 and Attachments K - R	N/A	Suggest wet weather compliance be partially defined by a design storm

1	13-26	Findings	several related	<p>Please add findings regarding iterative process.</p> <p>The iterative process is a process of implementing, evaluating, revising, or adding new BMPs to attain water quality standards, including total maximum daily load (TMDL) waste load allocations (WLAs). The previous order lacked the iterative process, which has resulted in violations for several Los Angeles County permittees and exposure to third party litigation. However, the State Water Resources Control Board (State Board) has affirmed, in several precedential water quality orders (including WQ 99-05 and 2001-15), the inclusion of the iterative process in MS4 permits. As the State Board noted in WQ 2001-15:</p> <p>This Board has already considered and upheld the requirement that municipal storm water discharges must not cause or contribute to exceedances of water quality objectives in the receiving water. We adopted an iterative procedure for complying with this requirement, wherein municipalities must report instances where they cause or contribute to exceedances, and then must review and improve BMPs so as to protect the receiving waters.</p> <p>The iterative process goes hand-in-hand with the Receiving Water Limitation provision of this order, which is intended to address a water quality standard exceedance. An MS4 permit is a point source permit, which is defined by §40 CFR 122.2 to mean outfall or end-of-pipe. Attainment of a water quality standard in stormwater discharge is achieved in the effluent or discharge from the MS4 through the implementation of BMPs contained in a Stormwater Quality Management Plan (SQMP). If a water quality standard is frequently exceeded as determined by outfall monitoring relative to an ambient condition of the receiving water (during the 5-year term of the Order) the permittee shall be required to propose better-tailored BMPs to address the exceedance. The process includes determining (1) if the exceedances are statistically significant and if so, would require the permittee to (2) identify the source of the exceedance; and (2) propose new or intensified BMPs to be implemented in the next MS4 permit – unless the Executive Officer determines that a more immediate response is required.</p>

				(continued from above) The iterative process does not apply to non-stormwater discharges. Section 402(p)(3)(B)(ii) of the Clean Water Act only prohibits non-stormwater discharges to the MS4 and not from it as is the case with stormwater discharges. This is because Congress set two standards for MS4 discharges: one stormwater and one for non-stormwater. As noted in WQO 2009-008, the Clean Water Act and the federal storm water regulations assign different performance requirements for storm water and non-storm water discharges. These distinctions in the guidance document, the Clean Water Act, and the storm water regulations make it clear that a regulatory approach for storm water - such as the iterative approach we have previously endorsed - is not necessarily appropriate for non-storm water.
2	146-149	Fact Sheet and Permit - Unfunded Mandate	several related	It is incorrect to assert an outcome on the unfunded mandates issue in a permit; this has nothing to do with protecting water quality. The unfunded mandates process has not completed a process and these assertions are opinion. Since the Fact Sheet is part of the permit, remove this section. There are many errors and incorrect assumptions, especially around the level of effort required for this permit when compared to the current permit and the economic issues that are incorrect.

## California Stormwater Quality Association®

*Dedicated to the Advancement of Stormwater Quality Management, Science and Regulation*

February 21, 2012

Mr. Charles Hoppin, Chair  
State Water Resources Control Board  
P.O. Box 100  
Sacramento, CA 95812-0100

**Subject: Receiving Water Limitation Provision to Stormwater NPDES Permits**

Dear Mr. Hoppin:

As a follow up to our December 16, 2011 letter to you and a subsequent January 25, 2012 conference call with Vice-Chair Ms. Spivy-Weber and Chief Deputy Director Jonathan Bishop, the California Stormwater Quality Association (CASQA) has developed draft language for the receiving water limitation provision found in stormwater municipal NPDES permits issued in California. This provision, poses significant challenges to our members given the recent 9th Circuit Court of Appeals decision that calls into question the relevance of the iterative process as the basis for addressing the water quality issues presented by wet weather urban runoff. As we have expressed to you and other Board Members on various occasions, CASQA believes that the existing receiving water limitations provisions found in most municipal permits needs to be modified to create a basis for compliance

that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but also allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. To that end, we have drafted the attached language in an effort to capture that intent. We ask that the Board give careful consideration to this language, and adopt it as 'model' language for use statewide.

Thank you for your consideration and we look forward to working with you and your staff on this important matter.

Yours Truly,

Richard Boon, Chair  
California Stormwater Quality Association

cc: Frances Spivy-Weber, Vice-Chair – State Water Board  
Tam Doduc, Board Member – State Water Board  
Tom Howard, Executive Director – State Water Board Jonathan  
Bishop, Chief Deputy Director – State Water Board Alexis Strauss,  
Director – Water Division, EPA Region IX

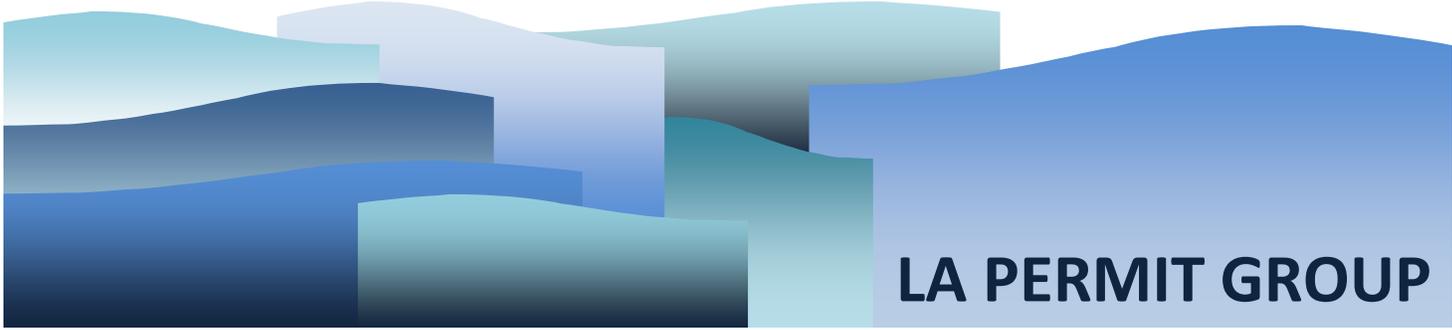

## CASQA Proposal for Receiving Water Limitation Provision

### D. RECEIVING WATER LIMITATIONS

1. Except as provided in Parts D.3, D.4, and D.5 below, discharges from the MS4 for which a Permittee is responsible shall not cause or contribute to an exceedance of any applicable water quality standard.
2. Except as provided in Parts D.3, D.4 and D.5, discharges from the MS4 of storm water, or non- storm water, for which a Permittee is responsible, shall not cause a condition of nuisance.
3. In instances where discharges from the MS4 for which the permittee is responsible (1) causes or contributes to an exceedance of any applicable water quality standard or causes a condition of nuisance in the receiving water; (2) the receiving water is not subject to an approved TMDL that is in effect for the constituent(s) involved; and (3) the constituent(s) associated with the discharge is otherwise not specifically addressed by a provision of this Order, the Permittee shall comply with the following iterative procedure:
  - a. Submit a report to the State or Regional Water Board (as applicable) that:
    - i. Summarizes and evaluates water quality data associated with the pollutant of concern in the context of applicable water quality objectives including the magnitude and frequency of the exceedances.
    - ii. Includes a work plan to identify the sources of the constituents of concern (including those not associated with the MS4to help inform Regional or State Water Board efforts to address such sources).
    - iii. Describes the strategy and schedule for implementing best management practices (BMPs) and other controls (including those that are currently being implemented) that will address the Permittee's sources of constituents that are causing or contributing to the exceedances of an applicable water quality standard or causing a condition of nuisance, and are reflective of the severity of the exceedances. The strategy shall demonstrate that the selection of BMPs will address the Permittee's sources of constituents and include a mechanism for tracking BMP implementation. The strategy shall provide for future refinement pending the results of the source identification work plan noted in D.3. ii above.
    - iv. Outlines, if necessary, additional monitoring to evaluate improvement in water quality and, if appropriate, special studies that will be undertaken to support future management decisions.
    - v. Includes a methodology (ies) that will assess the effectiveness of the BMPs to address the exceedances.
    - vi. This report may be submitted in conjunction with the Annual Report unless the State or Regional Water Board directs an earlier submittal.
  - b. Submit any modifications to the report required by the State of Regional Water Board within 60 days of notification. The report is deemed approved within 60 days of its submission if no response is received from the State or Regional Water Board.
  - c. Implement the actions specified in the report in accordance with the acceptance or approval,

including the implementation schedule and any modifications to this Order.

- d. As long as the Permittee has complied with the procedure set forth above and is implementing the actions, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the State Water Board or the Regional Water Board to develop additional BMPs.
4. For Receiving Water Limitations associated with waterbody---pollutant combinations addressed in an adopted TMDL that is in effect and that has been incorporated in this Order, the Permittees shall achieve compliance as outlined in Part XX (Total Maximum Daily Load Provisions) of this Order. For Receiving Water Limitations associated with waterbody-pollutant combinations on the CWA 303(d) list, which are not otherwise addressed by Part XX or other applicable pollutant--- specific provision of this Order, the Permittees shall achieve compliance as outlined in Part D.3 of this Order.
5. If a Permittee is found to have discharges from its MS4 causing or contributing to an exceedance of an applicable water quality standard or causing a condition of nuisance in the receiving water, the Permittee shall be deemed in compliance with Parts D.1 and D.2 above, unless it fails to implement the requirements provided in Parts D.3 and D.4 or as otherwise covered by a provision of this order specifically addressing the constituent in question, as applicable.

**SUBJECT:       Comments on the Draft NPDES Permit (Draft Order), Order No. R4-2012-XXXX; NPDES Permit NO. CAS004001, for MS4 Dischargers within the Los Angeles County Flood Control District**

The LA Permit Group (LAPG) appreciates the opportunity to provide comments on the subject Draft Order for the Los Angeles region. The Los Angeles Permit Group is a consortium of municipalities that was formed to ensure Los Angeles' stormwater is managed properly, both for flood control and water quality protection (LA Permit Group agencies list provided in Exhibit A).

The LA Permit Group was formed, to accomplish several important objectives, including:

- Promoting constructive collaboration and problem-solving between the regulated community (municipalities) and the Los Angeles Regional Water Quality Control Board (LARWQCB);
- Assisting in development of a new NPDES Permit that is capable of integrating the protection of water quality with other watershed objectives in a cost-effective and science-based manner;
- Focusing limited municipal resources on implementation of water quality protection activities that are efficient, effective and sustainable.

Over 62 Los Angeles County municipalities have actively participated in the effort to develop negotiations points and provide comments throughout the MS4 NPDES Permit development process. Comments and negotiations points are developed by each of the LA Permit Group's four Technical Sub-Committees (Development Programs, Reporting & CORE Programs, Monitoring, and TMDLs), which are then approved by the LA Permit Group. The group's consensus is represented by the Negotiations Committee. This comment letter and accompanying exhibits reflect a collaborative effort to develop a permit that will lead to water quality protection in a cost effective manner. We have a number of major and minor concerns with the Draft Order. Our comments are organized around the following major issues:

- Receiving Water Limitations
- TMDLs
- Monitoring
- MCMs
- Watershed Management Program
- Cost Implications

Our recommendations for each issue are noted in **bold** in this letter and our detailed comments on the Draft Order are provided in the Exhibits to this letter (Exhibit B).

We also want to note that the Draft Order contains a number of errors and inconsistencies. This is not surprising given the sheer magnitude of the draft document, which is the basis for our multiple requests for more time to review the more than 500 pages of Permit. As stated in our letter dated July 2, 2012 (incorporated in this letter as attached – Exhibit C) and in Public Comments at the July 12, 2012 Regional Board Meeting, the comment deadline of July 23, 2012 is far too short to address all the potential issues and concerns. On several occasions, the Regional Board staff has used the Staff Working Proposal process and workshops as a justification for the expeditious manner in which the Draft Order was developed and the curtailed 45-day public comment period. This justification is misplaced for several reasons:

- Each Staff Working Proposal was issued with only a few weeks for stakeholders to provide comments on what may be considered the most significant increase in public effort to address water quality issues in the past 20 years;
- Although we provided comments on the working proposal, it is unclear to us how the Regional Board staff addressed our comments. In some cases changes were made and other cases no changes were made. In both cases no explanation was provided. As a result we have attached our previous comment letters for the record (Exhibit D);
- By rolling out different working proposals at different times it was difficult to understand how the key provisions interacted with each other. It was only after the full draft Order was issued did we see the interaction (or lack of interaction) of the provisions;
- It is the LA Permit Group's goal to cooperatively develop the MS4 Permit to support the Regional Board's policy goal of a permit that would reduce the need for litigation. This goal is important to us as we believe that good policy and regulations are those that are developed reasonably, that Permittees are capable of complying with. Even though we have worked hard and in good faith with Regional Board staff to try to develop a Permit that is protective of water quality in a cost-effective and science-based manner, the draft Order places the Permittees in a very vulnerable position for not immediately complying with water quality standards (see our discussion below regarding Receiving Water Limitations);
- It is also important to note that stormwater managers have an obligation to adequately inform other municipal departments, legal counsel, city management and elected officials on the fiscal impact of this draft Order. The time to properly evaluate the Permit, assess its financial, legal, and personnel impacts, and inform our cities cannot be accomplished in the 45 day review period; and
- We have also heard from many cities that their executives and elected officials had registered for the League of California Cities Conference on September 5-7, 2012, months prior to the Permit adoption hearing notice. We request that the adoption hearing be rescheduled after September 6-7, 2012 to allow for elected officials and executive of the Permitted agencies to attend the hearing; it is imperative that the adoption hearing be scheduled at a time that municipal decision makers have the opportunity to attend and provide comments at the hearing.

It is essential that municipalities be given an additional 180 days to review the Permit and develop alternatives for the substantial issues found in this Draft Order. Based on the issues listed above and as communicated in our July 2<sup>nd</sup> letter and at the July 12<sup>th</sup> Regional Board meeting, we request that the our appeal for additional time be reconsidered. This could be accomplished by an additional review of a tentative Order before an adoption hearing is held.

### ***Receiving Water Limitations***

As previously outlined in our 05/14/12 comment letter on the working proposal, the Receiving Water Limitations (RWL) language in the Draft Order creates a liability to the municipalities that is unnecessary and counterproductive. We have the following significant concerns with the RWL language included in the Draft Order:

- Recent court decisions have created a new interpretation of the RWL that creates a liability for the Permittees without a commensurate increase in protection of water quality.
- The RWL as written is not a federal requirement so it is not necessary to maintain the current language.
- The RWL as written is contradictory to the Watershed Management Program.
- Alternative approaches are available to address the concerns and maintain the intent of the language in the approach; we request that RWQCB utilize this alternative language.

We feel that the RWL as included in not necessary and does not support the improvement of water quality as discussed in more detail below.

### **Creation of Unwarranted Liability**

The proposed language for the receiving water limitations provision is almost identical to the language that was litigated in the 2001 Permit. On July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.*<sup>1</sup> (*NRDC v. County of LA*) that determined that a municipality is liable for Permit violations if its discharges cause or contribute to an exceedance of a water quality standard. This represents a fundamental change in interpretation of policy and contrasts sharply with the Board's own understanding as expressed in a 2002 letter from then-Chair Diamond answering questions about the 2001 MS4 Permit in which she articulated this collective understanding that a violation of the Permit would occur only when a municipality fails to engage in good faith effort to implement the iterative process to correct the harm<sup>2</sup>. In light of the 9<sup>th</sup> Circuit's decision and based on the significant monitoring efforts being conducted by other municipal stormwater entities, municipal stormwater Permittees would be considered to be in non-compliance with their NPDES Permits. Accordingly, municipal stormwater Permittees will be exposed to considerable vulnerability, even though municipalities have little control over the sources of pollutants that create the vulnerability. Basically, the draft Order language again exposes the municipalities to enforcement action (and third party law suits) even when the municipality is engaged in an adaptive management approach to address the exceedance.

---

<sup>1</sup> No. 10-56017, 2011 U.S. App. LEXIS 14443, at \*1 (9th Cir., July 13, 2011).

<sup>2</sup> January 30, 2002. Letter from Francine Diamond, Chair, Los Angeles Regional Water Quality Control Board

The LA Permit Group would like to more fully address Board Member Glickfeld's question raised at the May 3rd workshop about how the RWL language as currently written puts cities in immediate non compliance, either individually or collectively. As noted above, significant monitoring by other MS4s in the state had demonstrated that MS4 discharges pose water quality issues and with the proposed outfall monitoring detailed in the Draft Order we would expect the runoff characteristics to be similar to other MS4 discharges in the State. As the RWL language is currently written, municipalities cannot cause or exceed water quality standards in the basin plan as soon as this Permit is adopted. While the Regional Board staff has noted that enforcement action is unlikely if the Permittees are implementing the iterative process, the reality is that municipalities are immediately vulnerable to third party lawsuits in addition to enforcement action by the Regional Board. This is in fact what happened to the City of Stockton. The City of Stockton was sued by a third party for violations of the cause/contribute prohibition even though the City was implementing a comprehensive iterative process with specific pollutant load reduction plans. This was a series of pollutants not covered by a TMDL, but that dealt with water quality exceedances. Cities will have no warning or time to react to any water quality exceedances, but still be vulnerable to third party lawsuits even when cities are diligently working to address the pollutants of concern. This will be disastrous public policy, creating a chilling effect on productive storm water programs. Also in the Santa Monica Bay, cities were sent Notices of Violation that, in essence, stated that all cities in the watershed were guilty until they proved their innocence when receiving water violations were found, in some cases miles away. The "cause and contribute" language was quoted prominently in those NOVs as justification for why the Regional Board could take such action.

It is inherently unfair and poor public policy to put cities in non-compliance on day one of the Permit without the opportunity for the cities to develop a plan of action, develop source identification, and implement a plan to address the concern. With the very recent legal interpretation that fundamentally changes how these Permits have been traditionally implemented, please understand that adjusting the Receiving Water Limitations language is a critical issue. Again, the receiving water limitation language must be modified to allow for the integrated approach (iterative/adaptive management) to address numerous TMDLs and non-TMDL water quality problems within the watershed based program in a systematic way. This is a fair and constructive approach to meet water quality standards.

### **Receiving Water Limitation Language as Written is Not Required under Federal Law**

We believe Federal Law does not require that the RWL language be written as presented in the Tentative Permit. Based on the language presented in other Permits throughout the United States, the proposed language is not the only option. The RWL provision as crafted in the contested 2001 Los Angeles permit is unique to California. Recent USEPA developed Permits (e.g. Washington D.C.<sup>3</sup>) do not contain similar limitations. Thus, we would submit that the decision to include such a provision and the structure of the provision is a State policy and therefore an opportunity exists for the Regional and State Boards to reaffirm the iterative process as the preferred approach for long-term water quality improvement.

### **Receiving Water Limitation Language as Written is Contradictory to the Watershed Management Program**

Beyond the legal/liability aspect of the RWLs we would submit that in a practical sense the RWL, as currently written, does not support the Permit's goal of protecting water quality and works against the Watershed Management Program proposal. On the one hand, the municipalities will develop watershed management

---

<sup>3</sup> NPDES Permit No. DC0000221, October 7, 2011, issued by USEPA Region 3.

programs that are based on the highest priority water quality issues within the watershed. Consistent with the Draft Order provision for the Watershed Management Program, we would expect the focus to be on TMDLs and the pollutants associated with those TMDLs. However, under the current RWL working proposal, the municipality will need to direct their resources to any and all pollutants that may cause or contribute to exceedances of water quality standards. Based on a review of other municipal outfall monitoring results in the State, there will be occasional exceedances of other non-TMDL pollutants (e.g. aluminum, iron, etc.). These exceedances may only occur once every 10 storms, but according to the current RWL proposal the municipalities must address these exceedances with the same priority as the TMDL pollutants. The LA Permit Group views this as unreasonable and ineffective use of limited municipal resources.

**We have requested that this language be revised on several occasions including written comments, workshop comments, and meetings with staff; however this issue has not yet been resolved in the Tentative Permit. An explanation is requested as to why this language remains as presented in the Draft Order is requested. Alternative Approaches are Available to Address Concerns.**

The RWL language is a critical issue for municipalities statewide and has been highlighted to the State Water Resources Control Board for consideration. Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue.

The California Association of Stormwater Quality (CASQA) has developed draft language that we feel should be used in lieu of the current language. The language provides specificity in compliance and subjects Permittees who are not engaged in good faith in the iterative process to enforcement without unnecessary and counterproductive liability for the majority of Permittees who are diligently implementing stormwater programs. We feel that the CASQA language maintains the intent of the current RWL while addressing the concerns outlined above.

**Recommendation: Develop Receiving Water Limitation language consistent with the California Association of Stormwater Quality language that was submitted in a comment letter on Caltrans Permit (Exhibit E) and on the Statewide Phase II Permit which defines action thresholds, an iterative/adaptive management process, and avoids unnecessary liability.**

### ***Total Maximum Daily Loads***

As outlined in our May 12, 2012 comment letter on the TMDL working proposal, the incorporation of TMDL WLAs into the Tentative Permit is of critical importance to the LASP. **WLAs should be incorporated using a BMP-based approach that includes an iterative approach to attain the WLAs and provides flexibility to the Permittees to address the complexities of addressing multiple TMDLs within a watershed.** The best mechanism to achieve water quality standards is by implementing BMPs, evaluating their effectiveness and implementing additional BMPs as necessary to meet TMDL WLAs. Without this process, and due to the requirement in the Draft Order to meet numeric values, our ability to effectively implement BMPs is hampered by the legal issues associated with Permit compliance.

The Draft OrderDraft Order proposes to incorporate more TMDLs than any other Permit in California issued to date. As a result, the manner in which the TMDLs are incorporated into the Permit is a critical issue to the LA Permit Group and will likely set a significant precedent for future MS4 Permits.

The rate of development of TMDLs in the Los Angeles Region was unparalleled in California, and likely the nation. A settlement agreement necessitated the much accelerated time schedule for these TMDLs. The TMDLs were developed based on the information available at the time, not the best information to identify or solve the problem. As a result, the sophistication of the TMDLs vary widely, meaning that not all TMDLs are created equal regarding knowledge of the pollutant sources, confidence in the technical analysis, availability of control measures sufficient to address the pollutant targets, etc. Additionally, the majority of the TMDLs were developed with the understanding that monitoring, special studies, and other information would be gathered during the early years of the TMDL implementation to refine the TMDLs. As such, many MS4 dischargers were told during TMDL adoption that any concerns they may have over inaccuracies in the TMDL analysis would be addressed through a TMDL reopener. The recent experience with the Santa Monica Bay Beaches Bacterial TMDL reopener demonstrates just how difficult, if not impossible, obtaining serious reconsideration of established TMDLs, irrespective of the weight of evidence presented. The proposed method of incorporating TMDL waste load allocations (WLAs) as outlined in the Draft OrderDraft Order does not effectively allow for addressing this phased method of implementing TMDLs; nor does it recognize the time, effort and complexities involved in addressing MS4 discharges; and places municipalities into non-compliance risk.

We recognize and appreciate that TMDLs must be incorporated in such a way as to require action to improve water quality. However, the Permit should recognize the articulated goal of many of the TMDLs to be adaptive management documents, using the iterative approach to achieve the goals, and consider the challenges of trying to address the non-point nature of stormwater. As such, it is imperative to have flexibility in selecting an approach to address the TMDLs and the time frame by which to implement the approach. We would like to thank Board staff for providing the opportunity to submit an implementation schedule and BMPs in context of a Watershed Management Plan to attain EPA TMDL WLAs. The same flexibility is also necessary to address Regional Board adopted TMDLs.

The LA Permit Group would submit that the Regional Board staff is making two policy decisions that have massive financial impacts to the region (studies show in the range of billions of dollars) with regards to incorporating TMDLs into a stormwater NPDES Permit:

- The inclusion of numeric effluent limitations for final TMDL WLAs.
- The use of time schedule orders to address Regional Board adopted TMDLs for which the compliance points have passed.

### **Numeric Effluent Limitations for Final TMDL WLAs**

The LA Permit Group opposes the incorporation of final WLAs solely as numeric effluent limitations in the proposed Permit language. Although staff has discretion to include numeric limits where feasible, it is not required and the use of numeric limits results in contradictions and compliance inconsistencies with the rest of the Permit requirements. Court decisions (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)<sup>4</sup>), State Board orders (Order WQ 2009-0008, In the Matter of the Petition of County of Los

---

<sup>4</sup> See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

Angeles and Los Angeles County Flood Control District, at p. 10)<sup>5</sup> have affirmed that WLAs can be incorporated as non-numeric effluent limitations.

Under 40 CFR Section 122.44 (k), the Regional Board may impose BMPs for control of storm water discharges in lieu of numeric effluent limitations when numeric limits are infeasible. It states that best management practices may be used to control or abate the discharge of pollutants when numeric effluent limitations are infeasible. In 2006, the State Board convened Blue Ribbon Panel made recommendations to the State Water Resources Control Board concluding that it was not feasible to incorporate numeric limits into Permits to regulate storm water, and at best, there could be some action level to focus on problematic drainage sheds<sup>6</sup>. Very little has changed in the technology and the feasibility of controlling storm water pollutants since 2006. What has changed is that a legally compelled, long list of TMDLs has been adopted in the LA Region in a very short time period. The draft stormwater Permit for CalTrans also states “Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 Code of Federal Regulations section 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water Permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP. To assist in determining if the BMPs are effectively achieving MEP standards, this Order requires effluent and receiving water monitoring. The monitoring data will be used to determine the effectiveness of the applied BMPs and to make appropriate adjustments or revisions to BMPs that are not effective.” The LAPG requests similar consideration as the Draft Order is a much more variable and complicated MS4 than CalTrans.

Additionally, during the May 3, 2012 MS4 Permit workshop, Regional Board staff seemed to indicate that the basis for incorporating the final WLAs as numeric effluent limitations is EPA’s 2010 memorandum pertaining to the incorporation of TMDL WLAs in NPDES Permits<sup>7</sup>. This memorandum (which is currently being reconsidered by U.S. EPA) states that “EPA recommends that, *where feasible*, the NPDES permitting authority *exercise its discretion* to include numeric effluent limitations as necessary to meet water quality standards” (emphasis added). This statement highlights the basic principle that the Regional Board has discretion in how WLAs are incorporated into a MS4 Permit. Regional Board staff commented during the workshop that staff have evaluated data and have determined numeric effluent limitations are now feasible. However, no information refuting the Blue Ribbon Panel report recommendations has been provided that demonstrates how the appropriateness of using strict numeric limits was determined and why these limits are considered feasible now even though historically both EPA and the State have made findings that developing numeric limits was likely to be infeasible.

Given the discretion available to Regional Board staff and the variability among the TMDLs with respect to understanding of the pollutant sources, confidence in the technical analysis, and availability of control measures sufficient to address the pollutant targets, **it is critical to use non-numeric water quality based**

---

<sup>5</sup> “[i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California’s NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board’s findings *supporting either the numeric or non-numeric* effluent limitations contained in the permit.” (Order WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)

<sup>6</sup> Storm Water Panel Recommendations to the California State Water Resources Control Board “The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities. June 19, 2006.

<sup>7</sup> U.S. EPA, *Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, Memorandum from U.S. EPA Director, Office of Wastewater Management James A. Hanlon and U.S. EPA Director, Office of Wetlands, Oceans, and Watershed Denise Keehner (Nov. 10, 2010).

**effluent limitations for final WLAs in this Permit.** The proposed Watershed Management Program will require quantitative analysis to select actions that will be taken to achieve TMDL WLAs. For the entire length of the TMDL compliance schedule, Permittees will be required to demonstrate compliance with interim WLAs by implementing actions that they have estimated to the best of their knowledge will result in achieving the WLAs and water quality standards. However, unless final WLAs are also expressed in this Permit as action-based water quality based effluent limitations, and if instead strict numeric limits are required for final WLAs, then, at the specified final compliance date, no matter how much the Permittee has done, no matter how much money has been spent, no matter how close to complying with the numeric values, no matter what other sources outside the Permittees' control have been identified and quantified, and no matter what other information has been developed and submitted to the Regional Board, the Permittee will be considered out of compliance with the Permit requirements. Furthermore, because of the structure established in this Permit, the Regional Board staff will have to consider all Permittees in this situation as being out of compliance with the Permit provisions if the strict numeric limits have not been met, regardless of the actions taken previously. This approach is inconsistent with the goals of good public policy, fair enforcement, fiscal responsibility and holding Permittees responsible only for discharges over which they have individual control.

#### **TMDLs Where Compliance Date Has Already Occurred**

The LA Permit Group is also concerned with the major policy decision related to the use of Time Schedule Orders for Regional Board adopted TMDLs for which the compliance date has already occurred prior to the approval of the NPDES Permit. There is a fundamental problem with the TMDL process whereby new information is not being incorporated into TMDLs. The ideal phased TMDL implementation process whereby dischargers can collect information, submit it to the Regional Board, and obtain revisions to the TMDL requirements to address data gaps and uncertainties has not occurred. As evidenced by the number of overdue Permits, the workload commitments of Regional Board staff are significant and TMDL reopeners seldom occur. Because the majority of the TMDLs have not been incorporated into Permit requirements until now, MS4 Permittees have been put in the position of trying to comply with TMDL requirements without knowing how compliance with those TMDLs would be determined and without knowing when or if promised considerations of modifications to the TMDL would occur. So Permittees would be expected to be in immediate compliance with new Permit provisions irrespective of most precedent, guidance regarding incorporation of TMDLs into MS4 Permits, and irrespective of what actions Permittees have taken to try and meet the TMDL requirements. This is neither fair nor consistent as requesting a TSO would place a Permittee in immediate non-compliance with the Permit and expose the Permittee to risk of third party lawsuits.

The LA Permit Group strongly believes that the adaptive management approach envisioned during TMDL development, whereby TMDL reopeners are used to consider new monitoring data and other technical information to modify the TMDLs, including TMDL schedules as appropriate, is the most straightforward way to address past due TMDLs. The Regional Board should use the reopener as an opportunity to adjust the implementation timelines to reflect the practical and financial reality faced by municipalities. Final WLAs should be delayed until serious reconsideration of the data that established the TMDLs so that the TMDLs can reflect information gathered during the implementation period. This will allow critically important data to be utilized to selectively modify time schedules in the TMDLs. Final compliance with TMDL Permit conditions should not occur prior to these additional TMDL reconsiderations. Additionally, the Permit should reflect any modifications to the TMDL schedules made through the reopener process, either through a delay in the issuance of the Permit until the modified TMDLs become effective, or by using its discretion to establish a specific compliance process for these TMDLs in the Permit. Providing for compliance with these TMDLs

through implementation of BMPs defined in the watershed management plans as we have requested for all other TMDLs is a feasible, fair and consistent way to achieve this goal.

#### **Recommendation:**

- **Provide a provision which requires that a TMDL be reconsidered in light of information that was not available when the TMDL was developed before the final WLAs become effective.** Whenever the reconsideration has been completed, the Permit should be reopened to make changes to any wasteload allocation, time schedules, and other pertinent information.
- **Translate WLAs into WQBELs, expressed as BMPs.**
- **State that the implementation of the BMPs using an iterative process will place the Permittee into compliance with the MS4 Permit.**
- **Provide for four compliance options for both interim and final WLAs:**
  - **Implement Actions/BMPs consistent with Watershed Management Program**
  - **Compliance at the outfall (end of pipe)**
  - **Compliance in the receiving water (river, creek, ocean)**
  - **No direct discharges**
- **Allow for the adaptive management approach to be utilized for TMDL compliance, consistent with the timelines identified in the Watershed Management Programs.**

#### **Monitoring**

The proposed monitoring program requirements have significantly increase compared to our current required efforts. Although we understand the need for monitoring to support the Permit, we believe there are number of issues within the MRP that need to more fully vetted and discussed. These issues include:

- **Receiving water monitoring should be consistent with SWAMP protocols including the requirement that ambient monitoring be conducted two days following a storm event.** Currently the receiving water monitoring is proposed to be conducted during storm events. Such an approach will not support the need to assess the receiving water quality consistent with the SWAMP approach that is used as the basis for 303(d) listing.
- **The focus and scope of non-stormwater monitoring is not commensurate with the environmental issues associated with dry weather flows.** We believe the non-stormwater monitoring should be to help identify illicit discharges and not for assessing the multitude of objectives noted in the MRP, II.E.a – c. Furthermore we would submit that the MS4s should focus its non-stormwater monitoring on discharges “into” our MS4 and not on discharges “through” or from our MS4s that may cause or contribute to exceedances of water quality standards. This is consistent with CWA section 402(p)(B).
- Regarding regional studies (MRP XI.A – B), the LAPG would submit that these studies should be conducted by the Regional or State Board. But if the Permit does require special studies, **the Permit needs to establish the mechanism/option for Permittees to participate in the studies without having to conduct the studies on an individual basis.** Furthermore, the Regional Board should be the agency to lead and coordinate these studies. The MRP appears to read that each and every Permittee must conduct the regional studies.
- **Toxicity monitoring should be limited to the receiving water only and not at the outfalls.** It’s important to establish whether is a toxicity issue in the receiving water before conducting this

expensive monitoring at the outfalls. Furthermore, recent Department of Pesticide Regulations<sup>8</sup> has severely limited the use of pyrethroid based pesticides, thus calling into question the need for expensive toxicity monitoring, especially at outfalls. And finally, should a study be deemed necessary, the Regional Board should lead this study.

- Insufficient time is allotted to prepare Coordinated Integrated Monitoring Plans (CIMP). Since the monitoring for TMDLs should continue per the TMDL schedules, the Permittees should be allowed sufficient time to prepare the CIMPs. To prepare a CIMP the Permittees will need more than a Letter of Intent to proceed. **We recommend that the Draft Order be modified to allow 12 months to submit a Memorandum of Agreement to participate in a CIMP and 24 months to submit the complete CIMP.** The time required to award the monitoring contract is 3 months, at least 6 months are needed to obtain Los Angeles County Flood Control Encroachment Permits, thus at least 9 months is needed before commencing monitoring.

### ***Minimum Control Measures***

In order to further water quality improvements, the Permit needs to set clear goals, while allowing flexibility with the programs and BMPs implemented. This is accomplished through integrated watershed planning and monitoring. This strategy has been requested by the LA Permit Group as it will allow Permittees to look at the larger picture and develop programs and BMPs based on addressing multiple pollutants. In doing so, limited local resources can be concentrated on the highest priorities. The LA Permit Group has on numerous occasions expressed our support of a watershed based approach to stormwater management. It would appear from a read of Provision VI.C.1.a (page 45) that the Board also supports this approach. We believe the opportunity for a municipality to customize the MCMs to reflect the jurisdiction's water quality conditions is absolutely critical if municipalities are to develop and implement stormwater programs that will result in environmental improvement. **We, however, suggest that the Permit ultimately establish criteria that will be used to support any customization of MCMs.** The criteria should be comprehensive but flexible. We suggest some flexibility in the criteria because the management of pollutants in stormwater is a challenging task and that the science and technology to help guide customizing MCMs are still developing. Furthermore, the municipal stormwater performance standard to reduce pollutants to the maximum extent practicable is not well defined and will depend on a number of factors<sup>9</sup>. This constraint, as well as USEPA position<sup>10</sup> that the iterative process is the basis for good stormwater management, supports the need to provide flexibility in defining the criteria for customizing MCMs. **Also, for clarification, the terms of adaptive management approach and the iterative approach need to be defined as equivalent and that they can be used interchangeably.**

### **Timeline for Implementation**

The Draft Order does not provide adequate and reasonable timelines for the start-up and implementation of the Minimum Control Measure requirements. For example, the Draft Order in provision VI.D.1.b.i requires the majority of MCMs to begin within 30 days, unless otherwise noted in the order. There are a number of new/enhanced provisions and it is fair to say that there will be a transition period between the time the Permit becomes effective and the time that the municipalities will have to modify their current stormwater management programs to be in compliance with the new Permit provisions. At the same time, consideration should be given to the time required to develop watershed based "customized" programs. The LA Permit

<sup>8</sup> [http://www.cdpr.ca.gov/docs/legbills/rulepkgs/11-004/text\\_final.pdf](http://www.cdpr.ca.gov/docs/legbills/rulepkgs/11-004/text_final.pdf).

<sup>9</sup> See E. Jennings 2/11/93 memorandum to Archie Mathews, State Water Resources Control Board.

<sup>10</sup> See Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 FR 43761 (Aug. 26, 1996).

Group requests that the Regional Board provide a revised timeline for implementation and phasing-in of the Minimum Control Measure requirements. **We request that the Permit allow a 12 month time schedule to transition from our current efforts to the new and enhanced MCMs requirements.**

### **Shifting of State Responsibility to the MS4**

The Draft Order shifts much of the State responsibilities regarding the State's General s for Construction and Industrial Activities to the municipalities. These new responsibilities have significant financial responsibilities on the permittees (ex. plan reviews, inspections time, reporting, enforcement, etc.). This is especially true for the Statewide General Construction Activities Permit (GCASP) and Provision VI.D.7. A few examples of where the Draft Order either shifts the responsibility or actually exceeds the requirements of the GCASP are listed below:

- Maintaining a database that overlaps with the States' own SMARTS database. Asking Permittees to collect the same data adds unnecessary time and expense with no benefit to water quality;
- Requiring the quantification of soil loss is redundant with the GCASP and adds additional MS4 costs.
- **Inspections will be increased by more than 200% and are redundant since the State should be responsible for implementation of its own permit particularly in light of the fact that the State collects a permit fee for implementation.**

**Those elements that shift State responsibility should be eliminated and the MCMs should be coordinated with other state and federal requirements, with particular attention to GCASP and General Industrial Activities Permit requirements.**

### **MCMs Should Reflect Effective Current Efforts**

The LA Permit Group understands that the new Permit must reflect current understanding of stormwater management and water quality issues. Where the current stormwater management effort is assessed to be inadequate, then additional efforts are warranted. However, when current efforts are assessed to be adequate for protecting water quality, then the MCMs should reflect current efforts. One significant area where the LA Permit Group believes that the current effort is protective of water quality is in the new development program. The City and County of Los Angeles as well as the City of Santa Monica have developed and adopted Low Impact Development ordinances and significant work, technical analysis, and public input have gone into the development of these ordinances. Each of these ordinances required tailoring of standards to address the unique characteristics of their city (ex. size, land uses, soils, groundwater, watershed(s), hydrology, etc.). **The Permit should reference the type of program and flexibility needed to accommodate the unique and vastly varying characteristics throughout the County.** Instead of providing detailed information in the text of the Permit, the LID provisions should outline general requirements of the program, and the details should be contained in a technical guidance manual. This point was reiterated by several speakers at the April 5, 2012 workshop, including BIA. Ultimately, it may be more constructive if the Regional Board created a template for the Permittees to use.

### **New Development MCM**

Notwithstanding our comments above, the LA Permit Group has a number of concerns with the New Development provision of the MCMs. While the LA Permit Group has concerns and need for clarification with the other MCMs we find the New Development MCM the most challenging and unsupportable. The provision is difficult to follow and the BMP selection hierarchy is confusing and at times in conflict. We have provided specific comments on this provision but it suffice to say that the LA Permit Group believes this provision should be redrafted. We have significant concerns with the following parts of the New Development MCM:

- Storm design criteria
- Alternative compliance option offsite mitigation
- Treatment control performance benchmarks
- BMP tracking and inspection
- BMP specificity and guidance
- Hydromodification

#### *Storm Design Criteria*

The Draft Order in Provision D.6.c.i (page 70) requires the developer to retain the stormwater quality design volume as calculated by either the 0.75 inch storm or the 85<sup>th</sup> percentile 24 hour storm whichever is greater. We take exception to the requirement to select the largest calculated volume. In all Permits to date in California these two design criteria were judged to be equivalent. **We recommend that the Draft Order be modified to specify that the two criteria are equivalent.** In fact, the current stormwater 2001 Permit for Los Angeles County includes four design criteria to choose from for the stormwater volume. The additional effort to assess every project to choose between two equivalent design criteria makes little sense and adds cost to any project. We recommend that the developer be allowed to choose between the two criteria without the need to calculate the largest.

#### *Alternative Compliance Option - Offsite Mitigation*

The Draft Order goes into great detail discussing an alternative compliance option to full on- site retention of the design storm volume. The alternative option takes the form of an offsite mitigation project. As currently structured it is highly unlikely that anyone will opt for this alternative compliance option. Probably the biggest hurdle for developers to overcome if they are to pursue offsite mitigation is the requirements that they must treat the project site runoff to the levels identified in Table 11. This combined with the requirement that the offsite mitigation project must be equivalent in pollutant load reduction as the original project site equates to the developer removing essentially twice as much pollutant loads as he would had accomplished on the project site had the site been able to retain the load onsite originally. This is inherently unfair. **We would recommend that the developer be required to remove only the pollutant loads that would have been removed at the project site at the mitigation site and if the mitigation site cannot meet that load reduction then the developer can implement treatment controls at the project site for the remaining differential.** Such an approach is fair and will be more readily accepted by the development community than the current proposal.

#### *Treatment Control Performance Benchmarks*

The concept of establishing benchmarks for post construction BMPs was initially developed in the 2009 Ventura MS4 Permit. However, there is a significant different between the Permits. The Ventura County's NPDES MS4 Permit requires the project developer to determine the pollutant of concern(s) for the development project and use this pollutant as the basis for selecting a top performing BMP. In the case of the Draft Order, there is no determination of the pollutant of concern for the development project. Instead post construction BMPs must meet all the benchmarks established in Table 11. Unfortunately, no one traditional post construction BMP (non-infiltration BMPs) is capable of meeting all the benchmarks and thus the developer will not be able to select a BMP. **We recommend that provision VI.D.6.c.iv.(1)(a) (page 74) be modified so that the selection of post construction BMPs is consistent with the Ventura Permit and is based**

**on the development site's pollutant of concern(s) and the corresponding top performing BMP(s) that can meet the Table 11 benchmarks.**

#### *BMP Tracking and Inspection*

In the Draft Order provision VI.D.6.d the Permittees are being required to track and inspect post construction BMPs including LID measures. The provision does allow that such effort can be addressed by the project developer but even with this consideration the provision is onerous for city staff as this would still require significant staff time (ex. plan reviews, data entry, letter preparation and enforcement, etc.). This is especially true for LID measures which if planned and designed correctly will include a large number of measures (planter boxes, infiltration trenches, swales, etc.) on every site. Furthermore most of the LID measures will be infiltration type measures which are difficult to inspect and should be only inspected in wet weather when one can ascertain that the LID measures are operating correctly. This inspection concept when taken to the extreme will mean that municipalities will be inspecting LID measures all over the community and only during rain events. This is just flat unreasonable and cost prohibitive for the municipality. Furthermore, the cost for implementation (e.g. inspection, monitoring, enforcement, etc.) are not shown to be commensurate with any corresponding improvement in water quality. **We recommend that the tracking and inspection of post construction BMPs be limited to only the conventional BMPs (e.g. detention basins, wetlands, etc.); alternatively require the MS4 to spot check a limited number of LID measures to ascertain how well they are operating.**

#### *BMP Specificity*

The Draft Order in Attachment H provides detail specifications for biofiltration and bioretention BMPs. The LA Permit Group believes that such specificity, although well intended, is counterproductive. Such specificity is equivalent to a wastewater NPDES Permit specifying the grain size in the multimedia filtration unit. It is more appropriate to establish the performance standard for the BMP and to allow the MS4 to develop design specifications to meet the standard. **We recommend that Attachment H be removed and a provision be established that establishes a collaborative approach to promote a technical guidance manual that would include the design specifications for bioretention/biofiltration.**

#### *Hydromodification*

The LAPG would submit that it is premature to change the hydromodification criteria, specifically the interim criteria. In our current 2001 order, Permittees were required to develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study. **We believe it more constructive to keep with the previously developed hydromodification criteria and not revised it for the interim until the final criteria can be developed by the State.** A change now and then one later on just adds confusion to the development process and creates additional work for a limited or non-existent water quality improvement. The effort under the 2001 Permit should be sufficient until such time the final criteria are developed.

#### **Public Agency MCM**

The Draft Order identifies a number of requirements for public agency MCMs. Our detailed comments are attached, but there are two issues we want to highlight here. First is provision VI.D.8.h.vii (page 102) which specifies additional trash BMPs regardless of whether the area is subject to a trash TMDL. We take exception to this approach, as the MCM requires prioritization, cleaning and inspection of catch basins as well as street sweeping and other management control measures to address trash at public events. And then even if the

Municipality is controlling trash through these control measures, the Municipality must still install trash excluders (see page 102 regarding “additional trash management practices”). This makes little sense and **the LA Permit Group would submit that if the initial control measures are successful, then the “additional trash management practices” are unnecessary (as evident by the lack of a TMDL).**

The second issue pertains to provision VI.D.8.d (page 94) regarding retrofitting opportunities. Provision VI.D.8.d.i requires that the MS4 develop an inventory of retrofit opportunities within the public right of way but then in provision VI.D.8.d.ii, the Draft Order requires the Permittees screen existing area of development. Furthermore in provision VI.D.8.d.iii the MS4 must prioritize all existing areas of development. Reading these provisions in whole would seem to indicate that the MS4 must identify all potential retrofit sites (private or publically owned) and to prioritize the sites. This is a contentious issue and should be addressed carefully. Stormwater regulations (40 CFR 122.26.(d)(2)(iv)(4) requires consideration of retrofitting opportunities, but the consideration is limited to flood management projects (i.e. public right of way) and does not require consideration of private areas. **We recommend that for this Permit term that the retrofit provision (i.e. inventory, screening, and prioritization) be limited to public right of ways lands only.**

### **ID/IC MCM**

The Draft Order identifies a number of provisions that are fundamental to an Illicit Connection/Illegal Discharge program. These provisions include

- III. Discharge Prohibition,
- VI.A.2 Standard Provisions – Legal Authority,
- VI.D. 9 IC/ID Elimination Program,
- Attachments E, Monitoring and Reporting and
- Attachment G Non-stormwater Action Levels.

When combined, the ID/IC program will require a significant effort and not always effective. We have provided specific comments on these provisions in the Exhibit to this letter but we would like to highlight two of the more significant issues. First, is the magnitude of the dry weather monitoring being required. The TMDLs monitoring programs have already identified, to a large extent, a comprehensive non-stormwater monitoring program. **As such, the TMDL monitoring program should be the basis for the “non-stormwater outfall based monitoring program” and both should be identified in an Integrated Watershed Monitoring Program.**

The second issue pertains to the non-stormwater action levels established in Attachment G. One of the goals of establishing non-stormwater action levels is to assist Permittees in identifying illicit connections and/or discharges at outfalls. Exceedances of action levels can help Permittees prioritize and focus resources on areas that are having a real impact on water quality. Unfortunately, as currently drafted, the non-stormwater action levels do not accomplish this goal. The action levels established in the Draft Order are derived from Basin Plan, CTR, or COP water quality objectives. The non-stormwater action levels do not facilitate the consideration of actual impacts (e.g., excess algal growth), have no nexus to receiving water conditions, and do not address NAL issues unrelated to illicit discharges (e.g., groundwater). The action levels and the associated monitoring specified in the Monitoring and Reporting Program would require Permittees to investigate and address issues on an outfall-by-outfall basis, even if the receiving water is in compliance with all water quality standards. This will not assist Permittees in prioritizing resources on outfalls that are clearly having an impact on water quality. **We recommend that the Permit allow the Watershed Management Programs to guide the customization of the NALs based on the highest water quality priorities in each**

watershed and to establish them at a level that would provide better assurance that illicit discharges can actually be found and not have every outfall become a high priority outfall. If NALs are not established through the Watershed Management Programs, or Permittees should be required to use the default NALs and approach identified in Attachment G.

### ***Watershed Management Programs***

Overall, the LA Permit Group supports the Regional Board's proposed approach to address high priority water quality issues through the development and implementation of a Watershed Management Program. However, one of our biggest concerns continues not be addressed, is the Draft Order proposed timeline for developing the watershed management program(s). The Draft Order allows the municipalities only one year to develop a comprehensive watershed management program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate and run the models based on relevant data, draft the plans, and obtain necessary approvals from political bodies. As a comparison, the City of Torrance required two years to prepare a comprehensive water quality plan that addressed a suite of TMDLs, similar to what is being considered in the watershed management program. **We believe that it will require at least 24 months to develop a draft plan that is comprehensive, analytically supported, and implementable. Alternatively we would suggest a phased approach where some initial efforts (e.g. MOUs, retrofit inventory) could be completed and submitted within 12 months but allow 24 month timeline for the more complicated or resource intensive efforts.**

We also offer the following comments regarding the Watershed Management Program (our line item by line item review and comments are attached):

- The Draft Order seems to be silent on the critical issue of sources of pollutants outside the authority of MS4 Permittees (e. g. aerial deposition, upstream contributions, discharges allowed by another NPDES permit, etc.). **We request that Permittees be allowed to demonstrate that some sources are outside the Permittee's control and not responsible for managing or abating those sources.**
- **The Permit needs to clearly state that watershed management programs and the reasonable assurance analysis can be used for TMDL compliance purposes.**
- **The Permit should clarify that the adaptive management process is equivalent to the iterative process described in the Receiving Water Limitation provision and provide the legal justification for the adaptive management process.**
- More careful consideration should be given to the frequency and extent of the reporting and adaptive management assessments. The current Draft Order results in a significant annual effort and the LA Permit Group members question the value of such an effort. Current reporting appears to overwhelm Regional Board staff resources and has provided limited feedback to the municipalities. We believe that the reporting can be streamlined and that the jurisdictional and watershed reporting should be combined. **Furthermore, we recommend that the adaptive management process be applied every two years instead of the every year frequency noted in the Draft Order.**
- It is unclear how the current implementation of our stormwater program and TMDL compliance will be handled during the interim period before development of the watershed management program. For those entities that choose this path, **the LA Permit Group requests that current, significant efforts in our existing programs and implementation plans be allowed to continue while we evaluate new MCMs as part of the watershed management program.**

- **Consideration of the technical and financial feasibility of complying with water quality standards should be included in the watershed management program.**
- **The timing of revising the Watershed Management Programs is in conflict and confusing. There should only be one revision to the Watershed Management Program, and only when adaptive management/iterative process demonstrates that the modification is warranted.**
- **The adaptive management/iterative approach and timing should be consistent between individual Permittees (“jurisdictional watershed management program”) and the watershed management program.**

### ***Cost/Economic Implications***

Regarding fiscal resources, the LA Permit Group would like to reemphasize the limited parameters in which municipalities operate. The Draft Order (page 40) requires municipalities to exercise its authority to secure fiscal resources necessary to meet all of the requirements of the Permit. We have reservations as to whether this provision is legal given that it appears to violate the State Constitution, Article XVI, Section 18. That being said, Permittees have a limited amount of funds that are under local control. Any additional funds needed to raise money for stormwater programs would need to come from increased/new stormwater fees and grants. **New fees for stormwater are regulated under the State’s Prop 218 regulations, and require a public vote. Therefore, raising new fees is an item that is not under direct control of the municipalities – the Permit language should reflect this.** Furthermore, in addition to clean water, local resources are also directed to a number of health, safety and quality of life factors. Thus, all these factors need to be developed in balance with each other. This requires a strategic process and that will take time to get right. We request that the Regional Board develop the Permit conditions based on a reasonable timeframe in balance with the existing economy and other health, safety, regulatory and quality of life factors that local agencies are responsible for.

The LA Permit Group also wants to address the issue of whether or not these Permit requirements constitute an unfunded mandate. The Fact Sheet makes a unilateral statement that the Regional Board has determined that the Permit requirements do not exceed Federal requirements and therefore are not unfunded mandates. No back up information is provided to substantiate this claim. Our request is for the Regional Board to substantiate this statement for each section of the Permit. We also want to point out that the court decisions on unfunded mandates claims are still on appeal, and it is premature to conclude on the merits of the appeal.

As previously discussed at workshops, and in comment letters, and requested by many Board Members, the economic implications of the many proposed Permit requirements are of critical importance. It is also worth noting that the cost for complying with both the stormwater regulations and TMDL requirements should be carefully considered. This point is highlighted in the March 20, 2012 memo<sup>11</sup> from OMB to heads of executive departments and agencies (including USEPA) which clarified Presidential Executive Order 13563. This Order requires the agencies to take into account among other things, and to the extent practicable, the costs of cumulative regulations. This is particularly relevant for this Draft Order where we have the convergence of TMDLs and stormwater regulations. Although we have not had sufficient time to assess the cost for the new stormwater requirements, the County of Los Angeles has completed an analysis (using the Los Angeles County BMP Decision Support System model) to assess the effort required to implement low impact development retrofits throughout Los Angeles County to address all TMDLs and 303(d) listings. This model roughly estimated that, to meet these water quality standards, the area would have to spend between \$17 billion and

---

<sup>11</sup> Cass R. Sunstein, Executive Office of the President, OMB memorandum for the Heads of Executive Departments and Agencies regarding Cumulative Effects of Regulations, March 20, 2012.

\$42 billion. Los Angeles River Watershed Bacteria TMDL could cost up to \$5.4 billion for full, inclusive, implementation costs for that watershed alone for only one pollutant. Even if the Water Quality Funding Initiative passes (and it is far from guaranteed to pass), it would take a full 20 years dedicating the entire fund to the Los Angeles River Bacteria TMDL to pay for these requirements. It would require over 60 years paying for the larger estimate. In the fact sheet, Regional Board staff stated that the TMDL costs were considered during the TMDL adoption process. However, given Executive Order 13563, we would submit that the Board should consider all costs associated with the management of stormwater. With these types of economic implications, **it is critical that this Regional Board and their staff more carefully evaluate comments and provide additional, extended comment periods for these requirements.**

In closing, we thank you for the opportunity to comment on the Draft Order and we look forward to meeting with you to discuss our comments and to explore alternative approaches. However, we must reiterate the need for more time to review and analyze this Draft Order. In spite of the Regional Board staff statement<sup>12</sup> that there has been a myriad of opportunities to present our concerns and comments, we believe otherwise. The LAPG would submit that we have not had an opportunity to voice our concerns to the Regional Board members themselves as we have been limited (in some cases prevented) in responding to questions posed by the Board members during different workshops. Consequently, **we respectfully request that that the Board provide another complete second draft Tentative Order with an additional review period to allow Permittees to have at least a total of 180 days to discuss and review the full document.** We believe it important to review the entire draft Permit to better understand the relationship among the various provisions; this is especially true for the monitoring provision and its relationship to the watershed management program. We also believe that the Regional Board staff will be hard pressed to consider and respond to all the comments that will be submitted on the Draft Order. Thus, it is advantageous to all parties that more time is provided to craft a permit that is implementable and protective of water quality. We request the issues presented in our letter are resolved in a revised Permit draft. . Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,

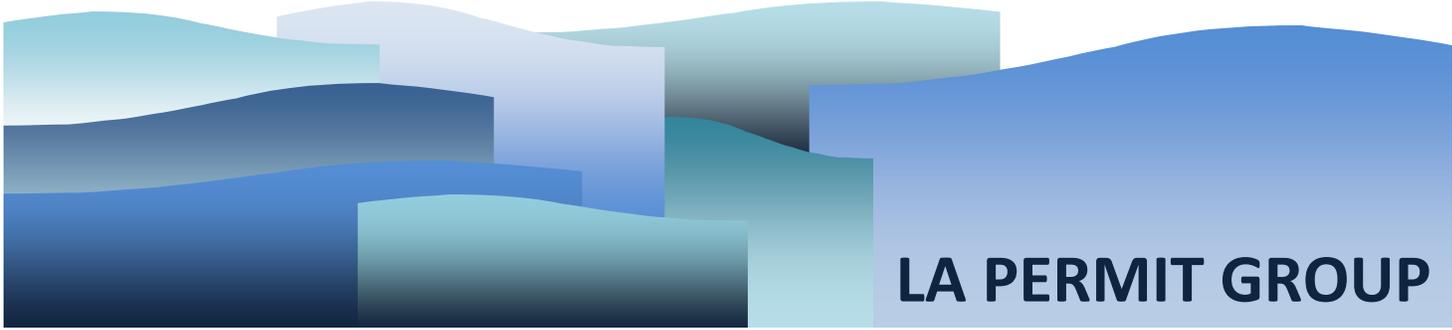

Heather M. Maloney, Chair  
LA Permit Group

**SUBJECT: Comments on the Draft NPDES Permit (Draft Order), Order No. R4-2012-XXXX; NPDES Permit NO. CAS004001, for MS4 Dischargers within the Los Angeles County Flood Control District**

The LA Permit Group (LAPG) appreciates the opportunity to provide comments on the subject Draft Order for the Los Angeles region. The Los Angeles Permit Group is a consortium of municipalities that was formed to ensure Los Angeles' stormwater is managed properly, both for flood control and water quality protection (LA Permit Group agencies list provided in Exhibit A).

The LA Permit Group was formed, to accomplish several important objectives, including:

- Promoting constructive collaboration and problem-solving between the regulated community (municipalities) and the Los Angeles Regional Water Quality Control Board (LARWQCB);
- Assisting in development of a new NPDES Permit that is capable of integrating the protection of water quality with other watershed objectives in a cost-effective and science-based manner;
- Focusing limited municipal resources on implementation of water quality protection activities that are efficient, effective and sustainable.

Over 62 Los Angeles County municipalities have actively participated in the effort to develop negotiations points and provide comments throughout the MS4 NPDES Permit development process. Comments and negotiations points are developed by each of the LA Permit Group's four Technical Sub-Committees (Development Programs, Reporting & CORE Programs, Monitoring, and TMDLs), which are then approved by the LA Permit Group. The group's consensus is represented by the Negotiations Committee. This comment letter and accompanying exhibits reflect a collaborative effort to develop a permit that will lead to water quality protection in a cost effective manner. We have a number of major and minor concerns with the Draft Order. Our comments are organized around the following major issues:

- Receiving Water Limitations
- TMDLs
- Monitoring
- MCMs
- Watershed Management Program
- Cost Implications

Our recommendations for each issue are noted in **bold** in this letter and our detailed comments on the Draft Order are provided in the Exhibits to this letter (Exhibit B).

We also want to note that the Draft Order contains a number of errors and inconsistencies. This is not surprising given the sheer magnitude of the draft document, which is the basis for our multiple requests for more time to review the more than 500 pages of Permit. As stated in our letter dated July 2, 2012 (incorporated in this letter as attached – Exhibit C) and in Public Comments at the July 12, 2012 Regional Board Meeting, the comment deadline of July 23, 2012 is far too short to address all the potential issues and concerns. On several occasions, the Regional Board staff has used the Staff Working Proposal process and workshops as a justification for the expeditious manner in which the Draft Order was developed and the curtailed 45-day public comment period. This justification is misplaced for several reasons:

- Each Staff Working Proposal was issued with only a few weeks for stakeholders to provide comments on what may be considered the most significant increase in public effort to address water quality issues in the past 20 years;
- Although we provided comments on the working proposal, it is unclear to us how the Regional Board staff addressed our comments. In some cases changes were made and other cases no changes were made. In both cases no explanation was provided. As a result we have attached our previous comment letters for the record (Exhibit D);
- By rolling out different working proposals at different times it was difficult to understand how the key provisions interacted with each other. It was only after the full draft Order was issued did we see the interaction (or lack of interaction) of the provisions;
- It is the LA Permit Group's goal to cooperatively develop the MS4 Permit to support the Regional Board's policy goal of a permit that would reduce the need for litigation. This goal is important to us as we believe that good policy and regulations are those that are developed reasonably, that Permittees are capable of complying with. Even though we have worked hard and in good faith with Regional Board staff to try to develop a Permit that is protective of water quality in a cost-effective and science-based manner, the draft Order places the Permittees in a very vulnerable position for not immediately complying with water quality standards (see our discussion below regarding Receiving Water Limitations);
- It is also important to note that stormwater managers have an obligation to adequately inform other municipal departments, legal counsel, city management and elected officials on the fiscal impact of this draft Order. The time to properly evaluate the Permit, assess its financial, legal, and personnel impacts, and inform our cities cannot be accomplished in the 45 day review period; and
- We have also heard from many cities that their executives and elected officials had registered for the League of California Cities Conference on September 5-7, 2012, months prior to the Permit adoption hearing notice. We request that the adoption hearing be rescheduled after September 6-7, 2012 to allow for elected officials and executive of the Permitted agencies to attend the hearing; it is imperative that the adoption hearing be scheduled at a time that municipal decision makers have the opportunity to attend and provide comments at the hearing.

It is essential that municipalities be given an additional 180 days to review the Permit and develop alternatives for the substantial issues found in this Draft Order. Based on the issues listed above and as communicated in our July 2<sup>nd</sup> letter and at the July 12<sup>th</sup> Regional Board meeting, we request that the our appeal for additional time be reconsidered. This could be accomplished by an additional review of a tentative Order before an adoption hearing is held.

### ***Receiving Water Limitations***

As previously outlined in our 05/14/12 comment letter on the working proposal, the Receiving Water Limitations (RWL) language in the Draft Order creates a liability to the municipalities that is unnecessary and counterproductive. We have the following significant concerns with the RWL language included in the Draft Order:

- Recent court decisions have created a new interpretation of the RWL that creates a liability for the Permittees without a commensurate increase in protection of water quality.
- The RWL as written is not a federal requirement so it is not necessary to maintain the current language.
- The RWL as written is contradictory to the Watershed Management Program.
- Alternative approaches are available to address the concerns and maintain the intent of the language in the approach; we request that RWQCB utilize this alternative language.

We feel that the RWL as included in not necessary and does not support the improvement of water quality as discussed in more detail below.

### **Creation of Unwarranted Liability**

The proposed language for the receiving water limitations provision is almost identical to the language that was litigated in the 2001 Permit. On July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.*<sup>1</sup> (*NRDC v. County of LA*) that determined that a municipality is liable for Permit violations if its discharges cause or contribute to an exceedance of a water quality standard. This represents a fundamental change in interpretation of policy and contrasts sharply with the Board's own understanding as expressed in a 2002 letter from then-Chair Diamond answering questions about the 2001 MS4 Permit in which she articulated this collective understanding that a violation of the Permit would occur only when a municipality fails to engage in good faith effort to implement the iterative process to correct the harm<sup>2</sup>. In light of the 9<sup>th</sup> Circuit's decision and based on the significant monitoring efforts being conducted by other municipal stormwater entities, municipal stormwater Permittees would be considered to be in non-compliance with their NPDES Permits. Accordingly, municipal stormwater Permittees will be exposed to considerable vulnerability, even though municipalities have little control over the sources of pollutants that create the vulnerability. Basically, the draft Order language again exposes the municipalities to enforcement action (and third party law suits) even when the municipality is engaged in an adaptive management approach to address the exceedance.

---

<sup>1</sup> No. 10-56017, 2011 U.S. App. LEXIS 14443, at \*1 (9th Cir., July 13, 2011).

<sup>2</sup> January 30, 2002. Letter from Francine Diamond, Chair, Los Angeles Regional Water Quality Control Board

The LA Permit Group would like to more fully address Board Member Glickfeld's question raised at the May 3rd workshop about how the RWL language as currently written puts cities in immediate non compliance, either individually or collectively. As noted above, significant monitoring by other MS4s in the state had demonstrated that MS4 discharges pose water quality issues and with the proposed outfall monitoring detailed in the Draft Order we would expect the runoff characteristics to be similar to other MS4 discharges in the State. As the RWL language is currently written, municipalities cannot cause or exceed water quality standards in the basin plan as soon as this Permit is adopted. While the Regional Board staff has noted that enforcement action is unlikely if the Permittees are implementing the iterative process, the reality is that municipalities are immediately vulnerable to third party lawsuits in addition to enforcement action by the Regional Board. This is in fact what happened to the City of Stockton. The City of Stockton was sued by a third party for violations of the cause/contribute prohibition even though the City was implementing a comprehensive iterative process with specific pollutant load reduction plans. This was a series of pollutants not covered by a TMDL, but that dealt with water quality exceedances. Cities will have no warning or time to react to any water quality exceedances, but still be vulnerable to third party lawsuits even when cities are diligently working to address the pollutants of concern. This will be disastrous public policy, creating a chilling effect on productive storm water programs. Also in the Santa Monica Bay, cities were sent Notices of Violation that, in essence, stated that all cities in the watershed were guilty until they proved their innocence when receiving water violations were found, in some cases miles away. The "cause and contribute" language was quoted prominently in those NOVs as justification for why the Regional Board could take such action.

It is inherently unfair and poor public policy to put cities in non-compliance on day one of the Permit without the opportunity for the cities to develop a plan of action, develop source identification, and implement a plan to address the concern. With the very recent legal interpretation that fundamentally changes how these Permits have been traditionally implemented, please understand that adjusting the Receiving Water Limitations language is a critical issue. Again, the receiving water limitation language must be modified to allow for the integrated approach (iterative/adaptive management) to address numerous TMDLs and non-TMDL water quality problems within the watershed based program in a systematic way. This is a fair and constructive approach to meet water quality standards.

### **Receiving Water Limitation Language as Written is Not Required under Federal Law**

We believe Federal Law does not require that the RWL language be written as presented in the Tentative Permit. Based on the language presented in other Permits throughout the United States, the proposed language is not the only option. The RWL provision as crafted in the contested 2001 Los Angeles permit is unique to California. Recent USEPA developed Permits (e.g. Washington D.C.<sup>3</sup>) do not contain similar limitations. Thus, we would submit that the decision to include such a provision and the structure of the provision is a State policy and therefore an opportunity exists for the Regional and State Boards to reaffirm the iterative process as the preferred approach for long-term water quality improvement.

### **Receiving Water Limitation Language as Written is Contradictory to the Watershed Management Program**

Beyond the legal/liability aspect of the RWLs we would submit that in a practical sense the RWL, as currently written, does not support the Permit's goal of protecting water quality and works against the Watershed Management Program proposal. On the one hand, the municipalities will develop watershed management

---

<sup>3</sup> NPDES Permit No. DC0000221, October 7, 2011, issued by USEPA Region 3.

programs that are based on the highest priority water quality issues within the watershed. Consistent with the Draft Order provision for the Watershed Management Program, we would expect the focus to be on TMDLs and the pollutants associated with those TMDLs. However, under the current RWL working proposal, the municipality will need to direct their resources to any and all pollutants that may cause or contribute to exceedances of water quality standards. Based on a review of other municipal outfall monitoring results in the State, there will be occasional exceedances of other non-TMDL pollutants (e.g. aluminum, iron, etc.). These exceedances may only occur once every 10 storms, but according to the current RWL proposal the municipalities must address these exceedances with the same priority as the TMDL pollutants. The LA Permit Group views this as unreasonable and ineffective use of limited municipal resources.

**We have requested that this language be revised on several occasions including written comments, workshop comments, and meetings with staff; however this issue has not yet been resolved in the Tentative Permit. An explanation is requested as to why this language remains as presented in the Draft Order is requested. Alternative Approaches are Available to Address Concerns.**

The RWL language is a critical issue for municipalities statewide and has been highlighted to the State Water Resources Control Board for consideration. Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue.

The California Association of Stormwater Quality (CASQA) has developed draft language that we feel should be used in lieu of the current language. The language provides specificity in compliance and subjects Permittees who are not engaged in good faith in the iterative process to enforcement without unnecessary and counterproductive liability for the majority of Permittees who are diligently implementing stormwater programs. We feel that the CASQA language maintains the intent of the current RWL while addressing the concerns outlined above.

**Recommendation: Develop Receiving Water Limitation language consistent with the California Association of Stormwater Quality language that was submitted in a comment letter on Caltrans Permit (Exhibit E) and on the Statewide Phase II Permit which defines action thresholds, an iterative/adaptive management process, and avoids unnecessary liability.**

### ***Total Maximum Daily Loads***

As outlined in our May 12, 2012 comment letter on the TMDL working proposal, the incorporation of TMDL WLAs into the Tentative Permit is of critical importance to the LASP. **WLAs should be incorporated using a BMP-based approach that includes an iterative approach to attain the WLAs and provides flexibility to the Permittees to address the complexities of addressing multiple TMDLs within a watershed.** The best mechanism to achieve water quality standards is by implementing BMPs, evaluating their effectiveness and implementing additional BMPs as necessary to meet TMDL WLAs. Without this process, and due to the requirement in the Draft Order to meet numeric values, our ability to effectively implement BMPs is hampered by the legal issues associated with Permit compliance.

The Draft OrderDraft Order proposes to incorporate more TMDLs than any other Permit in California issued to date. As a result, the manner in which the TMDLs are incorporated into the Permit is a critical issue to the LA Permit Group and will likely set a significant precedent for future MS4 Permits.

The rate of development of TMDLs in the Los Angeles Region was unparalleled in California, and likely the nation. A settlement agreement necessitated the much accelerated time schedule for these TMDLs. The TMDLs were developed based on the information available at the time, not the best information to identify or solve the problem. As a result, the sophistication of the TMDLs vary widely, meaning that not all TMDLs are created equal regarding knowledge of the pollutant sources, confidence in the technical analysis, availability of control measures sufficient to address the pollutant targets, etc. Additionally, the majority of the TMDLs were developed with the understanding that monitoring, special studies, and other information would be gathered during the early years of the TMDL implementation to refine the TMDLs. As such, many MS4 dischargers were told during TMDL adoption that any concerns they may have over inaccuracies in the TMDL analysis would be addressed through a TMDL reopener. The recent experience with the Santa Monica Bay Beaches Bacterial TMDL reopener demonstrates just how difficult, if not impossible, obtaining serious reconsideration of established TMDLs, irrespective of the weight of evidence presented. The proposed method of incorporating TMDL waste load allocations (WLAs) as outlined in the Draft OrderDraft Order does not effectively allow for addressing this phased method of implementing TMDLs; nor does it recognize the time, effort and complexities involved in addressing MS4 discharges; and places municipalities into non-compliance risk.

We recognize and appreciate that TMDLs must be incorporated in such a way as to require action to improve water quality. However, the Permit should recognize the articulated goal of many of the TMDLs to be adaptive management documents, using the iterative approach to achieve the goals, and consider the challenges of trying to address the non-point nature of stormwater. As such, it is imperative to have flexibility in selecting an approach to address the TMDLs and the time frame by which to implement the approach. We would like to thank Board staff for providing the opportunity to submit an implementation schedule and BMPs in context of a Watershed Management Plan to attain EPA TMDL WLAs. The same flexibility is also necessary to address Regional Board adopted TMDLs.

The LA Permit Group would submit that the Regional Board staff is making two policy decisions that have massive financial impacts to the region (studies show in the range of billions of dollars) with regards to incorporating TMDLs into a stormwater NPDES Permit:

- The inclusion of numeric effluent limitations for final TMDL WLAs.
- The use of time schedule orders to address Regional Board adopted TMDLs for which the compliance points have passed.

### **Numeric Effluent Limitations for Final TMDL WLAs**

The LA Permit Group opposes the incorporation of final WLAs solely as numeric effluent limitations in the proposed Permit language. Although staff has discretion to include numeric limits where feasible, it is not required and the use of numeric limits results in contradictions and compliance inconsistencies with the rest of the Permit requirements. Court decisions (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)<sup>4</sup>), State Board orders (Order WQ 2009-0008, In the Matter of the Petition of County of Los

---

<sup>4</sup> See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

Angeles and Los Angeles County Flood Control District, at p. 10)<sup>5</sup> have affirmed that WLAs can be incorporated as non-numeric effluent limitations.

Under 40 CFR Section 122.44 (k), the Regional Board may impose BMPs for control of storm water discharges in lieu of numeric effluent limitations when numeric limits are infeasible. It states that best management practices may be used to control or abate the discharge of pollutants when numeric effluent limitations are infeasible. In 2006, the State Board convened Blue Ribbon Panel made recommendations to the State Water Resources Control Board concluding that it was not feasible to incorporate numeric limits into Permits to regulate storm water, and at best, there could be some action level to focus on problematic drainage sheds<sup>6</sup>. Very little has changed in the technology and the feasibility of controlling storm water pollutants since 2006. What has changed is that a legally compelled, long list of TMDLs has been adopted in the LA Region in a very short time period. The draft stormwater Permit for CalTrans also states “Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 Code of Federal Regulations section 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water Permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP. To assist in determining if the BMPs are effectively achieving MEP standards, this Order requires effluent and receiving water monitoring. The monitoring data will be used to determine the effectiveness of the applied BMPs and to make appropriate adjustments or revisions to BMPs that are not effective.” The LAPG requests similar consideration as the Draft Order is a much more variable and complicated MS4 than CalTrans.

Additionally, during the May 3, 2012 MS4 Permit workshop, Regional Board staff seemed to indicate that the basis for incorporating the final WLAs as numeric effluent limitations is EPA’s 2010 memorandum pertaining to the incorporation of TMDL WLAs in NPDES Permits<sup>7</sup>. This memorandum (which is currently being reconsidered by U.S. EPA) states that “EPA recommends that, *where feasible*, the NPDES permitting authority *exercise its discretion* to include numeric effluent limitations as necessary to meet water quality standards” (emphasis added). This statement highlights the basic principle that the Regional Board has discretion in how WLAs are incorporated into a MS4 Permit. Regional Board staff commented during the workshop that staff have evaluated data and have determined numeric effluent limitations are now feasible. However, no information refuting the Blue Ribbon Panel report recommendations has been provided that demonstrates how the appropriateness of using strict numeric limits was determined and why these limits are considered feasible now even though historically both EPA and the State have made findings that developing numeric limits was likely to be infeasible.

Given the discretion available to Regional Board staff and the variability among the TMDLs with respect to understanding of the pollutant sources, confidence in the technical analysis, and availability of control measures sufficient to address the pollutant targets, **it is critical to use non-numeric water quality based**

---

<sup>5</sup> “[i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California’s NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board’s findings *supporting either the numeric or non-numeric* effluent limitations contained in the permit.” (Order WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)

<sup>6</sup> Storm Water Panel Recommendations to the California State Water Resources Control Board “The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities. June 19, 2006.

<sup>7</sup> U.S. EPA, *Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, Memorandum from U.S. EPA Director, Office of Wastewater Management James A. Hanlon and U.S. EPA Director, Office of Wetlands, Oceans, and Watershed Denise Keehner (Nov. 10, 2010).

**effluent limitations for final WLAs in this Permit.** The proposed Watershed Management Program will require quantitative analysis to select actions that will be taken to achieve TMDL WLAs. For the entire length of the TMDL compliance schedule, Permittees will be required to demonstrate compliance with interim WLAs by implementing actions that they have estimated to the best of their knowledge will result in achieving the WLAs and water quality standards. However, unless final WLAs are also expressed in this Permit as action-based water quality based effluent limitations, and if instead strict numeric limits are required for final WLAs, then, at the specified final compliance date, no matter how much the Permittee has done, no matter how much money has been spent, no matter how close to complying with the numeric values, no matter what other sources outside the Permittees' control have been identified and quantified, and no matter what other information has been developed and submitted to the Regional Board, the Permittee will be considered out of compliance with the Permit requirements. Furthermore, because of the structure established in this Permit, the Regional Board staff will have to consider all Permittees in this situation as being out of compliance with the Permit provisions if the strict numeric limits have not been met, regardless of the actions taken previously. This approach is inconsistent with the goals of good public policy, fair enforcement, fiscal responsibility and holding Permittees responsible only for discharges over which they have individual control.

#### **TMDLs Where Compliance Date Has Already Occurred**

The LA Permit Group is also concerned with the major policy decision related to the use of Time Schedule Orders for Regional Board adopted TMDLs for which the compliance date has already occurred prior to the approval of the NPDES Permit. There is a fundamental problem with the TMDL process whereby new information is not being incorporated into TMDLs. The ideal phased TMDL implementation process whereby dischargers can collect information, submit it to the Regional Board, and obtain revisions to the TMDL requirements to address data gaps and uncertainties has not occurred. As evidenced by the number of overdue Permits, the workload commitments of Regional Board staff are significant and TMDL reopeners seldom occur. Because the majority of the TMDLs have not been incorporated into Permit requirements until now, MS4 Permittees have been put in the position of trying to comply with TMDL requirements without knowing how compliance with those TMDLs would be determined and without knowing when or if promised considerations of modifications to the TMDL would occur. So Permittees would be expected to be in immediate compliance with new Permit provisions irrespective of most precedent, guidance regarding incorporation of TMDLs into MS4 Permits, and irrespective of what actions Permittees have taken to try and meet the TMDL requirements. This is neither fair nor consistent as requesting a TSO would place a Permittee in immediate non-compliance with the Permit and expose the Permittee to risk of third party lawsuits.

The LA Permit Group strongly believes that the adaptive management approach envisioned during TMDL development, whereby TMDL reopeners are used to consider new monitoring data and other technical information to modify the TMDLs, including TMDL schedules as appropriate, is the most straightforward way to address past due TMDLs. The Regional Board should use the reopener as an opportunity to adjust the implementation timelines to reflect the practical and financial reality faced by municipalities. Final WLAs should be delayed until serious reconsideration of the data that established the TMDLs so that the TMDLs can reflect information gathered during the implementation period. This will allow critically important data to be utilized to selectively modify time schedules in the TMDLs. Final compliance with TMDL Permit conditions should not occur prior to these additional TMDL reconsiderations. Additionally, the Permit should reflect any modifications to the TMDL schedules made through the reopener process, either through a delay in the issuance of the Permit until the modified TMDLs become effective, or by using its discretion to establish a specific compliance process for these TMDLs in the Permit. Providing for compliance with these TMDLs

through implementation of BMPs defined in the watershed management plans as we have requested for all other TMDLs is a feasible, fair and consistent way to achieve this goal.

#### **Recommendation:**

- **Provide a provision which requires that a TMDL be reconsidered in light of information that was not available when the TMDL was developed before the final WLAs become effective.** Whenever the reconsideration has been completed, the Permit should be reopened to make changes to any wasteload allocation, time schedules, and other pertinent information.
- **Translate WLAs into WQBELs, expressed as BMPs.**
- **State that the implementation of the BMPs using an iterative process will place the Permittee into compliance with the MS4 Permit.**
- **Provide for four compliance options for both interim and final WLAs:**
  - **Implement Actions/BMPs consistent with Watershed Management Program**
  - **Compliance at the outfall (end of pipe)**
  - **Compliance in the receiving water (river, creek, ocean)**
  - **No direct discharges**
- **Allow for the adaptive management approach to be utilized for TMDL compliance, consistent with the timelines identified in the Watershed Management Programs.**

#### **Monitoring**

The proposed monitoring program requirements have significantly increase compared to our current required efforts. Although we understand the need for monitoring to support the Permit, we believe there are number of issues within the MRP that need to more fully vetted and discussed. These issues include:

- **Receiving water monitoring should be consistent with SWAMP protocols including the requirement that ambient monitoring be conducted two days following a storm event.** Currently the receiving water monitoring is proposed to be conducted during storm events. Such an approach will not support the need to assess the receiving water quality consistent with the SWAMP approach that is used as the basis for 303(d) listing.
- **The focus and scope of non-stormwater monitoring is not commensurate with the environmental issues associated with dry weather flows.** We believe the non-stormwater monitoring should be to help identify illicit discharges and not for assessing the multitude of objectives noted in the MRP, II.E.a – c. Furthermore we would submit that the MS4s should focus its non-stormwater monitoring on discharges “into” our MS4 and not on discharges “through” or from our MS4s that may cause or contribute to exceedances of water quality standards. This is consistent with CWA section 402(p)(B).
- Regarding regional studies (MRP XI.A – B), the LAPG would submit that these studies should be conducted by the Regional or State Board. But if the Permit does require special studies, **the Permit needs to establish the mechanism/option for Permittees to participate in the studies without having to conduct the studies on an individual basis.** Furthermore, the Regional Board should be the agency to lead and coordinate these studies. The MRP appears to read that each and every Permittee must conduct the regional studies.
- **Toxicity monitoring should be limited to the receiving water only and not at the outfalls.** It’s important to establish whether is a toxicity issue in the receiving water before conducting this

expensive monitoring at the outfalls. Furthermore, recent Department of Pesticide Regulations<sup>8</sup> has severely limited the use of pyrethroid based pesticides, thus calling into question the need for expensive toxicity monitoring, especially at outfalls. And finally, should a study be deemed necessary, the Regional Board should lead this study.

- Insufficient time is allotted to prepare Coordinated Integrated Monitoring Plans (CIMP). Since the monitoring for TMDLs should continue per the TMDL schedules, the Permittees should be allowed sufficient time to prepare the CIMPs. To prepare a CIMP the Permittees will need more than a Letter of Intent to proceed. **We recommend that the Draft Order be modified to allow 12 months to submit a Memorandum of Agreement to participate in a CIMP and 24 months to submit the complete CIMP.** The time required to award the monitoring contract is 3 months, at least 6 months are needed to obtain Los Angeles County Flood Control Encroachment Permits, thus at least 9 months is needed before commencing monitoring.

### ***Minimum Control Measures***

In order to further water quality improvements, the Permit needs to set clear goals, while allowing flexibility with the programs and BMPs implemented. This is accomplished through integrated watershed planning and monitoring. This strategy has been requested by the LA Permit Group as it will allow Permittees to look at the larger picture and develop programs and BMPs based on addressing multiple pollutants. In doing so, limited local resources can be concentrated on the highest priorities. The LA Permit Group has on numerous occasions expressed our support of a watershed based approach to stormwater management. It would appear from a read of Provision VI.C.1.a (page 45) that the Board also supports this approach. We believe the opportunity for a municipality to customize the MCMs to reflect the jurisdiction's water quality conditions is absolutely critical if municipalities are to develop and implement stormwater programs that will result in environmental improvement. **We, however, suggest that the Permit ultimately establish criteria that will be used to support any customization of MCMs.** The criteria should be comprehensive but flexible. We suggest some flexibility in the criteria because the management of pollutants in stormwater is a challenging task and that the science and technology to help guide customizing MCMs are still developing. Furthermore, the municipal stormwater performance standard to reduce pollutants to the maximum extent practicable is not well defined and will depend on a number of factors<sup>9</sup>. This constraint, as well as USEPA position<sup>10</sup> that the iterative process is the basis for good stormwater management, supports the need to provide flexibility in defining the criteria for customizing MCMs. **Also, for clarification, the terms of adaptive management approach and the iterative approach need to be defined as equivalent and that they can be used interchangeably.**

### **Timeline for Implementation**

The Draft Order does not provide adequate and reasonable timelines for the start-up and implementation of the Minimum Control Measure requirements. For example, the Draft Order in provision VI.D.1.b.i requires the majority of MCMs to begin within 30 days, unless otherwise noted in the order. There are a number of new/enhanced provisions and it is fair to say that there will be a transition period between the time the Permit becomes effective and the time that the municipalities will have to modify their current stormwater management programs to be in compliance with the new Permit provisions. At the same time, consideration should be given to the time required to develop watershed based "customized" programs. The LA Permit

<sup>9</sup> See E. Jennings 2/11/93 memorandum to Archie Mathews, State Water Resources Control Board.

<sup>10</sup> See Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 FR 43761 (Aug. 26, 1996).

Group requests that the Regional Board provide a revised timeline for implementation and phasing-in of the Minimum Control Measure requirements. **We request that the Permit allow a 12 month time schedule to transition from our current efforts to the new and enhanced MCMs requirements.**

### **Shifting of State Responsibility to the MS4**

The Draft Order shifts much of the State responsibilities regarding the State's General s for Construction and Industrial Activities to the municipalities. These new responsibilities have significant financial responsibilities on the permittees (ex. plan reviews, inspections time, reporting, enforcement, etc.). This is especially true for the Statewide General Construction Activities Permit (GCASP) and Provision VI.D.7. A few examples of where the Draft Order either shifts the responsibility or actually exceeds the requirements of the GCASP are listed below:

- Maintaining a database that overlaps with the States' own SMARTS database. Asking Permittees to collect the same data adds unnecessary time and expense with no benefit to water quality;
- Requiring the quantification of soil loss is redundant with the GCASP and adds additional MS4 costs.
- **Inspections will be increased by more than 200% and are redundant since the State should be responsible for implementation of its own permit particularly in light of the fact that the State collects a permit fee for implementation.**

**Those elements that shift State responsibility should be eliminated and the MCMs should be coordinated with other state and federal requirements, with particular attention to GCASP and General Industrial Activities Permit requirements.**

### **MCMs Should Reflect Effective Current Efforts**

The LA Permit Group understands that the new Permit must reflect current understanding of stormwater management and water quality issues. Where the current stormwater management effort is assessed to be inadequate, then additional efforts are warranted. However, when current efforts are assessed to be adequate for protecting water quality, then the MCMs should reflect current efforts. One significant area where the LA Permit Group believes that the current effort is protective of water quality is in the new development program. The City and County of Los Angeles as well as the City of Santa Monica have developed and adopted Low Impact Development ordinances and significant work, technical analysis, and public input have gone into the development of these ordinances. Each of these ordinances required tailoring of standards to address the unique characteristics of their city (ex. size, land uses, soils, groundwater, watershed(s), hydrology, etc.). **The Permit should reference the type of program and flexibility needed to accommodate the unique and vastly varying characteristics throughout the County.** Instead of providing detailed information in the text of the Permit, the LID provisions should outline general requirements of the program, and the details should be contained in a technical guidance manual. This point was reiterated by several speakers at the April 5, 2012 workshop, including BIA. Ultimately, it may be more constructive if the Regional Board created a template for the Permittees to use.

### **New Development MCM**

Notwithstanding our comments above, the LA Permit Group has a number of concerns with the New Development provision of the MCMs. While the LA Permit Group has concerns and need for clarification with the other MCMs we find the New Development MCM the most challenging and unsupportable. The provision is difficult to follow and the BMP selection hierarchy is confusing and at times in conflict. We have provided specific comments on this provision but it suffice to say that the LA Permit Group believes this provision should be redrafted. We have significant concerns with the following parts of the New Development MCM:

- Storm design criteria
- Alternative compliance option offsite mitigation
- Treatment control performance benchmarks
- BMP tracking and inspection
- BMP specificity and guidance
- Hydromodification

#### *Storm Design Criteria*

The Draft Order in Provision D.6.c.i (page 70) requires the developer to retain the stormwater quality design volume as calculated by either the 0.75 inch storm or the 85<sup>th</sup> percentile 24 hour storm whichever is greater. We take exception to the requirement to select the largest calculated volume. In all Permits to date in California these two design criteria were judged to be equivalent. **We recommend that the Draft Order be modified to specify that the two criteria are equivalent.** In fact, the current stormwater 2001 Permit for Los Angeles County includes four design criteria to choose from for the stormwater volume. The additional effort to assess every project to choose between two equivalent design criteria makes little sense and adds cost to any project. We recommend that the developer be allowed to choose between the two criteria without the need to calculate the largest.

#### *Alternative Compliance Option - Offsite Mitigation*

The Draft Order goes into great detail discussing an alternative compliance option to full on- site retention of the design storm volume. The alternative option takes the form of an offsite mitigation project. As currently structured it is highly unlikely that anyone will opt for this alternative compliance option. Probably the biggest hurdle for developers to overcome if they are to pursue offsite mitigation is the requirements that they must treat the project site runoff to the levels identified in Table 11. This combined with the requirement that the offsite mitigation project must be equivalent in pollutant load reduction as the original project site equates to the developer removing essentially twice as much pollutant loads as he would had accomplished on the project site had the site been able to retain the load onsite originally. This is inherently unfair. **We would recommend that the developer be required to remove only the pollutant loads that would have been removed at the project site at the mitigation site and if the mitigation site cannot meet that load reduction then the developer can implement treatment controls at the project site for the remaining differential.** Such an approach is fair and will be more readily accepted by the development community than the current proposal.

#### *Treatment Control Performance Benchmarks*

The concept of establishing benchmarks for post construction BMPs was initially developed in the 2009 Ventura MS4 Permit. However, there is a significant different between the Permits. The Ventura County's NPDES MS4 Permit requires the project developer to determine the pollutant of concern(s) for the development project and use this pollutant as the basis for selecting a top performing BMP. In the case of the Draft Order, there is no determination of the pollutant of concern for the development project. Instead post construction BMPs must meet all the benchmarks established in Table 11. Unfortunately, no one traditional post construction BMP (non-infiltration BMPs) is capable of meeting all the benchmarks and thus the developer will not be able to select a BMP. **We recommend that provision VI.D.6.c.iv.(1)(a) (page 74) be modified so that the selection of post construction BMPs is consistent with the Ventura Permit and is based**

**on the development site's pollutant of concern(s) and the corresponding top performing BMP(s) that can meet the Table 11 benchmarks.**

#### *BMP Tracking and Inspection*

In the Draft Order provision VI.D.6.d the Permittees are being required to track and inspect post construction BMPs including LID measures. The provision does allow that such effort can be addressed by the project developer but even with this consideration the provision is onerous for city staff as this would still require significant staff time (ex. plan reviews, data entry, letter preparation and enforcement, etc.). This is especially true for LID measures which if planned and designed correctly will include a large number of measures (planter boxes, infiltration trenches, swales, etc.) on every site. Furthermore most of the LID measures will be infiltration type measures which are difficult to inspect and should be only inspected in wet weather when one can ascertain that the LID measures are operating correctly. This inspection concept when taken to the extreme will mean that municipalities will be inspecting LID measures all over the community and only during rain events. This is just flat unreasonable and cost prohibitive for the municipality. Furthermore, the cost for implementation (e.g. inspection, monitoring, enforcement, etc.) are not shown to be commensurate with any corresponding improvement in water quality. **We recommend that the tracking and inspection of post construction BMPs be limited to only the conventional BMPs (e.g. detention basins, wetlands, etc.); alternatively require the MS4 to spot check a limited number of LID measures to ascertain how well they are operating.**

#### *BMP Specificity*

The Draft Order in Attachment H provides detail specifications for biofiltration and bioretention BMPs. The LA Permit Group believes that such specificity, although well intended, is counterproductive. Such specificity is equivalent to a wastewater NPDES Permit specifying the grain size in the multimedia filtration unit. It is more appropriate to establish the performance standard for the BMP and to allow the MS4 to develop design specifications to meet the standard. **We recommend that Attachment H be removed and a provision be established that establishes a collaborative approach to promote a technical guidance manual that would include the design specifications for bioretention/biofiltration.**

#### *Hydromodification*

The LAPG would submit that it is premature to change the hydromodification criteria, specifically the interim criteria. In our current 2001 order, Permittees were required to develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study. **We believe it more constructive to keep with the previously developed hydromodification criteria and not revised it for the interim until the final criteria can be developed by the State.** A change now and then one later on just adds confusion to the development process and creates additional work for a limited or non-existent water quality improvement. The effort under the 2001 Permit should be sufficient until such time the final criteria are developed.

#### **Public Agency MCM**

The Draft Order identifies a number of requirements for public agency MCMs. Our detailed comments are attached, but there are two issues we want to highlight here. First is provision VI.D.8.h.vii (page 102) which specifies additional trash BMPs regardless of whether the area is subject to a trash TMDL. We take exception to this approach, as the MCM requires prioritization, cleaning and inspection of catch basins as well as street sweeping and other management control measures to address trash at public events. And then even if the

Municipality is controlling trash through these control measures, the Municipality must still install trash excluders (see page 102 regarding “additional trash management practices”). This makes little sense and **the LA Permit Group would submit that if the initial control measures are successful, then the “additional trash management practices” are unnecessary (as evident by the lack of a TMDL).**

The second issue pertains to provision VI.D.8.d (page 94) regarding retrofitting opportunities. Provision VI.D.8.d.i requires that the MS4 develop an inventory of retrofit opportunities within the public right of way but then in provision VI.D.8.d.ii, the Draft Order requires the Permittees screen existing area of development. Furthermore in provision VI.D.8.d.iii the MS4 must prioritize all existing areas of development. Reading these provisions in whole would seem to indicate that the MS4 must identify all potential retrofit sites (private or publically owned) and to prioritize the sites. This is a contentious issue and should be addressed carefully. Stormwater regulations (40 CFR 122.26.(d)(2)(iv)(4) requires consideration of retrofitting opportunities, but the consideration is limited to flood management projects (i.e. public right of way) and does not require consideration of private areas. **We recommend that for this Permit term that the retrofit provision (i.e. inventory, screening, and prioritization) be limited to public right of ways lands only.**

### **ID/IC MCM**

The Draft Order identifies a number of provisions that are fundamental to an Illicit Connection/Illegal Discharge program. These provisions include

- III. Discharge Prohibition,
- VI.A.2 Standard Provisions – Legal Authority,
- VI.D. 9 IC/ID Elimination Program,
- Attachments E, Monitoring and Reporting and
- Attachment G Non-stormwater Action Levels.

When combined, the ID/IC program will require a significant effort and not always effective. We have provided specific comments on these provisions in the Exhibit to this letter but we would like to highlight two of the more significant issues. First, is the magnitude of the dry weather monitoring being required. The TMDLs monitoring programs have already identified, to a large extent, a comprehensive non-stormwater monitoring program. **As such, the TMDL monitoring program should be the basis for the “non-stormwater outfall based monitoring program” and both should be identified in an Integrated Watershed Monitoring Program.**

The second issue pertains to the non-stormwater action levels established in Attachment G. One of the goals of establishing non-stormwater action levels is to assist Permittees in identifying illicit connections and/or discharges at outfalls. Exceedances of action levels can help Permittees prioritize and focus resources on areas that are having a real impact on water quality. Unfortunately, as currently drafted, the non-stormwater action levels do not accomplish this goal. The action levels established in the Draft Order are derived from Basin Plan, CTR, or COP water quality objectives. The non-stormwater action levels do not facilitate the consideration of actual impacts (e.g., excess algal growth), have no nexus to receiving water conditions, and do not address NAL issues unrelated to illicit discharges (e.g., groundwater). The action levels and the associated monitoring specified in the Monitoring and Reporting Program would require Permittees to investigate and address issues on an outfall-by-outfall basis, even if the receiving water is in compliance with all water quality standards. This will not assist Permittees in prioritizing resources on outfalls that are clearly having an impact on water quality. **We recommend that the Permit allow the Watershed Management Programs to guide the customization of the NALs based on the highest water quality priorities in each**

watershed and to establish them at a level that would provide better assurance that illicit discharges can actually be found and not have every outfall become a high priority outfall. If NALs are not established through the Watershed Management Programs, or Permittees should be required to use the default NALs and approach identified in Attachment G.

### ***Watershed Management Programs***

Overall, the LA Permit Group supports the Regional Board's proposed approach to address high priority water quality issues through the development and implementation of a Watershed Management Program. However, one of our biggest concerns continues not be addressed, is the Draft Order proposed timeline for developing the watershed management program(s). The Draft Order allows the municipalities only one year to develop a comprehensive watershed management program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate and run the models based on relevant data, draft the plans, and obtain necessary approvals from political bodies. As a comparison, the City of Torrance required two years to prepare a comprehensive water quality plan that addressed a suite of TMDLs, similar to what is being considered in the watershed management program. **We believe that it will require at least 24 months to develop a draft plan that is comprehensive, analytically supported, and implementable. Alternatively we would suggest a phased approach where some initial efforts (e.g. MOUs, retrofit inventory) could be completed and submitted within 12 months but allow 24 month timeline for the more complicated or resource intensive efforts.**

We also offer the following comments regarding the Watershed Management Program (our line item by line item review and comments are attached):

- The Draft Order seems to be silent on the critical issue of sources of pollutants outside the authority of MS4 Permittees (e. g. aerial deposition, upstream contributions, discharges allowed by another NPDES permit, etc.). **We request that Permittees be allowed to demonstrate that some sources are outside the Permittee's control and not responsible for managing or abating those sources.**
- **The Permit needs to clearly state that watershed management programs and the reasonable assurance analysis can be used for TMDL compliance purposes.**
- **The Permit should clarify that the adaptive management process is equivalent to the iterative process described in the Receiving Water Limitation provision and provide the legal justification for the adaptive management process.**
- More careful consideration should be given to the frequency and extent of the reporting and adaptive management assessments. The current Draft Order results in a significant annual effort and the LA Permit Group members question the value of such an effort. Current reporting appears to overwhelm Regional Board staff resources and has provided limited feedback to the municipalities. We believe that the reporting can be streamlined and that the jurisdictional and watershed reporting should be combined. **Furthermore, we recommend that the adaptive management process be applied every two years instead of the every year frequency noted in the Draft Order.**
- It is unclear how the current implementation of our stormwater program and TMDL compliance will be handled during the interim period before development of the watershed management program. For those entities that choose this path, **the LA Permit Group requests that current, significant efforts in our existing programs and implementation plans be allowed to continue while we evaluate new MCMs as part of the watershed management program.**

- **Consideration of the technical and financial feasibility of complying with water quality standards should be included in the watershed management program.**
- **The timing of revising the Watershed Management Programs is in conflict and confusing. There should only be one revision to the Watershed Management Program, and only when adaptive management/iterative process demonstrates that the modification is warranted.**
- **The adaptive management/iterative approach and timing should be consistent between individual Permittees (“jurisdictional watershed management program”) and the watershed management program.**

### ***Cost/Economic Implications***

Regarding fiscal resources, the LA Permit Group would like to reemphasize the limited parameters in which municipalities operate. The Draft Order (page 40) requires municipalities to exercise its authority to secure fiscal resources necessary to meet all of the requirements of the Permit. We have reservations as to whether this provision is legal given that it appears to violate the State Constitution, Article XVI, Section 18. That being said, Permittees have a limited amount of funds that are under local control. Any additional funds needed to raise money for stormwater programs would need to come from increased/new stormwater fees and grants. **New fees for stormwater are regulated under the State’s Prop 218 regulations, and require a public vote. Therefore, raising new fees is an item that is not under direct control of the municipalities – the Permit language should reflect this.** Furthermore, in addition to clean water, local resources are also directed to a number of health, safety and quality of life factors. Thus, all these factors need to be developed in balance with each other. This requires a strategic process and that will take time to get right. We request that the Regional Board develop the Permit conditions based on a reasonable timeframe in balance with the existing economy and other health, safety, regulatory and quality of life factors that local agencies are responsible for.

The LA Permit Group also wants to address the issue of whether or not these Permit requirements constitute an unfunded mandate. The Fact Sheet makes a unilateral statement that the Regional Board has determined that the Permit requirements do not exceed Federal requirements and therefore are not unfunded mandates. No back up information is provided to substantiate this claim. Our request is for the Regional Board to substantiate this statement for each section of the Permit. We also want to point out that the court decisions on unfunded mandates claims are still on appeal, and it is premature to conclude on the merits of the appeal.

As previously discussed at workshops, and in comment letters, and requested by many Board Members, the economic implications of the many proposed Permit requirements are of critical importance. It is also worth noting that the cost for complying with both the stormwater regulations and TMDL requirements should be carefully considered. This point is highlighted in the March 20, 2012 memo<sup>11</sup> from OMB to heads of executive departments and agencies (including USEPA) which clarified Presidential Executive Order 13563. This Order requires the agencies to take into account among other things, and to the extent practicable, the costs of cumulative regulations. This is particularly relevant for this Draft Order where we have the convergence of TMDLs and stormwater regulations. Although we have not had sufficient time to assess the cost for the new stormwater requirements, the County of Los Angeles has completed an analysis (using the Los Angeles County BMP Decision Support System model) to assess the effort required to implement low impact development retrofits throughout Los Angeles County to address all TMDLs and 303(d) listings. This model roughly estimated that, to meet these water quality standards, the area would have to spend between \$17 billion and

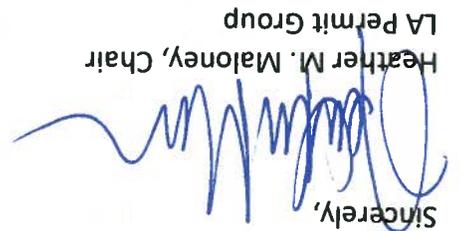

---

<sup>11</sup> Cass R. Sunstein, Executive Office of the President, OMB memorandum for the Heads of Executive Departments and Agencies regarding Cumulative Effects of Regulations, March 20, 2012.

\$42 billion. Los Angeles River Watershed Bacteria TMDL could cost up to \$5.4 billion for full, inclusive, implementation costs for that watershed alone for only one pollutant. Even if the Water Quality Funding Initiative passes (and it is far from guaranteed to pass), it would take a full 20 years dedicating the entire fund to the Los Angeles River Bacteria TMDL to pay for these requirements. It would require over 60 years paying for the larger estimate. In the fact sheet, Regional Board staff stated that the TMDL costs were considered during the TMDL adoption process. However, given Executive Order 13563, we would submit that the Board should consider all costs associated with the management of stormwater. With these types of economic implications, it is critical that this Regional Board and their staff more carefully evaluate comments and provide additional, extended comment periods for these requirements.

In closing, we thank you for the opportunity to comment on the Draft Order and we look forward to meeting with you to discuss our comments and to explore alternative approaches. However, we must reiterate the need for more time to review and analyze this Draft Order. In spite of the Regional Board staff statement<sup>12</sup> that there has been a myriad of opportunities to present our concerns and comments, we believe otherwise. The LAPG would submit that we have not had an opportunity to voice our concerns to the Regional Board members themselves as we have been limited (in some cases prevented) in responding to questions posed by the Board members during different workshops. Consequently, we respectfully request that the Board provide another complete second draft Tentative Order with an additional review period to allow Permittees to have at least a total of 180 days to discuss and review the full document. We believe it important to review the entire draft Permit to better understand the relationship among the various provisions; this is especially true for the monitoring provision and its relationship to the watershed management program. We also believe that the Regional Board staff will be hard pressed to consider and respond to all the comments that will be submitted on the Draft Order. Thus, it is advantageous to all parties that more time is provided to craft a permit that is implementable and protective of water quality. We request the issues presented in our letter are resolved in a revised Permit draft. Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,

Heather M. Maloney, Chair

**LA Permit Group Detailed Comments re: Draft Order**

Agency/Reviewer: LA Permit Group

Comment		Doc. Reference		Comments	
No.	Page	Section	Apr-12	Jul-12	
1	General	General	Any TMDL, for which compliance with a waste load allocation (WLA) is exclusively set in the receiving water, shall be amended by a re-opener to also allow compliance at the outfall to allow that flexibility, or other end-of-pipe, that shall be determined by translating the WLA into non-numeric WQBELs, expressed as best management practices (BMPs). While the TMDL re-opener is pending, an affected Permittee shall be in compliance with the receiving water WLA through the implementation of permit requirements	Same comment	
2	17	Findings	Not clear on what "discharges from the MS4 for which they are owners and/or operators" means.	The Tentative Order, states " ... each Permittee shall maintain the necessary legal authority to control the contribution of pollutants to its MS4 and shall include in its storm water management program a comprehensive planning process that includes intergovernmental coordination, where necessary." If the MS4/catch basin is owned by the LACFCD, does this mean that the LACFCD needs to control the contribution of pollutants?	
3	pages 111 - 123 and Attachments K - R	TMDL	<p>Santa Monica Bay Beaches Bacteria TMDL (SMBBB TMDL) is currently being reconsidered. As part of that reconsideration, the summer dry weather targets must be revised to be consistent with the reference beach/anti-degradation approach established for the SMBBB TMDL and with the extensive data collected over that past seven years since original adoption of the SMBBB TMDL. This data clearly shows that natural and non-point sources result in 10% exceedances during dry weather. Data collected at the reference beach since adoption of the TMDL, as tabulated in Table 3 of the staff report of the proposed revisions to the Basin Plan Amendment, demonstrate that natural conditions associated with freshwater outlets from undeveloped watersheds result in exceedances of the single sample bacteria objectives during both summer and winter dry weather on approximately 10% of the days sampled.</p> <p>Thus the previous Source Analysis in the Basin Plan Amendment adopted by Resolution No. 02-004 which stated that "historical monitoring data from the reference beach indicate no exceedances of the single sample targets during summer dry weather and on average only three percent exceedance during winter dry weather" was incorrect and based on a data set not located at the point zero compliance location. Continued allocation of zero summer dry weather exceedances in the proposed Basin Plan Amendment is in direct conflict with the stated intent to utilize the reference beach/anti-degradation approach and ignores the scientifically demonstrated reality of natural causes and non-point sources of indicator bacteria exceedances.</p>	This is a critical issue that was not addressed in the recent reopener. The reference reach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included	
4	pages 111 - 123 and Attachments K - R	TMDL	Continued use of the zero summer dry weather exceedance level will make compliance with the SMBBB TMDL impossible for the Jurisdictional agencies. This is also in conflict with the intent of the Regional board as expressed in finding 21 of Resolution 2002-022 "that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas".	This is a critical issue that was not addressed in the recent reopener. The reference reach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included	
5	pages 111 - 123 and Attachments K - R	TMDL	The SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) was approved by the Regional Board staff and that CSMP should be incorporated into the TMDL monitoring requirements of the next MS4 Permit. The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week, thus it is highly confusing and misleading to refer to "daily monitoring". The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week.	The problem with sites monitored two days a week has not been corrected. Please provide clarification that this issue could be addressed and would supersede the TMDL if submitted in an integrated monitoring plan. This is critical for summer dry weather and 5-day per week sites.	

6	pages 111 - 123 and Attachments K - R	TMDL	This discussion in this section devoted to the SMBBB TMDL seems to create confusion regarding the meaning of the terms "water quality objectives or standards," "receiving water limitations," and "water quality-based effluent limitations". Water quality objectives or water quality standards are those that apply in the receiving water. Water Quality Effluent Based Limits apply to the MS4. So the "allowable exceedance days" for the various conditions of summer dry weather, winter dry weather, and wet weather should be referred to as "water quality-based effluent limitations" since those are the number of days of allowable exceedances of the water quality objectives that are being allowed for the MS4 discharge under this permit. While the first table that appears under this section at B.1 (b) should have the heading "water quality standards" or "water quality objectives" rather than the term "effluent limitations".	In effect the effluent limitations are stricter than the receiving water standards. This is inconsistent with law and creates a situation in which permittees are out of compliance at the effective date of this permit. Please adjust so that limits are consistent with standards and not exceeding standards.
7	pages 111 - 123 and Attachments K - R	TMDL	While it makes sense for the Jurisdictional Groups previously identified in the TMDLs to work jointly to carry out implementation plans to meet the interim reductions, only the responsible agencies with land use or MS4 tributary to a specific shoreline monitoring location can be held responsible for the final implementation targets to be achieved at each individual compliance location. An additional table is needed showing the responsible agencies for each individual shoreline monitoring location.	A table is still needed and should be developed. Perhaps referred to in this section but placed in the Watershed Management Plan and then approved by Executive Officer with the plan.
8	pages 111 - 123 and Attachments K - R	TMDL	The Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4 based on estimates from limited data on existing stormwater discharges which resulted in a waste load allocation for stormwater that is lower than necessary to meet the TMDL targets, in the case of DDT far lower than necessary. EPA stated that "If additional data indicates that existing stormwater loadings differ from the stormwater waste load allocations defined in the TMDL, the Los Angeles Regional Water Quality Control Board should consider reopening the TMDL to better reflect actual loadings." [USEPA Region IX, SMB TMDL for DDTs and PCBs, 3/26/2012]	Same comment
9	pages 111 - 123 and Attachments K - R	TMDL	In order to avoid a situation where the MS4 permittees would be out of compliance with the MS4 Permit if monitoring data indicate that the actual loading is higher than estimated and to allow time to re-open the TMDL if necessary, recommend as an interim compliance objective WQBELs based on the TMDL numeric targets for the sediment fraction in stormwater of 2.3 ug DDT/g of sediment on an organic carbon basis, and 0.7 ug PCB/g sediment on an organic carbon basis.	Same comment
10	pages 111 - 123 and Attachments K - R	TMDL	Although the Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4, they should be translated as WQBELs in a manner such that watershed management areas, subwatersheds and individual permittees have a means to demonstrate attainment of the WQBEL. Recommend that the final WLAs be expressed as an annual mass loading per unit area, e.g., per square mile. This in combination with the preceding recommendation for an interim WQBEL will still serve to protect the Santa Monica Bay beneficial uses for fishing while giving the MS4 Permittees time to collect robust monitoring data and utilize it to evaluate and identify controllable sources of DDT and PCBs.	Please clarify that this situation would be covered under the new provisions for USEPA established TMDLs opens the door for allowing Permittees to address this through their plans.
11	pages 111 - 123 and Attachments K - R	TMDL	The Machado Lake Trash WQBELs listed in the table at B.3 of Attachment N in the Tentative Order appear to have been calculated from preliminary baseline waste load allocations discussed in the July 11, 2007 staff report for the Machado Lake Trash TMDL, rather than from the basin plan amendment. In some cases the point source land area for responsible jurisdictions used in the calculation are incorrect because they were preliminary estimates and subsequent GIS work on the part of responsible agencies has corrected those tributary areas. In other cases some of the jurisdictions may have conducted studies to develop a jurisdiction-specific baseline generation rate. The WQBELs should be expressed as they were in the adopted TMDL WLAs, that is as a percent reduction from baseline and not assign individual baselines to each city but leave that to the individual city's trash reporting and monitoring plan to clarify.	Same comment

12	pages 111 - 123 and Attachments K - R	TMDL	<p>The WLAs in the adopted Machado Lake Trash TMDL were expressed in terms of percent reduction of trash from Baseline WLA with the note that percent reductions from the Baseline WLA will be assumed whenever full capture systems are installed in corresponding percentages of the conveyance discharging to Machado Lake. As discussed in subsequent city-specific comments, there are errors in the tributary areas originally used in the staff report, but in general, tributary areas are available only to about three significant figures when expressed in square miles. Thus the working draft should not be carrying seven significant figures in expressing the WQBELs as annual discharge rates in uncompressed gallons per year. The convention when multiplying two measured values is that the number of significant figures expressed in the product can be no greater than the minimum number of significant figures in the two underlying values. Thus if the tributary area is known to only three or four significant figures, and the estimated trash generation rate is known to four significant figures, the product can only be expressed to three or four significant figures.</p> <p>Thus there should be no values to the right of the decimal place and the whole numbers should be rounded to the correct number of significant figures.</p>	Same comment
13	pages 111 - 123 and Attachments K - R	TMDL	<p>The Machado Lake Nutrient TMDL provides for a reconsideration of the TMDL 7.5 years from the effective date prior to the final compliance deadline. Please include an additional statement as item C.3.c of Attachment N: "By September 11, 2016 Regional Board will reconsider the TMDL to include results of optional special studies and water quality monitoring data completed by the responsible jurisdictions and revise numeric targets, WLAs, LAs and the implementation schedule as needed."</p>	Same comment
14	pages 111 - 123 and Attachments K - R	TMDL	<p>Table C is not provided in the section on TMDLs for Dominguez Channel and Greater LA and Long Beach Harbors Toxic Pollutants. Please clarify and reference that Attachment D Responsible Parties Table RB4 Jan 27, 12 which was provided to the State Board and responsible agencies during the SWRCB review of this TMDL, and is posted on the Regional Board website in the technical documents for this TMDL, is the correct table describing which agencies are responsible for complying with which waste load allocations, load allocations and monitoring requirements in this VERY complex TMDL. Attachment D should be included as a table in this section of the MS4 Permit.</p>	Partially addressed--the table provided in the Tentative Order is not the detailed Attachment D which clarifies which agencies are responsible for which portions of the TMDL--need to include that table.
15	pages 111 - 123 and Attachments K - R	TMDL	<p>The Dominguez Channel and Greater LA and Long Beach Harbor Waters Toxic Pollutants TMDL provides for a reconsideration of the TMDL targets and WLAs. Please include an additional statement as item E.5 of Attachment N: "By March 23, 2018 Regional Board will reconsider targets, WLAs and LAs based on new policies, data or special studies. Regional Board will consider requirements for additional implementation or TMDLs for Los Angeles and San Gabriel Rivers and interim targets and allocations for the end of Phase II."</p>	Same comment
16	pages 111 - 123 and Attachments K - R	TMDL	<p>City of Hermosa Beach is only within one watershed, the Santa Monica Bay Watershed, and so should not be shown in italics as a multi-watershed permittee</p>	Addressed in Table K-3 of the Tentative Order but not in Table K-2 of the Tentative Order.
17	pages 111 - 123 and Attachments K - R	TMDL	<p>Recommend not listing specific water bodies in E.5.b.i.(1).(c) because then it risks becoming obsolete if new TMDLs are established for trash, or if they are reconsidered. Furthermore, it is not clear why Santa Monica Bay was left out of this list since the Marine Debris TMDL allows for compliance via the installation of for full capture devices.</p>	Not addressed, still don't know why Santa Monica Bay Marine Debris was not included in the list at E.5.b.i.(1).(c) but it is listed in E.5.a.ii and Attachment M Section B.
19	pages 111 - 123 and Attachments K - R	TMDL	N/A	Suggest wet weather compliance be partially defined by a design storm.

20	pages 111 - 123 and Attachments K - R	TMDL	N/A	<p>Regional Board staff has incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a "numeric effluent limitation." Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board's clear <del>opposition</del> reluctance to use numeric effluent limitations.</p> <p>In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: <i>we will generally not require "strict compliance" with water quality standards through numeric effluent limitations," and instead "we will continue to follow an iterative approach, which seeks compliance over time" with water quality standards .</i></p> <p>[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]</p> <p>More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:</p> <p><i>Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. <u>This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.</u></i></p> <p>The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the <i>Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.</i></p>
21	pages 111 - 123 and Attachments K - R	Table K-8	Please remove, in its entirety, the Santa Ana River TMDLs	Same comment
22	pages 111 - 123 and Attachments K - R	E.1.c	Permittees under the new MS4 permit (those in LA County) need to be able to separate themselves from Orange County cities. Since the 0.941 kg/day is a total mass limit, it needs to be apportioned between the two counties. Also, the MS4 permit needs to contain language allowing permittees to convert group-based limitations to individual permittee based limitations.	Same comment
23	111	E.2	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions.	Same comment
24	111	E.2.a.i	N/A	This provision creates confusion and inconsistency with the language in the rest of the permit. By stating that the permittee <b>shall</b> demonstrate compliance through compliance monitoring points, it appears to preclude determining compliance through other methods as outlined in other portions of the permit. This provision does not reference any of the other compliance provisions in the TMDL section, and could therefore be interpreted on its own as a separate compliance requirement. Additionally, the requirement to use the TMDL established compliance monitoring locations regardless of whether an approved TMDL monitoring plan or Integrated plan has been developed is not consistent with the goal of integrated monitoring outlined in the permit. This provision would be more appropriate as a monitoring and reporting requirement for the TMDL section with modified language such as "Monitoring locations to be used for demonstrating compliance in accordance with Parts VI.E.2.d or VI.E.2.e shall be established at compliance monitoring locations established in each TMDL or at locations identified in an approved TMDL monitoring plan or in accordance with an approved integrated monitoring program per Attachment E Part VI.C.5 (Integrated Watershed Monitoring and Assessment)."

25	112	E.2.b.iv	For "each Permittee is responsible for demonstrating that its discharge did not cause or contribute to an exceedance," how is this going to be possible? There is allowed non-storm water discharges, a commingled system, and the LA County region is practically urbanized (impervious landscape). Additionally, a gas tanker on local freeways often discharges onto freeway drains, which connect to MS4 permittee drains - the point here is a private party as the actual discharger should be held responsible and not the MS4 permittee. Lastly, the Construction General Permit cannot establish numeric limitations without the Regional/State Boards clearly demonstrating how compliance will be achieved - the MS4 permit is overly conditioned in terms of achieving compliance and subjects MS4 permittees to violations/enforcement, and given these circumstances, the Boards need to clearly demonstrate how compliance will be achieved.	Same comment
26	112	E.2.b.v.(2)	N/A	This provision should not require that the permittee demonstrate that the discharge from the MS4 <b>is treated</b> to a level that does not exceed the applicable water quality-based effluent limitation. Permittees may achieve the applicable WQBELs through means other than treatment and they should be able to demonstrate that their discharge does not exceed the applicable water quality-based effluent limitation through monitoring or other means than demonstration of treatment.
28	113	E.2.d.i.4.b.	Is this in effect setting a design storm for the design of structural BMPs to address attainment of TMDLs, or is it simply referring to SUSMP/LID type structural BMPs? If it is in effect setting a design storm, there needs to be some sort of exception for TMDLs in which a separate design storm is defined, e.g., for trash TMDLs where the 1-year, 1-hour storm is used.	This is not clarified, but it is still a problem as not all retrofit projects which might be used to address TMDLs may be able to handle the full 85th percentile 24-hour storm, there should be some provision for doing this through a combination of BMPs, e.g., LID plus retrofit.
29	114	E.2.e	Please add the language from interim limits E.2.d.4 a - c and EPA TMDLs to the Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations to ensure sufficient coordination between all TMDLs and the timelines and milestones that will be implemented in the Watershed Management Program.	Same comment
30	116	E.4.a	This provision states "A-Permittees shall comply immediately ... for which final compliance deadlines have passed pursuant to the TMDL implementation schedule." This provision is unreasonable. First, various brownfields/abandoned toxic sites exists, some of which were permitted to operate by State/Federal agencies - nothing has or will likely be done with these sites that contribute various pollutants to surface and sub-surface areas. Additionally, this permit is going to require a regional monitoring program - this program will yield results on what areas are especially prone to particular pollutants. Until these results are made known, MS4 Permittees will have a hard time knowing where to focus its resources and particularly, the placement of BMPs to capture, treat, and remove pollutants. For these reasons, this provision should be revised to first assess pollutant sources and then focus on compliance with BMP implementation.	Same comment
31	116-123	E.5	Please clarify that cities are not responsible for retrofiting.	Same comment
32	116-123	E.5.a - c	Recommend not listing specific waterbody/trash TMDLs here, but simply leave the reference to Attachments to identify the Trash TMDLs. Otherwise, this may have to be revised in the future. Again, Santa Monica Bay Marine Debris TMDL was not included in this list, it is unclear whether it was an oversight or intentional?	Same comment
33	116-123	E.5.b.ii.2	Define "partial capture devices", define "institutional controls". Permittees need to have clear direction of how to attain the "zero" discharges which will have varying degrees of calculations regardless of which compliance method is followed. Explain the Regional Board's approval process for determining how institution controls will supplement full and partial capture to attain a determination of "zero" discharge.	Same comment
34	116-123	E.5.b.ii.(4)	MFAC and TMRP should be an option available to the Los Angeles River.	Same comment
35	116-123	E.5.c.i.(1)	For reporting compliance based on Full Capture Systems, what is the significance of needing to know "the drainage areas addressed by these installations?" Unfortunately, record keeping in Burbank is limited to the location and size of City-owned catch basins. A drainage study would need to be done to define these drainage areas. As such, we do not believe this requirement serves a purpose in regards to full capture system installations and their intended function.	Same comment
36	Attachment L	D.3 a - c	Please change the Receiving Water Limitations for interim and final limits to the TMDL approved table. There should be no interpretation of the number of exceedance days based on daily for weekly sampling with, especially with no explanation of the ratio or calculations, and no discussion of averaging. Please revert to the original TMDL document.	The table was adjusted, but did not eliminate the interpretation of number of exceedance days that are not expressly completed in the Santa Clara River TMDL. Remove all interpretation of number of exceedance days other than what has been expressed in the original TMDL number of days of exceedances without interpretation or recalculation.

37	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For the Freshwater portion of the Dominguez Channel: There are no provisions for BMP implementation to comply with the interim goals. The wording appears to contradict Section E.2.d.i.4 which allows permittees to submit a Watershed Management Plan or otherwise demonstrate that BMPs being implemented will have a reasonable expectation of achieving the interim goals.	Same comment
38	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For Greater LA Harbor: Similar to the previous comment regarding this section. The Table establishing Interim Effluent Limitations, Daily Maximum (mg/kg sediment), does not provide for natural variations that will occur from time to time in samples collected from the field. Given the current wording in the proposed Receiving Waters Limitations, even one exceedance could potentially place permittees in violation regardless of the permittees level of effort. Reference should be made in this section to Section E.2.d.i.4 which will provide the opportunity for the Permittee to develop BMP-base compliance efforts to meet interim goals.	Same comment
39	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For the freshwater portion of the Dominguez Channel: the wording should be clarified. Section 5.a states that "Permittees subject to this TMDL are listed in Attachment K, Table K-4." Then the Table in Section E.2.b Table "Interim Effluent Limitations--- Sediment", lists all permittees except the Fresh water portion of the Dominguez Channel. For clarification purposes, we request adding the phase to the first row: "Dominguez Channel Estuary (below Vermont)"	Same comment
40	Attachment O, Page 3	C	For the LA River metals. Some permittees have opted out of the grouped effort. This section needs to detail how these mass-based daily limitations will be reapportioned.	Same comment
41	Attachment O, Page 7	D.4	Why are "Receiving Water Limitations" being inserted here? None of the other TMDLs seem to follow that format.	Same comment
42	Attachment P	TMDLs in the San Gabriel River WMA	It is the permittees understanding that the lead impairment of Reach 2 of the San Gabriel River has been removed. It should be removed from the MS4 permit.	Same comment

Agency/Reviewer: **LA Permit Group**

Comment	Doc. Reference		Comments	
No.	Page	Section	Apr-12	Jul-12
1	General	General	While it may be appropriate to have an overall design storm for the NPDES Permit and TMDL compliance, this element seems to address individual sites. Recommend developing more prominently in the areas of the Permit that deals with compliance that the overall Watershed Management Program should deal with the 85th percentile storm and that beyond that, Permittees are not held responsible for the water quality from the much larger storms. However, requiring individual projects to meet this standard is limiting as there may be smaller projects implemented that individually would not meet 85th percentile, but collectively would work together to meet that standard. Please clearly indicate cities are only responsible for the 85th percentile storm for compliance and that individual projects may treat more of less than number.	Changes were made but it is unclear that the overall program would be collectively only held to the 85th percentile storm if working in multiple areas, and individual sites only if the Watershed Management Program states that individual sites would be responsible.
2	46	Process	Please clarify that Permittees will only be responsible for continuing existing programs and TMDL implementation plans during the interim 18 month period while developing the Watershed Management Program and securing approval of those programs	Same comment
3	46-47	Table 9 and Process	Please allow 24 months for development of the Watershed Management Program to provide sufficient time for calibration and the political process to adopt these programs.	Same comment. However, there could be a phased approach in which a permittee could submit early actions within this timeline, while more time is offered for the resource intensive aspects.
4	46-53	various	The Table (TBD) on page 2 states implementation of the Watershed Program will begin upon submittal of final plan. Page 11, section 4 Watershed Management Program Implementation states each Permittee shall implement the Watershed Management Program upon approval by the Executive Officer. Page 13 section iii says the Permittee shall implement modifications to the storm water management program upon acceptance by the Executive Officer. All three of these elements should be consistent and state upon approval by the Executive Officer. The item on page 13 should be changed to reflect the Watershed Management Program, or clarify that the Watershed Management Program is the storm water management program.	Table 9 and Watershed Management Implementation are still inconsistent. The table says submittal and the Watershed Management Program Implementation states upon approval. Please make these consistent
5	47	Program Development	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions.	Same comment
6	48	3.a.ii	Pollutants in category 4 should not be included in this permit term, request elimination of any evaluation of category 4. Request elimination of category 3, as work should focus on the first two categories at this point	Thank you for removing category 4. Category 3 puts a burden on cities during this permit cycle. In the next permit term, when permittees have a better understanding of sources and location of the high priority pollutant additional actions may be warranted. At this time including category 3 adds an investigative burden that is unwarranted given the substantial increase in requirements and monitoring that are already included in this draft tentative order.
7	52	Reasonable Assurance Analysis	Reasonable assurance analysis and the prioritization elements should also include factors for technical and economic feasibility	Same comment
8	112	E.2.b.iii	For the "group of Permittees" having compliance determined as a whole, this should only be the case if the group of Permittees have moved forward with shared responsibilities (MOAs, cost sharing, a Watershed Management Program). It would not be fair to have one entity not be a part of the "group" and be the main cause of exceedances/violations.	In the Tentative Order, permittees must notify the Regional Board 6 months after the Order's effective date on whether it plans to participate in the development of a Watershed Management Program. Given this, a sub-watershed will not know whether all permittees will participate or not. It should also be noted that allowed non-stormwater discharges and other NPDES permit discharges may be the cause of exceedances/violations and not the "group of permittees."

Comment		Doc. Reference		Comments	
No.	Page	Section	Apr-12	Jul-12	
1	37-38	All	Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue	There are several NPDES Permits, including the Caltrans Permit and others, that adjust the Receiving Water Limitation language in response to new interpretations. Currently, the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. LASP has provided the Regional Board staff with sample language. It is imperative that the Regional Board works with the State Board on this very important issue. It is critical that the LA draft tentative order Receiving Water Limitation language be adjusted to ensure cities working in good faith are not subject to enforcement and third party litigation.

1	13-26	Findings	several related		<p>Please add findings regarding the iterative process.</p> <p>The iterative process is a process of implementing, evaluating, revising, or adding new BMPs to attain water quality standards, including total maximum daily load (TMDL) waste load allocations (WLAs). The State Water Resources Control Board (State Board) has affirmed, in several precedential water quality orders (including WQ 99-05 and 2001-15), the inclusion of the iterative process in MS4 permits. As the State Board noted in WQ 2001-15:</p> <p>This Board has already considered and upheld the requirement that municipal storm water discharges must not cause or contribute to exceedances of water quality objectives in the receiving water. We adopted an iterative procedure for complying with this requirement, wherein municipalities must report instances where they cause or contribute to exceedances, and then must review and improve BMPs so as to protect the receiving waters.</p> <p>The iterative process goes hand-in-hand with the Receiving Water Limitation provision of this order, which is intended to address a water quality standard exceedance. An MS4 permit is a point source permit, which is defined by §40 CFR 122.2 to mean outfall or end-of-pipe. Attainment of a water quality standard in stormwater discharge is achieved in the effluent or discharge from the MS4 through the implementation of BMPs contained in a Stormwater Quality Management Plan (SQMP). If a water quality standard is frequently exceeded as determined by outfall monitoring relative to an ambient condition of the receiving water (during the 5-year term of the Order) the permittee shall be required to propose better-tailored BMPs to address the exceedance. The process includes determining (1) if the exceedances are statistically significant and if so, would require the permittee to (2) identify the source of the exceedance; and (2) propose new or intensified BMPs to be implemented in the next MS4 permit – unless the Executive Officer determines that a more immediate response is required.</p> <p>(continued from previous page) The iterative process does not apply to non-stormwater discharges. Section 402(p)(3)(B)(ii) of the Clean Water Act only prohibits non-stormwater discharges to the MS4 and not from it as is the case with stormwater discharges. This is because Congress set two standards for MS4 discharges: one stormwater and one for non-stormwater. As noted in WQO 2009-008, the Clean Water Act and the federal storm water regulations assign different performance requirements for storm water and non-storm water discharges. These distinctions in the guidance document, the Clean Water Act, and the storm water regulations make it clear that a regulatory approach for storm water - such as the iterative approach we have previously endorsed - is not necessarily appropriate for non-storm water.</p>

2	24 and Attachment F, Pages 146-149	Unfunded Mandates Section of Fact Sheet and Permit	several related	It is incorrect to assert an outcome on the unfunded mandates issue in a permit; this has nothing to do with protecting water quality. The unfunded mandates process has not completed a process and these assertions are opinion. Since the Fact Sheet is part of the permit, remove this section. There are many errors and incorrect assumptions, especially around the level of effort required for this permit when compared to the current permit, and the economic issues that are incorrect.

Comment	Doc. Reference		Comments
No.	Page	Section	Jul-12
1	General	General	It is appropriate to have an exemption for a Permittee from a violation of RWL and or WQBELs caused by a non-stormwater discharge from a potable water supply or distribution system not regulated by an NPDES permit but required by state or federal statute; this should clearly apply to all NPDES permits issued to others within, or flow through, the MS4 permittees jurisdiction. We would request that also included in this category should be emergency releases caused by water line breaks which are not necessary, but are unexpected and have to be dealt with as an emergency. MS4 permittees should be exempt from RWL or WQBEL violations associated with any permitted NPDES discharges that are effectively authorized by LARWQCB under the Clean Water Act.
2	General	General	Since it could take 6 months for an agency to decide if they want to join in the development of a Watershed Management Plan or just modify their current Stormwater Management Program to comply with the new permit MCMs, the implementation of the new MCMs should follow this timeline. In the interim the permittees will be required to continue implementing their current Stormwater Management Program.
3	26	A.	<p>RB staff proposed language requires the permittees to “prohibit non-stormwater discharges <b>through the</b> MS4 to receiving waters” except where authorized by a separate NPDES permit or conditionally. This prohibition is inconsistent with legal authority provisions in the federal regulations since 40 CFR 122.26(d)(1)(ii) which requires legal authority to control discharges <b>to</b> the MS4 but not <b>from</b> the MS4. Additionally, with respect to the definition of an illicit discharge at 40 CFR 122.26(b)(2), an illicit discharge is defined as “a discharge <b>to</b> the MS4 that is not composed entirely of stormwater”. In issuing its final rulemaking for stormwater discharges on Friday, November 16, 1990[1], USEPA states that:</p> <p><i>“Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT) and the Best Conventional Pollutant Control Technology (BCT) and where necessary, water quality-based controls), but permits for <b>discharges from</b> municipal separate storm sewer systems must require controls to the maximum extent practicable, and where necessary water quality-based controls, and must include a requirement to effectively prohibit non-stormwater <b>discharges into</b> the storm sewers.”</i></p> <p>This is further illuminated by the section on Effective Prohibition on Non- Stormwater Discharges[2]:</p> <p><i>“Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water discharges <b>into the storm sewers</b> . Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather, an ‘effective prohibition’ would require separate NPDES permits for non-storm water discharges to municipal storm sewers”</i></p> <p>The rulemaking goes on to say that the permit application:</p> <p><i>“requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems.”</i></p> <p>Nowhere in the rulemaking is the subject of prohibiting discharges from the MS4 discussed. Furthermore, USEPA provides model ordinance language on the subject of discharge prohibitions: <a href="http://www.epa.gov/owow/NPS/ordinance/mol5.htm">http://www.epa.gov/owow/NPS/ordinance/mol5.htm</a>. Section VII Discharge Prohibitions of this model ordinance provides discharge prohibition language as follows:</p> <p><i>“No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.”</i></p> <p>Thus we recommend that staff eliminate the “from” language at both Part III.A.1.a. and Part III.A.2.</p>
4	28	A.2.b.vi	The conditional exemption of street/sidewalk water is inconsistent with the requirement in the industrial/commercial MCM section that street washing must be diverted to the sanitary sewer. Sidewalk water should definitely be conditionally exempt, but so also should patios and pool deck washing. If street washing has to be diverted to the sanitary sewer for industrial/commercial facilities, then it should for all facilities and so should parking lot wash water as they are similar in their pollutant loads.
5	33-36, Table 8	Discharge Prohibitions	Enforcing NPDES permits issued for the various NSWDS referenced in this table should be the responsibility of the State/Regional Board, not the MS4 permittee. Therefore, it is inappropriate to include a condition that places a responsibility on the MS4 permittee to ensure requirements of NPDES permits are being implemented or effective in order for the pertaining NSWDC category to be exempt. Proper enforcement of the various NPDES permits mentioned in this table should ensure impacts from these discharges are negligible.

6	39	A.2.a.i	<p>Staff proposal states: "Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites."</p> <p>It appears the intent of this language is to transfer the State's inspection and enforcement responsibilities to municipalities through the MS4 permit. When a separate general NPDES permit is issued by the Regional or State Board it should be the responsibility of that agency collecting such permit fees to control the contribution of pollutants, not MS4 permittees.</p>
7	39	A.2.a.vii	<p>Staff proposal states: "Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Co-permittees."</p> <p>The intention of this statement is unclear and should be explained, and a definition of "shared MS4" should be provided. How would an inter-agency agreement work with an upstream and downstream agency? This is not practical - this agreement should have been done before the interconnection of MS4 systems occurred. An example of this agreement should be provided within the Permit. The permittee will not agree to the responsibility of an exceedance without first having evidence of the source and its known origin (in other words, an IC/ID is a private "culprit" and not the cause of the City).</p>
8	39	A.2.a.xi	<p>Staff proposal states: "Require that structural BMPs are properly operated and maintained."</p> <p>MS4 agencies can control discharges through an illicit discharge program, and conditioning new/redevelopment to ensure mitigation of pollutants. Unless the existing development private property owners/tenants are willing or in the process of retrofitting its property, the installation and O&amp;M of BMPs is not practical and cannot be legally enforceable against an entity that does not own or control the property, such as a municipal entity.</p>
9	39	A.2.a.xii	<p>Staff proposal states: "Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4."</p> <p>It is difficult, if not impossible, to accurately quantify the exact effectiveness of a particular set of BMP's in reducing the discharge of pollutants. Some discharges may be reduced over time given reductions in industrial activity, population in a particular portion of the community feeding into the MS4, or for other reasons not directly related to implementation of structural BMPs. Given that the County of LA is generally urbanized and thus impervious, a lethargic economic climate (meaning development and redevelopment is not occurring in an expeditious manner), and that several pollutants do not have known BMPs effective at removing/reducing the content (i.e., metals, toxics, pesticides), the effectiveness of BMPs should not be required and instead should only be used for research, development, and progress of BMP testing.</p>
10	40	A.2.b	<p>Staff proposal states: "Permittee must submit a statement certified by its chief legal counsel that the Permittee has the legal authority within its jurisdiction to implement... Each permittee shall submit this certification annually..."</p> <p>To sign this statement, chief counsel will have to analyze this 500 page Permit, analyze the municipal code, and prepare a statement as to whether actions can be commenced and completed in the judicial system. An annual certification is redundant and unnecessary in addition to being extraordinarily costly. At most, legal analysis should be done once during the Permit term. Otherwise, please delete this requirement.</p>
11	40	A.3	<p>The staff proposal includes a section on Fiscal Resources. Most MS4's do not have a storm water quality funding source, and even those that do have a funding source are not structured to meet the requirements of the proposed MS4 requirements (for instance, development funds may be collected to construct an extended detention basin, but not for street sweeping, catch basin cleaning, public right-of-way structural BMPs, etc).</p>
12	40	A.3.a	<p>Staff proposal states: "Each Permittee shall exercise its full authority to secure the fiscal resources necessary to meet all requirements of this Order"</p> <p>This sentence has no legally enforceable standard. What exactly does the exercise of "full authority" mean when the exercise of a city's right to tax comes with consequences and no guarantee of success? Municipal entities must adjust for a variety of urgent needs, some federally mandated in a manner that cannot be ignored. So, if we seek the fiscal resources to fund the programs required in the permit and the citizens say "No", then a municipality will have a limited ability to comply with "all requirements of this Order".. Can the language be changed to state: "Each permittee shall make its best efforts given existing financial and budget constraints to secure fiscal resources necessary to meet all requirements of this Order"?</p>
13	40	A.3.c	<p>Staff proposal states: "Each permittee shall conduct a fiscal analysis... to implement the requirements of this Order."</p> <p>Most MS4's do not have adequate funding to meet all requirements of the Tentative MS4 Permit. A Permit requirement to secure funding is overreach. Please delete this section.</p>
14	58	D.4.a.i.(2)	<p>Staff proposal states: "To measurably change the waste disposal and storm water pollution generation behavior of target audiences..."</p> <p>Define the method to be used to measure behavior change. As written, this requirement is vague and open to interpretation.</p>
15	60	D.4.d.i.(2).(b)	<p>Staff proposal states: "... including personal care products and pharmaceuticals)"</p> <p>The stormwater permit should pertain only to stormwater issues. Pharmaceuticals getting into waters of the US are typically a result of waste treatment processes. All references to pharmaceuticals should be removed from this MS4 permit.</p>
16	60	D.4.d.i.(3)	<p>The Regional Board assumes that all of the listed businesses will willingly allow the City to install displays containing the various BMP educational materials in their businesses. If the businesses do allow the installations then the City must monitor the availability of the handouts because the business will not monitor or keep the display full or notify the City when the materials are running out. If the business will not allow the City to display the educational material must we document that denial? Will that denial indicate that the City is not in compliance?</p>
17	63-66	D.5.d-f	<p>These sections pertain to inspecting critical source facilities where it appears the intent is to transfer the State's Industrial General Permit inspection and enforcement responsibilities to municipalities through the MS4 permit. We request eliminating these sections OR revise to exclude all MS4 permittee responsibility for NPDES permitted industrial facilities.</p>

19	67	D.6.a.i.(3)	The stated objective of mimicking the predevelopment water balance is not consistent with the requirement that the entire design storm be managed onsite. Please consider allowing subtracting the predevelopment runoff from the design volume or flow.
20	69	D.6.b.ii.(1).(a)	Please clarify whether this paragraph applies to what is existing on the site or what is being redeveloped.
21	70	D.6.c.i.(2).(b)	Consider removing the "whichever is greater" wording. The two methods are considered equivalent and the 85 <sup>th</sup> percentile was calculated to be the 0.75-inch for downtown Los Angeles. Currently, the 0.75-inch storm criterion has been used throughout the County for uniformity. While requiring the 85 <sup>th</sup> percentile to be used instead appears more technically appropriate, requiring calculating both criteria and using the greater value appears punitive.
22	70	D.6.c.i.(4)	Consider deleting this sentence since it is redundant with item VI.D.6.c.i.1 and green roofs are not feasible not only based on the provisions of this order but also due to regional climate and implementability considerations.
23	70	D.6.c.ii.(2)	Add "lack of opportunities for rainwater use" as one of the technical infeasibility criteria to acknowledge the fact that most of the type of development projects cannot utilize the captured volume of water.
24	72	D.6.c.iii.(1).(b). (ii)	The requirement for raised underdrain placement to achieve nitrogen removal is inconsistent with standard industry designs and is based on limited evidence that this change will improve nitrogen removal. Furthermore, by raising the underdrain, other water quality problems may result such as low dissolved oxygen and bacterial growth due to the septic conditions that will be created.
25	72	D.6.c.iii.(2).(b)	The requirement to provide treatment for the project site runoff when offsite mitigation is provided is punitive and unfair considering that an alternative site needs to be retrofitted to retain the equivalent volume. Please consider removing the on-site requirement when mitigation occurs in an offsite location.
26	72	D.6.c.iii.(4)	The conditions listed for offsite projects are overly restrictive. Also, considering legal and logistical constraints regarding offsite mitigation, this alternative is not very feasible.
27	75	Table 11	The concept of establishing benchmarks for post construction BMPs was initially developed in the 2009 Ventura MS4 permit. However there is a significant different between the permits. The Ventura County's NPDES MS4 permit requires the project developer to determine the pollutant of concern(s) for the development project and use this pollutant as the basis for selecting a top performing BMP. In the case of the Draft Order, there is no determination of the pollutant of concern for the development project. Instead post construction BMPs must meet all the benchmarks established in Table 11. Unfortunately, no one traditional post construction BMP (non-infiltration BMPs) is capable of meeting all the benchmarks and thus the developer will not be able to select a BMP. We recommend that provision VI.D.6.c.iv.(1)(a) (page 74) be modified so that the selection of post construction BMPs is consistent with the Ventura permit and is based on the development site's pollutant of concern(s) and the corresponding top performing BMP(s) that can meet the Table 11 benchmarks.
28	75	D.6.c.v.(1).(a). (i)	Erosion Potential (Ep) is not a widely used term in our region, and may not be the most appropriate term to be used as an indicator of the potential hydromodification impacts.
29	76	D.6.c.v.(1).(a). (iv)	The requirement for development of a new Interim Hydromodification Control Criteria is unnecessary considering there is already peak storm control requirements in the existing MS4 Permit and that the State Water Board is finalizing the statewide Hydromodification Policy.
30	77	D.6.c.v.(1).(c). (i).1	The requirement to retain on site the 95 <sup>th</sup> percentile storm is excessive and inconsistent with all other storm design parameters that appear in this order. It may also not be an appropriate storm in terms of soil deposits for the soil deprived streams such as Santa Clara Creek. Again, consider referring to the statewide policy for a consistent and technical basis of the hydromodification requirements.
31	80	D.6.d.i.1	The requirement of 180 days for the "Local Ordinance Equivalence" may be difficult to be met due to the typical processing and public review period for changes to local municipal codes. Consider revising this provision to require immediate start of this effort instead.
32	83	D.7.a.iii	MEP should be changed to BAT and BCT for consistency with the State's General Construction Permit (GCASP).
33	83	D.7.d	Consider introducing a minimum threshold for construction sites such as those for grading permits. As proposed, minor repair works or trivial projects will be considered construction projects and will unnecessarily be subject to these provisions.
34	83	Table 12	Some of the listed BMPs will not be applicable for all construction sites. Consider replacing the title of the Table 12 to "Applicable Set of BMPs for Construction Sites"
35	84-91	D.7.e-j	All these provisions refer to construction sites of greater than one acre. These sites are subject to the General Construction Permit provisions and within the authority of the State agencies. Towards ensuring compliance with these regulations, the State is collecting a significant fee that covers inspection and tracking of these facilities. We are disputing the need to establish an unnecessary parallel enforcement scheme for these sites. This is consistent with the RWQCB member(s) voice at one of the workshops.
36	84-91	D.7.g-j	Refer to the State's GCASP and its SWPPP requirements to avoid delicacy.
37	85	D.7.g.ii.(9)	There is no need to introduce a new term/document of Erosion and Sediment Control Plan for construction sites that are already subject to GCASP's SWPPP requirements.
38	87	Table 13	Delete. This table is the same as Table 12.
39	90	Table 17	The suggested inspections could not possibly be accommodated based on current resources because of the concurrent need to visit all sites. However, if the GCASP funding is transferred for locally-based enforcement, an increase number of inspections may be accommodated.
40	90	D.7.j.ii.(2).(a)	Consider deleting this requirement as being unnecessary. The placement of BMPs may not be needed based on the season of construction and the planned phases.
41	94	D.8.d	If there is a specific pollutant to address, retrofitting or any other BMP would best be accomplished through a TMDL, which is for the Permittees to determine rather than a prescribed blanket approach. As written, this is too broad of a requirement with unknown costs that is attempting to solve a problem before there is a problem. Please delete VI.D.8.d.
42	94	D.8.d.i	Staff proposal states: "Each Permittee shall develop an inventory of retrofitting opportunities that meets the requirements of this Part VI.8.D... The goals of the existing development retrofitting inventory are to address the impacts of existing development through regional or sub-regional retrofit projects that reduce the discharges of storm water pollutants into the MS4 and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards."  This process would require land acquisition, a feasibility analysis, no impacts to existing infrastructure, proper soils, and support of various interested stakeholders. Additionally, if a property or area is being developed/redeveloped, retrofitting the site for water quality purposes makes sense, but not for an area where no development/redevelopment is planned. Finally, the LID provisions have already included provisions for off-site mitigation, in which we recommend that regional water quality projects be considered in lieu of local-scale water quality projects that will prove difficult to upkeep, maintain, and replace, let alone have existing sites evaluated as feasible. For these reasons, this requirement should be removed.

43	95	D.8.d.v	Any retrofit activities should be the result of either an illicit discharge investigation or TMDL monitoring follow-up and will need to be addressed on a site-by-site basis. A blanket effort as proposed in a highly urbanized area is simply not feasible at this time.
44	96	D.8.e.ii	Staff proposal states: "Each Permittee shall implement the following measures for...flood management projects"  Flood management projects need to be clearly defined.
45	102	D.8.h.vii.(1)	This requirement appears to be an "end-run" around the lack of catch basin structural BMPs in areas not covered by Trash TMDLs. The requirement has the potential to be extraordinarily economically burdensome. If an area is NOT subjected to a Trash TMDL, then the need for any mitigation devices is baseless. The MS4 permit requirements should not circumvent nor minimize the CWA 303(d) process.
46	103	D.8.h.ix	Staff proposal requires: "Infiltration from Sanitary Sewer to MS4 / Preventive Maintenance...."  The State Water Board has implemented a separate permit for sewer maintenance activities. Additional sewer maintenance requirements are redundant and unnecessary. Please delete this requirement.
47	106-110	D.9	A definition of "outfall" is required for clarity. An "outfall" for purposes of "non-stormwater outfall-based monitoring program" should be defined as "major outfall" pursuant to Clean Water Act 40 CFR 122.26. Please revise each mention of "outfall" to read "major outfall" when discussing "non-stormwater outfall-based monitoring program".
48	107	D.9.b.i	Please revise the proposed language to "Permittee/Permittees shall develop written procedures for conducting investigations to identify the source of <b>suspected</b> illicit discharges, including procedures to eliminate the discharge once source is located." It is not known if a discharge is illicit until the investigation is completed.
49	107	D.9.b.iii.(1)	"Illicit discharges suspected of being sanitary sewage... shall be investigated first." ICID inspectors should be allowed to make the determination of which event should be investigated first. For example, a toxic waste spill or a truck full of gasoline spill should take precedence over a sewage spill. This requirement should be amended to the "most toxic or severe threat to the watershed" shall be investigated first.
50	Attachment A	Definitions	The Definition of: "Development", "New Development" and "Re-development" should be added. The definitions in the existing permit should be used:  <i>"Development" means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i>  <i>"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.</i>  <i>"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i>  The last of the three "routine maintenance" activities listed above should exclude projects related to existing streets since typically you are not changing the "purpose" of the street to carry vehicles and should not be altered.
51	Attachment A, Page 1	Definitions	The biofiltration definition limits the systems that allow incidental infiltration. Many municipal ordinances and established engineering practices will not allow even incidental infiltration if the planter boxes are located adjacent to a building structure. Thus, this definition will exclude the most common types of planter boxes which logically have to be placed next to the building to collect roof runoff. For this reason, consider allowing biofiltration to include planter boxes without incidental infiltration since they may be the only applicable BMPs.
52			Some small cities do not have digital maps. In the "General" category of Section 11, please provide a 1 year time schedule for cities to create digital maps OR provide the municipality the ability to develop comprehensive maps of the storm sewer system in any format.
53			Omit the comment, "Each mapped MS4 outfall shall be located using geographical positioning system (GPS) and photographs of the outfall shall be taken to provide baseline information to track operation and maintenance needs over time." This requirement is cost prohibitive and of little value because many City outfalls are underground and could not be accurately located or photographed. Photographs of outfalls in channels have little value since data required is already included on "As-Built" drawings. Geographic coordinates can easily be obtained using Google Earth or existing GIS coordinate systems.  "The contributing drainage area for each outfall should be clearly discernible..." The scope of this requirement would involve thousands of records of drainage studies. The Regional Board should be aware that this requirement would be very labor intensive, time consuming, and very costly.
54			Storm drain maps should show watershed boundaries which by definition provide the location and name of the receiving water body. Please revise (3) to read "The name of all receiving water bodies from those MS4 major outfalls identified in (1).
55			The LA Permit Group proposes "non-stormwater outfall-based monitoring program" to be flow based monitoring. Please revise item (4) of 11.c.i. to read "(4) monitoring flow of unidentified or authorized non-stormwater discharges, and..."
56			"Monitoring of unknown or authorized discharges" "Authorized" discharges are exempted or conditionally exempted for various reasons. Monitoring authorized discharges is monitoring for the sake of monitoring and offers no clear goal or water quality benefit. Please delete this requirement. If the source of a discharge is unknown, then monitoring may be used as an optional tool to identify the culprit.

[1] 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

Comment	Doc. Reference		Comments
No.	Page	Section	Jul-12
1	Multiple	Multiple	The use of the HUC-12 watershed for limits is a good start but there needs to be some flexibility in its use to insure that the HUC-12 truly reflects the actual watershed boundary.
2	Multiple	Multiple	The rain gages to be used for determining a wet versus dry weather day should be selected by the agencies and approved by the Regional Board. Since monitoring plans will be on a regional basis the use of 50% of County rain gages in a watershed may not be necessary. Plus, predictions do not necessarily use County rain gages.
3	Attachment E, Page 3	II.A.1	Omit as a primary objective to assess the "biological impacts" of discharges from the MS4. The MS4 Permit is to regulate water quality. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to assess biological impacts of discharges and to set water quality regulations to prevent adverse biological impacts. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
4	Attachment E, Page 4	II.E.1	<p>Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) indicates:</p> <p><i>The permit requires all <b>effluent</b> and <b>ambient</b> monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.</i></p> <p>The only definition of "ambient" monitoring is defined by SWAMP protocol as being 72 hours after a storm event.</p> <p>Regarding monitoring purposes "b" and "c" assessing trends in pollution concentrations should be: (1) limited to ambient water quality monitoring; and (2) Regional Board's surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.</p> <p><i>Recommended Corrective Action:</i> Clarify that RWL monitoring is only in the ambient condition as defined by SWAMP and that ambient monitoring is performed as part of the SWAMP and is not the responsibility of MS4 permittees.</p>
5	Attachment E, Page 4	II.E.1.c	Omit Item c. The MS4 Permit is to regulate water quality. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to "Determine whether the designated beneficial uses are fully supported as ...aquatic toxicity and bio-assessment monitoring." This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
6	Attachment E, Page 4	II.E.2.a	<p>Outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to monitor progress towards achieving TMDL WLAs that are expressed in the receiving water. Instead, Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs, if necessary.</p> <p>Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.</p> <p><i>Recommended Correction:</i> Either utilize MALs, in lieu of numeric WQBELs, to measure progress towards achieving TMDL WLAs expressed in the receiving water or eliminate MALs entirely.</p>
7	Attachment E, Page 4	II.E.3.a	<p>Regarding "a," This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.</p> <p><i>Recommended Correction:</i> Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the IC/ID program.</p>
8	Attachment E, Page 4	II.E.3.b	<p>With regard to "b", see previous responses regarding MALs and the limitation of the non-stormwater discharge prohibition to the MS4.</p> <p><i>Recommended Correction:</i> Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.</p>
9	Attachment E, Page 4	II.E.3.c	<p>Regarding "c", as mentioned, non-stormwater discharges cannot be applied to receiving water limitations because they are only prohibited to the MS4, not from or through it.</p> <p><i>Recommended Correction:</i> Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.</p>

10	Attachment E, Page 4	II.E.4	<p>Omit Item 4. Monitoring of Development/Re-development BMPs is the responsibility of the Developers. Requirements for monitoring Developer BMPs should be part of Section VI.D.6. <i>Planning and Land Development Program</i> and the responsibility of the Developer.</p> <p>The purpose of this requirement is not authorized under federal stormwater regulations as it relates to monitoring. Requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4's pollution contribution relative to exceeding ambient water quality standards. There is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.</p> <p>Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines "effectiveness" -- effective relative to what standard? It is also not clear how such monitoring is to be performed.</p> <p><i>Recommended Correction:</i> Delete this requirement.</p>
11	Attachment E, Page 5	II.E.5	<p>Omit Item 5. The MS4 Permit is to regulate discharges to receiving water. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to conduct Regional Studies for Southern California Monitoring Coalition, bio-assessment and Pyrethroid pesticides. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.</p> <p>Requiring 85 jurisdictions to conduct regional monitoring is duplicative and inefficient and should be conducted by a Regional authority.</p> <p>Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board's SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County's mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.</p>
12	Attachment E, Pages 5-6	III.F & G	Omit Items F. & G. Specifying Sampling Methods and Analytical Procedures in the permit adds unnecessary liability for Cities for work that is already described in USEPA Protocols and per approved TMDLs. These Items should be combined and state to follow USEPA Protocols or per approved TMDLs.
13	Attachment E, Page 6	III.H.3	There is a typo for Item 3. Item 3. should read "...requirements identified in Part XVIII.A.5. and Part XVIII.A.7 of this MRP."
14	Attachment E, Pages 7-8	IV.C.1	More time is needed to prepare Coordinated Integrated Monitoring Plans due to the number of agencies involved. Since existing monitoring programs will proceed as Coordinated Integrated Monitoring Plans are being prepared, then there is no need for accelerated schedules. Revise Item 1. to provide twelve (12) months for each Watershed Group to submit a Memorandum of Understanding to work with other agencies for a Coordinated Integrated Monitoring Plan. A letter of intent allows a Permittee to drop out of the process at any time and 12 months are required to process a Memorandum of Understanding with County and State agencies.
15	Attachment E, Page 8	IV.C.2	Revise Item 2. to require "Each Permittee not participating in a Coordinated Integrated Monitoring Plan to submit an Integrated Monitoring Plan..."
16	Attachment E, Page 8	IV.C.3	Revise to allow participating Permittees 24 months to submit a Coordinated Integrated Monitoring Plan. It will take a minimum of 12 months to process a Memorandum of Understanding with County and State agencies and that agreement is required before any Permittee will award a contract to a consultant to prepare a Coordinated Integrated Monitoring Plan. It takes 3 months to issue Request for Proposals and award a contract and then 9 months for a consultant to prepare a Coordinated Integrated Monitoring Plan. Since existing monitoring programs will proceed as Coordinated Integrated Monitoring Plans are being prepared, then there is no need for accelerated schedules.

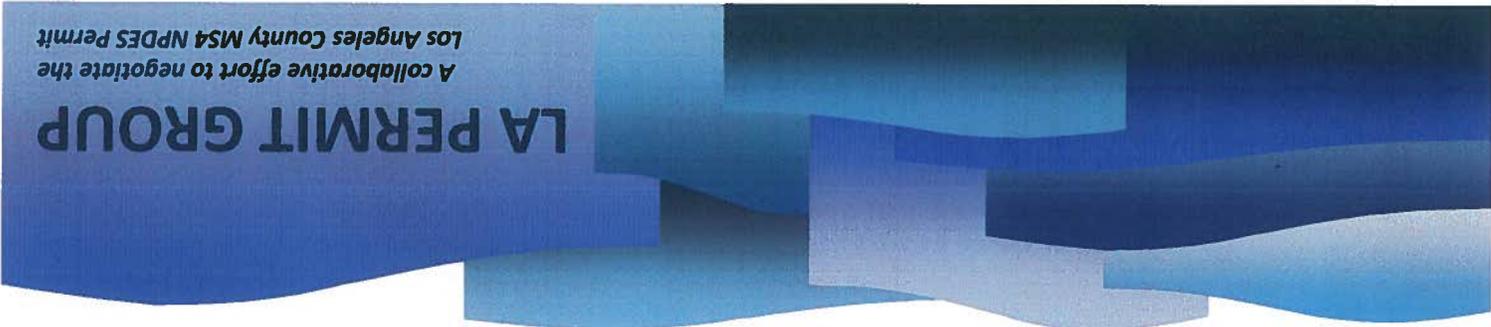

17	Attachment E, Page 8	IV.C.5	Revise to allow 9 months after approval of an IMP or CIMP by the Executive Officer to commence monitoring. It takes 3 months to issue Request for Proposals and award a contract for monitoring. It takes an additional 6 months to obtain permits from the Los Angeles County Flood Control District to access monitoring locations on their systems.
----	-------------------------	--------	--

18	Attachment E, Page 8	IV.C.7	<p>Both the current permit shoreline monitoring program (CI-6948) and the SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) are being incorporated into the new permit. <b>The CI-6948 shoreline monitoring requirements, Section II.D – page T-11, is redundant to the CSMP.</b> All stations monitored in the CI-6948 are also monitored in the CSMP. Furthermore, the SMBBB TMDL specifies that the agencies are to select sampling frequency and the CSMP states that the agencies have selected weekly sampling frequency. However, CI-6948 requires several stations to be monitored up to 5 days per week and with the addition of the CSMP additional stations will be monitored two days per week.</p> <p>Paragraph II.D.b) of the CI-6948 shoreline monitoring section specifies that the sampling frequency at 28th Street (DHS 113), also SMB-5-2, and Herondo storm drain (DHS 115), also SMB-6-1, be increased to 5 times per week. Paragraph II.D.e) states that monitoring sites are to be monitored 5 days per week if the historical water quality is worse than the reference beach. However, no evidence was presented to the responsible agencies that this was the case for the SMB-5-2 or 6-1.</p> <p>An evaluation of historical data was presented by the Regional Board Staff Report for the reconsideration of the SMBBB TMDL dated May 2012. Further evaluation of this data shows that SMB-5-2 and SMB-6-1 should not be subject to the increase frequency for the following reasons:</p> <ol style="list-style-type: none"> <li>1. Of the 67 stations being monitored as part of the CSMP, SMB-5-2 and 6-1 are ranked 57 and 43 respectively in the percent of exceedances during the summer dry weather period.</li> <li>2. 37 stations being monitored only weekly or two days per week had a higher summer-dry weather exceedance percentage than SMB-6-1.</li> <li>3. The Reference Beach monitoring station (SMB-1-1) had a summer dry weather period exceedance percentage of 10.2% versus 6.9% and 3.2% for SMB-5-2 and 6-1, respectively.</li> <li>4. The Reference Beach monitoring station (SMB-1-1) had an average year-round exceedance percentage of 12.1% versus 14.6% and 11.4% for SMB-5-2 and 6-1, respectively. Although exceedance rate for SMB 5-2 is higher than the Reference Beach monitoring station based on year round results, it is lower during the critical summer-dry weather period.</li> <li>5. Of the 8 stations being monitored five days per week SMB-6-1 and 5-2 have the lowest summer dry weather period exceedance percentage (top 6 ranged from 40.9% to 8.5% compared to 6.9% and 3.2% for SMB-5-2 and 6-1).</li> </ol> <p>In addition, the inclusion of both the CI-6948 shoreline monitoring program and CSMP into the permit will result in 5 (SMB-5-1, 5-3, 5-5, 6-5, and 6-6) of the other 9 monitoring stations in SMBBB TMDL Jurisdictional Groups 5 and 6 being monitored 2 days per week which is not the case for any of the other CSMP stations.</p> <p>For all of the above reasons, the shoreline monitoring provisions of CI-6948 should be removed from the new permit monitoring program. However, at a minimum, paragraph D.1.b) should be removed and paragraph D.1.e).(1) should be modified to remove stations S13 (SMB-5-1), S14 (SMB-5-3) S15 (SMB-5-5), S17 (SMB-6-5) and S18 (SMB-6-6).</p> <p>The following is proposed wording modification to Attachment E, Section IV.C.7:</p> <p>“7. Monitoring requirements pursuant to Order No. 01-182, except Section D.1.b) is removed and Section D.1.e).(1) is modified to removed sites S13, S14, S15, S17 and S18 of the Monitoring and Reporting Program - CI-6948, shall remain in effect until the Executive Officer of the Regional Water Board approves a Permittee(s) IMP and/or CIMP plan(s).”</p>
19	Attachment E, Page 14	VI.C.1.b	Monitoring should be performed per approved IMP or CIMP or approved TMDL. The IMP and CIMP should identify rain gauges to use in the appropriate watershed.
20	Attachment E, Page 15	VI.C.1.d	Omit iv. The TMDLs will specify if TSS or SSC monitoring is required, otherwise sediments are needed for beach replenishment and the naturally occurring transport of sediments should not be regulated.
21	Attachment E, Page 15	VI.C.1.d	Omit vi. This imposing of State and Federal responsibilities on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
22	Attachment E, Page 15	VI.D.1.a	Omit the requirement for “One of the monitoring events shall be during the month with the historically lowest instream flows.” This data does not exist and it would be simpler to specify the historically driest month.
23	Attachment E, Page 15	VI.D.1.b	Revise item i. and ii. to simply be on days with no measurable rain. There are sufficient days of no measurable rain in Southern California and any rain event could result in isolated stormwater run off.
24	Attachment E, Page 16	VII.A	Revise the description to include database, “The IMP and/or CIMP plan(s) shall include a map <b>and/or database</b> of the MS4 to include the following information:” GIS maps all come with database(s) that include much of the required information.
25	Attachment E, Page 17	VIII.A.2.e	Include the option to monitor “upstream of the actual outfall or downstream of a political boundary”. Sometimes the best location to do monitoring is at the next manhole downstream from a city boundary.
26	Attachment E, Page 17	VIII.B.1.a	Omit “except aquatic toxicity, which shall be monitored once per year...”. This imposing of State and responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
27	Attachment E, Page 18	VIII.B.1.b	Omit Item ii. and iii. Monitoring should be performed per approved IMP or CIMP or approved TMDL.
28	Attachment E, Page 18	VIII.B.1.c	Omit Item iv. The TMDLs will specify if TSS or SSC monitoring is required, otherwise sediments are needed for beach replenishment and the naturally occurring transport of sediments should not be regulated.
29	Attachment E, Page 18	VIII.B.1.c	Omit vi. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
30	Attachment E, Page 19	IX.A.2	Include “natural flows” or “natural sources” as a potential source of non-storm water flow.
31	Attachment E, Page 22	IX.E.2	Revise last sentence to read, “100% of the outfalls <b>in the inventory</b> within 5 years...”

32	Attachment E, Page 22	IX.F.2	Omit the requirement to report to the Regional Board "within 30 days of determination" because there are too many report submittals that could lead to a Notice of Violation that will have no impact on water quality. Reporting source identifications in the annual report provides central location for submittals.
33	Attachment E, Page 23	IX.G.3 & 4	Outfalls not subject to dry weather TMDLs that have significant dry weather flows should have continuous flow monitoring done for a quarter with water quality sampling done once at the beginning of that time period. If the water quality sampling indicates pollutant concentrations that exceed water quality standards, then the IC/ID investigation procedures should begin. If no water quality standards are exceeded or the IC/ID investigation eliminates the source of pollutants, then that flow has been demonstrated NOT to cause or contribute to pollutant loading and should be stopped. To continue monitoring a site that is known NOT to cause or contribute to pollutant loading is a waste of resources and an un-funded mandate.
34	Attachment E, Page 24	X	This section should be moved to Section VI.D.6.d.iv. for clarity.
35	Attachment E, Page 25	XI	Omit this section. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform Pyrethroid and SCCWRP regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
36	Attachment E, Page 28	XII	Omit this section. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform aquatic toxicity regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
37	Attachment E, Page 38	XIV.I.1 & 2	It is not reasonable to force Permittees to make changes to approved Monitoring and Reporting Programs based on the whim of an "interested" party or "as deemed necessary by EO". This provides unlimited power to interested parties or EO. Recommend these items be revised to include a caveat that there would be no additional costs or as approved by Regional Board, to make those changes open and transparent.
38	Attachment E, Page 39	XIV.M	Omit section M. as it is redundant to section L.
39	Attachment E, Page 44	XVIII.A.5	Omit Items b. & c. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform aquatic toxicity regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
40	Attachment E, Pages 49-52	XIX.B	Only include schedules for IMP and CIMP for USEPA established TMDLs and revise those schedules to be 9 months for IMP and 24 months for CIMP. Having due dates for Monitoring and Reporting plans for IMP and CIMP past the due date established by the TMDL creates confusion.

**Exhibit C:**

**LA Permit Group Comment Letters re: Working Proposals**

February 9, 2012

Sam Unger, Executive Officer  
Los Angeles Regional Water Quality Control Board  
320 West Fourth Street, Suite 200  
Los Angeles, CA 90013

**SUBJECT: LA Permit Group Comments Regarding the 1/23/12 Workshop on Monitoring and TMDLs**

Dear Mr. Unger:

The LA Permit group appreciates the opportunity to provide comments regarding the Regional Board's January 23, 2012 Workshop on the proposed Monitoring and TMDL programs for the upcoming Los Angeles County MS4 NPDES permit. Detailed comments and recommendations regarding each of these programs are attached (Monitoring Program Comments – Exhibit A and TMDL Program Comments – Exhibit B). The LA Permit Group recognizes that the upcoming MS4 NPDES permit is a very difficult and complicated permit to develop, especially given the integration of many TMDLs. However, the permit must contain provisions that are economically achievable and sustainable and that will not expose permittees to unreasonable compliance issues. We look forward to continued discussion and collaboration with you and your staff in order to cooperatively develop economically achievable and sustainable permit provisions.

The LA Permit Group is a collaborative effort developed to negotiate the Los Angeles County MS4 NPDES Permit. Over 60 Los Angeles County municipalities are actively participating in the effort to develop and provide comments and recommendations throughout the MS4 NPDES Permit development process. Comments and recommendations are developed by each of the LA Permit Group's four Technical Sub-Committees (Land Development, Reporting & Core Programs, Monitoring, and TMDLs) which are then approved by the LA Permit Group; the group's consensus is represented by the Negotiations Committee. The LA Permit Group's comments and recommendations contained in Exhibits A and B of this letter have been developed by the Monitoring and TMDL Technical Sub-Committees and were approved by the LA Permit Group at our February 8, 2012 meeting.

Thank you for the opportunity to comment on the proposed Monitoring and TMDLs programs and we look forward to meeting with you to discuss our comments and recommendations presented in this letter. Please feel free to contact me at (626) 932-5577 or hmaloney@ci.monrovia.ca.us if you have any questions regarding our comments.

Sincerely,  
  
Heather M. Maloney  
Chair, LA Permit Group

**LA Permit Group  
Comments on Monitoring Provisions Proposed at RWQCB Workshop on 1/23/12**

The LA Permit group appreciates the opportunity to provide comments regarding the Regional Board's 1/23/12 workshop on the proposed monitoring program for the upcoming NPDES permit. The comments are organized to provide our overall general comments regarding the monitoring program and then our specific comments on the details presented in the workshop.

**General Comments**

In our 11/10/11 presentation to the Regional Board, The LA Permit Group identified an integrated Watershed Monitoring Program (IWMP) approach supporting a comprehensive and focused monitoring program. Although the Board staff indicated interest in the approach, we were disappointed to see the approach was not well captured in the 01/23/12 workshop. We still would submit that the overarching monitoring program should be based on the concepts found in an IWMP (see attached proposal for an IWMP, p.5 & 6).

**Regional Monitoring Programs**

1. Duplicative efforts. The proposed regional monitoring programs appears to duplicate ongoing studies/activities by other permittees in southern California, thus, we question what new and useful information will be provided that is not already being developed.

*Recommendation: Modify the requirement for regional monitoring programs to account for existing and on-going regional monitoring efforts (also see our Special Comments on this issue).*

**Stormwater and Non-stormwater Monitoring Programs**

1. Need to Promote a Watershed Approach. The proposed monitoring strategy appears to minimize instead of promote a watershed approach to monitoring and provides little insights into the water quality issues within a watershed. Instead it focuses exclusively on individual permittees.

*Recommendation: It is recommended that the monitoring program be based on a watershed and TMDL and that it:*

- a. evaluates the current conditions in impaired water bodies (identified by effective TMDLs), facilitates the attainment of WLAs and assessment of effectiveness and improvement of BMPs to effectively address each impairment to the extent it is potentially contributed by the MS4, and
- c. identifies the extent to which the impairment may be caused by factors or sources other than discharges from the MS4
- d. promotes the IWMP and provides time schedule incentives.

*The LA Permit Group has developed a position paper that captures this fundamental strategy (see attachment). The strategy, we believe, would better serve as the framework for the monitoring program than the one currently being considered by the Regional Board.*

2. Lack of Clear Goals and Objectives. The proposed strategy for stormwater and non-stormwater lacks well defined goals and management questions. Instead the strategy appears to be a resource-intensive, far reaching attempt to collect monitoring data for collection sake without any explanation as to how the data will be used to guide management decisions. The monitoring program must be designed to answer specific management questions and/or objectives. The program must provide a comprehensive but focused attempt to address a number of management

questions. Furthermore the proposed strategy isolates the stormwater/non-stormwater monitoring from other elements of the monitoring program such as receiving water and tributary monitoring. As a result it is difficult to understand the overall relationships between the various monitoring efforts and limits the Permittees' ability to direct their monitoring efforts according to local and watershed specific concerns.

*Recommendation: We strongly recommend that the Regional Board revisit the stormwater monitoring programs to incorporate an integrated watershed monitoring strategy that addresses water quality management based questions and TMDLs. Similarly, we recommend that the monitoring program reflect an adaptive management approach such that we have the ability to modify our monitoring efforts as monitoring data and information are gathered.*

**Specific Comments**

Although we have fundamental concerns with the overall approach provided in the 1/23/12 workshop and strongly recommend modifications in the approach, we have none-the-less developed specific comments on the Regional Board approach. These comments are provided below.

**Regional Monitoring Programs**

1. Pyrethroid Study. We suggest that the Surface Water Ambient Monitoring Program would be a better vehicle for assessing the overall impacts of pesticides (pyrethroids) in the watersheds than the MS4 stormwater programs. This is especially true since pyrethroid is a statewide issue and not just a potential Los Angeles area issue.
2. Hydromodification Study. Many municipalities discharge directly or indirectly into concrete channels thus calling into question the value of a hydromodification study for these municipalities. Furthermore, the Southern California Coastal Water Research Project (SCCWRP) has a number of studies focused on hydromodification including one that assesses the impacts of hydromodification and identifies management practices that could offset the impacts<sup>1</sup>. Thus we would suggest that the proposed hydromodification study for the LA permittees be eliminated and instead allow SCCWRP efforts in this area to be the base studies.
3. Low Impact Development Study. As with the hydromodification study we believe that there is already ongoing research with LID and that the proposed study for the LA permittees is unwarranted. The Southern California Monitoring Coalition had previously identified this area for research and received grant monies to assess the effectiveness of LID strategies. This work was recently conducted by the SCM. In addition, the SCM Coalition conducted a study to identify impediments to LID implementation and this study is also just now being completed. Thus we question the value of LA permittee specific studies for LID.

*Recommendation: Modify the requirement for regional monitoring programs to account for existing and ongoing regional monitoring efforts.*

**Stormwater and Non-stormwater Monitoring Programs**

1. Clear Logic Needed for Deciding Monitoring Efforts. The logic for both stormwater and non-stormwater monitoring efforts is confusing and in some cases appears to be in conflict. Furthermore, there appears to be little nexus between TMDLs and the proposed monitoring effort. *Recommendation: It is absolutely necessary that a logical decision tree be developed to guide the Permittees. The development of a decision tree could be part of the integrated watershed monitoring plan.*

2. Confusing objectives for non-stormwater monitoring. The proposed non-stormwater monitoring (slides 21-23?) does not address the stated requirement in slide 24 to determine the relative flow contribution of other permitted discharges. Also it is unclear what will be gained by the extensive monitoring effort. Furthermore the time line proposed to complete this work is woefully inadequate (9 months). If the purpose of the non-stormwater monitoring is to assess the categorical exemptions, then the current framework is inadequate.

*Recommendation: We recommend that a well defined regional study be incorporated into the IWMP that already includes flow monitoring in numerous locations to assess categorical exemptions instead of the each permittee based approach currently proposed.*

3. Aquatic Toxicity Monitoring. Slide 18 indicates that stormwater monitoring includes aquatic toxicity monitoring. We would submit that it is premature to conduct outfall toxicity monitoring until it has been established that toxicity is present in the receiving water. Furthermore we would submit that should toxicity monitoring be required, acute toxicity is the appropriate toxicity test given the short duration of stormwater discharges.

*Recommendation: Toxicity monitoring should be acute and be limited to the receiving water and not be a part of an outfall monitoring program unless dictated by a TMDL. Aquatic Toxicity monitoring is required by a number of TMDLs and could be extracted from IWMP.*

4. Technical concerns include the following:

- a. Unclear how baseline non-stormwater flows are established.
- b. Possible conflicting criteria regarding the use of land uses to identify outfalls and the minimum number of outfalls (slides 15-16).
- c. Need better definition for "significant" non-stormwater flows. The requirement noted in slide 21 regarding 10% above the lowest rolling average needs to be evaluated more closely as it appears that all outfalls will qualify under this criteria.

<sup>2</sup> Slide numbers are based on Regional Board 1/23/12 presentation by PG Environmental.

- d. When are field measurements and grab samples collected during a storm event? Logistically it will be difficult and costly to require grab samples in addition to the flow weighted samples. Most stormwater data are categorized as event mean concentrations which is a flow weighted composite sample. Grab samples do not reflect EMC but rather just a point in time concentrations.

- e. The use of bacteria as a monitoring parameter to identify sources of sewage is questionable given bacteria is ubiquitous in our environment and difficult to track. Bacteria source tracking should be addressed in the TMDL on a case by case situation.
- f. Without receiving water data the MS4 is limited in its ability to determine whether non-stormwater discharges are causing or contributing to exceedances of water quality standards. However there is no receiving water monitoring coupled with the non-stormwater monitoring.

- g. The 1/23/12 presentation introduced some new as well as some not so new terms. Given the relatively early stage of development of the stormwater permitting program, it is important to clearly define these terms to avoid confusion and misunderstanding during the permit approval process. We realize that the adopted Permit will have a definition section but to assist in the permit development and adoption stage it would be useful to provide definitions upfront including the definition for outfalls, major or otherwise.

*Recommendation: Conduct case studies for Torrance and the Los Angeles River watersheds and others as appropriate to address a range of different conditions (e.g. size, receiving waters, TMDLs, etc.). These case studies will likely clarify the purpose and approach of the monitoring and lead to improvements in the monitoring program. Furthermore we believe it would be constructive to have PG Environmental participate in these discussions.*

### Closing

The LA Permit Group again appreciates the opportunity to provide these comments and look forward to working with the Regional Board especially in evaluating case studies to better craft a long term, constructive and cost effective monitoring program.

LA Permit Group, proposal for

**INTEGRATED WATERSHED MONITORING PLANS**

It is the MS4 Co-Permittees' intent to utilize Total Maximum Daily Load (TMDL) monitoring as the primary monitoring program requirement in the next MS4 Permit. The Co-Permittees support a TMDL-driven monitoring program that:

- evaluates the current conditions of recognized impaired water bodies (identified by the 303d List),
- facilitates the attainment of WLAs and assessment of effectiveness and improvement of BMPs to effectively address each impairment to the extent it is potentially contributed by the MS4, and
- identifies the extent to which the impairment may be caused by factors or sources other than discharges from the MS4

The Co-Permittees wish to work cooperatively with the assistance of outside experts, e.g., Council for Watershed Health<sup>3</sup> or consulting firm, to prepare Integrated Watershed Monitoring Plans to meet TMDL monitoring requirements. Currently the adopted TMDLs require each agency or subwatershed group to submit separate TMDL Monitoring and Reporting Plans and to prepare individual annual monitoring reports for each TMDL. The end result will be numerous monitoring plans that are not coordinated, with redundancies between monitoring programs, without standard sampling or analysis methods to ensure data comparability, and with the potential for data gaps, which will create a multitude of annual reports which must be reviewed by Regional Board staff that do not provide a comprehensive picture of watershed health.

The goal of Integrated Watershed Monitoring Plans would be to provide:

- TMDL objective-driven monitoring plan designs,
- comprehensive data management and reporting,
- SWAMP-compatible QA/QC and data validation,
- data synthesis and interpretation on a watershed scale, and
- single, comprehensive annual monitoring reports for each watershed addressing all the adopted TMDLs in that watershed.

Integrated Watershed Monitoring Plans will be developed and implemented for each major watershed in the County. The Co-Permittees recognize the efficiencies that can be obtained by preparing Integrated Watershed Monitoring Plans that address all TMDLs for that watershed. During the process of developing the Integrated Watershed Monitoring Plans the Co-Permittees would bring together watershed stakeholders, compile an inventory of existing or pending monitoring efforts, develop a comprehensive list of monitoring questions to address the identified watershed impairments and design coordinated monitoring programs. The provisions of the 3rd term permit Monitoring and Reporting Program and the relevant TMDL monitoring requirements will be incorporated into each Integrated

<sup>3</sup> The Council for Watershed Health (Council) has worked with the Wastewater Treatment Plants to prepare coordinated monitoring plans for the Los Angeles and San Gabriel River watersheds.

LA Permit Group, proposal for

INTEGRATED WATERSHED MONITORING PLANS, cont.

Watershed Monitoring Plan and the requirement for implementing individual TMDL monitoring plans would be eliminated once they have been incorporated into the approved Integrated Watershed Monitoring Plan. The Co-Permittees would need to develop a Memorandum of Understanding to contract for preparation of the Integrated Watershed Monitoring Plans and Annual Reports.

The Co-Permittees recognize the value of having Integrated Watershed Monitoring Plans to assess the extent of MS4 contribution to TMDL-listed impairments and to design and evaluate BMPs to reduce those contributions to attain WLA, but also recognize that the same monitoring data can be used by the Regional Board to issue Notices of Violation and/or for Third Party lawsuits. Such regulatory and legal actions would be counterproductive and would obstruct the iterative adaptive process needed to efficiently and effectively improve water quality, thus the co-permittees request that the MS4 Permit language for Monitoring and TMDLs be written to require Integrated Watershed Monitoring Plans but to clearly state that so long as a Co-Permittee is carrying out its obligations in implementing measures in accordance with the provisions of an approved TMDL Implementation Plan and participating in a cooperative MOA to carry out the Integrated Watershed Monitoring Plans, that during this Permit term exceedances of Water Quality Standards, TMDL Waste Load Allocations, or Effluent Limits will not constitute a Permit violation. Integrated Watershed Monitoring Plans approved by the Executive Officer would supersede previously approved TMDL Monitoring and Reporting Plans.

Permittees that do not want to participate in the Integrated Watershed approach shall develop and/or utilize existing or future TMDL monitoring plans and schedules. Existing TMDLs should have the option to be included in the Integrated Watershed approach, and resulting timeframe adjustments, if they so chose.

**Draft Comments on TMDL Provisions Proposed at RWQCB Workshop on 1/23/12**

**LA Permit Group**

The Los Angeles Permit Group appreciates the opportunity to provide input to RWQCB staff on the elements of TMDL WLA incorporation into the MS4 permit as provided in the presentation and handouts during the workshop on 1/23/12.

The group supports many of the concepts outlined in the presentation, particularly the multiple methods of demonstrating compliance, which includes the implementation of rigorous implementation plans using an adaptive management strategy as a method of compliance. However, the group has a few key concerns with the proposal that we would like to share.

**Reasonable Assurance Plan**

We request that the Reasonable Assurance Plan (RAP) not be used as the mechanism for identifying the BMPs that will be used to comply with the TMDL WLAs. Rather, we request that the requirements to meet TMDL WLAs be incorporated into the Stormwater Quality Management Plan, as described below.

1. Stormwater Quality Management Plans, based on the TMDL implementation plans and other elements, can be developed with a watershed/sub watershed based or individual permittee approach rather than a "one size fits all" approach.

a. Permittees shall develop a process to evaluate BMPs that will fall under one or more of the following categories:

- i. Operational source control BMPs that prevent contact of pollutants with rainwater or stormwater runoff;
- ii. Runoff reduction BMPs;
- iii. Treatment control BMPs where effectiveness information is available;
- iv. True source control BMPs that eliminate or greatly reduce a potential pollutant at the original source pursuant to a legislative or regulatory time schedule; or
- v. Research and development for pollutant types where effective BMPs have not been identified.

b. These categories will be incorporated as part of the Stormwater Quality Management Plans.

c. Stormwater Quality Management Plans will identify effective BMPs to be implemented in an iterative manner to attain the WLAs based on the design storm.

2. Stormwater Quality Management Plans designed to attain the TMDL WLAs will include:

- a. specific, targeted steps scheduled to attain the WLAs through the use of BMPs;
- b. specific procedures for evaluating BMP effectiveness; and
- c. provisions for special studies if needed.

The Stormwater Quality Management Plans can incorporate BMPs identified in implementation plans to address the TMDL requirements.

TMDL Compliance

Our second, and primary concern, is the way in which compliance with TMDL permit provisions is being discussed. It is our understanding from the presentation, that at the end of a TMDL implementation schedule, if a permittee is not meeting the numeric values assigned as WLAs in the TMDL, the permittee will be considered out of compliance with the permit requirements. We have significant concerns with this approach to developing the permit for a number of reasons.

It is our understanding that this approach would result in the inclusion of numeric effluent limitations as the mechanism for incorporating the TMDL WLAs. For those TMDLs whose compliance dates have passed, permittees would be considered in violation of the permit if they are not meeting the numeric effluent limitations from the moment the permit is effective. If warranted, the Regional Board would use a Time Schedule Order (TSO) to provide some additional time for coming into compliance. If this is the proposed approach, in essence, the permittees would be going from complying with the current permit that includes only a few TMDL requirements to potentially being out of compliance for requirements that have never been in their permit.

Permittees are planning on taking actions as outlined in the Stormwater Quality Management Plan above to make significant progress towards improving water quality. However, we have concerns that requirements being proposed go beyond MEF given the economic and staff resources available to achieve the WLAs for an unprecedented number of TMDLs being incorporated into this permit. These concerns are based on a number of factors including but not limited to:

- TMDLs were developed using inadequate data with the intent that TMDL provisions would be revised through TMDL reconsiderations and special studies. Most of the TMDLs have not been reconsidered.
- Other sources may prevent attainment of standards in the receiving water no matter what actions are taken by the MS4 permittees.
- Many WLAs cannot be met within the permit term.
- Regulation of the sources of some pollutants are outside of MS4 permittees control.
- The design storm has not yet been defined and implementation of BMPs to ensure compliance under all conditions, including extreme storm events, could be extremely costly and technically infeasible.

Although we recognize that additional requirements and rigor need to be added to the permit to address TMDLs, we feel that there are straightforward ways to do this that do not represent such a significant shift in the regulation of stormwater discharges and place dischargers into an untenable situation of potentially being out of compliance with their permit from the effective date.

To address these concerns, the group would like to propose the following approach for compliance with TMDL WLAs.

1. Implement TMDL WLAs as BMP-based water quality based effluent limitations (WQBELs) in the permit. This is consistent with federal regulations (40 CFR 122.44(d)(1)(vii)(B) which require inclusion of effluent limits, defined at 40 CFR 122.2 as "any restriction imposed by the Director on quantities, discharge rates, and concentrations of "pollutants" which are "discharged" from

- "point sources", which are "consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA."
2. Define BMP-based WQBELs as "implementation of BMPs included in a Regional Board Executive Officer approved Stormwater Quality Management Plan. The Stormwater Quality Management Plan (SQMP) shall describe the proposed BMPs and the documentation demonstrating that when implemented, the BMPs are expected to attain the WLAS, and a process for evaluating BMP effectiveness and implementing additional actions if necessary to meet the TMDL WLAS." This is consistent with other recently adopted permits in California and with the requirements as described in the 1/23/12 RWQCB presentation.
  3. Consistent with the four methods for demonstrating compliance with TMDLs as presented in the 1/23/12 RWQCB presentation, a co-permittee which is achieving WLAs at the outfall (or equivalent point of compliance within the drainage system) or in receiving waters may cease implementing additional BMPs if appropriate.
  4. Violations of the BMP based WQBEL provisions would consist of the following provisions, in keeping with the 1/23/12 RWQCB presentation:
    - a. Not submitting the SQMP.
    - b. Not implementing all elements of the SQMP in accordance with the approved schedule.
    - c. Not implementing additional BMPs or revising the SQMP per the process outlined in the SQMP or on schedule.

We can provide example permit language to help expand upon the approach outlined above. We appreciate your consideration of this approach and would like to meet to discuss these important issues related to TMDLs.

#### Additional Comments on the Proposed Text

In addition to the general topics outlined above, we have some concerns about the draft language that was provided for the TMDLs. First, we request that a non-trash example be provided to allow a better understanding of how compliance will be determined for constituents that do not have a clear method of determining compliance outlined in the TMDL. Additionally, we feel that some of the language proposed is not consistent with the approach outlined in the presentation. We have highlighted the language of potential concern below.

#### Part 7. Total Maximum Daily Loads (TMDLs) Provisions

The second bullet states "The Permittees shall comply with the following effluent limitations and/or receiving water limitations..." This is followed by tables with the numeric WLAs.

We have three concerns with this language:

1. The language implies that the effluent limitations are strictly numeric.
2. The language does not include any reference to how compliance will be determined, with the exception of the trash TMDL.
3. The language refers to both effluent limitations and receiving water limitations for the Santa Clara River Bacteria TMDL. We feel this does not accurately reflect the language in the TMDL and creates confusion related to the receiving water limitations outlined in a separate portion of the document.

**EXHIBIT B**

We feel that these concerns could be addressed through the approach outlined above for incorporation of TMDL WLAs.

*MS4 Permit Provisions to Implement Trash TMDLs*

We appreciate the incorporation of language to define alternative methods of compliance (i.e. full capture) and hope to see similar language for other constituents. However, we feel that some minor language modifications may be necessary to clearly show the linkage and ensure the permit is clear.

In B. (1)(d) Language regarding compliance through an MFAC program is not clearly defined. We feel that the language should clearly state that the permittee is deemed in compliance through implementing an approved MFAC program.

In B.(2), the language discussing violations of the permit should reference the previous section where compliance is defined.

**SUBJECT: Technical Comments on Los Angeles Regional Water Quality Control Board Staff Working Proposals for the**

**Greater Los Angeles County M54 Permit (Permit) – Watershed Management Programs, TMDLs and Receiving Water Limitations**

Dear Ms. Purdy and Mr. Ridgeway:

The Los Angeles Permit Group would like to take this opportunity to provide comments on the working proposals for Watershed Management Programs, Total Maximum Daily Loads, and Receiving Water Limitations. These documents were posted on the Regional Board website on April 23, 2012. The LA Permit Group appreciates the Regional Board staff's effort to develop the next NPDES stormwater permit and their commitment to meet with various stakeholders including our group. We look forward to continuing the dialogue with the Board staff on this very important permit. Our highest priorities on the Watershed Management Program, TMDLs and Receiving Water Limitations are:

- Provide additional time to develop the Watershed Management Program to integrate the 32 TMDLs and prioritize efforts.
- Prior to adopting the Los Angeles M54 NPDES Permit, reopen TMDLs for reconsideration where final compliance periods have passed and initiate the Basin Plan Amendment process to extend compliance deadlines to coordinate with the Watershed Management Program and consider substantial amounts of new information available. While the TMDL reopeners are pending, an affected Permittee would be in compliance through the implementation of core programs and implementation plans.
- Initiate TMDL reopeners/reconsideration where compliance with a waste load allocation (WLA) is exclusively set in the receiving water to also include compliance at the outfall, or other end-of-pipe; while the TMDL reopener is pending, an affected Permittee would be in compliance with the receiving water WLA through the implementation of core programs and implementation plans.
- Develop Receiving Water Limitation language that supports implementing the Watershed Management Programs without unnecessary vulnerability.

- All compliance points (interim WLA, milestones, and final WLA) for all TMDLs should allow for compliance timelines and actions consistent with the Watershed Management Programs that will be developed, rather than with strict numeric limits to determine compliance.

As noted in discussions with you, the LA Permit Group requested additional time to review the working proposals presented at the May 3, 2012 Regional Board Workshop. Given the brief comment deadline, there are significant additional concerns that could not be fully explored or analyzed. Prior to issuing a tentative order, a complete administrative draft is needed to provide stakeholders (with a minimum 30 day review period) to allow the permittees to fully see how the various provisions of the permit will work together in order to gain a holistic view of the permit. This is essential in order to address the unprecedented policies and actions anticipated in the Los Angeles MS4 NPDES Permit.

These topics are further highlighted below. Detailed comments are attached for each Watershed Management Program, Receiving Water Limitations and TMDLs.

### **Watershed Management Programs**

Overall, the LA Permit Group supports the Regional Board's proposed approach to address high priority water quality issues through the development and implementation of a watershed management program. We believe the working proposal provides sufficient detail to guide the development of the programs without being overly prescriptive and constraining. However, one of our biggest concerns with the working proposal is the proposed timeline for developing the watershed management programs. As noted in the workshop, municipalities would have only one year to develop a comprehensive watershed management program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate the data, draft the plans, and obtain necessary approvals from political bodies. As a comparison, the City of Torrance required two years to prepare a comprehensive water quality plan that addressed a suite of TMDLs, similar to what is being considered in the watershed management program. The permit should provide that the time schedule for submittal of the Draft Plan be 24 months after permit adoption.

We also offer the following comments regarding the watershed management program (our line item by line item review and comments are attached):

- The working proposal seems to be silent on the critical issue of sources of pollutants outside the authority of MS4 permittees (e. g. aerial deposition, upstream contributions, discharges allowed by another NPDES permit, etc.). We request that permittees be allowed to demonstrate that some sources are outside the permittee's control.
- Reasonable assurance necessitates closer integration with TMDL and storm water monitoring programs. Currently the working proposal does not provide a sufficient tie-in between the monitoring and the watershed program. This lack of tie-in was acknowledged in the workshop by Board staff. It is expected that this tie-in will be addressed once the monitoring provisions are drafted.
- The watershed plan is obviously tied closely with the TMDLs which is reasonable and constructive. But we would suggest that staff broaden the definition of water quality issues to consider protection of and impacts to existing ecosystems in the analysis.
- More careful consideration should be given to the frequency and extent of the reporting and adaptive management assessments. The current proposal results in a significant annual effort and the LA Permit Group members question the value of such an effort. Current reporting appears to overwhelm state staff resources without providing the state with usable feedback on the significant efforts about our programs. We believe that the reporting can be streamlined and that the jurisdictional and watershed reporting should be combined.

- It is unclear how program implementation and TMDL compliance will be handled during the interim period before development of the watershed management program. For those entities that choose to develop a watershed management program, the LA Permit Group requests that current, significant efforts in our existing programs and implementation plans be allowed to continue while we evaluate new MCMs as part of the watershed management program.
- Consideration of the technical and financial feasibility of complying with water quality standards should be included in the watershed management program.

### Total Maximum Daily Loads

Of critical importance to this permit and to water quality is the incorporation of TMDLs into the NPDES permit. This NPDES permit proposes to incorporate more TMDLs than any other permit in California issued to date. As a result, the manner in which the TMDLs are incorporated into the permit is a critical issue for the LA Permit Group and will likely set a significant precedent for all future MS4 permits.

The rate of development of TMDLs in the Los Angeles Region was unparalleled in California, and likely the nation. A settlement agreement necessitated the much accelerated time schedule for these TMDLs. The TMDLs were developed based on the information available at the time, not the best information to identify or solve the problem. As a result, the sophistication of the TMDLs vary widely, meaning that not all TMDLs are created equal regarding knowledge of the pollutant sources, confidence in the technical analysis, availability of control measures sufficient to address the pollutant targets, etc. Additionally, the majority of the TMDLs were developed with the understanding that monitoring, special studies, and other information would be gathered during the early years of the TMDL implementation to refine the TMDLs. As such, many MS4 dischargers were told during TMDL adoption that any concerns they may have over inaccuracies in the TMDL analysis would be addressed through a TMDL reopener. The proposed method of incorporating TMDL WLAS, as outlined in the working proposal, does not effectively allow for addressing this phased method of implementing TMDLs, nor does it recognize the time, effort and complexities involved in addressing MS4 discharges, and it places municipalities into immediate compliance risk for permit requirements that have never been incorporated into the MS4 permit previously.

We recognize and appreciate that TMDLs must be incorporated in such a way as to require action to improve water quality. However, the permit should recognize the articulated goal of many of the TMDLs to be adaptive management documents and consider the challenges of trying to address the non-point nature of stormwater. As such, it is imperative to have flexibility in selecting an approach to address the TMDLs and the time frame by which to implement the approach.

Regional Board staff is making three significant policy decisions with regards to incorporating TMDLs into this permit that the LA Permit Group would like staff to reconsider:

1. The inclusion of numeric effluent limitations for final TMDL WLAS.
2. The use of time schedule orders to address Regional Board adopted TMDLs for which the compliance points have passed.
3. The use of time schedule orders for EPA adopted TMDLs with no implementation plans.

The first policy decision of concern is the incorporation of final WLAS solely as numeric effluent limitations in the proposed permit language. Although staff has discretion to include numeric limits, it is not required and the use of numeric limits results in contradictions and compliance inconsistencies with the rest of the permit requirements. Court decisions (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)<sup>1</sup>), State Board orders (Order

<sup>1</sup> See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

WQ 2009-0008, in the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10)<sup>2</sup> have affirmed that WLAS can be incorporated as non-numeric effluent limitations. Under 40 CFR Section 122.44 (k), the Regional Board may impose BMPs for control of storm water discharges in lieu of numeric effluent limitations when numeric limits are infeasible. It states that best management practices may be used to control or abate the discharge of pollutants when numeric effluent limitations are infeasible. In 2006, the Blue Ribbon Panel made recommendations to the State Water Resources Control Board concluding that it was not feasible to incorporate numeric limits into permits to regulate storm water, and at best there could be some action level, but not numeric waste load allocations. Very little has changed in the technology and the feasibility of controlling storm water pollutants since 2006. What has changed is that a legally compelled, long list of TMDLs has been adopted in the LA Region in a very short time period.

Additionally, during the May 3, 2012 MS4 Permit workshop, Regional Board staff seemed to indicate that the basis for incorporating the final WLAS as numeric effluent limitations is EPA's 2010 memorandum pertaining to the incorporation of TMDL WLAS in NPDES permits<sup>3</sup>. This memorandum (which is currently being reconsidered by U.S. EPA) states that "EPA recommends that, where feasible, the NPDES permitting authority exercise its discretion to include numeric effluent limitations as necessary to meet water quality standards" (emphasis added). This statement highlights the basic principle that the Regional Board has discretion in how the WLAS are incorporated into the MS4 Permit. Regional Board staff commented during the workshop that staff have evaluated data and have determined numeric effluent limitations are now feasible. However, no information refuting the Blue Ribbon Panel report recommendations has been provided that demonstrates how the appropriateness of using strict numeric limits was determined and why these limits are considered feasible now even though historically both EPA and the State have made findings that developing numeric limits was likely to be infeasible<sup>4</sup>.

Given the discretion available to Regional Board staff and the variability among the TMDLs with respect to understanding of the pollutant sources, confidence in the technical analysis, and availability of control measures sufficient to address the pollutant targets, it is critical to use non-numeric water quality based effluent limitations for both interim and final WLAS in this permit. The proposed Watershed Management Program will require quantitative analysis to select actions that will be taken to achieve TMDL WLAS. For the entire length of the TMDL compliance schedule, permittees will be required to demonstrate compliance with interim WLAS by implementing actions that they have estimated to be the best of their knowledge will result in achieving the WLAS and water quality standards. Additionally, permittees will be held responsible for compliance with actions to meet the core program requirements of the permit. However, unless final WLAS are also expressed in this permit as action-based water quality based effluent limitations, and if instead strict numeric limits are required for final WLAS, then, at the specified final compliance date, no matter how much the permittee has done, no matter how much money has been spent, no matter how close to complying with the numeric values, and no matter what other information has been developed and submitted to the Regional Board, the permittee will be considered out of compliance with the permit requirements. And because of the structure established in this permit, the Regional Board staff will have to consider all permittees in this situation as being out of compliance with the permit provisions if the strict numeric limits have not been met, regardless of the actions

<sup>2</sup> "[i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California's NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board's findings supporting either the numeric or non-numeric effluent limitations contained in the permit." (Order WQ 2009-0008, in the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)

<sup>3</sup> U.S. EPA, *Revisions to the November 22, 2002 Memorandum "Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs, Memorandum from U.S. EPA Director, Office of Wastewater Management James A. Hanlon and U.S. EPA Director, Office of Wetlands, Oceans, and Watershed Denise Keehner* (Nov. 10, 2010).  
<sup>4</sup> Storm Water Panel Recommendations to the California State Water Resources Control Board "The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities. June 19, 2006.

taken previously. This approach is inconsistent with the goals of good public policy, fair enforcement and fiscal responsibility.

To address this issue, the LA Permit Group recommends that:

- WLAs be translated into WQBELs, expressed as BMPs and that implementation of the BMPs will place the permittee into compliance with the MS4 Permit
- The WLAs be included as specific actions (BMPs) that will be designed to achieve the WLAs
- Include language that states that compliance with the TMDLs can be achieved through implementing BMPs defined in the watershed management plan

The second major policy decision of concern is the use of Time Schedule Orders for Regional Board adopted TMDLs for which the compliance date has already occurred prior to the approval of the NPDES permit. The ideal phased TMDL implementation process whereby dischargers can collect information, submit it to the Regional Board, and obtain revisions to the TMDL requirements to address data gaps and uncertainties has not occurred. As evidenced by the number of overdue permits, the workload commitments of Regional Board staff are significant and TMDL reopeners seldom occur. Because the majority of the TMDLs have not been incorporated into permit requirements until now, MS4 permittees have been put in the position of trying to comply with TMDL requirements without knowing how compliance with those TMDLs would be determined and without knowing when or if promised considerations of modifications to the TMDL would occur. And now, they are expected to be in immediate compliance with new permit provisions which differ from most precedent and guidance regarding incorporation of TMDLs into MS4 permits, regardless of what actions they have taken to try and meet the TMDL requirements. This is neither fair nor consistent.

The LA Permit Group strongly believes that the adaptive management approach envisioned during TMDL development, whereby TMDL reopeners are used to consider new monitoring data and other technical information to modify the TMDLs, including TMDL schedules as appropriate, is the most straightforward way to address past due TMDLs. Some of the past due TMDLs are currently being considered for modifications and Regional Board staff should use this opportunity to adjust the implementation timelines to reflect the practical and financial reality faced by municipalities. There is no reason why the reopeners cannot reflect information gathered during the implementation period, including information that may be considered in developing the Time Schedule Orders in the future, to selectively modify time schedules in the TMDLs. Additionally, the permit should reflect any modifications to the TMDL schedules made through the reopening process, either through a delay in the issuance of the permit until the modified TMDLs become effective, or by using your discretion to establish a specific compliance process for these TMDLs in the permit. Providing for compliance with these TMDLs through implementation of BMPs defined in the watershed management plans as we have requested for all other TMDLs is a feasible, fair and consistent way to achieve this goal.

The third policy decision of concern is the manner in which EPA adopted TMDLs are being incorporated into the permit. The draft proposal requires immediate compliance with EPA TMDL targets. The effect of this approach is to put MS4 dischargers immediately out of compliance for TMDLs that may have only been adopted in March 2012. However, the Regional Board has the discretion to include a compliance schedule in the permit for EPA adopted TMDLs should they so choose. Federal law does not prohibit the use of an implementation schedule when incorporating EPA adopted TMDLs into MS4 permits. Additionally, State law may be interpreted to require the development of an implementation plan prior to incorporation of EPA adopted TMDLs into permits. Accordingly, the LA Permit Group recommends that the working proposal be modified to include compliance schedules for EPA adopted TMDLs in the permit.

## Receiving Water Limitations

The proposed Receiving Water Limitations (RWL) language creates a liability to the municipalities that we believe is unnecessary and counterproductive. The proposed language for the receiving water limitations provision is almost identical to the language that was litigated in the 2001 permit. On July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.*<sup>5</sup> (NRDC v. County of LA) that determined that a municipality is liable for permit violations if its discharges cause or contribute to an exceedance of a water quality standard.

In light of the 9<sup>th</sup> Circuit's decision and based on the significant monitoring efforts being conducted by other municipal stormwater entities, municipal stormwater permittees will now be considered to be in non-compliance with their NPDES permits. Accordingly, municipal stormwater permittees will be exposed to considerable vulnerability, even though municipalities have little control over the sources of pollutants that create the vulnerability. Fundamentally, the proposed language again exposes the municipalities to enforcement action (and third party lawsuits) even when the municipality is engaged in an adaptive management approach to address the exceedance.

The LA Permit Group would like to more fully address Board Member Glickfeld's question raised at the May 3rd workshop about how RWL language as currently written puts cities in immediate non compliance, either individually or collectively. As written, TMDLs as well as water quality standards in the basin plan would have to be specifically met as soon as this permit is adopted. Many of the adopted TMDLs include language that cities are jointly and severably liable for compliance.

While the Regional Board staff has noted that enforcement action is unlikely if the permittees are implementing the iterative process, the reality is that municipalities are immediately vulnerable to third party lawsuits as well as enforcement action by Regional Board staff. In the Santa Monica Bay, cities were sent Notices of Violation that, in essence, stated that all cities in the watershed were guilty until they proved their innocence when receiving water violations were found, in some cases miles away. The "cause and contribute" language was quoted prominently in those NOV's as justification for why the Regional Board could take such action. As another case in point the City of Stockton was sued by a third party for violations of the cause/contribute prohibition even though the City was implementing a comprehensive iterative process with specific pollutant load reduction plans. Cities will have no warning or time to react to any water quality exceedances, but still be vulnerable to third party lawsuits even when cities are diligently working to address the pollutants of concern. This will be disastrous public policy, creating a chilling affect on productive storm water programs.

It is not fair and consistent enforcement to put cities in a vulnerable situation to be determined out of compliance with water quality standards in the basin plan without time to develop a plan of action, develop source identification, and implement a plan to address the concern. With the very recent legal interpretation that fundamentally changes how these permits have been traditionally implemented, please understand that adjusting the Receiving Water Limitations language is a critical issue. Again, the receiving water limitation language must be modified to allow for the integrated approach to address numerous TMDLs within the watershed based program to solve prioritized water quality problems in a systematic way. This is a fair and focused method to enforce water quality standards.

The receiving water limitation provision as crafted in the contested 2001 Los Angeles permit is unique to California. Recent USEPA developed permits (e.g. Washington D.C.) do not contain similar limitations. Thus, we would submit that the decision to include such a provision and the structure of the provision is a State defined requirement and therefore an opportunity exists for the Regional and State Boards to reaffirm the iterative process as the preferred approach for long term water quality improvement.

<sup>5</sup> No. 10-56017, 2011 U.S. App. LEXIS 14443, at \*1 (9th Cir., July 13, 2011).

Beyond the legal/liability aspect of the receiving water limitations we would submit that in a practical sense the RWL works against the Watershed Management Program proposal. On the one hand the municipalities will develop watershed management programs that are based on the high priority water quality issues within the watershed. Consistent with the working proposal for the watershed management programs we would expect the focus to be on TMDLs and the pollutants associated with those TMDLs. However, under the current RWL working proposal the municipalities will need to direct their resources to any and all pollutants that may cause or contribute to exceedances of water quality standards. Based on a review of other municipal outfall monitoring results in the State there may be occasional exceedances of other non-TMDL pollutants (e.g. aluminum, iron, etc.). These exceedances may only occur once every 10 storms but according to the current RWL proposal, the municipalities must also address these exceedances with the same priority as the TMDL pollutants. The LA Permit Group views this as unreasonable and ineffective use of limited municipal resources.

The RWL language is a critical issue for municipalities statewide and has been highlighted to the State Water Resources Control Board for consideration. Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue.

As previously discussed at the May 3rd workshop, and requested by many Board Members, the economic implications of the many proposed permit requirements are of critical importance. The LA Permit Group will be providing the requested information in a subsequent submittal shortly. However, the short timeframe for commenting on these working proposals has precluded us from assembling the information before the comment deadline on May 14, 2012.

In closing, we thank you for the opportunity to comment on the working proposals and we look forward to meeting with you to discuss our comments and to explore alternative approaches. Furthermore we respectfully request that the Board provide a complete administrative draft of the Permit to stakeholders prior to the public issuance of the Tentative Order. Overall, the comment deadline was too short to address all the potential issues and concerns with the Watershed Management Program, TMDLs, and Receiving Water Limitation sections and that there are significant, additional concerns that could not be fully explored or analyzed given the comment deadline. Thus it is important to review the entire draft permit to better understand the relationship among the various provisions; this is especially true for the monitoring provision and its relationship to the watershed management program. We strongly encourage you to use your discretion on these matters to make the adjustments requested. Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,  
  
Heather M. Maloney, Chair  
LA Permit Group

Document Name: TMDL Working Proposal - April 23 2012

Agency/Reviewer: LA Stormwater Permit Group

Comment No.	Doc. Reference Page	Section	Comments	Rvwr (optional)	Author Response
1	5	B.1.c.(2)	Santa Monica Bay Beaches Bacteria TMDL (SMBBB TMDL) is currently being reconsidered. As part of that reconsideration the summer dry weather targets must be revised to be consistent with the reference beach/anti-degradation approach established for the SMBBB TMDL and with the extensive data collected over that past seven years since original adoption of the SMBBB TMDL. This data clearly shows that natural and non-point sources result in 10% exceedances during dry weather. Data collected at the reference beach since adoption of the TMDL, as tabulated in Table 3 of the staff report of the proposed revisions to the Basin Plan Amendment, demonstrate that natural conditions associated with freshwater outlets from undeveloped watersheds result in exceedances of the single sample bacteria objectives during both summer and winter dry weather on approximately 10% of the days sampled.		
1	5	B.1.c.(2)	Thus the previous Source Analysis in the Basin Plan Amendment adopted by Resolution No. 02-004 which stated that "historical monitoring data from the reference beach indicate no exceedances of the single sample targets during summer dry weather and on average only three percent exceedance during winter dry weather" was incorrect and based on a data set not located at the point zero compliance location. Continued allocation of zero summer dry weather exceedances in the proposed Basin Plan Amendment is in direct conflict with the stated intent to utilize the reference beach/anti-degradation approach and ignores the scientifically demonstrated reality of natural causes and non-point sources of indicator bacteria exceedances.		
1	5	B.1.c.(2)	Continued use of the zero summer dry weather exceedance level will make compliance the SMBBB TMDL impossible for the Jurisdictional agencies. This is also in conflict with the intent of the Regional board as expressed in finding 21 of Resolution 2002-022 "that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas".		

2		B.1.	The SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) was approved by the Regional Board staff and that CSMP should be incorporated into the TMDL monitoring requirements of the next MS4 Permit. The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week, thus it is highly confusing and misleading to refer to "daily monitoring". The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week.		
3		B.1.	The SMBBB TMDL is currently being reconsidered at a hearing scheduled for June 7, 2012. The 4th term MS4 Permit should incorporate the revised waste load allocations which are to be adopted at that hearing, rather than the previous basin plan amendments.		
4	5	B.1.c.(3)	Description of SMB 5-5 under Beach Monitoring Location is incorrect (and seems to have been switched with the description of SMB 5-3). SMB 5-5 is a historic monitoring location "50 yards south of the Hermosa Pier" as described in the adopted basin plan amendment and in the Regional Board approved Coordinated Shoreline Monitoring Plan. Whereas SMB 5-3 has been relocated from the historic location 50 yards south of the Manhattan Beach Pier to the zero point of the southern storm drain outfall against the strand wall under the Pier, thus an apt description of that location would be: "Manhattan Beach Pier, southern drain".		
5	1-6	B.1 throughout	This discussion in this section devoted to the SMBBB TMDL seems to create confusion regarding the meaning of the terms "water quality objectives or standards, and "receiving water limitations" and "water quality-based effluent limitations". Water quality objectives or water quality standards are those that apply in the receiving water. Water Quality Effluent Based Limits apply to the MS4. So the "allowable exceedance days" for the various conditions of summer dry weather, winter dry weather and wet weather should be referred to as "water quality-based effluent limitations" since those are the number of days of allowable exceedances of the water quality objectives that are being allowed for the MS4 discharge under this permit. While the first table that appears under this section at B.1 (b) should have the heading "water quality standards" or "water quality objectives" rather than the term "effluent limitations".		

6	5	B.1.c(3)	While it makes sense for the Jurisdictional Groups previously identified in the TMDLs to work jointly to carry out implementation plans to meet the interim reductions, only the responsible agencies with land use or MS4 tributary to a specific shoreline monitoring location can be held responsible for the final implementation targets to be achieved at each individual compliance location. An additional table is needed showing the responsible agencies for each individual shoreline monitoring location.		
7	6-7	B.2.	Santa Monica Bay Nearshore and Offshore Debris TMDL: An alternate compliance schedule is needed for responsible agencies that adopt local ordinances banning plastic bags, smoking in public places, and single-use expanded polystyrene by three years from the adoption date, or by November 4, 2013. Those agencies are to have a three year extension of the final compliance date, until March 20, 2023 to meet the final waste load allocations.		
8	7	B.3.	The Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4 based on estimates from limited data on existing stormwater discharges which resulted in a waste load allocation for stormwater that is lower than necessary to meet the TMDL targets, in the case of DDT far lower than necessary. EPA stated that "If additional data indicates that existing stormwater loadings differ from the stormwater waste load allocations defined in the TMDL, the Los Angeles Regional Water Quality Control Board should consider reopening the TMDL to better reflect actual loadings." [USEPA Region IX, SMB TMDL for DDTs and PCBs, 3/26/2012]		
8	7	B.3.	In order to avoid a situation where the MS4 permittees would be out of compliance with the MS4 Permit if monitoring data indicate that the actual loading is higher than estimated and to allow time to re-open the TMDL if necessary, recommend as an interim compliance objective WQBELs based on the TMDL numeric targets for the sediment fraction in stormwater of 2.3 ug DDT/g of sediment on an organic carbon basis, and 0.7 ug PCB/g sediment on an organic carbon basis.		

9	7	B.3	<p>Although the Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4, they should be translated as WQBELs in a manner such that watershed management areas, subwatersheds and individual permittees have a means to demonstrate attainment of the WQBEL. Recommend that the final WLAs be expressed as an annual mass loading per unit area, e.g., per square mile. This in combination with the preceding recommendation for an interim WQBEL will still serve to protect the Santa Monica Bay beneficial uses for fishing while giving the MS4 Permittees time to collect robust monitoring data and utilize it to evaluate and identify controllable sources of DDT and PCBs.</p>		
10	3	C.2.c)	<p>The Machado Lake Trash WQBELs listed in the table at C.2.c) in the staff working proposal appear to have been calculated from preliminary baseline waste load allocations discussed in the July 11, 2007 staff report for the Machado Lake Trash TMDL, rather than from the basin plan amendment. In some cases the point source land area for responsible jurisdictions used in the calculation are incorrect because they were preliminary estimates and subsequent GIS work on the part of responsible agencies has corrected those tributary areas. In other cases some of the jurisdictions may have conducted studies to develop a jurisdiction-specific baseline generation rate. The WQBELs should be expressed as they were in the adopted TMDL WLAs, that is as a percent reduction from baseline and not assign individual baselines to each city but leave that to the individual city's trash reporting and monitoring plan to clarify.</p>		

11	3	C.2.c)	<p>The WLAs in the adopted Machado Lake Trash TMDL were expressed in terms of percent reduction of trash from Baseline WLA with the note that percent reductions from the Baseline WLA will be assumed whenever full capture systems are installed in corresponding percentages of the conveyance discharging to Machado Lake. As discussed in subsequent city-specific comments, there are errors in the tributary areas originally used in the staff report, but in general, tributary areas are available only to about three significant figures when expressed in square miles. Thus the working draft should not be carrying seven significant figures in expressing the WQBELs as annual discharge rates in uncompressed gallons per year. The convention when multiplying two measured values is that the number of significant figures expressed in the product can be no greater than the minimum number of significant figures in the two underlying values. Thus if the tributary area is known to only three or four significant figures, and the estimated trash generation rate is known to four significant figures, the product can only be expressed to three or four significant figures. Thus there should be no values to the right of the decimal place and the whole numbers should be rounded to the correct number of significant figures.</p>		
12	3	C.2.c)	<p>The Regional Board's preliminary baseline trash generation rate for the City of Rolling Hills Estates was based on an assumed area of 1.22 square miles multiplied by the estimated trash generation rate of 5334 gallons of uncompressed trash per square mile per year. However as explained in the City's Trash Monitoring and Reporting Plan, subsequent GIS work performed by City and County of Los Angeles and confirmed by the City of Rolling Hills Estates' consultant identified a 2.76 square mile drainage area tributary to Machado Lake from the City of Rolling Hills Estates. Using this corrected area and the default trash generation rate of 5334 gallons of uncompressed trash per square mile per year would result in a corrected baseline of 14,700 gallons per year.</p>		
13	3	C.2.c)	<p>The Regional Board's preliminary baseline trash generation rate for the City of Rolling Hills was based on an assumed area of 0.56 square miles multiplied by the estimated trash generation rate of 5334 gallons of uncompressed trash per square mile per year. However as explained in the City's Trash Monitoring and Reporting Plan, subsequent GIS work performed by City and County of Los Angeles and confirmed by the City of Rolling Hills' consultant identified a 1.313 square miles drainage area tributary to Machado Lake from the City of Rolling Hills. Using this corrected area and the default trash generation rate of 5334 gallons of uncompressed trash per square mile per year would result in a corrected baseline of 7004 gallons per year.</p>		

14	3	C.3	The Machado Lake Nutrient TMDL provides for a reconsideration of the TMDL 7.5 years from the effective date prior to the final compliance deadline. Please include an additional statement as item: 3.c)(3)"By September 11, 2016 Regional Board will reconsider the TMDL to include results of optional special studies and water quality monitoring data completed by the responsible jurisdictions and revise numeric targets, WLAs, LAs and the implementation schedule as needed."		
15	4	C.5.a)	Table C is not provided in the section on TMDLs for Dominguez Channel and Greater LA and Long Beach Harbors Toxic Pollutants. Please clarify and reference that Attachment D Responsible Parties Table RB4 Jan 27, 12 which was provided to the State Board and responsible agencies during the SWRCB review of this TMDL, and is posted on the Regional Board website in the technical documents for this TMDL, is the correct table describing which agencies are responsible for complying with which waste load allocations, load allocations and monitoring requirements in this VERY complex TMDL. Attachment D should be included as a table in this section of the MS4 Permit.		
16	4-8	C.5.	The Dominguez Channel and Greater LA and Long Beach Harbor Waters Toxic Pollutants TMDL provides for a reconsideration of the TMDL targets and WLAs. Please include an additional statement as item: 4.e) "By March 23, 2018 Regional Board will reconsider targets, WLAs and LAs based on new policies, data or special studies. Regional Board will consider requirements for additional implementation or TMDLs for Los Angeles and San Gabriel Rivers and interim targets and allocations for the end of Phase II."		
17	1, 3, 15	Attach I	City of Hermosa Beach is only within one watershed, the Santa Monica Bay Watershed, and so should not be shown in italics as a multi-watershed permittee		
18	2	E.2.b.v.1.	Recommend using the same language from E.2.d.i.3 to describe the demonstration. Therefore substitute this for the current language at E.2.b.v.1: "Demonstrate that there is no direct or indirect discharge from the Permittee's MS4 to the receiving water during the time period subject to the water quality-based effluent limitation and/or receiving water limitation for the pollutant(s) associated with a specific TMDL."		

19	3	E.2.d.i.1.	Recommend clarifying this item by incorporating the footnote into the text and modifying this item to read as follows: "There are no violations of the interim water quality-based effluent limitation for the pollutant(s) associated with a specific TMDL at the Permittee's applicable MS4 outfall(s) which may include: a manhole or other point of access to the MS4 at the Permittee's jurisdictional boundary, a manhole or other point of access to the MS4 at a subwatershed boundary that collects runoff from more than one Permittee's jurisdiction, or may be an outfall at the point of discharge to the receiving water that collects runoff from one or more Permittee's jurisdictions."		
20	4	E.2.d.i.4.b.	Is this in effect setting a design storm for the design of structural BMPs to address attainment of TMDLs, or is it simply referring to SUSMP/LID type structural BMPs? If it is in effect setting a design storm, there needs to be some sort of exception for TMDLs in which a separate design storm is defined, e.g., for trash TMDLs where the 1-year, 1-hour storm is used.		
21	8	E.5.b.(c)	Recommend not listing specific water bodies in E.5.b.(c) because then it risks becoming obsolete if new TMDLs are established for trash, or if they are reconsidered. Furthermore, it is not clear why Santa Monica Bay was left out of this list since the Marine Debris TMDL allows for compliance via the installation of full capture devices.		
22	7	E.5.a.i-x	Recommend not listing specific waterbody/trash TMDLs here, but simply leave the reference to Attachments X through X to identify the Trash TMDLs. Otherwise this may have to be revised in the future. Again, Santa Monica Bay Marine Debris TMDL was not included in this list, not sure whether it was an oversight or intentional?		
23	2	E.2.b.ii	Not clear on what "discharges from the MS4 for which they are owners and/or operators" means.		
24	2	E.2.b.iii	For the "group of Permittees" having compliance determined as a whole, this should only be the case if the group of Permittees have moved forward with shared responsibilities (MOAs, cost sharing, a Watershed Management Program). It would not be fair to have one entity not be a part of the "group" and be the main cause of exceedances/violations.		

26	3	E.2.c.iii	For time schedule orders, the Burbank Water Reclamation Plant required a TSO since its interim permit limits expired, with the TSO bridging the gap between the time when the interim limits expired and when the new BWRP NPDES permit became effective. It should be noted that the Water-Effects-Ratio study was submitted in 2008 and it took the Regional Board nearly 2 years to complete its review of the study, which as a result required Burbank to request 2 1-year TSOs. Our concern with TSOs in the MS4 permit is that various efforts will be made to comply with the permit provisions and permit limits, including special studies for reopener purposes, and yet the TSO requests can either be delayed, or be limited to 1-year TSOs, placing extra burden on MS4 permittees to apply each year for the TSO, which requires a Regional Board hearing for adoption/approval.		
28	5	E.4.a	This provision states "A Permittee shall comply immediately ... for which final compliance deadlines have passed pursuant to the TMDL implementation schedule." This provision is unreasonable. First, various brownfields/abandoned toxic sites exists, some of which were permitted to operate by State/Federal agencies - nothing has or will likely be done with these sites that contribute various pollutants to surface and sub-surface areas. Additionally, this permit is going to require a regional monitoring program - this program will yield results on what areas are especially prone to particular pollutants. Until these results are made known, MS4 Permittees will have a hard time knowing where to focus its resources and particularly, the placement of BMPs to capture, treat, and remove pollutants. For these reasons, this provision should be revised to first assess pollutant sources and then focus on compliance with BMP implementation.		
29	12-13	E.5.c.i(1)	For reporting compliance based on Full Capture Systems, what is the significance of needing to know "the drainage areas addressed by these installations?" Unfortunately, record keeping in Burbank is limited to the location and size of City-owned catch basins. A drainage study would need to be done to define these drainage areas. As such, we do not believe this requirement serves a purpose in regards to full capture system installations and their intended function.		
30	7	E.5	Please clarify that cities are not responsible for retrofitting.		
31	4	E. 2. e	Please add the language from interim limits E.2.d.4 a - c to the Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations to ensure sufficient coordination between all TMDLs and the timelines and milestones that will be implemented in the Watershed Management Program.		

32	4	E.3	Instead of TSO, please include mechanisms that allow for time to complete Basin Plan Amendments for EPA Established TMDLs. This will protect cities from unnecessary vulnerability and allow for these TMDLs to be incorporated into the Watershed Management Programs. Incorporate permit language that will reopen the LA MS4 upon completion of the Basin Plan Amendments necessary for coordination with these programs.		
33	Santa Clara River	A. 4 c)	Please change the Receiving Water Limitations for interim and final limits to the TMDL approved table. There should be no interpretation of the number of exceedance days based on daily for weekly sampling with, especially with no explanation of the ratio or calculations, and no discussion of averaging. Please revert to the original TMDL document.		
34		1 E.2	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions		
35			Santa Ana River TMDLs should be removed; this TMDL is eliminated		
36	9	5.b.ii.2	Define "partial capture devices", define "institutional controls". Permittees need to have clear direction of how to attain the "zero" discharges which will have varying degrees of calculations regardless of which compliance method is followed. Explain the Regional Board's approval process for determining how institutional controls will supplement full and partial capture to attain a determination of "zero" discharge.		
37	10	5.b.ii.(4)	MFAC and TMRP should be an option available to the Los Angeles River.		
38	1 of 19	B	Substantial comments have been submitted for the Reopener of the SMBBB. Rather than restate these comments, please address these comments in the MS4.		
39	3 of 24	3.a)1	For the LA River metals. Some permittees have opted out of the grouped effort. This section needs to detail how these mass-based daily limitations will be reapportioned.		
40	6 of 24	4.d	Why are "receiving Water Limitations" being inserted here? None of the other TMDLs seem to follow that format.		
41	1 of 9	1.b	It is the permittees understanding that the lead impairment of Reach 2 of the San Gabriel River has been removed. It should be removed from the MS4 permit.		
42	1 of 9	1.c	Permittees under the new MS4 permit (those in LA County) need to be able to separate themselves from Orange County cities. Since the 0.941 kg/day is a total mass limit, it needs to be apportioned between the two counties. Also, The MS4 permit needs to contain language allowing permittees to convert grouped-base limitations to individual permittee based limitations.		

43	1	G	Please remove, in its entirety, the Santa Ana River TMDLs		
44	general	general	Any TMDL, for which compliance with a waste load allocation (WLA) is exclusively set in the receiving water, shall be amended by a re-opener to also include compliance at the outfall, or other end-of-pipe, that shall be determined by translating the WLA into non-numeric WQBELs, expressed as best management practices (BMPs). While the TMDL re-opener is pending, an affected Permittee shall be in compliance with the receiving water WLA through the implementation of core programs.		
45	4 of 8	C.5.b.1	For the Freshwater portion of the Dominguez Channel: There are no provisions for BMP implementation to comply with the interim goals. The wording appears to contradict Section E.2.d.i.4 which allows permittees submit a Watershed Management Plan or otherwise demonstrate that BMPs being implemented will have a reasonable expectation of achieving the interim goals.		
46	4 of 8	C.5.b.2	For Greater LA Harbor: Similar to the previous comment regarding this section. The Table establishing Interim Effluent Limitations, Daily Maximum (mg/kg sediment), does not provide for natural variations that will occur from time to time in samples collected from the field. Given the current wording for the proposed Receiving Waters Limitations, even one exceedance could potentially place permittees in violation regardless of the permittees level of effort. Reference should be made in this section to Section E.2.d.i.4 which will provide the opportunity for Permittee to develop BMP-based compliance efforts to meet interim goals.		
47	4 of 8	C.5.b.2	For the freshwater portion of the Dominguez Channel: the wording should be clarified. Section 5.a states that "Permittees subject to this TMDL are listed in Table C." Then the Table in Section C.5.b.2 Table "Interim Effluent Limitations-- Sediment", lists all permittees except the Fresh water portion of the Dominguez Channel. For clarification purposes, we request adding the phase to the first row: "Dominguez Channel Estuary (below Vermont)"		

Document Name: Watershed Management Program Working Proposal - April 23 2012

Agency/Reviewer: LA Stormwater Permit Group

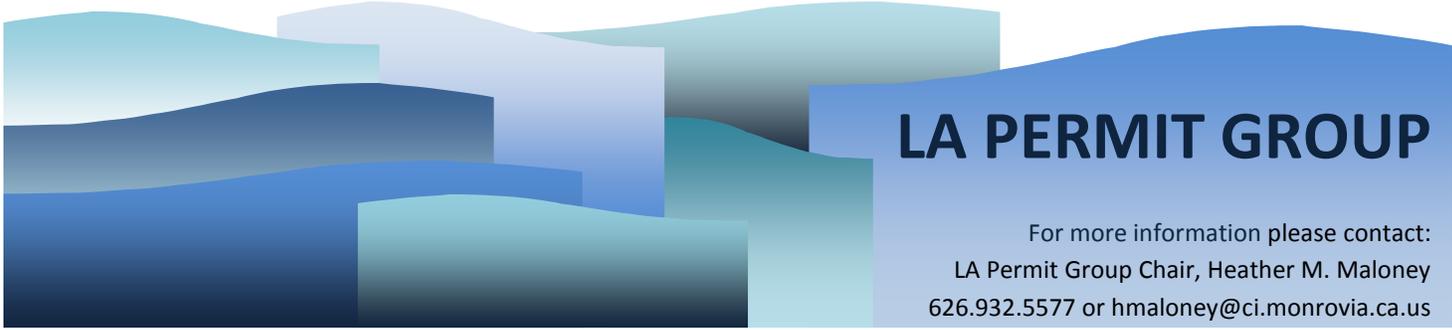

Comment		Doc. Reference		Comments	Rvwr (optional)	Author Response
No.	Page	Section				
1	4	(4)		Pollutants in category 4 should not be included in this permit term, request elimination of any evaluation of category 4. Request elimination of category 3, as work should focus on the first two categories at this point		
2	2, 11, 13	various		The Table (TBD) on page 2 states implementation of the Watershed Program will begin upon submittal of final plan. Page 11, section 4 Watershed Management Program Implementation states each Permittee shall implement the Watershed Management Program upon approval by the Executive Officer. Page 13 section iii says the Permittee shall implement modifications to the storm water management program upon acceptance by the Executive Officer. All three of these elements should be consistent and state upon approval by the Executive Officer. The item on page 13 should be changed to reflect the Watershed Management Program, or clarify that the Watershed Management Program is the storm water management program.		
3	2, 3	Table and C.2.a - d		Please allow 24 months for development of the Watershed Management Program to provide sufficient time for calibration and the political process to adopt these programs		
4	4	C.3.a.iii		Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions		
5	9	(5)		Reasonable assurance analysis and the prioritization elements should also include factors for technical and economic feasibility		
6	2	C.2		Please clarify that Permittees will only be responsible for continuing existing programs and TMDL implementation plans during the interim 18 month period while developing the Watershed Management Program and securing approval of those programs		

7	9	(4)(c)	<p>While it may be appropriate to have an overall design storm for the NPDES Permit and TMDL compliance, this element seems to address individual sites. Recommend developing more prominently in the areas of the Permit that deals with compliance that the overall Watershed Management Program should deal with the 85th percentile storm and that beyond that, Permittees are not held responsible for the water quality from the much larger storms. However, requiring individual projects to meet this standard is limiting as there may be smaller projects implemented that individually would not meet 85th percentile, but collectively would work together to meet that standard. Please clearly indicate cities are only responsible for the 85th percentile storm for compliance and that individual projects may treat more of less than than number.</p>

1	1 - 2	all	Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue

**SUBJECT: Technical Comments on Los Angeles Regional Water Quality Control Board Staff Working Proposals for the Greater Los Angeles County MS4 Permit (Permit) – Minimum Control Measures and Non-Stormwater Discharges**

Dear Ms. Purdy and Mr. Ridgeway:

The Los Angeles Permit Group would like to take this opportunity to provide comments on the working proposals for Minimum Control Measures (MCMs) and prohibitions for non-stormwater discharges. These documents were posted on the Regional Board website on March 21 and March 28, 2012 respectively. The LA Permit Group appreciates the Regional Board staff's effort to develop the next NPDES stormwater permit and their commitment to meet with various stakeholders including our group. We look forward to continuing the dialogue with the Board staff on this very important permit. Our overarching comments on the MCMs and non-stormwater discharges are highlighted in this letter. Detailed comments regarding the Staff Working Proposal for MCMs are attached. Detailed comments related to Non-stormwater Discharges will be submitted next week.

### **Watershed-Based Program and Maximum Extent Practical Standard**

In order to achieve further water quality improvements, the Permit needs to set clear goals, while allowing flexibility with the programs and BMPs implemented. The way to accomplish this is through integrated watershed planning and monitoring. This strategy has been presented by the LA Permit Group as it will allow permittees to look at the larger picture and develop programs and BMPs based on addressing multiple pollutants. In doing so, limited local resources can be concentrated on the highest priorities. The LA Permit Group has on numerous occasions expressed our support of a watershed based approach to stormwater management. It would appear in Provision VI.C.1.a that the Board proposal also supports this approach.

The permit should allow permittees to tailor actions as part of a Watershed Plan.. The permit should clearly indicate that permittees have the option of either adopting the MCMs as they are laid out within the permit or pursue a Watershed Plan that provides permittees with the flexibility to customize the MCMs. The opportunity for a municipality to customize the MCMs to reflect the jurisdiction's water quality conditions is absolutely critical if municipalities are to

develop and implement stormwater programs that will result in achievement of water quality standards and environmental improvement. We, however, feel the MCMs are overly prescriptive and suggest that the permit ultimately establish a criterion that will be used to support any customization of MCMs. The criteria should be comprehensive but flexible. We suggest flexibility in the criteria because the management of pollutants in stormwater is a challenging task and the science and technology to help guide customizing MCMs are still developing. Furthermore, the municipal stormwater performance standard to reduce pollutants to the maximum extent practicable is not well defined and will depend on a number of factors<sup>1</sup>. This constraint, as well as USEPA position<sup>2</sup> that the iterative/adaptive process is the basis for good stormwater management, supports the need to provide flexibility in defining the criteria for customizing actions.

We anticipate having further comments related to the MCMs once further information has been released regarding the permit structure and how the various aspects of the permit will work together. For example, it is difficult to fully comment on the MCMs until we are able to see them in the context of the compliance structure and the Watershed Plan section of the Permit.

### **Timeline and Fiscal Resources**

The Staff Working Proposal does not provide timelines for the start-up and implementation of the MCM requirements. It is fair to say that there will be a transition period between the time the Permit becomes effective and the time that the municipalities will have to modify their current stormwater management programs to be in compliance with the new Permit provisions. At the same time, consideration should be given to the time required to develop watershed based “customized” programs. The LA Permit Group requests that the Regional Board provide a draft timeline for implementation and phasing-in of the MCM requirements.

Regarding fiscal resources, the LA Permit Group would like to recognize the parameters in which municipalities operate. The Staff Working Proposal requires municipalities to exercise its authority to secure fiscal resources necessary to meet all of the requirements of the Permit (page 5). However, we have a limited amount of funds that are under local control. Any additional funds needed for stormwater programs would need to come from increased/new stormwater fees and grants. New fees for stormwater are regulated under the State’s Prop 218 regulations, and require a public vote so this is an item that is not under direct control of the municipalities – the Regional Board must take this into consideration and this provision should be removed from the permit. Furthermore in addition to clean water, local resources are also directed to a number of health, safety and quality of life factors. Thus, all these factors need to be developed in balance with each other. This requires a strategic process and that will take time to get right. We urge you to develop the permit conditions based on a reasonable timeframe in balance with the existing economy and other health, safety, regulatory and quality of life factors that local agencies are responsible for.

### **Shifting of State Responsibility to the MS4 Permittees**

The Staff Working Proposal shifts much of the State responsibilities to the Municipalities regarding the State’s General Permits for Construction Activities (CGP), Industrial Activities (IGP) and NPDES permits issued for non-stormwater discharges. Such examples are noted in our attached detailed comments.

In addition, there are requirements outlined in the Staff Working Proposal that exceed those required in the CGP and IGP. For example, the CGP compared to Provision 9.f which requires a ESCP for construction sites of all sizes. A few examples of where the Staff Working Proposal either shifts the responsibility or actually exceeds the requirements of the CGP are listed below:

---

<sup>1</sup> See E. Jennings 2/11/93 memorandum to Archie Mathews, State Water Resources Control Board.

<sup>2</sup> See Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 FR 43761 (Aug. 26, 1996).

- Maintaining a database that overlaps with the State's own SMARTS database. Asking Permittees to collect the same data adds unnecessary time and expense with no benefit to water quality.
- Maintaining a database for all types of permits is excessive and includes building permits that have little or no relevance to water quality protection.
- Requiring the development of a Rain Event Action Plan for small sites under 1 acre or for sites that would be categorized as Risk Level 1 under the CGP.

Those elements that shift State responsibility should be eliminated and the MCMs should be coordinated with other state and federal requirements, with particular attention to CGP and IGP requirements.

### **MCMs Should Reflect Effective Current Efforts**

The LA Permit Group understands that the new Permit must reflect current efforts of stormwater management and water quality issues. Where the current stormwater management effort is assessed to be inadequate, then additional efforts are warranted. However, when permittees' current efforts are assessed to be adequate for protecting water quality, then the MCMs should reflect permittees' current efforts. One significant area where the LA Permit Group believes that the current effort is protective of water quality is in the new development program. Both the City and County of Los Angeles have developed and adopted Low Impact Development Ordinances and significant work, technical analysis, and public input have gone into the development of these ordinances. Rather than developing more stringent standards, the Permit should use these pre-established Ordinances as a reference for the type of program and flexibility needed to accommodate the unique and vastly varying characteristics throughout the County. Instead of providing detailed information in the text of the Permit, the LID provisions should outline general requirements of the program, and the details contained in a technical guidance manual. This point was reiterated by several speakers at the April 5, 2012 workshop, including BIA and supported by several Regional Board Members.

### **"MCMs for New Development"**

Notwithstanding our comments above, the LA Permit Group has a number of concerns with the New Development provision of the MCMs. While the LA Permit Group has concerns and requests clarification with the other MCMs, we find the New Development MCMs the most challenging and unsupportable. These provisions are difficult to follow and the BMP selection hierarchy is confusing and at times in conflict. The LA Permit Group believes this provision should be redrafted. We have significant concerns with the following parts of the New Development MCMs:

- Selection hierarchy
- Infeasibility criteria
- Treatment Control Performance benchmarks (water quality based versus technology based)
- BMP tracking
- Inspection program
- BMP specificity

### **"MCMs for Public Agency Activities"**

The Staff Working Proposal identifies, in a number of provisions, requirements to address trash regardless of whether the area is subject to a trash TMDL. We take exception to this approach, as on the one hand the MCMs requires prioritization, cleaning and inspection of catch basins as well as street sweeping and some other management control measures to address trash at public events. And then, even if the municipality is controlling trash through these control measures, the municipality must still install trash excluders (see page 63 regarding "additional trash management practices"). This makes little sense and the LA Permit Group would submit that if the initial control measures are successful, then the "additional trash management practices" are unnecessary (as evident by the lack of a TMDL).

**“MCMs for ID/IC”**

The Staff Working Proposal identifies a significant non-stormwater outfall based monitoring program. The LA Permit Group submits that TMDLs monitoring programs have already identified, to a large extent, a comprehensive non-stormwater monitoring program. As such we suggest that the TMDL monitoring program be the basis for the “non-stormwater outfall based monitoring program” and both should be identified in an Integrated Watershed Monitoring Program.

The other critical issue in the ID/IC program is clarifying the responsibilities of the municipalities and the Regional Board. This is particularly important when dealing with ongoing illicit discharges (see page 71). When this type of discharge occurs, the ultimate responsibility in correcting the illicit discharge lies with the discharger. The municipalities and the Regional Board may need to work in tandem to address a recalcitrant discharger, but the fiscal responsibility should lie with the discharger and not the municipality or Regional Board.

**Non-Stormwater Prohibitions**

The two overriding concerns associated with the proposed non-stormwater prohibition requirements is 1) the assumption that certain non-stormwater discharges should be conditioned to be allowed and 2) the need for further discussion and collaboration regarding potable water and fire operations and training activities discharges to MS4s. In the first case the LA Permit Group would submit that the monitoring data to support these conditions is lacking and should be the focus of the next Permit term. The LA Permit Group supports the need to place certain conditions on non-stormwater discharges when it has been shown that the discharge is an issue in the receiving water. Anything less than such a demonstration calls into question the water quality benefit for the additional cost to implement the conditions. Regarding our second observation, the LA Permit Group has worked closely with a group of community water systems and Fire Chiefs to discuss how potable water discharges should be addressed. While we have reached consensus on certain aspects, additional discussion and time is needed to work towards consensus.

In particular, the permit should differentiate between natural flows such as stream diversions, natural springs, uncontaminated groundwater and flows from riparian habitats and wetlands and urban discharges. Natural flows should not be held to a standard equal to urban discharges. The requirements to conduct appropriate monitoring and explore alternatives for the discharge are not commensurate with water quality concerns. Natural sources should not be conditioned in order to be allowed. The LA Permit Group recommends that the Regional Board continue the current permit format of categorizing natural sources separately from urban activity discharges.

Thank you for the opportunity to comment on the working proposals and we look forward to meeting with you to discuss our comments and to explore alternative approaches. Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,

Heather Maloney  
Chair, LA Permit Group

Attachment A: Specific Comments on the Regional Board Staff Working Proposal for the Greater Los Angeles County MS4 Permit

**LOS ANGELES PERMIT GROUP COMMENTS  
 MINIMUM CONTROL MEASURES – 3/28/2012 STAFF WORKING PROPOSAL  
 LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
<b>General</b>			
1	2	C.1.c	<p>The Definition of: "Development", "New Development" and "Re-development" should be added. The definitions in the existing permit should be used:</p> <p><i><b>“Development”</b> means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i></p> <p><i><b>“New Development”</b> means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.</i></p> <p><i><b>“Redevelopment”</b> means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i></p> <p>The last of the three "routine maintenance" activities listed above should exclude projects related to existing streets since typically you are not changing the "purpose" of the street to carry vehicles and should not be altered.</p>
<b>Legal Authority</b>			
2	4	2.a.i	<p>Staff proposal states: "Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites."</p> <p>It appears the intent of this language is to transfer the State's inspection and enforcement responsibilities to municipalities through the MS4 permit. When a separate general NPDES permit is issued by the Regional or State Board it should be the responsibility of that agency collecting such permit fees to control the contribution of pollutants, not MS4 permittees.</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

3	4	2.a.vii	<p>Staff proposal states: "Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Co-permittees."</p> <p>The intention of this statement is unclear and should be explained, and a definition of "shared MS4" should be provided. How would an inter-agency agreement work with an upstream and downstream agency? This is not practical - this agreement should have been done before the interconnection of MS4 systems occurred. An example of this agreement should be provided within the Permit. The permittee will not agree to the responsibility of an exceedance without first having evidence of the source and its known origin (in other words, an IC/ID is a private "culprit" and not the cause of the City).</p>
4	4	2.a.xi	<p>Staff proposal states: "Require that structural BMPs are properly operated and maintained."</p> <p>MS4 agencies can control discharges through an illicit discharge program, and conditioning new/redevelopment to ensure mitigation of pollutants. Unless the existing development private property owners/tenants are willing or in the process of retrofitting its property, the installation and O&amp;M of BMPs is not practical and cannot be legally enforceable against an entity that does not own or control the property, such as a municipal entity.</p>
5	5	2.a.xii	<p>Staff proposal states: "Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4."</p> <p>It is difficult, if not impossible; to accurately quantify the exact effectiveness of a particular set of BMP's in reducing the discharge of pollutants. Some discharges may be reduced over time given reductions in industrial activity, population in a particular portion of the community feeding into the MS4, or for other reasons not directly related to implementation of structural BMPs. Given that the County of LA is generally urbanized and thus impervious, a lethargic economic climate (meaning development and redevelopment is not occurring in an expeditious manner), and that several pollutants do not have known BMPs effective at removing/reducing the content (i.e., metals, toxics, pesticides), the effectiveness of BMPs should not be required and instead should only be used for research, development, and progress of BMP testing.</p>
<b>Fiscal Resources</b>			
6	5	3	<p>The staff proposal includes a section on Fiscal Resources. Most MS4's do not have a storm water quality funding source, and even those that do have a funding source are not structured to meet the requirements of the proposed MS4 requirements (for instance, development funds may be collected to construct an extended detention basin, but not for street sweeping, catch basin cleaning, public right-of-way structural BMPs, etc).</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

7	5	3.a	<p>Staff proposal states: "Each permittee shall exercise its full authority to secure fiscal resources necessary to meet all requirements of this Order"</p> <p>This sentence has no legally enforceable standard. What exactly does the exercise of "full authority" mean, when the exercise of a city's right to tax comes with consequences and no guarantee of success. Municipal entities must adjust for a variety of urgent needs, some federally mandated in a manner that cannot be ignored. So, if we seek the fiscal resources to fund the programs required in the permit and the citizens say "No", then a municipality will have a limited ability to comply with "all requirements of this Order".. Can the language be changed to state: "Each permittee shall make its best efforts given existing financial and budget constraints to secure fiscal resources necessary to meet all requirements of this Order"?</p>
<b>Public Information and Participation Program</b>			
8	6	6.a.iii	<p>Staff proposal states: "To measurably change the waste disposal and stormwater pollution generation behavior of target audiences..."</p> <p>Define the method to be used to measure behavior change. As written, this requirement is vague and open to interpretation.</p>
9	7	6.d.i.2.b	<p>Staff proposal states: "... including personal care products and pharmaceuticals)"</p> <p>The stormwater permit should pertain only to stormwater issues. Pharmaceuticals getting into waters of the US are typically a result of waste treatment processes. All references to pharmaceuticals should be removed from this MS4 permit.</p>
10	8	6.d.i.3	<p>The Regional Board assumes that all of the listed businesses will willingly allow the City to install displays containing the various BMP educational materials in their businesses. If the businesses do allow the installations then the City must monitor the availability of the handouts because the business will not monitor or keep the display full or notify the City when the materials are running out. If the business will not allow the City to display the educational material must we document that denial? Will that denial indicate that the City is not in compliance?</p>
<b>Industrial/Commercial Facilities Program</b>			
11	10	7.b.i.4	<p>Staff proposal states: "All other facilities tributary to waterbody segment addressed by a TMDL..."</p> <p>As written, this category is so vague that it could mean every single industrial or commercial facility. Please clearly define or revise this requirement. In this context, "commercial" refers to a currently unspecified category of facilities beyond those listed in VI.C.7.b.i.1 (page 9). Provide a precise definition for a commercial facility, or specify the extended category (or NAICSs/SICs) of facilities to be considered. Also, clarify how the Permittees will initially determine the pollutants generated for these facilities. A method that will promote consistency among Permittees is preferred, such as a table of potential pollutants based on business type or activities.</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

12	10	7.b.ii.6	<p>Staff proposal states: "A narrative description that describes the economic activities performed and principal products used at each facility"</p> <p>Since "economic activities" is an invasive question to ask of a facility, we suggest the following: "A narrative description of activities performed and/or principal products of each facility."</p>
13	11	7.d-f	<p>These sections pertain to inspecting critical source facilities where it appears the intent is to transfer the State's Industrial General Permit inspection and enforcement responsibilities to municipalities through the MS4 permit. We request eliminating these sections OR revise to exclude all MS4 permittee responsibility for NPDES permitted industrial facilities.</p>
14	17	7.e.i	<p>Staff proposal states: "...in the event a Permittee determines that a BMP is infeasible, Permittee shall require implementation of similar BMPs..." Judging a BMP to be "infeasible or ineffective" is subjective. Please delete this requirement.</p>
15	17	7.e.i	<p>Staff report states: "Facilities must implement the source control BMPs identified in the California Stormwater BMP Handbook, Industrial and Commercial, unless the pollutant generating activity does not occur. In the event that a Permittee determines that a BMP is infeasible at any site, the Permittee shall require implementation of similar BMPs that will achieve the equivalent reduction of pollutants in the stormwater discharges. Likewise, for those BMPs that are not adequately protective of water quality standards, a Permittee may require additional site-specific controls." It is not clear when source control BMPs would need to be implemented. Further, if the City implements low-flow diversions and an enhanced street sweeping program, it would not make sense to still require BMP retrofits to those catchment areas.</p>
<b>Development Planning</b>			
16	21	8.b.1	<p>This permit update would be a good opportunity to examine the type of developments that are subject to the permit. There should be a link between the selected categories and the water quality objectives. Perhaps a reworking of this section could provide that clear nexus.</p>
17	21	8.b.i.1.g	<p>Roadway construction projects that are part of a large development (i.e. track-home development) can be subjected to the associated residential or commercial/industrial development, making this requirement difficult to implement.</p>
18	21	8.b.i.1.g	<p>The proposed limit is too low for street construction projects by using the typical 10,000 square foot number that is used in several development projects. A street project that proposes to build 10,000 sq. ft. is an extremely small street project, as the requirement calls out overall area. It might consist of a one block extension of a street 60 feet wide by 166 feet long. When cities propose street extensions it is usually in terms of half mile or mile-long segments which involve more than 150,000 square feet (sq. ft.). For public works projects, the area of 50,000 sq. ft. is a more correct and appropriate threshold. Please delete this requirement.</p>
19	21	8.b.i.1.g	<p>Public Works roadway maintenance projects including the ones that expand the roadway capacity should not be subject to these provisions because of the limited opportunities for BMP incorporation. Existing roads incorporate a large number of utilities within them that limits the opportunities for BMP incorporation.</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

20	21	8.b.i.1.g	We support the use of opportunity-based BMP guidance for roadway projects such as the referenced USEPA's "Green Infrastructure: Green Streets", however calling for this implementation to the maximum control possible is contradictory.
21	24	8.c.i.1	It appears based on the language that the project performance criteria of c. is intended to apply to all categories of new development and redevelopment projects as listed in b.i and b.ii. Please clarify whether this is meant to apply to single family hillside homes with no size limit? A new definition of single family hillside home has not been provided in this working draft, so it is unclear whether this is the case. If the intention was to only require the narrative measures for single-family hillside homes as listed in 8.b.i.(1)k)-v, and not require to retain the design volume onsite, then that should be clarified by excluding them from the 8.c.i(1) statement.
22	24	8.c.i.2	The SWQDv definition should be modified to better reflect the purpose of the regulation as stated in 8.a.i(3) "... designing projects to minimize the impervious area footprint, and employing Low Impact Development (LID) design principles to mimic predevelopment water balance...". Modify as follows: "... the Stormwater Quality Design Volume (SWQDv) defined as the runoff from all impervious surfaces that are generated by a:..."
23	24	8.c.i.2.c	The "whichever is greater" requirement is unnecessary since both criteria are deemed to be equivalent. This requirement will only increase design time by having engineering staff perform multiple analyses.
24	24	8.c.i.5	Please define the term "wet-weather season".
25	24	8.c.i.5	The only reasonable and still beneficial rainwater harvesting approach would require the storage of the seasonal (winter-time) runoff for use when needed (spring and summer). This would increase the size of the rainwater harvesting BMPs. RWQCB should acknowledge that rainwater harvesting is both economically and technically infeasible for the vast majority of development projects in arid Los Angeles region climates.
26	24	8.c.i.6	The 72 hour drawdown requirement is counterproductive. Most irrigation practices do not irrigate landscaping within 72 hours after heavy/medium rainfall events because the ground could be saturated and the plants do not require water. Irrigating saturated ground could result in increase dry weather runoff because the water will not percolate into the saturated soil quick enough.
27	25-26	Table	The table provided lacks clarity and the use of $M_v$ parameter is not clear and is not defined. However it appears to require projects that cannot retain runoff on-site to seek alternative locations to retrofit. We anticipate that this requirement will be unfeasible for a number of legal, logistical and technical reasons and as a result the "Least Preferred Option" will be exercised in most cases. The "Least Preferred Option" requires the over-sizing of the biofiltration systems by a factor of 1.5. We recommend that any design be consistent with established design standards (i.e. California Stormwater Quality Association) for consistency and ease in its implementation.
28	25-26	Table	The requirements that are provided in this table seem to be overly prescriptive. The requirements are not water-quality driven but rather groundwater-recharge driven. A more balanced approach will allow the use of multiple BMP options and not excluding effective treatment technologies.
29	28	8.c.iii.3.b	The proposed language uses terms that may be understood by hydrologists, but most city engineers and development engineers would not know what a HUC-10 or an HUC-12 Hydrologic Area is. Please define these terms if they are going to be used in this regulatory permit.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

30	29	8.c.iii.3.c	The federal stormwater regulation place importance on water quality. Groundwater recharge is outside the purview of this permit. The requirement to prove equal benefit should be removed.
31	29	8.c.iii.3.g	This section introduces an arbitrary delay if a project opponent petitions the Executive Officer to review a projects off-site mitigation. The project proponent deserves to receive a response in a reasonable time when an appeal is filed with the Executive Officer. We respectfully request that lines of communications be opened between the Executive Officer and the project proponent within 15-days when a third party files an appeal of the local jurisdictions decision on a project.
32	30	8.c.iii.4	Requiring biofiltration systems to treat 1.5 times the SWQDv will not improve water quality during a 85th percentile storm event. The concentration leaving the system will not improve if the system is 50% larger. Biofilters are typically size by increasing the surface area as the flow increases. If the flow is lower than the design flow a small area of the system is utilized. The removal efficiency is the same for all flow rates below the design flow and therefore the concentration is the same for the design flow or below.
33	30	8.c.iii.5.b	Biofilters are not designed with detention volume. They are designed on a flow rate basis. The last portion of the paragraph regarding pore spaces and re-filter should be removed.
34	30	8.c.iv.1	New development/redevelopment project that are upstream of an offsite water quality mitigation project should be exempt from the requirements of this subsection. Requiring a project to mitigate their pollutant load twice is unnecessary. This subsection should only apply if the project would discharge to the receiving water without first draining to an offsite project.
35	31	8.c.iv - Table	The presence of benchmark tables, even for the projects that implement offsite mitigation is inappropriate. These standards for the great part are not attainable by existing technologies. Development projects instead should only be subject to design standards not performance standards. The idea of upgrading the treatment system to achieve compliance introduces unnecessary uncertainties to future development activities in our region.
36	33	8.c.v.1	Alternatives to the Ventura County Permit Hydromodification criteria should be considered such as those identified in the Los Angeles County Low Impact Development Standards Manual or maintain the “peak flow control” requirements as appear in the existing permit. Los Angeles County watersheds are significantly different than those of Ventura County. Los Angeles County has limited areas draining into natural drainage systems.
37	33	8.c.v.1.a	The use of Erosion Potential ( $E_p$ ) as a sole method for determining hydromodification impacts is inappropriate because of its limited use and difficulty to use. The existing Los Angeles County requirement to conduct hydrology and hydraulic analysis for SUSMP, 2-, 5-, 10-, 25-, and 50-year storm events and fully mitigate drainage impacts from these flow regimes is better understood.
38	37	8.c.vi	The Regional Board proposes an Annual Report item for each project that is approved with off-site mitigation. The calculations for the off-site mitigation should be easy to document, but the project performance without alternative compliance is not so clear. Please provide the information necessary to complete the annual report.
39	38	8.d.i	The proposed language as written would not accept existing LID Ordinances to be compliant with the applicable provisions of this Order. Please provide language that allows flexibility for existing LID ordinances and also provide criteria determining equivalency.
40	39	8.d.iv	It should be clarified that previously approved projects will not be subject to these requirements.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

41	40	8.d.iv.b	This requirement should be limited to the sites already visited as part of the “critical sources” program. Allow a self-inspection program where the property owners will be required to maintain their BMPs based on their type and maintenance needs. These requirements can be incorporated in the Covenant and Agreement (C & A). Property owners will be required to keep records of maintenance performed on these BMPs. Municipalities lack the resources to conduct the inspection. Municipalities can perform instead a review of the inspection records on a random and as-needed limited basis.
<b>Development Construction</b>			
42	41	9.d	Requiring this on all projects regardless of size is excessive. Small project will have minimal if any impact on water quality. A lower limit needs to be set for applicability such as 100 cubic yards of disturbed soil. It may be appropriate for projects to install a minimum set of BMPs without the need for a plan.
43	41	9.e.1.i	Maintaining the required database for all types of permits issued by the municipalities is excessive since not all permits require this type of information. In the City of Los Angeles for example about 35,000 building permits are issued annually.
44	42-43	9.f.ii	The number of elements for the ESCP should not be the same as those of the State SWPPP as required by the General Construction Permit. Existing Erosion Control Plans require the identification and placement of the BMPs in the engineering drawings and this has been identified as adequate.
45	43	9.f.ii.3.i	An example of how excessive it is to require these elements for the smaller sites is the requirement to prepare a Rain Event Action Plan (REAP). Under the Construction General Permit, a REAP is not required until the project reaches a Risk Level 2 status. It is not justifiable to say that a grading project, that does not disturb more than an acre and is not subject to a CGP, should be required to prepare a REAP.
46	43	9.f.ii.4	The requirement to discuss the rationale for the selection and design of the proposed BMPs (including soil loss calculations for the non-selected BMPs) is excessive and it dramatically increases the engineering costs of small construction projects. Please delete this requirement.
47	43	9.f.ii.5	The proposed language shifts much of the State responsibilities for sites greater than one acre to the Municipal Permittees without shifting the corresponding funding. Please consider setting-up a mechanism for the municipalities to operate the registration, fee collection, and inspection for sites that are under GCP coverage or revise the language so that Municipal Permittees are not made responsible parties for this activity.
48	43	9.f.ii.8	The proposed language asks cities to verify the approvals of the Army Corps of Engineers, Department of Fish and Game and the Regional Water Boards prior to the issuance of a grading or building permit. This requirement should not be implemented unless the Regional Board can provide a simple, easy to use system to accomplish the check. Furthermore, many projects reviewed every day do not require a 401, 404 or a 1600 certification to be allowed to grade on their site. The few cases where these certifications are required, they are taken care of in the EIR process rather than the Building or Grading permit process. This restriction should cite the Planning process rather than the building or grading process.
49	43-44	9.g.i	The Regional Board should not write this MS4 permit to overlap the CGP. A project that is required to have coverage under the CGP will deal with the Risk levels and apply the appropriate provisions of the CGP. Smaller sites that do not require coverage under the CGP should have lesser requirements than Risk Level 1 provisions.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

50	44	9.g.iv	The Regional Board is referring to an outdated set of BMP tables by referring to the 2003 version of the CASQA Manuals. CASQA has updated the manuals in 2010 and these are the manuals that should be referenced.
51	44-47	Tables	It appears that the Regional Board is taking the BMP tables from the CGP, without the language contained in the CGP that states that to avoid duplication each subsequent table needs to include or be added to the BMPs shown in the earlier list. Please include this language so that unfamiliar engineering, plan-checking, or inspection staff does not overlook the intent of the CGP.
52	48	Table	The proposed language would require municipalities to inspect GCP sites at least monthly. This constitutes a large increase in the inspection responsibilities for the municipalities for State responsibilities. Please delete or revise this requirement.
53	48	9.h.ii.2	The requirement to perform five inspections during the construction phase of a project, no matter how small, is excessive and serves no benefit. The only reasonable inspection would be during the grading phase and upon project completion as part of existing inspections.
54	50	9.h.ii.5.b	The language is all inclusive for the inspection portion of the permit. By asking the field inspector to "determine whether all BMPs have been selected, installed, implemented and maintained according to the approved plans." the Board is placing responsibility on the inspector which rightly should be the responsibility of the plan reviewer. If an inspector is having a dispute with the Contractor or builder of a project, the inspector can improperly raise the issue of BMP selection and cause great expense to the project. The Plan Reviewer should determine what BMPs are appropriate for the site and verify that they are properly designed. The inspector should verify that BMPs are install properly, and are being implemented and maintained as required by the field conditions; however, to allow the inspector to evaluate selection is overstepping his training and authority.
55	51	9.j	A more effective approach would be through a State mandate for a Statewide training program perhaps through the use of the contractor's license board. Because of their nomadic nature of construction activity, contractors move from City to City at will. For a City to be responsible for training the contractors that work within their city is not possible. This should either be a State responsibility, much like the QSD/QSP programs currently run by the State.
56	54	10.d	If there is a specific pollutant to address, retrofitting or any other BMP would best be accomplished through a TMDL, which is for the Permittees to determine rather than a prescribed blanket approach. As written, this is too broad of a requirement with unknown costs that is attempting to solve a problem before there is a problem. Please delete this VI.C.10.d.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

57	54	10.d	<p>Staff proposal states: "Each Permittee shall develop an inventory of retrofitting opportunities that meets the requirements of this Part. The goals of the existing development retrofitting inventory are to address the impacts of existing development through retrofit projects that reduce the discharges of stormwater pollutants into the MS4 and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards."</p> <p>This process would require land acquisition, a feasibility analysis, no impacts to existing infrastructure, proper soils, and support of various interested stakeholders. Additionally, if a property or area is being developed/redeveloped, retrofitting the site for water quality purposes makes sense, but not for an area where no development/redevelopment is planned. Finally, the LID provisions have already included provisions for off-site mitigation, in which we recommend that regional water quality projects be considered in lieu of local-scale water quality projects that will prove difficult to upkeep, maintain, and replace, let alone have existing sites evaluated as feasible. For these reasons, this requirement should be removed.</p>
58	56	10.d.v	<p>Any retrofit activities should be the result of either an illicit discharge investigation or TMDL monitoring follow-up and will need to be addressed on a site-by-site basis. A blanket effort as proposed in a highly urbanized area is simply not feasible at this time.</p>
59	56	10.e.ii	<p>Staff proposal states: "Each Permittee shall implement the following measures for flood management projects"</p> <p>Flood management projects need to be clearly defined.</p>
60	60	10.g.ii.7	<p>Staff proposal states: "Policies, procedures, and ordinances shall include commitments and a schedule to reduce the use of pesticides that cause impairment of surface waters..."</p> <p>The method which a pesticide that causes "impairment" to waterbodies needs to be defined.</p>
61	62	10.h.iv.1.c	<p>Staff proposal states: "Provide clean out of catch basins... 24 hours after event"</p> <p>Many public events happen on the weekends (i.e. Saturday). To avoid excessive overtime costs, please change the requirement to "next business day after the event" or "next business day."</p>
62	63	10.h.vii.1	<p>This requirement appears to be an "end-run" around the lack of catch basin structural BMPs in areas not covered by Trash TMDLs. The requirement has the potential to be extraordinarily economically burdensome. If an area is NOT subjected to a Trash TMDL, then the need for any mitigation devices is baseless. The MS4 permit requirements should not circumvent nor minimize the CWA 303(d) process.</p>
63	64	10.h.ix	<p>Staff proposal requires: "Infiltration from Sanitary Sewer to MS4 / Preventive Maintenance...."</p> <p>The State Water Board has implemented a separate permit for sewer maintenance activities. Additional sewer maintenance requirements are redundant and unnecessary. Please delete this requirement.</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

<b>Illicit Connection and Illicit Discharge Elimination Program</b>			
64	-	11	In general the LA Permit Group would like the flexibility to determine where (i.e. outfall vs. receiving water) monitoring is conducted and how the program is developed. This flexibility is necessary due to the variability in the physical makeup from one watershed to the next, and perspectives/philosophy of one permittee to the next. The Group proposes to do “non-stormwater outfall-based monitoring program” as part of an Integrated Watershed Monitoring Program. There is ample dry weather monitoring in the TMDLs to address a “non-stormwater outfall-based monitoring program”. Please revise each mention of “ <i>Each Permittee</i> ” to “Permittee/Permittees” to allow the flexibility of doing a Watershed or by individual city program, and sufficient program flexibility for receiving waterbody monitoring in-lieu of outfall monitoring.
65	-	11	A definition of “outfall” is required for clarity. An “outfall” for purposes of “non-stormwater outfall-based monitoring program” should be defined as “major outfall” pursuant to Clean Water Act 40CFR 122.26. Please revise each mention of “ <i>outfall</i> ” to read “major outfall” when discussing “non-stormwater outfall-based monitoring program”.
66	68	11.a	Some small cities do not have digital maps. In the “General” category of Section 11, please provide a 1 year time schedule for cities to create digital maps OR provide the municipality the ability to develop comprehensive maps of the storm sewer system in any format.
67	68	11.b.i.1	Omit the comment, “ <i>Each mapped MS4 outfall shall be located using geographical positioning system (GPS) and photographs of the outfall shall be taken to provide baseline information to track operation and maintenance needs over time.</i> ” This requirement is cost prohibitive and of little value because many City outfalls are underground and could not be accurately located or photographed. Photographs of outfalls in channels have little value since data required is already included on “As-Built” drawings. Geographic coordinates can easily be obtained using Google Earth or existing GIS coordinate systems.  “The contributing drainage area for each outfall should be clearly discernable...” The scope of this requirement would involve thousands of records of drainage studies. The Regional Board should be aware that this requirement would be very labor intensive, time consuming, and very costly.
68	69	11.b.i.3	Storm drain maps should show watershed boundaries which by definition provide the location and name of the receiving water body. Please revise (3) to read “The name of all receiving water bodies from those MS4 major outfalls identified in (1).”
69	69	11.c.i	The LA Permit Group proposes “non-stormwater outfall-based monitoring program” to be flow based monitoring. Please revise item (4) of 11., c. i. to read “(4) monitoring flow of unidentified or authorized non-stormwater discharges, and...”
70	69	11.c.i.4	“Monitoring of unknown or authorized discharges” “Authorized” discharges are exempted or conditionally exempted for various reasons. Monitoring authorized discharges is monitoring for the sake of monitoring and offers no clear goal or water quality benefit. Please delete this requirement. If the source of a discharge is unknown, then monitoring may be used as an optional tool to identify the culprit.
71	70	11.d.i	Please revise the proposed language to “Permittee/Permittees shall develop written procedures for conducting investigations to identify the source of <b>suspected</b> illicit discharges, including procedures to eliminate the discharge once source is located.” It is not know if a discharge is illicit until the investigation is completed.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

72	70	11.d.ii	Please revise the proposed language to “At a minimum, each Permittee/Permittees shall <b>initiate</b> an investigation(s) to identify and locate the source within 48 hours of becoming aware of the <b>suspected</b> illicit discharge.” Due to the intermittent nature of illicit discharges, it is may not be possible to conduct the investigation within 48 hours.
73	70	11.d.iii.1	“Illicit discharges suspected of sanitary sewage... shall be investigated first.” ICID inspectors should be allowed to make the determination of which event should be investigated first. For example, a toxic waste spill or a truck full of gasoline spill should take precedence over a sewage spill. This requirement should be amended to the “most toxic or severe threat to the watershed” shall be investigated first.
74	70	11.d.iii.4	Please revise the proposed language to “If the source of the discharge is found to be authorized under a NPDES permit...” If the discharge is permitted, then it is not “illicit”.
75	70	11.d.iv.1	Please revise the first sentence of the proposed language to “If the source of the illicit discharge has been determined to originate within a Permittee’s jurisdiction, the Permittee shall immediately notify the responsible party of the problem, and require the responsible party to conduct all necessary corrective actions to eliminate the <b>illicit</b> discharge within 48 hours of notification.” “Non-stormwater” discharges do not equate to “illicit” discharges.
76	70	11.d.iv.2	Please revise the first sentence of the proposed language to “If the source of the <b>suspected</b> illicit discharge has been determined to originate within an upstream jurisdiction, the Permittee shall...” Unknown discharges are suspected of being illicit discharges, but may in fact prove to be authorized discharges.
77	71	11.d.v	<p>Please revise the proposed language <i>“the Permittee shall work with the Regional Water Board to provide diversion of the entire flow to the sanitary sewer or provide treatment. In either instance, the Permittee shall notify the Regional Water Board in writing within 30 days of such determination and shall provide a written plan for review and comment that describes the efforts that have been undertaken to eliminate the illicit discharge, a description of the actions to be undertaken, anticipated costs, and a schedule for completion.”</i> To “the Permittee shall work with and provide support to the Regional Water Board to continue Progressive Enforcement Policy of the Regional Board.”</p> <p>In the case that an Illicit Discharge is ongoing, then the discharger can be identified and the responsibility to clean up and eliminate the discharge lies with the discharger. Any illicit discharge for which the Permittee has exhausted their Progressive Enforcement Policy should be deferred to the Regional Water Quality Control Board for additional Progressive Enforcement or permitting.</p>
78	71	11.e.i	Please revise the first sentence to “Permittee/Permittees, upon discovery or upon receiving a report of a suspected illicit connection, shall <b>initiate</b> an investigation within 21 days...” The process to determine the source of an illicit connection or responsible party may take a considerable time should the suspected source be an unoccupied site.
79	71	11.e.ii	Please revise the “days of completion” from 90 to 180 days. Illicit connections need to be disconnected from the storm drain system in the street Right of Way, which will require plans and permitting. Permitting with in State Right of Way can take on average 60 to 120 days.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

80	71	11.f.i	Revise the proposed first sentence to “Permittee/Permittees shall promote, publicize and facilitate public reporting of illicit discharges or water quality impacts associated with discharges into the MS4s through a central contact point...” It is not possible to distinguish authorized discharges from illicit discharges at the outfalls.
81	71& 72	11.f.ii.1&2	Revise “PIPP” to “Hotline”. The subject of this item is “reporting hotline requirements”.
82	72	11.f.iii	Omit this section. “No Dumping” signs have already been posted at open channels.
83	72	11.f.iv	Omit the second sentence, “The procedures shall be evaluated annually to determine whether changes or updates are needed to ensure that the procedures accurately document the methods employed by the Permittee.” This is an unnecessary and burdensome requirement. Procedures should be updated and documented as needed.
84	73	11.h.i	Please revise this section to “Permittee/Permittees must continue to implement a training program regarding or require contractors to implement training for the identification of IC/IDs for all municipal field staff who as part of their normal job responsibilities (e.g. street sweeping, storm drain maintenance, collection system maintenance, road maintenance), may come into contact with or otherwise observe an illicit discharge or illicit connection to the storm drain system. Training program documents must be available for review by the permitting authority.” Cities can require contractors to train their staff, but should not be directing contractor staff. The requirement to put notification procedures in fleet vehicles is unnecessary and is covered by the required training.
85	74	"Attachment	On page 74, reference is made to Bioretention/Biofiltration Design Criteria and the Ventura County Technical Guidance Manual. This criterion is likely not fit for LA County given that soils, impervious surface amounts, engineered channels, and agricultural practices are completely different in one county versus the other.

**LOS ANGELES PERMIT GROUP COMMENTS  
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
1	1	III.A.1.a and III.A.2	<p>RB staff proposed language requires the permittees to “effectively prohibit non-stormwater discharges <b>into</b> the MS4 and <b>from</b> the MS4 to receiving waters” except where authorized by a separate NPDES permit or conditionally authorized in sections III.A.3-6.</p> <p>This may overstep the required legal authority provisions in the federal regulations since 40CFR122.26 (d)(1)(ii) requires legal authority to control discharges <b>to</b> the MS4 but not <b>from</b> the MS4. Additionally, with respect to the definition of an illicit discharge at 40CFR122.26(b)(2), an illicit discharge is defined as “a discharge <b>to</b> the MS4 that is not composed entirely of stormwater”. In issuing its final rulemaking for stormwater discharges on Friday, November 16, 1990<sup>1</sup>, USEPA states that:</p> <p style="text-align: center;"><i>Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT) and the Best Conventional Pollutant Control Technology (BCT) and where necessary, water quality-based controls), but permits for <b>discharges from</b> municipal separate storm sewer systems must require controls to the maximum extent practicable, and where necessary water quality-based controls, and must include a requirement to effectively prohibit non-stormwater <b>discharges into</b> the storm sewers.</i></p> <p>This is further illuminated by the section on Effective Prohibition on Non- Stormwater Discharges<sup>2</sup>:</p> <p style="text-align: center;"><i>“Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water</i></p>

<sup>1</sup> 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

<sup>2</sup> 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

**LOS ANGELES PERMIT GROUP COMMENTS  
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
			<p><i>discharges into the storm sewers. Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather, an 'effective prohibition' would require separate NPDES permits for non-storm water discharges to municipal storm sewers"</i></p> <p>The rulemaking goes on to say that the permit application:</p> <p><i>"requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems."</i></p> <p>Nowhere in the rulemaking is the subject of prohibiting discharges <i>from</i> the MS4 discussed.</p> <p>Furthermore, USEPA provides model ordinance language on the subject of discharge prohibitions: <a href="http://www.epa.gov/owow/NPS/ordinance/mol5.htm">http://www.epa.gov/owow/NPS/ordinance/mol5.htm</a>. Section VII Discharge Prohibitions of this model ordinance provides discharge prohibition language as follows:</p> <p><i>No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.</i></p> <p>Thus we recommend that staff eliminate the "from" language at both Part III.A.1.a. and Part III.A.2.</p>
2	3	III.A.3.b	<p>This provisions outlined in this section are not clear. The provisions may be interpreted as the discharge being "exempt" as long as Table "X" does not contain an issue that is highlighted. Requiring the Permittees to look to Part V or Part VI.D or contact the Executive Officer to verify that there is no new information that will change the original permit determination is confusing.</p>

**LOS ANGELES PERMIT GROUP COMMENTS**  
**NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL**  
**LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
			We'd suggest that Table "X" be revised to include specific sections in Part V or VI.D that may modify the exempt determination. We'd respectfully request that, based on the Executive Officer's determination of a problem, a reopener clause is added so the Permit may be amended to account for changes exempt/conditionally exempt status.
3	3	III.A.3.b.i and III.A.3.b.ii	MS4 Permittees do not have the legal authority to divert and/or treat water from natural springs or riparian wetlands (including those which are spring fed) before they enter the MS4. We believe such flows should be unconditionally exempt from the discharge prohibitions.
4	3	III.A.3.b.iii	MS4 Permittees do not have the legal authority to override State or Regional Board authorized discharges from stream diversions. Once the State or Regional Board authorizes a discharge, the State or Regional Board becomes responsible for any pollutants in that discharge. For MS4 Permittees, this discharge should be unconditionally exempt.
5	4	III.A.3.b.x	The combination of gravity flow and a pumped flow is not appropriate. Gravity flow is not dewatering while pumped flow is dewatering. Please separate the two types of discharge. The installation of drain piping around a below grade foundation wall is intended to provide safety so that water pressure does not build up against a below grade wall. If the built-up water, which is generally not ground water but rather infiltrating rain water, then it can be drained by gravity which is not dewatering and therefore should not require an NPDES permit.
6	4	III.A.3.b.xv	The conditional exemption of street/sidewalk water is inconsistent with the requirement in the industrial/commercial MCM section that street washing must be diverted to the sanitary sewer. Sidewalk water should be conditionally exempt, but so also should patios and pool deck washing. If street washing has to be diverted to the sanitary sewer for industrial/commercial facilities, then it should for all facilities and so should parking lot wash water as they are similar in their pollutant loads.
7	4	III.A.3.b.xvi	Emergency fire fighting flows should be unconditionally exempt since they are necessary to protect life and property, regardless of whether or not they cause or contribute to an exceedance of RWL and/or WQBEL. To be consistent with the Ventura county permit, and because of the close link between emergency and non-emergency fire-fighting flows, we request all fire-fighting flows be unconditionally exempt or at minimum consider revising some of the proposed conditions of Table X to be more practicable and flexible.
8	4	III.A.3.b.xvi	Footnote No.10 which expressly prohibits building fire suppression system maintenance (e.g. fire line flushing) discharges to the MS4. With no viable alternative than discharging to the MS4, this prohibition directly conflict with California Health and Safety Code and the State Fire Marshall on the necessity to flush the system. Please delete this explicit prohibition.
9	6	III.A.5.c.i	The requirement to "eliminate irrigation overspray" is impossible to attain. An ordinance that

**LOS ANGELES PERMIT GROUP COMMENTS  
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

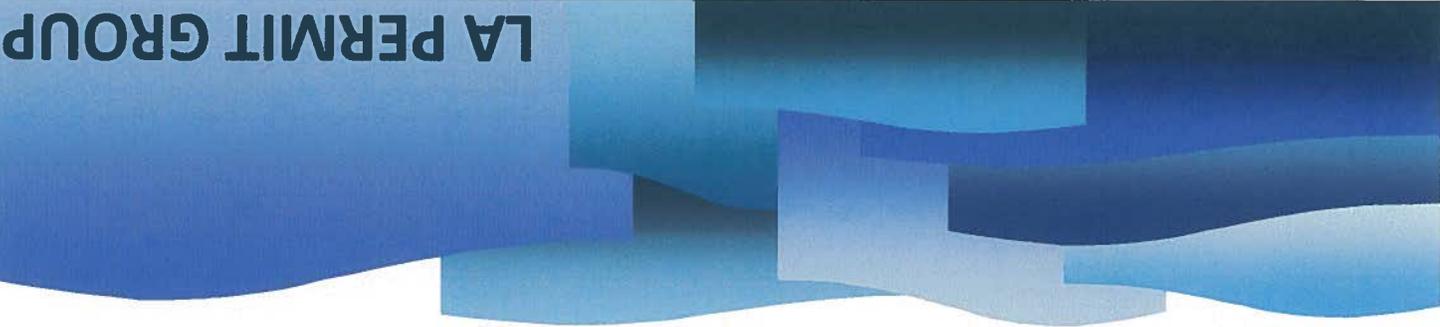

No.	Page	Citation	Comment
			requires Permittees to levy monetary fines against residents is overreach. Please delete this requirement.
10	6	III.A.6	The provision to require dischargers to notify the Permittee of the discharge, obtain local permits and implement BMPs may not be feasible for many dischargers such as car washing and sidewalk washing. Alternatively municipalities can be required to implement ordinances that require anyone within their jurisdiction to comply with a series of conditions when performing those tasks.
11	6	III.A.7	The requirement to determine whether any of the conditionally exempted non-stormwater discharges is a source of pollutants is a requirement to monitor every non-stormwater discharge. This requirement is overly burdensome on Permittee staff, very costly, and a responsibility that will come into question. Please delete this requirement.
12	7	III.A.8	The requirement of the Permittee to demonstrate that a specific non-stormwater discharge from a potable water supply caused an exceedance is a requirement to monitor every potable water supply discharge. This requirement places all the responsibility on the MS4 Permittees to monitor and test the samples. The burden of proof is placed on the Permittee for any exceedance until proven innocent by way of the monitoring results. Like emergency fire fighting discharges, potable water discharges should be exempt.
13	4	III.A.8	We support an exemption for a Permittee from a violation of RWL and or WQBELs caused by a non-stormwater discharge from a potable water supply or distribution system not regulated by an NPDES permit but required by state or federal statute. This should clearly apply to all NPDES permits issued to others within, or flow through, the MS4 Permittees jurisdiction. We would request that emergency releases caused by potable water line breaks, which are unexpected, and have to be dealt with as an emergency. MS4 permittees should be exempt from RWL or WQBEL violations associated with any permitted NPDES discharges that are effectively authorized by LARWQCB under the Clean Water Act.
14	8	III.A.9	The requirement of the Permittee to demonstrate that a specific non-stormwater discharge from a fire fighting activity caused an exceedance is a requirement to monitor every fire fighting activity, including location, date, time, duration, discharge pathway, and flow volume. This requirement places all the responsibility on the MS4 Permittees to monitor and test the samples, which is both labor intensive with limited personnel and extraordinarily costly. The burden of proof is placed on the Permittee for any exceedance until proven innocent by way of the monitoring results. It should be acknowledged by the Regional Board that fire fighting activity causes pollutants to be discharged. Discharges from all fire fighting activities should be unconditionally exempt, as protection of life and property is paramount.

**LOS ANGELES PERMIT GROUP COMMENTS**  
**NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL**  
**LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
15	Table X	General	Enforcing NPDES permits issued for the various NSWDS referenced in this table should be the responsibility of the State/Regional Board, not the MS4 permittee. Therefore, it is inappropriate to include a condition that places a responsibility on the MS4 permittee to ensure requirements of NPDES permits are being implemented or effective in order for the pertaining NSWDS category to be exempt. Proper enforcement of the various NPDES permits mentioned in this table should ensure impacts from these discharges are negligible.
16	Table X	Rising Groundwater	The condition that an NPDES permit is required when rising groundwater occurs where a sump pump is necessary in basement of residential buildings may become a significant burden to the LARWQCB—the number of such occurrences in the LA Basin will be very large.
17	Table X	Landscape Irrigation	Conditions should distinguish new landscape installation from retrofits. These conditions are much easier to require on new landscapes than on existing landscapes.
18	Table X	Swimming Pool/spa dischargers	By imposing additional criteria for the proper discharge of swimming pool water, it greatly increases the complexity for the thousands of homeowners in Los Angeles county to comply with these conditions and may result in fewer amounts of these flows from being dechlorinated. Consider simplifying the proposed conditions.

**Exhibit D:**

**LA Permit Group Request for Extended Comment Period**

July 2, 2012

Maria Mehranian, Chairperson  
California Regional Water Quality Control Board  
Los Angeles Region  
320 West 4<sup>th</sup> St., Suite 200  
Los Angeles, CA 90013

**SUBJECT: Comment Period for Draft NPDES Permit for MS4 Discharges**

Honorable Chairperson Mehranian:

This letter is to request the Regional Board to provide sufficient time for review the draft NPDES Permit for MS4 Discharges needed to make this process **open and transparent**.

The LA Permit Group is in receipt of the Notice of Opportunity for Public Comment and Notice of Public Hearing for the Draft NPDES Permit for MS4 Discharges and of the draft permit. This draft permit is over 500 pages and incorporates provisions for 33 TMDLs and implementation requirements, new low impact development requirements and extensive new requirements for new water quality monitoring, however our permittees have been given only 45 days to provide written comments.

While we understand a new MS4 Permit is long overdue in LA County, we do not understand why the Regional Board would want to rush this landmark regulation through the approval process. It is in everyone's best interest to keep the permitting process as open and transparent as possible. Through this entire process, the LA Permit Group has committed to a process that would cooperatively develop the next MS4 Permit. We have made every effort to stay engaged in the process and have proactively sought involvement in all aspects of the Permit development. The LA Permit Group is appreciative of the efforts the Board and Staff has taken to review certain aspects of the Permit with permittees in workshops; however, upon release of the Tentative, many of the Permit provisions contained substantial changes from previous versions, or contained brand new sections that we had not yet seen throughout this process. Seeing the permit in its entirety and having the opportunity to understand how each of the sections and programs work together is imperative in order for permittees to fully understand the permit provisions and to prepare comments.

We believe the Regional Board wants a review process that is open and transparent; however, providing permittees only 45 days to comment makes it impossible for this process to be open and transparent. In order to develop and provide relevant and meaningful comments, each permittees must first:

- Read a 500 page permit,
- Study the 500 page permit to understand how the provisions work together,
- Compare it to the last permit,
- Evaluate the resource needs to comply with the permit,
- Determine the fiscal and organizational impacts on city services; this requires coordination with several city departments,
- Prepare legal review and comments,

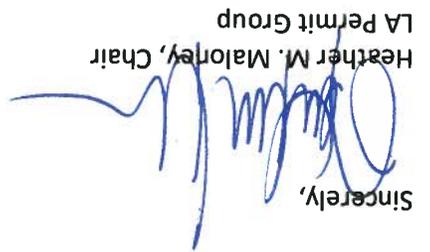

- Present information to and gather feedback from municipal governing body (the process of scheduling an item for a City Council Agenda requires at least 30-60 days in most cities). This does not allow staff time to conduct the following items listed above prior to presenting to their governing bodies, and then
- prepare written comments

Additionally, emphasis on coordination of comments has been called out in the Notice of Opportunity for Public Comment and Notice of Public Hearing for the Draft NPDES Permit. The 45-day comment period does not allow time for permittees to fully discuss the permit amongst each other in order to adequately coordinate comments and responses. This process is not only desired by permittees, but also necessary as many of the permit provisions are intended for permittees to work together on a watershed (or sub-watershed) scale. In order to fully understand how these provisions will work on a watershed scale, it is necessary that permittees (staff and elected officials) be allowed adequate time to fully understand the permit, coordinate and prepare comments.

Furthermore, for this process to be clearly open and transparent, permittee (City) staff should be given sufficient time to vet this permit within our agency staff and with our elected officials and then be given time to discuss and negotiate issues with Regional Board staff prior to the Tentative Draft comments due date.

The LA Permit Group respectfully requests for the comment period to be extended by **180 working days** for permittees to first try to work with Regional Board staff to draft a permit that has a reasonable chance for compliance and then prepare written comments on un-resolved issues. Additionally, we request that a Revised Tentative Permit be released with a 45-day comment period so that permittees have the opportunity to see any changes made to the Permit and have the chance to provide comments prior to the Adoption Hearing.

If you have any questions or request additional information, I may be reached at (626) 932-5577 or hmaloney@ci.monrovia.ca.us.

Sincerely,  
  
Heather M. Maloney, Chair  
LA Permit Group

**Exhibit E:**

**RWL submitted by CASQA re Caltrans permit**

**California Stormwater Quality Association**

*Dedicated to the Advancement of Stormwater Quality Management, Science and Regulation*

---

June 26, 2012

Jeanine Townsend, Clerk to the Board  
State Water Resources Control Board

**Subject: State of California Department of Transportation Municipal Separate Storm Sewer System Permit Second Revised Draft Tentative Order**

Dear Ms. Townsend:

The California Stormwater Quality Association appreciates this opportunity to comment on the subject Caltrans Municipal Separate Storm Sewer System (MS4) Permit Second Draft Tentative Order (draft Tentative Order). CASQA typically comments on individual MS4 permits only when there is an issue of potential statewide significance. Accordingly, we are compelled to comment on the Receiving Water Limitations provisions incorporated into the draft Tentative Order.

**The Draft Tentative Order in Provisions A and C will expose the Department to unwarranted and immediate liability.**

CASQA believes the current revision of the receiving water limitations section is contrary to established Board policy and appears to create an inability for Caltrans to comply. Multiple constituents in stormwater runoff on occasion may be higher than receiving water quality standards before it is discharged into the receiving waters, and may create the potential for the runoff to cause or contribute to exceedances in the receiving water itself. Previously, MS4s have presumed that permit language like that expressed in Receiving Water Limitation D.4 in conjunction with Board Policy (WQ 99-05) established an iterative management approach and process as the fundamental, and technically appropriate, basis of compliance. The “iterative process language” now at issue in the draft Tentative Order, however, combined with General Discharge Prohibition A.4, renders the iterative process obsolete as a compliance strategy. Moreover, in the wake of the July 2011 Ninth Circuit Court of Appeal’s decision, if this language is not revised, the precedent may be set for municipal permits that create unlimited liability for government entities across the State.

As you know, on July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.* (NRDC v. County of LA). The court’s opinion addressed two key issues for California’s MS4s, one of which is directly applicable here, that being whether a permittee who is in compliance with the iterative process is nevertheless still in violation of a MS4 permit that contains language like that proposed for Caltrans.

## CASQA comments on Caltrans MS4 Permit Second Revised Draft Tentative Order

Like the Caltrans draft Tentative Order, the County of Los Angeles MS4 permit includes Receiving Water Limitations language that is consistent with the language developed by the State Water Board in its Order WQ 99-05. In previous State Water Board orders, the Board indicated that the language specified in Order WQ 99-05 did not require strict compliance with water quality standards. The language in question is often referred to as the “iterative process.”

However, contrary to the State Water Board’s stated intent and the understanding of CASQA, the Ninth Circuit Court of Appeals found that, because the iterative process paragraph did not explicitly state that a party who was implementing the iterative process was not in violation of the permit, a party whose discharge “causes or contributes” to an exceedance of a water quality standard is in violation of the permit, even though that party is implementing the iterative process in good faith.

As a result of the court’s decision, if the draft language is not changed, all discharges to receiving waters must meet water quality standards to avoid being in violation of permit terms. Although an important goal, no one reasonably expects Caltrans or any other municipal permittee to be able to meet this goal now. Indeed, the impossibility of meeting this goal is reflected by the hundreds of TMDLs across the state that specifically recognize that water quality standards cannot currently be met, often for reasons beyond Caltrans or other permittees’ control, and that instead an adaptive program over a span of several years or longer is necessary.

Thus, unless this language is changed, Caltrans may be vulnerable to enforcement actions by the state and third party citizen suits alleging violations of the permit terms in question. Indeed, the liability resulting from a failure to address these provisions may be a risk to Caltrans regardless of the current or future enforcement policy of the State or Regional Water Boards. For example, the City of Stockton was engaged in the iterative process per the terms of its Permit, but was nonetheless challenged by a third-party on the basis of the Receiving Water Limitations language. There is no regulatory benefit to imposing permit provisions that result in the potential of immediate non-compliance for the Permittee.

To avoid undercutting the regulatory benefits of the State Water Board’s program for Caltrans (and other MS4s), the Receiving Water Limitations language must be revised. In an attempt to avoid this undercutting we have attached proposed language for the Receiving Water Limitation provision. CASQA believes that our suggested Receiving Water Limitations language is drafted in a manner to clearly indicate that compliance with the iterative process provides effective compliance with the discharge prohibition (General Discharge Prohibition A.4), and the “shall not cause or contribute” receiving water limitations (Receiving Water Limitations D.2 and D.3). Furthermore the proposed language allows the MS4s to focus and prioritize their resources on critical water quality issues that will lead to water quality improvement, such as those reflected by the TMDLs. We therefore request further consideration of this or other alternative language so as to avoid a situation where, even if Caltrans is in complete compliance with the iterative process provisions, it could be subject to significant liability and lawsuits.

We thank you again for the opportunity to provide our comments and we ask that the Board carefully consider them and our suggested Receiving Water Limitations language for the

CASQA comments on Caltrans MS4 Permit Second Revised Draft Tentative Order

Caltrans permit. If you have any questions, please contact CASQA Executive Director Geoff Brosseau at (650) 365-8620.

Sincerely,

A handwritten signature in black ink that reads "Richard Boon". The signature is written in a cursive style with a large initial "R" and "B".

Attachment – CASQA Proposed Language for Receiving Water Limitation Provision

## California Stormwater Quality Association<sup>®</sup>

*Dedicated to the Advancement of Stormwater Quality Management, Science and Regulation*

---

February 21, 2012

Mr. Charles Hoppin, Chair  
State Water Resources Control Board  
P.O. Box 100  
Sacramento, CA 95812-0100

**Subject: Receiving Water Limitation Provision to Stormwater NPDES Permits**

Dear Mr. Hoppin:

As a follow up to our December 16, 2011 letter to you and a subsequent January 25, 2012 conference call with Vice-Chair Ms. Spivy-Weber and Chief Deputy Director Jonathan Bishop, the California Stormwater Quality Association (CASQA) has developed draft language for the receiving water limitation provision found in stormwater municipal NPDES permits issued in California. This provision, poses significant challenges to our members given the recent 9th Circuit Court of Appeals decision that calls into question the relevance of the iterative process as the basis for addressing the water quality issues presented by wet weather urban runoff. As we have expressed to you and other Board Members on various occasions, CASQA believes that the existing receiving water limitations provisions found in most municipal permits needs to be modified to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but also allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. To that end, we have drafted the attached language in an effort to capture that intent. We ask that the Board give careful consideration to this language, and adopt it as 'model' language for use statewide.

Thank you for your consideration and we look forward to working with you and your staff on this important matter.

Yours Truly,

Richard Boon, Chair  
California Stormwater Quality Association

cc: Frances Spivy-Weber, Vice-Chair – State Water Board

## CASQA Proposal for Receiving Water Limitation Provision

### D. RECEIVING WATER LIMITATIONS

1. Except as provided in Parts D.3, D.4, and D.5 below, discharges from the MS4 for which a Permittee is responsible shall not cause or contribute to an exceedance of any applicable water quality standard.
2. Except as provided in Parts D.3, D.4 and D.5, discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible, shall not cause a condition of nuisance.
3. In instances where discharges from the MS4 for which the permittee is responsible (1) causes or contributes to an exceedance of any applicable water quality standard or causes a condition of nuisance in the receiving water; (2) the receiving water is not subject to an approved TMDL that is in effect for the constituent(s) involved; and (3) the constituent(s) associated with the discharge is otherwise not specifically addressed by a provision of this Order, the Permittee shall comply with the following iterative procedure:
  - a. Submit a report to the State or Regional Water Board (as applicable) that:
    - i. Summarizes and evaluates water quality data associated with the pollutant of concern in the context of applicable water quality objectives including the magnitude and frequency of the exceedances.
    - ii. Includes a work plan to identify the sources of the constituents of concern (including those not associated with the MS4 to help inform Regional or State Water Board efforts to address such sources).
    - iii. Describes the strategy and schedule for implementing best management practices (BMPs) and other controls (including those that are currently being implemented) that will address the Permittee's sources of constituents that are causing or contributing to the exceedances of an applicable water quality standard or causing a condition of nuisance, and are reflective of the severity of the exceedances. The strategy shall demonstrate that the selection of BMPs will address the Permittee's sources of constituents and include a mechanism for tracking BMP implementation. The strategy shall provide for future refinement pending the results of the source identification work plan noted in D.3. ii above.
    - iv. Outlines, if necessary, additional monitoring to evaluate improvement in water quality and, if appropriate, special studies that will be undertaken to support future management decisions.
    - v. Includes a methodology (ies) that will assess the effectiveness of the BMPs to address the exceedances.
    - vi. This report may be submitted in conjunction with the Annual Report unless the State or Regional Water Board directs an earlier submittal.

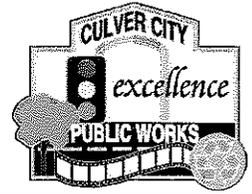

- b. Submit any modifications to the report required by the State or Regional Water Board within 60 days of notification. The report is deemed approved within 60 days of its submission if no response is received from the State or Regional Water Board.
  - c. Implement the actions specified in the report in accordance with the acceptance or approval, including the implementation schedule and any modifications to this Order.
  - d. As long as the Permittee has complied with the procedure set forth above and is implementing the actions, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the State Water Board or the Regional Water Board to develop additional BMPs.
4. For Receiving Water Limitations associated with waterbody-pollutant combinations addressed in an adopted TMDL that is in effect and that has been incorporated in this Order, the Permittees shall achieve compliance as outlined in Part XX (Total Maximum Daily Load Provisions) of this Order. For Receiving Water Limitations associated with waterbody-pollutant combinations on the CWA 303(d) list, which are not otherwise addressed by Part XX or other applicable pollutant-specific provision of this Order, the Permittees shall achieve compliance as outlined in Part D.3 of this Order.
5. If a Permittee is found to have discharges from its MS4 causing or contributing to an exceedance of an applicable water quality standard or causing a condition of nuisance in the receiving water, the Permittee shall be deemed in compliance with Parts D.1 and D.2 above, unless it fails to implement the requirements provided in Parts D.3 and D.4 or as otherwise covered by a provision of this order specifically addressing the constituent in question, as applicable.

**Subject: Comment letter – Draft NPDES Permit (Draft Order) for MS4 Dischargers within the Los Angeles County Flood Control District**

Dear Mr. Ridgeway:

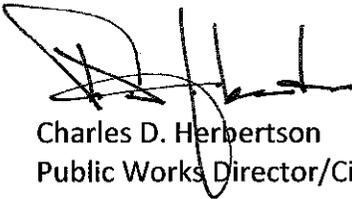

The City of Culver City (City) appreciates the opportunity to provide comments on the subject draft order for the Los Angeles region. The City has actively participated with other municipalities through the Los Angeles Permit Group (LAPG) to understand and comment on the complex provisions of the draft permit. Attached to this letter is the comment letter the LAPG will submit as a whole and which Culver City agrees with and supports. In addition, we would like to highlight a few issues of critical importance to the City of Culver City.

The City did not receive adequate time to review the draft permit in its entirety. The Regional Board released parts of the draft permit and labeled them as staff working proposals, but those sections changed once the entire permit was released. Because of the many interrelationships between the different sections of the permit, it is critical to provide an adequate opportunity to review the permit as a whole. In addition, the City and the LAPG did not receive a response to many of our comments from Regional Board staff so we are unaware of the impact of our efforts to engage in a consensus building process. The City respectfully requests a one-year extension to allow time for a continuing collaborative and iterative process whereby several drafts can be reviewed and subjected to comments, comments can be addressed or responded to and we will

have adequate opportunity to obtain input from City policy makers as the final permit takes shape.

The City recognizes the need to continue to make significant progress toward attainment of water quality standards. However, we also believe that no regulatory benefit accrues from the State establishing permit provisions that result in the potential of immediate non-compliance for Permittees. For these reasons, the City requests revision of the draft MS4 Permit as described in the letter dated July 23, 2012 from the LAPG and for the reasons stated above, a one-year extension to the permit adoption process.

Sincerely,

A handwritten signature in black ink, appearing to read 'C. Herbertson', with a large, stylized flourish on the left side.

Charles D. Herbertson  
Public Works Director/City Engineer

Los Angeles, CA 90013

**Subject: Comment letter – Tentative NPDES Permit (Draft Order) for  
MS4 Dischargers within the Los Angeles County Flood Control District**

The City of Downey (City) takes pride in itself as very proactive in reducing pollutants in storm water runoff. In a recent presentation to the Regional Board, it was mentioned that the city has over 1,000 Low Impact Development (LID) type systems located throughout the City. In fact, in an effort to distinguish itself, Downey was one of the few cities submitting a separate Report of Waste Discharge (ROWD) six months prior to the scheduled expiration of the current permit in 2006 with the purpose of obtaining coverage under a separate and individual MS4 permit. Downey has not requested this ROWD be withdrawn, but nonetheless recognizes the appropriateness of submitting comments at this time; in part as the Regional Board has listed the City as a permittee under the Tentative Permit.

Downey is not a member of the Los Angeles Permit Group (LAPG), but has been following the developments and vetting by some sixty (60) municipalities of that group's comments. Rather than submit many of the same comments, Downey hereby incorporates the comments being submitted to the Regional Board by the LAPG into this letter by reference. Downey would also like to incorporate by reference, the legal comments being submitted separately on behalf of the City of Signal Hill.

Downey further recognizes that the comments being submitted by the LAPG are extensive and that there will only be a very limited amount of time for the Regional Board to review and make the requested modifications to the tentative permit prior to the currently scheduled adoption date of September 7, 2012. The City would therefore like to bring to the attention of the Regional Board several items of importance.

1. The open section that lists the names of the contact person, thus incorporating the names into the MS4 permit is inappropriate as City personnel are very likely to change over the next 5 or more years. Only the City titles and addresses should be listed.
2. Section D.1.b.i (page 56) indicates that all the Minimum Control Measures (MCM) must be implemented within 30 days of the effective date of the permit. This is not realistic given that the permittees are being given six (6) months in which to decide whether to implement the MCMs or follow the Watershed Management Program (WMP) as described separately within the Tentative Permit.
3. During a presentation to the Regional Board earlier this year as part of comments on previous working drafts of the MS4 permit, the City of Downey indicated that eighty-nine (89) percent of their catch basins tributary to the Los Angeles River are now retrofitted with full-capture trash systems. The remaining eleven (11) percent could not be retrofitted due primarily to physical constraints of the catch basins. Section E.5.b.i(2) (118) appears to indicate that cities installing lesser effective partial control devices may be eligible for a determination of full compliance while those cities such as Downey that installed the full capture system would not be. This can and should be remedied by including the partial installation of full-capture devices in combination with institutional control as satisfying this item.
4. The Receiving Water Limitations (RWL) must be revised. This is a critical issue for the City. Under the current wording, any exceedance, whether: (1) under an existing TMDL, (2) listed on the 303d impaired waterbody list but where no TMDL is yet developed, or (3) not listed as an impairment but listed as a water quality standard would subject permittees to RWL requirements. For example, runoff would now be immediately subject to limitations on such "pollutants" as aluminum, sulfates, chloride, etc. If these pollutants were priorities, TMDLs or monitoring would have already be in place; and to the City's knowledge, no outfall monitoring has yet occurred. Cities must be given a reasonable opportunity to determine the current level of these "pollutants", and then develop economically and technically feasible control measures, preferably through an iterative adaptive approach. We understand that several statewide efforts are underway and the Regional Board is urged to review the proposed wording of these efforts and remedy the current deficiencies in the Receiving Waters Limitations wording.

5. As mentioned above, the City has a substantial LID program. Credit should be given to cities, such as Downey, that will have lowered the volume of runoff so that miniscule amounts of runoff that may from time to time exceed water quality standard not be considered violations (Water Quality Standards should be mass-bases as well as concentration-based.)
6. Under the construction provisions for sites over 1 acre. Since the SWPPP program (GCP) is in place and applications can now be electronically filed by contractors and since this is a State program, and therefore the State collects permit and inspection fees, cities should not be responsible for ensuring the SWPPP application process and the increased number of inspections unless the State provides a portion of the fees as reimbursement to cities for the additional costs.
7. Table 8, (Page 33): Under the provision for (LACFCD) Los Angeles County Flood Control District to mandate reporting by potable water suppliers should be amended. LACFCD has no legal mechanism to enforce this provision except where the discharge is to a County owned right of way, which is in only a very small number of cases. It makes much more sense and is consistent with the rest of the permit to require each MS4 permittee to have this requirement. Please consider revising the language accordingly, "Whenever there is a discharge of one acre-foot or more into the MS4, the MS4 Permittee shall require advance notification by the discharger to the MS4 Permittee."
8. Under Section D.7.h.ii.(8), the verification that contractors have obtained various State permits (401, 404, 1600, etc.) should not be the responsibility of the City. As owner/operator of the flood control channels where the actual connections will be made, verification of these permits should be the responsibility the Army Corps of Engineers or the County Flood Control District.
9. Attachment A: Please provide definitions for:

Construction Activity,  
Industrial Parks and  
Commercial Strip malls  
Trash excluders  
AMAL and MDAL (page G-13)

10. Item (4) (page 70): this item should be eliminated. It forces an evaluation of green roofs for every project, whether or not a green roof if proposed.

11. Section d.i. (page 80): whereby the Executive Office is to review and approved LID ordinance retroactively punishes cities like Downey that pro-actively initiated LID programs on their own volition. Existing LID programs should be grandfathered in automatically.
12. Section VI.D.7.f (page 84): land clearing for fire protection should not be considered a construction activity.
13. Having submitted its own ROWD, Downey recognized that an outfall monitoring program was going to be an integral part of their individual MS4 permit. However, the new outfall monitoring program as outlined in Attachment E of the tentative MS4 represents an extremely expensive endeavor. This needs to be completely revised in order to make it economically viable. As part of several Los Angeles River, San Gabriel River and Los Cerritos Channel TMDL groups, Downey is facing a shared monitoring costs well into the hundreds of thousands of dollar range. The costs for this outfall monitoring will include: (1) TMDL monitoring, (1) post-construction treatment system evaluation and (3) costs for pyrethroid studies. Even if limited to approximately 20 square miles of tributary areas (HUC-12) the costs are extremely high. Attachment E should be listed as "items that could be included in a monitoring plan" and this program will then be developed over the next several years.
14. As Downey is subject to both the USEPA San Gabriel River Reach 1 Metals TMDL and the USEPA Los Cerritos Channel TMDL, the City would like to complement the Regional Board staff for their effort to allow permittees subject to these USEPA TMDLs to prepare a Watershed Implementation Plan (WIP) in lieu of the Time Schedule Order as originally proposed in the original permit drafts. The City is pleased to see the Regional Board's intent to recognize interim efforts as equating to compliance via these WIPs which are anticipated to be submitted to the Regional Board in 2013. The City is concerned that the final TMDL goals will be strict numeric limits. For the purpose of this MS4 permit, it is requested that the final numeric limits be listed as iterative adaptive goals and that as the final date of the implementation period approaches, the Basin Plan be re-opened to review the progress to date and make a determination at that time whether to establish strict numeric limits or a continuation of the iterative adaptive process.
15. Section E.3.a (page 114): It is not clear from the Tentative Permit whether this was a grammatical oversight or a purposeful intent for cities such as Downey subject to a US EPA TMDL not to be given the option of implementing the MCM (as all other permittees are) in lieu of developing a WMP. For permittees such as Downey which are in multiple TMDL watersheds, it should be clear that

PAGE 5

Management Area Programs established by permittees for US EPA TMDL do not apply to the entire City unless specifically designated as such within the Watershed Management Program.

16. Section III.A.1 (page 26). "- - prohibit non-storm water discharges through the MS4 - -" , should be changed to: "- - prohibit non-storm water discharges into the MS4 - -". Leaving the wording as is would require permittees to discern non-exempt discharges within comingle flows for upstream sources outside the jurisdiction of the permittee.
17. Finally, the entire section h.ix (page 103) dealing with sanitary sewers should be omitted. Sanitary sewer system operations and maintenance are already addressed by an existing WDR.

Thank you in advance for consideration of these comments. Please call Louis Atwell of my staff at (562) 622-3398 if you have any questions or comments.

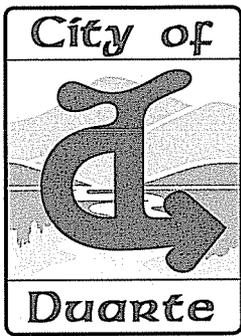

Sincerely,

John Oskoui, P.E.  
Director of Public Works

Subject: Tentative MS4 Order Comments

Dear Mr. Ridgeway:

The City of Duarte is pleased to submit the attached comments for your consideration in re: Order No. R4-2012-XXXX NPDES Permit No. CAS004001.

Please note that the City also supports comments and incorporates by reference the letter submitted to you from the Los Angeles Stormwater Permit (LASP) group. The City's comments are intended to be complimentary and more specific to the issues raised in the LASP group letter. The City's comment letter also contains additional issues not addressed in the LASP group letter.

Thank you for the opportunity to submit comments on this very important matter. Should you have any questions, please feel free to call me.

Sincerely,

Darrel George  
City Manager

**Comments Regarding Los Angeles MS4 Tentative Order No. R4-2012-XXXX  
NPDES PERMIT NO. CAS004001 (issue date unspecified)  
Attachment E: Monitoring and Reporting Plan**

---

1. Receiving Water Monitoring

The purpose of receiving water monitoring is to:

- a. *Determine whether the receiving water limitations are being achieved,*
- b. *Assess trends in pollutant concentrations over time, or during specified conditions,*
- c. *Determine whether the designated beneficial uses are fully supported as determined by water chemistry, as well as aquatic toxicity and bioassessment monitoring.*

Receiving water monitoring is to be performed at various in-stream stations.

At issue is "a" because it serves to determine compliance with receiving water limitations. The Regional Board has no legal authority to compel compliance with receiving water limitations through in-stream monitoring. Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) clearly indicates:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

According to Clean Water Act §502, effluent monitoring is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2 defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

In short, effluent monitoring in a receiving water because cannot be required because it lies outside the bounds of the outfall.

Regarding monitoring purposes “b” and “c” no argument is raised here provided that it is understood that assessing trends in pollution concentrations would be: (1) limited to ambient water quality monitoring; and (2) permittees shall be not responsible for funding such monitoring. With respect to the latter, the Regional Board’s surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.

*Recommended Corrective Action:* Delete 1(a) and make it clear that 1(b) and (c) relate to ambient monitoring that is not the responsibility of MS4 permittees.

## 2. Stormwater Outfall Based Monitoring

The purpose of stormwater outfall based monitoring – including TMDL monitoring -- is to:

- a. *Determine the quality of a Permittee’s discharge relative to municipal action levels, as described in Attachment G of this Order,*
- b. *Determine whether a Permittee’s discharge is in compliance with applicable wet weather WQBELs derived from TMDL WLAs,*
- c. *Determine whether a Permittee’s discharge causes or contributes to an exceedance of receiving water limitations.*

Insofar as “a” is concerned, outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to replace TMDL WLAs as alternatives to addressing receiving water quality. As noted in the National Research Council Report to USEPA:

*The NSQD (Pitt et al., 2004) allows users to statistically establish action levels based on regional or national event mean concentrations developed for pollutants of concern. The action level would be set to define unacceptable levels of stormwater quality (e.g., two standard deviations from the median statistic, for simplicity). Municipalities would then routinely monitor runoff quality from major outfalls. **Where an MS4 outfall to surface waters consistently exceeds the action level, municipalities would need to demonstrate that they have been implementing the stormwater program measures to reduce the discharge of pollutants to the maximum extent practicable.** The MS4 permittees can demonstrate the rigor of their efforts by documenting the level of implementation through*

*measures of program effectiveness, failure of which will lead to an inference of noncompliance and potential enforcement by the permitting authority*

Instead of following the above Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should be not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs if necessary.

Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.

*Recommended Correction:* Either require substitution of TMDLs with MALs or eliminate MALs entirely.

As for stormwater outfall monitoring purpose "b", such monitoring cannot be used to determine compliance with **wet weather WQBELs based on TMDL WLAs** for the following reasons:

1. The wet-weather WQBEL is based on a TMDL WLA in the receiving water that is non-ambient. As mentioned, federal regulations only require ambient monitoring in the receiving water, which by definition can never be deemed the same as wet weather monitoring. They are mutually exclusive. Regional Board staff has also incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a "numeric effluent limitation." Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board's clear opposition to numeric effluent limitations.

In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require "strict compliance" with water quality standards through numeric effluent limitations," and instead "we will continue to follow an iterative approach, which seeks compliance over time" with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

2. The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Regarding purpose "b" it should also be noted that the Regional Board's setting of WQBELs to translate the TMDL WLA in the receiving water to the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.*

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit's fact sheet. According to USEPA's NPDES Permit Writers' Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>1</sup>*

---

<sup>1</sup>United States Environmental Protection Agency, NPDES Permit Writers' Manual, September, 2010, page 6-30.

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis.

Complicating the performance of a reasonable potential analysis is the absence of (1) outfall monitoring data; and (2) ambient water quality standards. Though federal regulations require monitoring at the outfall, the Regional Board has not required it up until now. Even if outfall monitoring data were available to determine whether pollutants concentrations in the discharge exceeded the water quality standard is not possible. This is because, as mentioned earlier, TMDL WLAs are not expressed as ambient standards. A TMDL is an enhanced water quality standard. As noted in the National Research Council's *Assessing the TMDL Approach to Water Quality Management*, a report commissioned by the United States Congress in 2001:

*... EPA is obligated to implement the Total Maximum Daily Load (TMDL) program, the objective of which is attainment of ambient water quality standards through the control of both point and nonpoint sources of pollution.*

*Recommended Correction:* Eliminate this requirement.

Regarding purpose "c", the determinant for a water quality standard exceedance is in the discharge from the outfall -- not in the receiving water. The use of numeric WQBELs -- though incorrectly defined and established in this instance -- represents the compliance standard in discharges from the outfall. Adding a second compliance determinant in the receiving water is unnecessary and is not authorized under federal stormwater regulations because the receiving water lies outside the scope of the MS4.

*Recommended Corrective Action:* Eliminate this requirement.

### **3. Non-storm water outfall based monitoring**

The purposes of this type of monitoring are as follows:

- a. Determine whether a Permittee's discharge is in compliance with applicable dry weather WQBELs derived from TMDL WLAs.*
- b. Determine whether a Permittee's discharge exceeds non-storm water action levels, as described in Attachment G of this Order,*
- c. Determine whether a Permittee's discharge contributes to or causes an exceedance of receiving water limitations,*

- d. *Assist a Permittee in identifying illicit discharges as described in Part VI.D.9 of this Order.*

Regarding "a," This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.

*Recommended Correction:* Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the ICDDE program.

Withy regard to "b", see previous responses regarding MALs and the limitation of non-stormwater discharge prohibit to the MS4.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.

Regarding "c", as mentioned, non-stormwater discharges cannot by applied to receiving water limitations because of they are only prohibited to the MS4, not from or through it.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.

Regarding "d", this requirement is reasonable and in keeping with federal regulations with the exception that the identification of illicit discharges must adhere to the field screening requirements in CFR 40 §122.26. No non-stormwater discharge monitoring shall occur unless flow is first discovered at the outfall. This would trigger the implementation of additional requirements that the tentative order does not include.

#### **4. New Development/Re-development effectiveness monitoring**

The purpose of this requirement is a dubious and is not authorized under federal stormwater regulations as it relates to monitoring. To begin with, requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4's pollution contribution relative to exceeding ambient water quality standards. Without the determination of statistically significant exceedances of water quality standards, detected at the

outfall, the imposition of runoff infiltration requirements is arbitrary. Further, there is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.

Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines "effectiveness" -- effective relative to what standard? It is also not clear how such monitoring is to be performed.

*Recommended Correction:* Delete this requirement.

The MRP of the tentative order proposes regional studies "*to further characterize the impact of the MS4 discharges on the beneficial uses of the receiving waters. Regional studies shall include the Southern California Stormwater Monitoring Coalition (SMC) Regional Watershed Monitoring Program (bio-assessment), sediment monitoring for Pyrethroid pesticides, and special studies as specified in approved TMDLs (see Section XIX TMDL Reporting, below).*"

Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board's SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County's mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.

END COMMENTS

---

1. **Numeric Water Quality Based Effluent Limitations (WQBELs) applied to dry and wet weather Total Maximum Daily Load (TMDLs) waste load allocations (WLAs) and to stormwater and non-stormwater municipal action levels (MALs) are not authorized under federal stormwater regulations and are not in keeping with State Water Resources Control Board (State Board) water quality orders (WQOs).**

The tentative order specifies that: *Each Permittee shall comply with applicable WQBELs as set forth in Part VI.E of this Order, pursuant to applicable compliance schedules.* The tentative order specifies two categories of WQBELs, one for USEPA adopted TMDLs and one for Regional Board/State adopted TMDLs. Regarding USEPA adopted TMDLs, it appears that BMP-WQBELs may be used to meet TMDL WLAs in the receiving water. For Regional Board/State-adopted TMDLs, the tentative order specifies a different compliance method: meeting a “numeric” WQBEL which is derived directly from the TMDL waste load allocation. For example, the wet weather numeric WQBEL for dissolved copper for the Los Angeles River is 17 ug/l.

- a. Issue: *Regional Board staff is premature in requiring any kind of WQBEL because no exceedance of any TMDL WLA at the outfall has occurred.* This is because outfall monitoring is not a requirement of the current MS4 permit or previous MS4 permits.

The Regional Board’s setting of WQBELs – any WQBEL -- to translate the TMDL WLA for compliance at the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.*”

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit’s fact sheet. According to USEPA’s NPDES Permit Writers’ Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and*

*explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>1</sup>*

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis -- a consequence of the fact that no outfall monitoring has been required of the Regional Board either in the current or previous MS4 permits for Los Angeles County. Outfall monitoring is a mandatory requirement under federal regulations at CFR 40 §122.22, §122.2 and §122.26. CFR 40 §122.22(C)(3) requires effluent and ambient monitoring:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

"Effluent monitoring," according to Clean Water Act §502, is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2, defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

Conclusion: Because Regional Board staff has not required outfall monitoring, it could have not have detected an excursion above a water quality standard (includes TMDL WLAs). Therefore, it could not have conducted a reasonable potential analysis and, as further consequence, cannot require compliance with a WQBEL (numeric or BMP-based) or with any TMDL or MAL until those burdens have been met.

Recommended Correction: Eliminate all reference to comply with WQBELs until outfall monitoring and a reasonable potential analysis have been performed.

---

<sup>1</sup>United States Environmental Protection Agency, *NPDES Permit Writers' Manual*, September, 2010, page 6-30.

- b. Issue: Even if Regional Board staff conducted outfall monitoring and detected an excursion above a TMDL WLA and performed the requisite reasonable potential analysis, it cannot require a numeric WQBEL strictly derived from the TMDL WLA.

USEPA's 2010 guidance memorandum mentions that numeric WQBELs are permissible only if feasible.<sup>2</sup> This conclusion was reinforced by a memorandum from Mr. Kevin Weiss, Water Permits Division, USEPA (Washington D.C.). He explains:

*Some stakeholders are concerned that the 2010 memorandum can be read as advising NPDES permit authorities to impose end-of-pipe limitations on each individual outfall in a municipal separate storm sewer system. In general, EPA does not anticipate that end-of-pipe effluent limitations on each municipal separate storm sewer system outfall will be used frequently. Rather, the memorandum expressly describes "numeric" limitations in broad terms, including "numeric parameters acting as surrogates for pollutants such as stormwater flow volume or percentage or amount of impervious cover." In the context of the 2010 memorandum, the term "numeric effluent limitation" should be viewed as a significantly broader term than just end-of-pipe limitations, and could include limitations expressed as pollutant reduction levels for parameters that are applied system-wide rather than to individual discharge locations, expressed as requirements to meet performance standards for surrogate parameters or for specific pollutant parameters, or could be expressed as in-stream targets for specific pollutant parameters. Under this approach, NPDES authorities have significant flexibility to establish numeric effluent limitations in stormwater permits.<sup>3</sup>*

Reading the 2010 USEPA memorandum, together with Mr. Weiss's memorandum, creates the inescapable conclusion that (1) numeric WQBELs are permissible if "feasible" and (2) numeric WQBELs cannot be construed to only mean strict effluent limitations at the end-of-pipe (outfall) but more realistically must include surrogate parameters and other variants as well. Regional Board staff failed to examine alternative numeric WQBELs, along with BMP WQBELs, as a consequence of not conducting the appropriate analysis.

In any case, the feasibility of numeric WQBELs, whether strictly derived from TMDL WLAs or of the surrogate parameter type, the State Water Resources Control Board has determined that numeric effluent limitations are not feasible. In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require "strict compliance" with water quality standards through numeric effluent*

---

<sup>2</sup>Memorandum from James A. Hanlon, Director, Office of Waste Management, Revisions to the November 22, 2002 Memorandum Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs, November 12, 2010, page

<sup>3</sup>Memorandum from Kevin Weiss, Water Permits Division, USEPA (Washington D.C.), March 17, 2011.

*limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

The State Board’s decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Conclusion: The Regional Board does not have the legal authority to require numeric WQBELs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

- c. Issue: There cannot be a WQBEL to attain a dry weather TMDL WLA nor a WQBEL that addresses a non-stormwater municipal action level (MAL).

The foundation for this argument lies in the federal limitation of non-stormwater discharges to the MS4 – not from or through it as the tentative order concludes. Federal stormwater regulations only prohibit discharges to the MS4 and limits outfall monitoring to stormwater discharges. This is explained in greater detail under 4. *Non-stormwater Discharge Prohibitions.*

Conclusion: Regional Board does not have the legal authority to compel compliance with dry weather WQBELs or non-stormwater MALs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

2. **The tentative order has altered Receiving Water Limitation (RWL) language causing it to be overbroad and inconsistent with RWL in the current MS4 permit, the Ventura MS4 permit, State Board WQO 99-05, the draft Caltrans MS4 permit, and RWL language recommended by CASQA.**

- a. Issue: The proposed RWL language changes the “exceedance” determinant from water quality standards and objectives to receiving water limitations, thereby increasing the stringency of the requirement. The tentative order RWL version reads: *Discharges from the MS4 that cause or contribute to the violation of **receiving water limitations** are prohibited.*

Compare this with what is in the current MS4 permits for Los Angeles and Ventura Counties:

*Discharges from the MS4 that cause or contribute to a violation of **water quality standards** are prohibited.*

Whereas standard RWL language limits water quality standards to what is in the basin plan, and includes water quality objectives (relates to waters of the State), the tentative order uses revised language that replaces water quality standards with the following receiving water limitation criteria:

*Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38.*

It is unclear why Regional Board staff has removed water quality standards, which is a USEPA and State Board requirement, and replaced them with the more global receiving water limitation language that include additional compliance criteria (e.g., “or federal regulations including but not limited to 40 CFR § 131.38”). Other “federal regulations” could include CERCLA (Comprehensive Environmental Remediation and Compensation Liability Act).

Enlarging the scope of the RWL from water quality standards to a universe of other regulatory requirements exceeds RWL limitation language established in State Board WQO 99-05, a precedential decision. The order bases compliance on discharge prohibitions and receiving water limitations on the *timely implementation of control measures and other action in the discharges in accordance with the SWMP (stormwater management plan) and other requirements of the permit’s limitations*. It goes on to say that if exceedances of water quality standards or water quality objectives, collectively referred to as water quality standards

continues, the SWMP shall undergo an iterative process to address the exceedances. It should be noted that this language was mandated by USEPA.

It should be noted that the draft Caltrans MS4 permit is scheduled for adoption in September, as well as CASQA, proposes RWL language that is in keeping with WQO 99-05.

Conclusion: Regional Board does not have the legal authority to re-define RWL language to the extent it is proposing.

Recommended Correction: Replace RWL contained in the tentative order with the CASQA model or with language contained in the draft Caltrans MS4 permit.

- b. Issue: By eliminating water quality standards, the tentative order has created a separate compliance standard for TMDLs and for non-TMDLs. Standard RWL language in other MS4 permits designates the SWMP<sup>4</sup> as the exclusive determinant for achieving water quality standards in the receiving water. Since TMDLs are enhanced water quality standards, the SWMP (or in this case the SQMP) should enable compliance with TMDLs. Instead, the tentative order specifies compliance through implementation plans – including plans that were discussed in several State/Regional Board adopted TMDLs (e.g., the Los Angeles River Metals TMDL). The absence of water quality standards also creates a separate compliance standard for non-TMDLs. According to Regional Board staff, minimum control measures (MCMs) which make up the SQMP, are intended to meet non-TMDLs pollutants. Unclear is what defines non-TMDL pollutant. If there are no water quality standards referenced in the RWL then what are the non-TMDL pollutants that the MCMs are supported to address?

There is no authority under federal stormwater regulations to comply with any criterion other than water quality standards. The RWL language called-out in WQO 99-05, which was in response to a USEPA directive, makes it clear that water quality standards represent the only compliance criteria, not an expanded definition of receiving water limitations that exclude such criteria.

MS4 permits throughout the State include TMDL WLAs. None of them, however, has created a compliance mechanism that excludes water quality standards as a means of attaining them. Further, the State Board has, through the draft Caltrans MS4 permit and the draft Phase II MS4 permit, articulated its policy on compliance with water quality standards:

---

<sup>4</sup>USEPA and federal stormwater regulations use stormwater management program whereas the Los Angeles County MS4 permit uses stormwater quality management plan (SQMP). In effect they are the same. They consist of 6 core programs that must be implemented through MS4 permit.

they are to be met through the implementation of stormwater management programs. Equally noteworthy is that State Board has not created a dual standard for dealing with TMDLs and non-TMDLs. This is an obvious consequence of its adherence to WQO 99-05.

With regard to implementation plans contained in TMDLs, the Regional Board has no legal authority to include them into the MS4 permit. This issue discussed in greater detail later in these comments.

Conclusion: The tentative order must be revised to restore water quality standards in RWL language and, by extension, enable compliance with TMDLs and other water quality standards through the SQMP/MCMs.

Recommended Correction: Revise the tentative order to eliminate any reference to complying with anything else except water quality standards through the SQMP; and, therewith, eliminate any reference to complying with implementation plans contained in State/Regional Board TMDLs.

**3. The tentative order does not include the iterative process, a mechanism that is integral to RWL language which serves to achieve compliance with water quality standards.**

- a. Issue: The absence of the iterative process disables a safeguard to protect permittees against unjustifiably strict compliance with water quality standards – or in this case the expanded definition of receiving water limitations -- that is a requisite feature in all MS4 permits issued in California. The tentative order circumvents the iterative process by creating an alternative referred to as the adaptive/management process which is only available to those permittees that opt for a watershed management program.

Despite the fact RWL language in MS4 permits since the 90's have provided a description of an iterative process (the BMP adjustment mechanism), the term "iterative process" has only recently been specifically mentioned in them. The absence of this term resulted in the 9<sup>th</sup> Circuit Court Appeal's conclusion in *NRDC v. Los Angeles County Flood Control District* that there is no "textual support" in the current MS4 permit for the existence of an iterative process. This resulted in the court's conclusion that the LACFCD had exceeded water quality standards in the hardened portions of the Los Angeles and San Gabriel Rivers. More recent MS4 permit's issued in the State contain clear references to the iterative process.

Notwithstanding the absence of water quality standards in the tentative order, the iterative process must be included as required by Water Quality Orders 2001-15 and 2009-0008, wherein the State Board made it clear that: we will

generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.

Moreover, both the draft Caltrans MS4 permit and the draft Phase II MS4 permit contain references to the iterative process. The draft Caltrans MS4 permit refers to the iterative process in two places: finding 20, Receiving Water Limitations and in the Monitoring Results Report. Finding 20 states:

*The effect of the Department’s storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs).<sup>5</sup>*

Under the Monitoring Results Report section, the draft Caltrans MS4 permit reiterates the iterative process within the context of the following: *The MRR shall include a summary of sites requiring corrective actions needed to achieve compliance with this Order, and a review of any iterative procedures (where applicable) at sites needing corrective actions.*<sup>6</sup>

The draft Phase II MS4 references the iterative process in two places, in finding 35 and under its definition of MEP. Finding 35 states:

*This Order modifies the existing General Permit, Order 2003-0005-DWQ by establishing the storm water management program requirements in the permit and defining the minimum acceptable elements of the municipal storm water management program. Permit requirements are known at the time of permit issuance and not left to be determined later through iterative review and approval of Storm Water Management Plans (SWMPs).*

The draft Phase II MS4 permit also acknowledges the iterative process through the definition of maximum extent practicable (which is also included in the draft Caltrans MS4 permit), to the following extent:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP*

<sup>5</sup>See draft Caltrans MS4 permit (Tentative Order No. 2012-XX-DWQ NPDES No. CAS000003), page 10.

<sup>6</sup>ibid., page 35.

*development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the "iterative approach."<sup>7</sup>*

It should be clearly understood that the State Board is articulating clear policy on the iterative process through these two draft MS4 permits and that they must be followed by Regional Boards as subordinate jurisdictions.

Conclusion: The Regional Board has no authority to alter the iterative process/procedure by making a revised and diluted version of it available only to those MS4 permittees that wish to opt for watershed management program participation. Quite the contrary, the Regional Board is legally compelled to make the iterative process, as described herein, an undeniable requirement in the tentative order.

Recommended Correction: Regional Board staff should incorporate the iterative process into the tentative order in the findings section and in the RWL section. It should also be referenced again under a revised MEP definition.

4. **The tentative order incorrectly articulates the non-stormwater discharge prohibition to the MS4 to include discharges from and through it.**
  - a. Issue: The tentative order mentions prohibiting non-stormwater discharges not only to the MS4 but from and through it as well. Federal regulations did not authorize the non-stormwater discharge prohibition to go beyond "to" the MS4. This is a serious issue because extending the prohibition from or through the MS4 would subject non-stormwater discharges (including dry weather TMDL WLAs and non-stormwater municipal action levels) to pollutant limitations at the outfall.

The tentative order attempts to justify interpreting federal stormwater regulations to mean that non-stormwater discharges are prohibited not only to the MS4 but from it and through it as well by: (1) incorrectly stating the Clean Water Act §402(p)(B)(ii) of the Clean Water Act requires permittees effectively prohibit non-storm water discharges into

---

<sup>7</sup> See State Water Resources Control Board Water Quality Order No. XXXX-XXXX-DWQ, NPDES General Permit No. CASXXXXXX, page

watercourses (means receiving waters) as well as to the MS4; and (2) a misreading of Federal Register Volume 55, No. 222, 47990 (federal register) which contains an error with regard to the non-stormwater discharge prohibition.

§402(p)(B)(ii) does not (as the tentative order's fact sheet asserts) include watercourses, which according to Regional Board staff, means waters of the State and waters of the United States, both of which lie outside of the MS4. The original text of §402(p)(B)(ii) actually reads as follows: *Permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."*<sup>8</sup> There is no mention of watercourses.

The tentative order's fact sheet also relies on the afore-cited federal register which states: *402(p)(B)(3) requires that permits for discharges from municipal storm sewers require the municipality to "effectively prohibit" non-storm water discharges from the municipal storm sewer.* The fact sheet is correct about this. The problem is that the federal register is wrong here. It confuses 402(p)(B)(3), which addresses stormwater (not non-stormwater) discharges from the MS4, with 402(p)(B)(2), which once again prohibits non-stormwater discharges to the MS4. It should be noted that in the same paragraph above the defective federal register language, it says that ... *permits are to effectively prohibit non-storm water discharges to the municipal separate storm sewer system.*

In any case, this issue has been resolved since the federal register was published in November of 1990. All MS4 permits in the United States issued by USEPA prohibit non-stormwater discharges only to the MS4. USEPA guidance, such as the *Illicit Discharge Detection and Elimination: A Guidance Manual* bases investigation and monitoring on non-stormwater discharges being prohibited to the MS4. And, with the exception of Los Angeles Regional Board MS4 permits, MS4 permits issued by other Regional Boards also limit the MS4 discharge prohibition to the MS4. Beyond this, the draft Caltrans MS4 permit and draft Phase II MS4 permits also limit the non-stormwater prohibition to the MS4.

Conclusion: The Regional Board does not have the legal authority to extend the non-stormwater discharge prohibition from or through the MS4.

Recommended Correction: Revise the non-stormwater discharge prohibition to be limited to the MS4 only and delete all requirements that

---

<sup>8</sup>Municipal storm sewers is a truncated version of municipal separate stormwater system (MS4).

are based on the prohibition from or through the MS4. This includes the non-stormwater prohibition that is linked to CERCLA.

**5. The tentative order proposes to incorporate TMDL implementation plans, schedules, and monitoring requirements without legal authority.**

- a. Issue: Placing Regional Board/State Board TMDLs into the MS4 would result in serious consequences for permittees. For one thing, permittees subject to TMDLs that contain an implementation schedule with compliance dates for interim waste load allocations that have not been met, based on Los Angeles County mass emissions station or other data (e.g., from the Coordinated Monitoring Plan for the Los Angeles River Metals TMDL), will be in automatic non-compliance once the MS4 permit takes effect.

The tentative order proposes a safeguard in this event: coverage under a time schedule order (TSO). Essentially, a TSO is an enforcement action authorized under Porter-Cologne, the State's water code. The problem is that the Regional Board, at its discretion, could issue a clean-up and abatement order that could link permittees in the Dominguez Channel, Los Angeles River, and San Gabriel River Watersheds to the remediation of the Los Angeles and Long Beach Harbors which are currently CERCLA sites (caused by DDT, pesticides, metals, which are considered toxics, and other pollutants). Furthermore, the TSO, which is a State enforcement action, will not help with respect to a federal violation because of preemption. An exceedance will expose subject permittees to third party litigation under the Clean Water Act. NRDC would be able to take the matter straight to federal court.

In any case, the Regional Board has no legal authority under the Clean Water Act to incorporate implementation plans, schedules, or monitoring requirements into the MS4 permit. CWA §402(p)(B)(iii) simply states that controls are required *to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants*. The application of this provision is limited to: (1) the implementation of BMPs specified in a stormwater management plan appropriated through the six core programs; and (2) outfall monitoring. Monitoring, as mentioned earlier, is limited to outfall and ambient monitoring. Ambient monitoring, which is receiving water-based, has been assumed by the Regional Board and is funded through a stormwater ambient monitoring program (SWAMP) surcharge on the annual MS4 permit fee. Federal stormwater regulations mention nothing about TMDL implementation plans and schedules in an MS4 permit.

In fact, the Regional Board/State Board TMDL implementation plans, implementation schedules, and monitoring should be voided and prevented from being placed into the MS4 permit because (1) they set compliance determinant in the receiving water instead of the outfall; and (2) although the TMDL monitoring program requirements specify ambient monitoring that is to be performed by MS4 permittees, including Caltrans, the Regional Board has approved plans that treat wet weather monitoring as ambient monitoring, even though they are mutually exclusive. The Clean Water Act definition of ambient monitoring is the:

*Natural concentration of water quality constituents prior to mixing of either point or nonpoint source load of contaminants. Reference ambient concentration is used to indicate the concentration of a chemical that will not cause adverse impact to human health.*

The natural concentration of water quality constituents can only mean the state of a receiving water when it is not raining. This is further supported by the phrase "prior to mixing of either point or non-point source load of contaminants," which can only mean stormwater discharges from an outfall. In other words, stormwater discharges from an outfall cannot be mixed with a receiving water during a storm event because the ambient condition would be lost. Outfall monitoring of stormwater discharges is evaluated against the ambient condition of pollutant constituents in the receiving water for the ostensible purpose of determining its pollutant contribution.

Conclusion: The tentative order lacks the legal authority to include TMDL implementation plans, schedules, or monitoring plans adopted as basin plan amendments. No permittee, subject to any TMDL that requires an implementation plan, schedule, or monitoring plan can be compelled to comply with any of them. Further, even if it were legally permissible for these TMDL elements to be incorporated into the MS4 permit, no permittee could be placed into a state of non-compliance because the legitimate compliance point is in the outfall. Because no outfall monitoring has occurred, no violation could arise and, therefore, there would be no need for a TSO.

Recommended Correction: Eliminate requiring TMDL implementation plans, schedules, and monitoring to be incorporated into the tentative order.

6. **The tentative order contains references to the federal Comprehensive Environmental Remediation Compensation and Liability Act (CERCLA) that would make them additional regulatory requirements.**
  - a. Issue: The non-stormwater discharge prohibition under the tentative order states:

*Non-storm water discharges through an MS4 are prohibited unless authorized under a separate NPDES permit; authorized by USEPA pursuant to Sections 104(a) or 104(b) of the federal comprehensive Environmental Response, Compensation and Liability Act (CERCLA).*

At first blush, the CERCLA provision appears innocuous. But what if non-stormwater discharge is not authorized under CERCLA? Conceivably the MS4 permittee could be held responsible for those discharges. And because CERCLA is referenced in the MS4 permit, it could become a potential third party litigation issue. The inclusion of the CERCLA provision is even more suspect when considering that no other MS4 in the State contains such a reference. Beyond this, how would a permittee know if a discharge is one covered under CERCLA?

Conclusion: CERCLA is an unnecessary reference in the MS4 permit and has the potential to expose permittees to third party litigation. Further, the non-stormwater discharge prohibition only "to" the MS4 makes this issue academic. A permittee's only responsibility is to prohibit impermissible non-stormwater to the MS4, not through or from it; or to require the discharger to obtain permit coverage.

**7. The tentative order, under the effluent limitations section, contains technical effluent based limitations (TBELs) which typically are not included in MS4 permits and, in this particular case, does not appear to be purposeful.**

- a. Issue: Part IV.A.1 of the tentative order states that TBELs shall reduce pollutants in storm water discharges from the MS4 to the maximum extent practicable (MEP).

It is not clear as to the reason for including TBELs into the tentative order because they are generally not required of Phase MS4 permits. TBELs are referenced in the tentative order, but are not found under section 402(p), which addresses storm water, nor anywhere else in federal regulations. It is a term used to collectively refer to best available technologies, but again not in 402(p).

TBEL is a term USEPA uses to denote the following: (1) Best Practical Control Technology Currently Available (BPT); (2) Best Conventional Pollutant Control Technology (BCT); and (3) Best Available Technology Economically Achievable (BAT). Since these provisions were established prior to stormwater provisions of the CWA §402(p), they were applied to industrial waste-water discharges (including construction activity which is an industrial category sub-set). A clarifier connected to the sewer system

is a type of TBEL. POTWs are subject to TBELs example primary and secondary treatment.

According USEPA guidance:

*WQBELs are designed to protect water quality by ensuring that water quality standards are met in the receiving water. On the basis of the requirements of Title 40 of the Code of Federal Regulations (CFR) 125.3(a), additional or more stringent effluent limitations and conditions, such as WQBELs, are imposed when TBELs are not sufficient to protect water quality.*<sup>9</sup>

Since the MS4 permit proposes WQBELs (adapted to meet water quality standards at the outfall), it would appear that TBELs are irrelevant. In essence, the proposed WQBELs is an admission from Regional Board staff that TBELs are not sufficient to protect water quality.

Please note that the draft Caltrans and Phase II MS4 permits do not reference TBELs.

Conclusion: Clarification is needed to determine the purpose of referencing TBELs in the tentative order.

Recommended Correction: Either provide clarification and a justification requiring TBELs given that the tentative order requires WQBELs, a more stringent requirement. If clarification or justification cannot be provided, the TBEL provision should be removed.

## 8. Minimum Control Measures (MCMs)

a. Issue: Generally, MCMs should not be detailed in the tentative order. Instead, specific BMPs and other information should be placed in the Stormwater Quality Management Plan (SQMP), which is the case under the current MS4 permit. Federal guidance specifies that the core programs are to be implemented through the SQMP as a means of meeting water quality standards. More importantly, placing the specifics in the SQMP makes it easier to revise. If specific BMPs remain in the tentative order, and they are in error or need to be revised (e.g., to set BMP-WQBELs), a re-opener would be required. For example, in Part I. *Facility Information, Table 2.*, the permittee contact information is out of date. It would be better to place this and other detailed information in the SQMP where it can be updated regularly without having to re-open the permit.

b. Issue: SUSMP

---

<sup>9</sup>NPDES Permit Writers' Manual, September, 2010, page 5-40.

The tentative order replaces the Development Planning/SUSMP with Planning and Land Development Program. However, the SUSMP is mandated through a precedent-setting WQO issued by the State Board. Nothing in the order's fact sheet provides an explanation of why the SUSMP needs to be replaced. So doing would incur an unnecessary cost to revise the SQMP and SUSMP guidance materials. This is not to suggest that the Regional Board may not, in the final analysis, have the legal authority to change the SUSMP to its MCM equivalent. Nevertheless, it would be helpful from an administrative convenience standpoint to explain the need for the change in the fact sheet. It could be argued that the low impact development (LID) techniques have been successfully implemented through the SUSMP program for over five years.

- c. Issue: Retrofitting existing developments through the Land Use Development Program is not authorized under federal stormwater regulations. CFR 40 122.26 only authorizes retrofitting with respect to flood control devices which is to be explained in the MS4 permit as the following indicates:

*A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible.*

- d. Issue: The MCMs in the tentative order require off-site infiltration for groundwater recharge purposes. The tentative order is a stormwater permit, not a groundwater permit. As mentioned, 402(p)(3)(iii) of the Clean Water Act:

*Permits ... shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.*

The use of other infiltration controls that do not promote groundwater recharge have already demonstrated effectiveness in significantly reducing pollutants to the maximum extent practicable (MEP). Requiring infiltration anywhere for the purpose of recharging groundwater exceeds the scope of the MS4 since infiltrating to such an extent would add costs to the developer or permittee without significantly improving pollutant removal performance. Further, this requirement is unwarranted and premature because of the absence of outfall monitoring data that would demonstrate the need for groundwater-recharge oriented infiltration controls to address water quality standards and TMDLs vis-à-vis their intended purpose of protecting beneficial uses in a receiving water.

Conclusion: Requiring infiltration controls to facilitate groundwater recharge is not authorized under federal stormwater regulations. Further, many permittees are situated upstream of spreading grounds and other macro-infiltration basins that would obviate the need for this requirement.  
Recommended Correction: Eliminate this requirement from the order.

**9. The Maximum Extent Practicable (MEP) definition needs to be revised to reflect is updated definition found in the draft Phase II MS4 permit and in the draft Caltrans MS4 permit.**

- a. Issue: The order's MEP reference is a carry-over from the 2001 MS4 permit. A great deal has happened over the decade to warrant an update. Fortunately, the State Board, through the draft Phase II and Caltrans MS4 permits, has revised the MEP definition to be in keeping with current realities. To that end it has proposed the following definition:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the "iterative approach."<sup>10</sup>*

Conclusion: The order's MEP is out of data and inconsistent with State Board policy.

Recommended Correction: Replace order's MEP definition with the above-mentioned language.

**10. The tentative order inappropriately includes the Middle Santa Ana River Bacteria TMDL.**

---

<sup>10</sup>Op. Cit., page 35.

- a. Issue: It should be abundantly clear that the Regional Board cannot accept a TMDL adopted by another jurisdiction for implementation through the MS4 permit unless the Board includes into its basin plan as an amendment. This argument has been raised by legal counsel for the City of Claremont.

Conclusion: The Regional Board lacks legal authority to incorporate the Middle Santa Ana River bacteria TMDL into the proposed order.

Recommended Correction: Eliminate the requirement.

**11. Tentative order incorrectly asserts that its provisions do not constitute unfunded mandates under the California Constitution.**

- a. Issue: Contrary to what the order asserts, it contains provisions that exceed federal requirements in several places, thereby creating potential unfunded mandates. They include: (1) requiring wet and dry weather monitoring in the receiving water; (2) requiring numeric WQBELs; (3) requiring compliance with TMDL-related implementation plans, schedules, and monitoring; (4) requiring the non-stormwater discharge prohibition to include through and from the MS4; (5) revising the receiving water limitation language to include overbroad compliance requirements; (6) requiring groundwater recharge; and (7) monitoring for non-TMDL constituents at completed development project sites.

Conclusion: The order patently proposes requirements that create unfunded mandates.

Recommended Correction: Delete all of the aforementioned requirements that exceed federal regulations.

### COMMENTS ON THE DRAFT LOS ANGELES COUNTY MS4 PERMIT CITY OF EL SEGUNDO

Dear Mr. Ridegway and Ms. Purdy:

As a member of the LA Permit Group, the City of El Segundo joins in the comments submitted to your office by that organization. Those comments are incorporated herein by reference. In addition, the City of El Segundo is providing the following additional comments on the Los Angeles County MS4 Permit.

1. Please update the Facility/Discharger Information for the City of El Segundo(WDID# 4B190170001). Change the Facility Contact to: Stephanie Katsouleas, Public Works Director, [skatsouleas@elsegundo.org](mailto:skatsouleas@elsegundo.org). The Mailing Address for the City of El Segundo is still 350 Main Street, El Segundo, CA 90245 and my contact phone number should be (310) 524-2356.
2. The timelines to develop new watershed management and monitoring programs are too short. The Santa Monica Bay and Dominguez Channel Watershed Agencies have been working together for several years on the bacteria TMDLs. Based on this past activity; we know a lot of lead time is required for the governing bodies to execute new Memorandums of Agreement. This is particularly an issue because the agencies include the State of California (Caltrans), Los Angeles County, and City of Los Angeles, as well many smaller cities. In addition to entering into MOA's the obligations may require securing funding, hiring consultants, etc. All of these activities take time and the timelines in the permit are short.

3. The requirements of the Outfall Based Monitoring are onerous. The Permit requires that “Storm water discharges from the MS4 shall be monitored at outfalls, manholes or in channels at the Permittee’s jurisdictional boundary.” There are no open channels or water bodies. The Permit does not provide a definition of “outfall.” However, the Outfall Based Monitoring section uses this term to describe a program of sampling storm water at the entry and exit from a jurisdictional boundary. “Outfall” is not simply being used as a term to describe a location where a pipe discharges to an open channel or water body.
4. The Receiving Water Limitations Language must be amended. As written, the City can be deemed in violation of the permit, and vulnerable to costly citizen suits, even if it is acting in good faith to do everything in its power to correct exceedances. Stated differently, even though the RWQCB requires cities to implement an iterative process to improve BMPS to address exceedances, the City is still in violation of the permit during the iterative process. This was a serious defect in the last permit and it has not been remedied in this draft.

Previously, municipal stormwater permittees had understood that the receiving water limitations language in conjunction with Board Policy (WQ 99-05) established an iterative management approach *as a basis for permit compliance*. However, since the permit language does not actually say that the permittee is in compliance while engaging in the iterative management process, a federal court has determined that the permit violation still exists while the permittee is taking actions to address the problem.

On July 13, 2011, the Ninth Circuit Court of Appeals in *NRDC vs. County of Los Angeles / Los Angeles County Flood Control District* found that the Defendant County had violated the receiving water limitations, despite its compliance with the iterative management process. The Court said that the obligation to not cause or contribute to a violation of receiving water limitations is separate and distinct from the obligation to participate in the iterative management process. Thus, a municipality is in violation of the permit if its discharges cause or contribute to an exceedance of a water quality standard, even while improving its management practices and control measures. This is a fundamental change in interpretation of policy. The Court’s decision also contrasts sharply with the Board’s own understanding as expressed in a 2002 letter from then-Chair Diamond answering questions about the 2001 MS4 Permit in which she articulated the collective understanding that a violation of the permit would occur only when a municipality fails to engage in good faith effort to implement the iterative process to correct the harm.

An MS4 permittee should not automatically be in violation of the permit if there is an exceedance; the exceedance may not have even been caused from an MS4 discharge. The permit must acknowledge that MS4 discharges are not the only source of pollutants in the water and regulate accordingly. If monitoring demonstrates that a particular compliance strategy is not working through no fault of the discharger, then the discharger must have time to identify and implement a new strategy before being held liable for water quality alterations that may be beyond its control.

To address this problem, the City recommends that the proposed CASQA language submitted by the LA Permit Group be used in lieu of the current language.

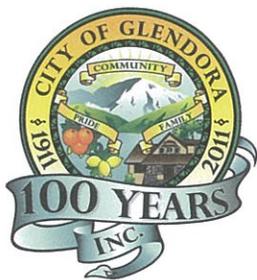

5. The final TMDL Waste Load Allocations (WLAs) do not allow compliance to be demonstrated through implementation of BMPS that provide reasonable assurances that WLAs are met. Implementing the City's storm water control measures will meet interim guidelines, which are often based on the number and thoroughness of implementation measures. But final TMDL limits require compliance with strict numerical water quality standards (effluent limits) either at the end of the pipe or in receiving waters when final compliance is due. For many reasons, these will be difficult to meet. Also, the permit proposes that if the final compliance period has already passed when the permit is adopted, that the City must submit a Time Schedule Order (TSO) setting out a compliance plan. Similar to the iterative process described above, submittal of a TSO and implementing a compliance plan does not shield the City from citizen suits, and may increase the risk of legal liability *while the City is implementing its compliance schedule*. This is a problem that needs to be addressed.
6. Lastly, while we appreciate the access and opportunity that Board staff provided to the permittees during the time that this draft permit was under development, and the opportunity to provide input, significant issues remain unresolved and many more have become evident now that this draft permit has been released in its entirety. A forty-five day review period for a 500-page permit is hardly adequate and has not provided us enough time to fully review and digest all the interrelated parts of this permit, to consider the implications and costs of the proposal, and provide complete and comprehensive comments.

We appreciate the opportunity to provide these comments and urge the Regional Board to review the comments provided by all of the permittees, issue a revised draft permit, and accept additional comments on the revised draft before adopting a final permit.

Sincerely,

Stephanie Katsouleas  
Director of Public Works

Subject: Tentative MS4 Order Comments

---

Dear Mr. Ridgeway:

The City of Glendora is pleased to submit the attached comments for your consideration in re: Order No. R4-2012-XXXX NPDES Permit No. CAS004001.

Please note that the City also supports comments submitted to you from the Los Angeles Stormwater Permit (LASP) group. The City's comments are intended to be complimentary and more specific to the issues raised in the LASP group letter. The City's comment letter also contains additional issues not addressed in the LASP group letter.

Thank you for the opportunity to submit comments on this very important matter. Should you have any questions, please feel free to call me.

Sincerely,

A handwritten signature in blue ink that reads 'J.L. Burke'.

Jerry L. Burke, P.E.  
Assistant Director of Public Works/City Engineer

Attachment: Comments

Cc: David A. Davies, Director of Public Works  
File

**1. Numeric Water Quality Based Effluent Limitations (WQBELs) applied to dry and wet weather Total Maximum Daily Load (TMDLs) waste load allocations (WLAs) and to stormwater and non-stormwater municipal action levels (MALs) are not authorized under federal stormwater regulations and are not in keeping with State Water Resources Control Board (State Board) water quality orders (WQOs).**

The tentative order specifies that: *Each Permittee shall comply with applicable WQBELs as set forth in Part VI.E of this Order, pursuant to applicable compliance schedules.* The tentative order specifies two categories of WQBELs, one for USEPA adopted TMDLs and one for Regional Board/State adopted TMDLs. Regarding USEPA adopted TMDLs, it appears that BMP-WQBELs may be used to meet TMDL WLAs in the receiving water. For Regional Board/State-adopted TMDLs, the tentative order specifies a different compliance method: meeting a “numeric” WQBEL which is derived directly from the TMDL waste load allocation. For example, the wet weather numeric WQBEL for dissolved copper for the Los Angeles River is 17 ug/l.

- a. Issue: *Regional Board staff is premature in requiring any kind of WQBEL because no exceedance of any TMDL WLA at the outfall has occurred.* This is because outfall monitoring is not a requirement of the current MS4 permit or previous MS4 permits.

The Regional Board’s setting of WQBELs – any WQBEL -- to translate the TMDL WLA for compliance at the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.*”

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit’s fact sheet. According to USEPA’s NPDES Permit Writers’ Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and*

*explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.*<sup>1</sup>

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis -- a consequence of the fact that no outfall monitoring has been required of the Regional Board either in the current or previous MS4 permits for Los Angeles County. Outfall monitoring is a mandatory requirement under federal regulations at CFR 40 §122.22, §122.2 and §122.26. CFR 40 §122.22(C)(3) requires effluent and ambient monitoring:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

“Effluent monitoring,” according to Clean Water Act §502, is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2, defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

Conclusion: Because Regional Board staff has not required outfall monitoring, it could have not have detected an excursion above a water quality standard (includes TMDL WLAs). Therefore, it could not have conducted a reasonable potential analysis and, as further consequence, cannot require compliance with a WQBEL (numeric or BMP-based) or with any TMDL or MAL until those burdens have been met.

Recommended Correction: Eliminate all reference to comply with WQBELs until outfall monitoring and a reasonable potential analysis have been performed.

---

<sup>1</sup>United States Environmental Protection Agency, *NPDES Permit Writers' Manual*, September, 2010, page 6-30.

- b. Issue: Even if Regional Board staff conducted outfall monitoring and detected an excursion above a TMDL WLA and performed the requisite reasonable potential analysis, it cannot require a numeric WQBEL strictly derived from the TMDL WLA.

USEPA's 2010 guidance memorandum mentions that numeric WQBELs are permissible only if feasible.<sup>2</sup> This conclusion was reinforced by a memorandum from Mr. Kevin Weiss, Water Permits Division, USEPA (Washington D.C.). He explains:

*Some stakeholders are concerned that the 2010 memorandum can be read as advising NPDES permit authorities to impose end-of-pipe limitations on each individual outfall in a municipal separate storm sewer system. In general, EPA does not anticipate that end-of-pipe effluent limitations on each municipal separate storm sewer system outfall will be used frequently. Rather, the memorandum expressly describes "numeric" limitations in broad terms, including "numeric parameters acting as surrogates for pollutants such as stormwater flow volume or percentage or amount of impervious cover." In the context of the 2010 memorandum, the term "numeric effluent limitation" should be viewed as a significantly broader term than just end-of-pipe limitations, and could include limitations expressed as pollutant reduction levels for parameters that are applied system-wide rather than to individual discharge locations, expressed as requirements to meet performance standards for surrogate parameters or for specific pollutant parameters, or could be expressed as in-stream targets for specific pollutant parameters. Under this approach, NPDES authorities have significant flexibility to establish numeric effluent limitations in stormwater permits.<sup>3</sup>*

Reading the 2010 USEPA memorandum, together with Mr. Weiss's memorandum, creates the inescapable conclusion that (1) numeric WQBELs are permissible if "feasible" and (2) numeric WQBELs cannot be construed to only mean strict effluent limitations at the end-of-pipe (outfall) but more realistically must include surrogate parameters and other variants as well. Regional Board staff failed to examine alternative numeric WQBELs, along with BMP WQBELs, as a consequence of not conducting the appropriate analysis.

In any case, the feasibility of numeric WQBELs, whether strictly derived from TMDL WLAs or of the surrogate parameter type, the State Water Resources Control Board has determined that numeric effluent limitations are not feasible. In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require "strict compliance" with water quality standards through numeric effluent*

---

<sup>2</sup>Memorandum from James A. Hanlon, Director, Office of Waste Management, Revisions to the November 22, 2002 Memorandum *Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, November 12, 2010, page

<sup>3</sup>Memorandum from Kevin Weiss, Water Permits Division, USEPA (Washington D.C.), March 17, 2011.

*limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

The State Board’s decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Conclusion: The Regional Board does not have the legal authority to require numeric WQBELs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

- c. Issue: There cannot be a WQBEL to attain a dry weather TMDL WLA nor a WQBEL that addresses a non-stormwater municipal action level (MAL).

The foundation for this argument lies in the federal limitation of non-stormwater discharges to the MS4 – not from or through it as the tentative order concludes. Federal stormwater regulations only prohibit discharges to the MS4 and limits outfall monitoring to stormwater discharges. This is explained in greater detail under 4. *Non-stormwater Discharge Prohibitions.*

Conclusion: Regional Board does not have the legal authority to compel compliance with dry weather WQBELs or non-stormwater MALs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

2. **The tentative order has altered Receiving Water Limitation (RWL) language causing it to be overbroad and inconsistent with RWL in the current MS4 permit, the Ventura MS4 permit, State Board WQO 99-05, the draft Caltrans MS4 permit, and RWL language recommended by CASQA.**

- a. Issue: The proposed RWL language changes the “exceedance” determinant from water quality standards and objectives to receiving water limitations, thereby increasing the stringency of the requirement. The tentative order RWL version reads: *Discharges from the MS4 that cause or contribute to the violation of **receiving water limitations** are prohibited.*

Compare this with what is in the current MS4 permits for Los Angeles and Ventura Counties:

*Discharges from the MS4 that cause or contribute to a violation of **water quality standards** are prohibited.*

Whereas standard RWL language limits water quality standards to what is in the basin plan, and includes water quality objectives (relates to waters of the State), the tentative order uses revised language that replaces water quality standards with the following receiving water limitation criteria:

*Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38.*

It is unclear why Regional Board staff has removed water quality standards, which is a USEPA and State Board requirement, and replaced them with the more global receiving water limitation language that include additional compliance criteria (e.g., “or federal regulations including but not limited to 40 CFR § 131.38”). Other “federal regulations” could include CERCLA (Comprehensive Environmental Remediation and Compensation Liability Act).

Enlarging the scope of the RWL from water quality standards to a universe of other regulatory requirements exceeds RWL limitation language established in State Board WQO 99-05, a precedential decision. The order bases compliance on discharge prohibitions and receiving water limitations on the *timely implementation of control measures and other action in the discharges in accordance with the SWMP (stormwater management plan) and other requirements of the permit’s limitations*. It goes on to say that if exceedances of water quality standards or water quality objectives, collectively referred to as water quality standards

continues, the SWMP shall undergo an iterative process to address the exceedances. It should be noted that this language was mandated by USEPA.

It should be noted that the draft Caltrans MS4 permit is scheduled for adoption in September, as well as CASQA, proposes RWL language that is in keeping with WQO 99-05.

Conclusion: Regional Board does not have the legal authority to re-define RWL language to the extent it is proposing.

Recommended Correction: Replace RWL contained in the tentative order with the CASQA model or with language contained in the draft Caltrans MS4 permit.

- b. Issue: By eliminating water quality standards, the tentative order has created a separate compliance standard for TMDLs and for non-TMDLs. Standard RWL language in other MS4 permits designates the SWMP<sup>4</sup> as the exclusive determinant for achieving water quality standards in the receiving water. Since TMDLs are enhanced water quality standards, the SWMP (or in this case the SQMP) should enable compliance with TMDLs. Instead, the tentative order specifies compliance through implementation plans – including plans that were discussed in several State/Regional Board adopted TMDLs (e.g., the Los Angeles River Metals TMDL). The absence of water quality standards also creates a separate compliance standard for non-TMDLs. According to Regional Board staff, minimum control measures (MCMs) which make up the SQMP, are intended to meet non-TMDLs pollutants. Unclear is what defines non-TMDL pollutant. If there are no water quality standards referenced in the RWL then what are the non-TMDL pollutants that the MCMs are supported to address?

There is no authority under federal stormwater regulations to comply with any criterion other than water quality standards. The RWL language called-out in WQO 99-05, which was in response to a USEPA directive, makes it clear that water quality standards represent the only compliance criteria, not an expanded definition of receiving water limitations that exclude such criteria.

MS4 permits throughout the State include TMDL WLAs. None of them, however, has created a compliance mechanism that excludes water quality standards as a means of attaining them. Further, the State Board has, through the draft Caltrans MS4 permit and the draft Phase II MS4 permit, articulated its policy on compliance with water quality standards:

---

<sup>4</sup>USEPA and federal stormwater regulations use stormwater management program whereas the Los Angeles County MS4 permit uses stormwater quality management plan (SQMP). In effect they are the same. They consist of 6 core programs that must be implemented through MS4 permit.

they are to be met through the implementation of stormwater management programs. Equally noteworthy is that State Board has not created a dual standard for dealing with TMDLs and non-TMDLs. This is an obvious consequence of its adherence to WQO 99-05.

With regard to implementation plans contained in TMDLs, the Regional Board has no legal authority to include them into the MS4 permit. This issue discussed in greater detail later in these comments.

Conclusion: The tentative order must be revised to restore water quality standards in RWL language and, by extension, enable compliance with TMDLs and other water quality standards through the SQMP/MCMs.

Recommended Correction: Revise the tentative order to eliminate any reference to complying with anything else except water quality standards through the SQMP; and, therewith, eliminate any reference to complying with implementation plans contained in State/Regional Board TMDLs.

**3. The tentative order does not include the iterative process, a mechanism that is integral to RWL language which serves to achieve compliance with water quality standards.**

- a. Issue: The absence of the iterative process disables a safeguard to protect permittees against unjustifiably strict compliance with water quality standards – or in this case the expanded definition of receiving water limitations -- that is a requisite feature in all MS4 permits issued in California. The tentative order circumvents the iterative process by creating an alternative referred to as the adaptive/management process which is only available to those permittees that opt for a watershed management program.

Despite the fact RWL language in MS4 permits since the 90's have provided a description of an iterative process (the BMP adjustment mechanism), the term "iterative process" has only recently been specifically mentioned in them. The absence of this term resulted in the 9<sup>th</sup> Circuit Court Appeal's conclusion in *NRDC v. Los Angeles County Flood Control District* that there is no "textual support" in the current MS4 permit for the existence of an iterative process. This resulted in the court's conclusion that the LACFCD had exceeded water quality standards in the hardened portions of the Los Angeles and San Gabriel Rivers. More recent MS4 permit's issued in the State contain clear references to the iterative process.

Notwithstanding the absence of water quality standards in the tentative order, the iterative process must be included as required by Water Quality Orders 2001-15 and 2009-0008, wherein the State Board made it clear that: *we will*

generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.

Moreover, both the draft Caltrans MS4 permit and the draft Phase II MS4 permit contain references to the iterative process. The draft Caltrans MS4 permit refers to the iterative process in two places: finding 20, Receiving Water Limitations and in the Monitoring Results Report. Finding 20 states:

*The effect of the Department’s storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs).<sup>5</sup>*

Under the Monitoring Results Report section, the draft Caltrans MS4 permit reiterates the iterative process within the context of the following: *The MRR shall include a summary of sites requiring corrective actions needed to achieve compliance with this Order, and a review of any iterative procedures (where applicable) at sites needing corrective actions.*<sup>6</sup>

The draft Phase II MS4 references the iterative process in two places, in finding 35 and under its definition of MEP. Finding 35 states:

*This Order modifies the existing General Permit, Order 2003-0005-DWQ by establishing the storm water management program requirements in the permit and defining the minimum acceptable elements of the municipal storm water management program. Permit requirements are known at the time of permit issuance and not left to be determined later through iterative review and approval of Storm Water Management Plans (SWMPs).*

The draft Phase II MS4 permit also acknowledges the iterative process through the definition of maximum extent practicable (which is also included in the draft Caltrans MS4 permit), to the following extent:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP*

---

<sup>5</sup>See draft Caltrans MS4 permit (Tentative Order No. 2012-XX-DWQ NPDES No. CAS000003), page 10.

<sup>6</sup>Ibid., page 35.

*development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the “iterative approach.”*<sup>7</sup>

It should be clearly understood that the State Board is articulating clear policy on the iterative process through these two draft MS4 permits and that they must be followed by Regional Boards as subordinate jurisdictions.

Conclusion: The Regional Board has no authority to alter the iterative process/procedure by making a revised and diluted version of it available only to those MS4 permittees that wish to opt for watershed management program participation. Quite the contrary, the Regional Board is legally compelled to make the iterative process, as described herein, an undeniable requirement in the tentative order.

Recommended Correction: Regional Board staff should incorporate the iterative process into the tentative order in the findings section and in the RWL section. It should also be referenced again under a revised MEP definition.

4. **The tentative order incorrectly articulates the non-stormwater discharge prohibition to the MS4 to include discharges from and through it.**
  - a. Issue: The tentative order mentions prohibiting non-stormwater discharges not only to the MS4 but from and through it as well. Federal regulations did not authorize the non-stormwater discharge prohibition to go beyond “to” the MS4. This is a serious issue because extending the prohibition from or through the MS4 would subject non-stormwater discharges (including dry weather TMDL WLAs and non-stormwater municipal action levels) to pollutant limitations at the outfall.

The tentative order attempts to justify interpreting federal stormwater regulations to mean that non-stormwater discharges are prohibited not only to the MS4 but from it and through it as well by: (1) incorrectly stating the Clean Water Act §402(p)(B)(ii) of the Clean Water Act requires permittees effectively prohibit non-storm water discharges into

---

<sup>7</sup> See State Water Resources Control Board Water Quality Order No. XXXX-XXXX-DWQ, NPDES General Permit No. CASXXXXXX, page

watercourses (means receiving waters) as well as to the MS4; and (2) a misreading of Federal Register Volume 55, No. 222, 47990 (federal register) which contains an error with regard to the non-stormwater discharge prohibition.

§402(p)(B)(ii) does not (as the tentative order's fact sheet asserts) include watercourses, which according to Regional Board staff, means waters of the State and waters of the United States, both of which lie outside of the MS4. The original text of §402(p)(B)(ii) actually reads as follows: *Permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."*<sup>8</sup> There is no mention of watercourses.

The tentative order's fact sheet also relies on the afore-cited federal register which states: *402(p)(B)(3) requires that permits for discharges from municipal storm sewers require the municipality to "effectively prohibit" non-storm water discharges from the municipal storm sewer.* The fact sheet is correct about this. The problem is that the federal register is wrong here. It confuses 402(p)(B)(3), which addresses stormwater (not non-stormwater) discharges from the MS4, with 402(p)(B)(2), which once again prohibits non-stormwater discharges to the MS4. It should be noted that in the same paragraph above the defective federal register language, it says that ... *permits are to effectively prohibit non-storm water discharges to the municipal separate storm sewer system.*

In any case, this issue has been resolved since the federal register was published in November of 1990. All MS4 permits in the United States issued by USEPA prohibit non-stormwater discharges only to the MS4. USEPA guidance, such as the *Illicit Discharge Detection and Elimination: A Guidance Manual* bases investigation and monitoring on non-stormwater discharges being prohibited to the MS4. And, with the exception of Los Angeles Regional Board MS4 permits, MS4 permits issued by other Regional Boards also limit the MS4 discharge prohibition to the MS4. Beyond this, the draft Caltrans MS4 permit and draft Phase II MS4 permits also limit the non-stormwater prohibition to the MS4.

Conclusion: The Regional Board does not have the legal authority to extend the non-stormwater discharge prohibition from or through the MS4.

Recommended Correction: Revise the non-stormwater discharge prohibition to be limited to the MS4 only and delete all requirements that are based on the prohibition from or through the MS4. This includes the non-stormwater prohibition that is linked to CERCLA.

---

<sup>8</sup>Municipal storm sewers is a truncated version of municipal separate stormwater system (MS4).

**5. The tentative order proposes to incorporate TMDL implementation plans, schedules, and monitoring requirements without legal authority.**

- a. Issue: Placing Regional Board/State Board TMDLs into the MS4 would result in serious consequences for permittees. For one thing, permittees subject to TMDLs that contain an implementation schedule with compliance dates for interim waste load allocations that have not been met, based on Los Angeles County mass emissions station or other data (e.g., from the Coordinated Monitoring Plan for the Los Angeles River Metals TMDL), will be in automatic non-compliance once the MS4 permit takes effect.

The tentative order proposes a safeguard in this event: coverage under a time schedule order (TSO). Essentially, a TSO is an enforcement action authorized under Porter-Cologne, the State's water code. The problem is that the Regional Board, at its discretion, could issue a clean-up and abatement order that could link permittees in the Dominguez Channel, Los Angeles River, and San Gabriel River Watersheds to the remediation of the Los Angeles and Long Beach Harbors which are currently CERCLA sites (caused by DDT, pesticides, metals, which are considered toxics, and other pollutants). Furthermore, the TSO, which is a State enforcement action, will not help with respect to a federal violation because of preemption. An exceedance will expose subject permittees to third party litigation under the Clean Water Act. NRDC would be able to take the matter straight to federal court.

In any case, the Regional Board has no legal authority under the Clean Water Act to incorporate implementation plans, schedules, or monitoring requirements into the MS4 permit. CWA §402(p)(B)(iii) simply states that controls are required *to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.* The application of this provision is limited to: (1) the implementation of BMPs specified in a stormwater management plan appropriated through the six core programs; and (2) outfall monitoring. Monitoring, as mentioned earlier, is limited to outfall and ambient monitoring. Ambient monitoring, which is receiving water-based, has been assumed by the Regional Board and is funded through a stormwater ambient monitoring program (SWAMP) surcharge on the annual MS4 permit fee. Federal stormwater regulations mention nothing about TMDL implementation plans and schedules in an MS4 permit.

In fact, the Regional Board/State Board TMDL implementation plans, implementation schedules, and monitoring should be voided and prevented

from being placed into the MS4 permit because (1) they set compliance determinant in the receiving water instead of the outfall; and (2) although the TMDL monitoring program requirements specify ambient monitoring that is to be performed by MS4 permittees, including Caltrans, the Regional Board has approved plans that treat wet weather monitoring as ambient monitoring, even though they are mutually exclusive. The Clean Water Act definition of ambient monitoring is the:

*Natural concentration of water quality constituents prior to mixing of either point or nonpoint source load of contaminants. Reference ambient concentration is used to indicate the concentration of a chemical that will not cause adverse impact to human health.*

The natural concentration of water quality constituents can only mean the state of a receiving water when it is not raining. This is further supported by the phrase “prior to mixing of either point or non-point source load of contaminants,” which can only mean stormwater discharges from an outfall. In other words, stormwater discharges from an outfall cannot be mixed with a receiving water during a storm event because the ambient condition would be lost. Outfall monitoring of stormwater discharges is evaluated against the ambient condition of pollutant constituents in the receiving water for the ostensible purpose of determining its pollutant contribution.

Conclusion: The tentative order lacks the legal authority to include TMDL implementation plans, schedules, or monitoring plans adopted as basin plan amendments. No permittee, subject to any TMDL that requires an implementation plan, schedule, or monitoring plan can be compelled to comply with any of them. Further, even if it were legally permissible for these TMDL elements to be incorporated into the MS4 permit, no permittee could be placed into a state of non-compliance because the legitimate compliance point is in the outfall. Because no outfall monitoring has occurred, no violation could arise and, therefore, there would be no need for a TSO.

Recommended Correction: Eliminate requiring TMDL implementation plans, schedules, and monitoring to be incorporated into the tentative order.

**6. The tentative order contains references to the federal Comprehensive Environmental Remediation Compensation and Liability Act (CERCLA) that would make them additional regulatory requirements.**

- a. Issue: The non-stormwater discharge prohibition under the tentative order states:

*Non-storm water discharges through an MS4 are prohibited unless authorized under a separate NPDES permit; authorized by USEPA*

*pursuant to Sections 104(a) or 104(b) of the federal comprehensive Environmental Response, Compensation and Liability Act (CERCLA).*

At first blush, the CERCLA provision appears innocuous. But what if non-stormwater discharge is not authorized under CERCLA? Conceivably the MS4 permittee could be held responsible for those discharges. And because CERCLA is referenced in the MS4 permit, it could become a potential third party litigation issue. The inclusion of the CERCLA provision is even more suspect when considering that no other MS4 in the State contains such a reference. Beyond this, how would a permittee know if a discharge is one covered under CERCLA?

Conclusion: CERCLA is an unnecessary reference in the MS4 permit and has the potential to expose permittees to third party litigation. Further, the non-stormwater discharge prohibition only “to” the MS4 makes this issue academic. A permittee’s only responsibility is to prohibit impermissible non-stormwater to the MS4, not through or from it; or to require the discharger to obtain permit coverage.

7. **The tentative order, under the effluent limitations section, contains technical effluent based limitations (TBELs) which typically are not included in MS4 permits and, in this particular case, does not appear to be purposeful.**
  - a. Issue: Part IV.A.1 of the tentative order states that TBELs shall reduce pollutants in storm water discharges from the MS4 to the maximum extent practicable (MEP).

It is not clear as to the reason for including TBELs into the tentative order because they are generally not required of Phase MS4 permits. TBELs are referenced in the tentative order, but are not found under section 402(p), which addresses storm water, nor anywhere else in federal regulations. It is a term used to collectively refer to best available technologies, but again not in 402(p).

TBEL is a term USEPA uses to denote the following: (1) Best Practical Control Technology Currently Available (BPT); (2) Best Conventional Pollutant Control Technology (BCT); and (3) Best Available Technology Economically Achievable (BAT). Since these provisions were established prior to stormwater provisions of the CWA §402(p), they were applied to industrial waste-water discharges (including construction activity which is an industrial category sub-set). A clarifier connected to the sewer system is a type of TBEL. POTWs are subject to TBELs example primary and secondary treatment.

According USEPA guidance:

*WQBELs are designed to protect water quality by ensuring that water quality standards are met in the receiving water. On the basis of the requirements of Title 40 of the Code of Federal Regulations (CFR) 125.3(a), additional or more stringent effluent limitations and conditions, such as WQBELs, are imposed when TBELs are not sufficient to protect water quality.*<sup>9</sup>

Since the MS4 permit proposes WQBELs (adapted to meet water quality standards at the outfall), it would appear that TBELs are irrelevant. In essence, the proposed WQBELs is an admission from Regional Board staff that TBELs are not sufficient to protect water quality.

Please note that the draft Caltrans and Phase II MS4 permits do not reference TBELs.

Conclusion: Clarification is needed to determine the purpose of referencing TBELs in the tentative order.

Recommended Correction: Either provide clarification and a justification requiring TBELs given that the tentative order requires WQBELs, a more stringent requirement. If clarification or justification cannot be provided, the TBEL provision should be removed.

## **8. Minimum Control Measures (MCMs)**

a. Issue: Generally, MCMs should not be detailed in the tentative order. Instead, specific BMPs and other information should be placed in the Stormwater Quality Management Plan (SQMP), which is the case under the current MS4 permit. Federal guidance specifies that the core programs are to be implemented through the SQMP as a means of meeting water quality standards. More importantly, placing the specifics in the SQMP makes it easier to revise. If specific BMPs remain in the tentative order, and they are in error or need to be revised (e.g., to set BMP-WQBELs), a re-opener would be required. For example, in Part I. *Facility Information, Table 2.*, the permittee contact information is out of date. It would be better to place this and other detailed information in the SQMP where it can be updated regularly without having to re-open the permit.

b. Issue: SUSMP

The tentative order replaces the Development Planning/SUSMP with Planning and Land Development Program. However, the SUSMP is mandated through a precedent-setting WQO issued by the State Board. Nothing in the order's fact sheet provides an explanation of why the SUSMP needs to be replaced. So doing would incur an unnecessary cost

---

<sup>9</sup> *NPDES Permit Writers' Manual*, September, 2010, page 5-40.

to revise the SQMP and SUSMP guidance materials. This is not to suggest that the Regional Board may not, in the final analysis, have the legal authority to change the SUSMP to its MCM equivalent. Nevertheless, it would be helpful from an administrative convenience standpoint to explain the need for the change in the fact sheet. It could be argued that the low impact development (LID) techniques have been successfully implemented through the SUSMP program for over five years.

- c. Issue: Retrofitting existing developments through the Land Use Development Program is not authorized under federal stormwater regulations. CFR 40 122.26 only authorizes retrofitting with respect to flood control devices which is to be explained in the MS4 permit as the following indicates:

*A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible.*

- d. Issue: The MCMs in the tentative order require off-site infiltration for groundwater recharge purposes. The tentative order is a stormwater permit, not a groundwater permit. As mentioned, 402(p)(3)(iii) of the Clean Water Act:

*Permits ... shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.*

The use of other infiltration controls that do not promote groundwater recharge have already demonstrated effectiveness in significantly reducing pollutants to the maximum extent practicable (MEP). Requiring infiltration anywhere for the purpose of recharging groundwater exceeds the scope of the MS4 since infiltrating to such an extent would add costs to the developer or permittee without significantly improving pollutant removal performance. Further, this requirement is unwarranted and premature because of the absence of outfall monitoring data that would demonstrate the need for groundwater-recharge oriented infiltration controls to address water quality standards and TMDLs vis-à-vis their intended purpose of protecting beneficial uses in a receiving water.

Conclusion: Requiring infiltration controls to facilitate groundwater recharge is not authorized under federal stormwater regulations. Further, many permittees are situated upstream of spreading grounds and other macro-infiltration basins that would obviate the need for this requirement.

Recommended Correction: Eliminate this requirement from the order.

**9. The Maximum Extent Practicable (MEP) definition needs to be revised to reflect is updated definition found in the draft Phase II MS4 permit and in the draft Caltrans MS4 permit.**

- a. Issue: The order's MEP reference is a carry-over from the 2001 MS4 permit. A great deal has happened over the decade to warrant an update. Fortunately, the State Board, through the draft Phase II and Caltrans MS4 permits, has revised the MEP definition to be in keeping with current realities. To that end it has proposed the following definition:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the "iterative approach."<sup>10</sup>*

Conclusion: The order's MEP is out of data and inconsistent with State Board policy.

Recommended Correction: Replace order's MEP definition with the above-mentioned language.

**10. The tentative order inappropriately includes the Middle Santa Ana River Bacteria TMDL.**

- a. Issue: It should be abundantly clear that the Regional Board cannot accept a TMDL adopted by another jurisdiction for implementation through the MS4 permit unless the Board includes into its basin plan as an

---

<sup>10</sup>Op. Cit., page 35.

amendment. This argument has been raised by legal counsel for the City of Claremont.

Conclusion: The Regional Board lacks legal authority to incorporate the Middle Santa Ana River bacteria TMDL into the proposed order.

Recommended Correction: Eliminate the requirement.

**11. Tentative order incorrectly asserts that its provisions do not constitute unfunded mandates under the California Constitution.**

- a. Issue: Contrary to what the order asserts, it contains provisions that exceed federal requirements in several places, thereby creating potential unfunded mandates. They include: (1) requiring wet and dry weather monitoring in the receiving water; (2) requiring numeric WQBELs; (3) requiring compliance with TMDL-related implementation plans, schedules, and monitoring; (4) requiring the non-stormwater discharge prohibition to include through and from the MS4; (5) revising the receiving water limitation language to include overbroad compliance requirements; (6) requiring groundwater recharge; and (7) monitoring for non-TMDL constituents at completed development project sites.

Conclusion: The order patently proposes requirements that create unfunded mandates.

Recommended Correction: Delete all of the aforementioned requirements that exceed federal regulations.

**END COMMENTS**

**Comments Regarding Los Angeles MS4 Tentative Order No. R4-2012-XXXX  
NPDES PERMIT NO. CAS004001 (issue date unspecified)  
Attachment E: Monitoring and Reporting Plan**

---

1. Receiving Water Monitoring

The purpose of receiving water monitoring is to:

- a. *Determine whether the receiving water limitations are being achieved,*
- b. *Assess trends in pollutant concentrations over time, or during specified conditions,*
- c. *Determine whether the designated beneficial uses are fully supported as determined by water chemistry, as well as aquatic toxicity and bioassessment monitoring.*

Receiving water monitoring is to be performed at various in-stream stations.

At issue is “a” because it serves to determine compliance with receiving water limitations. The Regional Board has no legal authority to compel compliance with receiving water limitations through in-stream monitoring. Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) clearly indicates:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

According to Clean Water Act §502, effluent monitoring is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2 defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

In short, effluent monitoring in a receiving water because cannot be required because it lies outside the bounds of the outfall.

Regarding monitoring purposes “b” and “c” no argument is raised here provided that it is understood that assessing trends in pollution concentrations would be: (1) limited to ambient water quality monitoring; and (2) permittees shall be not responsible for funding such monitoring. With respect to the latter, the Regional Board’s surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.

*Recommended Corrective Action:* Delete 1(a) and make it clear that 1(b) and (c) relate to ambient monitoring that is not the responsibility of MS4 permittees.

## 2. Stormwater Outfall Based Monitoring

The purpose of stormwater outfall based monitoring – including TMDL monitoring -- is to:

- a. *Determine the quality of a Permittee’s discharge relative to municipal action levels, as described in Attachment G of this Order,*
- b. *Determine whether a Permittee’s discharge is in compliance with applicable wet weather WQBELs derived from TMDL WLAs,*
- c. *Determine whether a Permittee’s discharge causes or contributes to an exceedance of receiving water limitations.*

Insofar as “a” is concerned, outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to replace TMDL WLAs as alternatives to addressing receiving water quality. As noted in the National Research Council Report to USEPA:

*The NSQD (Pitt et al., 2004) allows users to statistically establish action levels based on regional or national event mean concentrations developed for pollutants of concern. The action level would be set to define unacceptable levels of stormwater quality (e.g., two standard deviations from the median statistic, for simplicity). Municipalities would then routinely monitor runoff quality from major outfalls. **Where an MS4 outfall to surface waters consistently exceeds the action level, municipalities would need to demonstrate that they have been implementing the stormwater program measures to reduce the discharge of pollutants to the maximum extent practicable.** The MS4 permittees can demonstrate the rigor of their efforts by documenting the level of implementation through*

*measures of program effectiveness, failure of which will lead to an inference of noncompliance and potential enforcement by the permitting authority*

Instead of following the above Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs if necessary.

Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.

*Recommended Correction:* Either require substitution of TMDLs with MALs or eliminate MALs entirely.

As for stormwater outfall monitoring purpose “b”, such monitoring cannot be used to determine compliance with **wet weather WQBELs based on TMDL WLAs** for the following reasons:

1. The wet-weather WQBEL is based on a TMDL WLA in the receiving water that is non-ambient. As mentioned, federal regulations only require ambient monitoring in the receiving water, which by definition can never be deemed the same as wet weather monitoring. They are mutually exclusive. Regional Board staff has also incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a “numeric effluent limitation.” Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board’s clear opposition to numeric effluent limitations.

In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require “strict compliance” with water quality standards through numeric effluent limitations, and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

2. The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Regarding purpose "b" it should also be noted that the Regional Board's setting of WQBELs to translate the TMDL WLA in the receiving water to the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.*"

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit's fact sheet. According to USEPA's NPDES Permit Writers' Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>1</sup>*

---

<sup>1</sup>United States Environmental Protection Agency, NPDES Permit Writers' Manual, September, 2010, page 6-30.

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis.

Complicating the performance of a reasonable potential analysis is the absence of (1) outfall monitoring data; and (2) ambient water quality standards. Though federal regulations require monitoring at the outfall, the Regional Board has not required it up until now. Even if outfall monitoring data were available to determine whether pollutants concentrations in the discharge exceeded the water quality standard is not possible. This is because, as mentioned earlier, TMDL WLAs are not expressed as ambient standards. A TMDL is an enhanced water quality standard. As noted in the National Research Council's *Assessing the TMDL Approach to Water Quality Management*, a report commissioned by the United States Congress in 2001:

*... EPA is obligated to implement the Total Maximum Daily Load (TMDL) program, the objective of which is attainment of ambient water quality standards through the control of both point and nonpoint sources of pollution.*

*Recommended Correction:* Eliminate this requirement.

Regarding purpose "c", the determinant for a water quality standard exceedance is in the discharge from the outfall – not in the receiving water. The use of numeric WQBELs -- though incorrectly defined and established in this instance -- represents the compliance standard in discharges from the outfall. Adding a second compliance determinant in the receiving water is unnecessary and is not authorized under federal stormwater regulations because the receiving water lies outside the scope of the MS4.

*Recommended Corrective Action:* Eliminate this requirement.

### **3. Non-storm water outfall based monitoring**

The purposes of this type of monitoring are as follows:

- a. Determine whether a Permittee's discharge is in compliance with applicable dry weather WQBELs derived from TMDL WLAs.*
- b. Determine whether a Permittee's discharge exceeds non-storm water action levels, as described in Attachment G of this Order,*
- c. Determine whether a Permittee's discharge contributes to or causes an exceedance of receiving water limitations,*

- d. *Assist a Permittee in identifying illicit discharges as described in Part VI.D.9 of this Order.*

Regarding “a,” This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.

*Recommended Correction:* Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the ICDDE program.

With regard to “b”, see previous responses regarding MALs and the limitation of non-stormwater discharge prohibit to the MS4.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.

Regarding “c”, as mentioned, non-stormwater discharges cannot be applied to receiving water limitations because they are only prohibited to the MS4, not from or through it.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.

Regarding “d”, this requirement is reasonable and in keeping with federal regulations with the exception that the identification of illicit discharges must adhere to the field screening requirements in CFR 40 §122.26. No non-stormwater discharge monitoring shall occur unless flow is first discovered at the outfall. This would trigger the implementation of additional requirements that the tentative order does not include.

#### **4. New Development/Re-development effectiveness monitoring**

The purpose of this requirement is a dubious and is not authorized under federal stormwater regulations as it relates to monitoring. To begin with, requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4’s pollution contribution relative to exceeding ambient water quality standards. Without the determination of statistically significant exceedances of water quality standards, detected at the

outfall, the imposition of runoff infiltration requirements is arbitrary. Further, there is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.

Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines “effectiveness” -- effective relative to what standard? It is also not clear how such monitoring is to be performed.

*Recommended Correction:* Delete this requirement.

The MRP of the tentative order proposes regional studies “*to further characterize the impact of the MS4 discharges on the beneficial uses of the receiving waters. Regional studies shall include the Southern California Stormwater Monitoring Coalition (SMC) Regional Watershed Monitoring Program (bio-assessment), sediment monitoring for Pyrethroid pesticides, and special studies as specified in approved TMDLs (see Section XIX TMDL Reporting, below).*”

Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board’s SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County’s mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.

## VIA U.S. MAIL AND E-MAIL (PDF)

Mr. Ivar Ridgeway  
California Regional Water Quality Control Board, Los Angeles Region  
320 West 4th Street, Suite 200  
Los Angeles, California 90013  
[LAMS42012@waterboards.ca.gov](mailto:LAMS42012@waterboards.ca.gov)  
[rpurdy@waterboards.ca.gov](mailto:rpurdy@waterboards.ca.gov)  
[iridgeway@waterboards.ca.gov](mailto:iridgeway@waterboards.ca.gov)

Dear Mr. Ridgeway:

The City of Hidden Hills ("City") submits the following comments to the Los Angeles Regional Water Quality Control Board's ("Regional Board") Tentative Order No. R4-2012-xxx, NPDES Permit No. CAS004001) ("Permit"). The LA Permit Group has submitted comments regarding the Permit which the City joins and supports. The City reserves the right to make additional legal comments on the Permit prior to the close of the public hearing to adopt the Permit and at the public hearing itself.

The City's comment letter regarding the Permit is organized into two main parts. Part I contains the City's legal comments. Part II contains the City's technical comments. On behalf of the City of Hidden Hills, we hereby submit the following initial comments on the Permit:

### I. LEGAL COMMENTS

#### 1. The Time Provided to Review the Permit Is Insufficient and Denies Permittees Due Process of Law

The period provided to review and comment on the Permit has been unreasonably short given the breadth of the Permit. Beginning on March 28, 2012, Regional Board staff issued a series of Staff Working Proposals pertaining to key sections of the Permit. Regional Board staff has used their Staff Working Proposal workshops as a justification for the hurried manner in which the Permit was developed. The same justification was used by the Executive Director in denying the LA Permit Group's request for a time extension.

This justification, however, fails for several reasons. First, Regional Board staff gave the permittees only a few weeks to comment on each of the Staff Working Proposals. Furthermore, the Regional Board staff did not respond to any comments, leaving permittees to guess at which requirements would be incorporated into the Permit. Seeing the Permit in its entirety and having the opportunity to understand how each of the sections and programs work together is imperative in order for permittees to fully understand the Permit provisions and to prepare comments.

Second, despite all the working proposals, workshops, and meetings, the permittees are left with a Permit that cannot be complied with from the first day the Permit goes into effect, due to the Receiving Water Limitation (RWL) and the Waste Load Allocations (WLA) requirements that could subject the permittees to third party lawsuits.

We believe the Regional Board wants a review process that is open and transparent. Providing permittees only forty-five (45) days to comment makes this impossible. To develop and provide relevant and meaningful comments, each permittee must first:

- Read a 500 page Permit;
- Study the 500 page Permit to understand how the provisions work together;
- Compare it to the last Permit;
- Evaluate the resource needs to comply with the Permit;
- Determine the fiscal and organizational impacts on City services, which requires coordination with several City departments;
- Conduct technical and legal review of the Permit and prepare comments;
- Present information to and gather feedback from the City Council. Staff needs time to conduct a thorough review of the items listed above, prior to presenting them to the City Council; and
- Prepare written comments.

To ensure a proper review of the Permit, the City hereby requests an extension of 180 working days to include a Revised Tentative Permit to be released with a 45-day comment period. The intent of a Revised Tentative Permit is to ensure the permittees have the opportunity to review any changes made to the existing draft and provide comments prior to the Permit adoption hearing.

The extreme speed with which the Permit is being circulated and reviewed and proposed to be adopted amounts to a denial of the City's due process rights and is contrary to state and federal law. By denying the permittees a meaningful opportunity to review and comment on a Permit that so drastically affects the permittees' rights and finances, the Regional Board has denied the permittees due process rights under state and federal law. *See Spring Valley Water Works v. San Francisco*, 82 Cal. 286 (1890) (reasonable notice and opportunity to be heard are essential elements of "due process of law," whatever the nature of the power exercised.) Furthermore, under the Clean Water Act, a reasonable and meaningful opportunity for stakeholder participation is mandatory. *See, e.g., Arkansas Wildlife Fed'n v. ICI Ams.*, 29 F.3d 376, 381 (8th Cir. 1994) ("the overall regulatory scheme affords significant citizen participation, even if the state law does not contain precisely the same public notice and comment provisions as those found in the federal CWA.") For the reasons stated above, the Permit does not satisfy the Clean Water Act standard and violates the City's due process rights.

## **2. The Permit Should Be Revised to Provide that Implementation of BMPs is Sufficient to Constitute Compliance with the Permit**

Permittees should be able to achieve compliance with the Permit through a best management practice ("BMP") based iterative approach. Regional Board staff has previously indicated that it would not create a permit for which permittees would be out of compliance from the very first day the Permit goes into effect. This necessarily means the Permit cannot require immediate

strict compliance with water quality standards. Yet the Fact Sheet states that a party whose discharge “causes or contributes” to an exceedance of a water quality standard is in violation of the Permit, even if that party is implementing the iterative process in good faith. *See* Fact Sheet at pp. F-35-38. These positions are incompatible and render the iterative approach meaningless.

As written, the Permit requires that all discharges to receiving waters must immediately meet water quality standards to avoid violating the Permit. This presents an impossible standard for permittees to meet, especially given the fact that thirty-three (33) TMDLs have been incorporated into the Permit. This means that numerous water bodies that currently do not meet water quality standards will be governed by the Permit and permittees will be subject to potential liability immediately. Even for TMDLs for which the Regional Board issues time scheduling orders, such orders will not protect a permittee from third-party lawsuits for measured exceedances, based on the Permit’s current language. Even if such lawsuits are unfounded, the legal costs to defend such suits are enormous. For this same reason, final wasteload allocations should not be incorporated into the Permit, especially where we are dealing with TMDLs that have been rushed through due to the *Browner* consent decree with the understanding that they would be refined over time with reopeners as new information becomes available.

A BMP-based approach should be utilized in the Permit, as outlined in EPA’s November 12, 2010 Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on those WLAs.” (“EPA Memorandum”). *See also* 40 C.F.R. § 122.44(k).

To accomplish this purpose, the City supports using the receiving water limitation language proposed by CASQA, which is similar to the language in the Draft Caltrans Permit. Otherwise, cities are potentially vulnerable to third party lawsuits such as those brought against the City of Stockton and the County of Los Angeles by third parties within the last five years.

Furthermore, the EPA Memorandum is clear that an increased reliance on numerics should be coupled with the “disaggregation” of different storm water sources within permits. *See* EPA Memorandum at pp. 3-4. The Permit currently aggregates multiple sources of storm water runoff while additionally imposing numeric standards. This will result in a system whereby the innocent will be punished alongside the guilty for numeric standard exceedances. The Regional Board should not allow this inequitable and legally unjustifiable result to occur.

Another reason for adopting a BMP-based approach is that new and existing conditionally exempt non-stormwater discharges may also contribute to measured exceedances. This inequitable result means the exempt discharges may nonetheless contribute to permittee liability.

### **3. The Permit Improperly Intrudes Upon the City’s Land Use Authority in Violation of the Tenth Amendment of the U.S. Constitution**

To the extent that this Permit relies on federal authority under the Clean Water Act to impose land use regulations and dictate specific methods of compliance, it violates the Tenth Amendment of the U.S. Constitution. Furthermore, to the extent the Permit requires a municipal permittee to modify its city ordinances in a specific manner, it also violates the Tenth Amendment. According to the Tenth Amendment:

“The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.”

Article XI, section 7 of the California Constitution also guarantees municipalities the right to “make and enforce within [their] limits all local police, sanitary and other ordinances and regulations not in conflict with general laws.” *See also City of W. Hollywood v. Beverly Towers*, 52 Cal. 3d 1184, 1195 (1991). Furthermore, the United States Supreme Court has held that the ability to enact land use regulations is delegated to municipalities as part of their inherent police powers to protect the public health, safety, and welfare of its residents. *See Berman v. Parker*, 348 U.S. 26, 32-33 (1954). Because it is a constitutionally conferred power, land use powers cannot be overridden by State or federal statutes.

Even so, both the Clean Water Act and the Porter-Cologne Act provisions regarding NPDES permitting do not indicate that the Legislature intended to preempt local land use authority. *Sherwin Williams Co. v. City of Los Angeles*, 4 Cal. 4th 893 (1993); *California Rifle & Pistol Assn. v. City of West Hollywood*, 66 Cal. App. 4th 1302, 1309 (1998) (Preemption of police power does not exist unless “Legislature has removed the constitutional police power of the City to regulate” in the area); *see* Water Code §§ 13374 and 13377 and 33 U.S.C. § 1342 (b)(1)(B).

If the Permit is adopted, the City believes that this Permit could establish the Regional Board as a “super municipality” responsible for setting zoning policy and requirements throughout Los Angeles County. The prescriptive and one-size-fits-all nature of this policy will ensure that any resident or business challenging the conditions set forth in this Permit would not only sue the municipality charged with implementing these requirements, but would also have to sue the Regional Board itself to obtain the requested relief. The City does not believe this is the intent of the Regional Board. Rather than adopting programs that dictate the precise method of compliance, the Regional Board should collaborate with the City and other permittees to develop a range of model programs that each municipality could then modify and adopt according to its own individual circumstances.

#### **4. The Permit Constitutes an Unconstitutional Unfunded Mandate**

The Permit contains mandates imposed at the Regional Board’s discretion that are unfunded and go beyond the specific requirements of either the Clean Water Act or the EPA’s regulations implementing the Clean Water Act, and thus exceed the “Maximum Extent Practicable” (“MEP”) standard. Accordingly, these aspects of the Permit constitute non-federal state mandates. *See City of Sacramento v. State of California*, 50 Cal. 3d 51, 75-76 (1990). Indeed, the Court of Appeals has previously held that NPDES permit requirements imposed by the Regional Board under the Clean Water and Porter-Cologne Acts can constitute state mandates subject to claims for subvention. *County of Los Angeles v. Commission on State Mandates*, 150 Cal. App. 4th 898, 914-16 (2007).

The Permit goes beyond federal law, as the Permit is at least twice as long, and in some cases, three times as long as other MS4 permits developed by other Regional Boards in the State of California, such as the Lahontan Regional Board and the Central Valley Regional Board, not to mention permits developed by EPA. This means that either some Regional Boards are failing to impose federally mandated requirements pursuant to the Clean Water Act, or the more likely explanation is that the Regional Board is imposing requirements that go beyond federal law.

### **A. The Permit's Minimum Control Measure Program is an Unfunded State Mandate**

The Permit's Minimum Control Measure program ("MCM Program") qualifies as a new program or a program requiring a higher level of service for which state funds must be provided. The particular elements of the MCM Program that constitute unfunded mandates are:

- The requirements to control, inspect, and regulate non-municipal permittees and potential permittees (Permit at pp. 38-40);
- The public information and participation program (Permit at pp. 58-60);
- The industrial/commercial facilities program (Permit at p. 63);
- The public agency activities program (Permit at pp. 56-63); and
- The illicit connection and illicit discharge elimination program (Permit at pp. 106-109).

The MCM Program requirement that the permittees inspect and regulate other, non-municipal NPDES permittees is especially problematic and clearly constitutes an unfunded mandate. (*See, e.g.,* Permit at pp. 38-40.) These are unfunded requirements which entail significant costs for staffing, training, attorney fees, and other resources. Notably, the requirement to perform inspections of sites already subject to the General Construction Permit is clearly excessive. Permittees would be required to perform pre-construction inspections, monthly inspections during active construction, and post-construction inspections. The requirements of this Permit exceed past permits, meaning that the Regional Board is requiring a higher level of service than in prior permits.

Furthermore, there are no adequate alternative sources of funding for inspections. User fees will not fully fund the program required by the Permit. Cal. Gov't Code, § 17556(d). NPDES permittees already pay the Regional Water Quality Control Boards fees that cover such inspections in part. It is inequitable to both cities and individual permittees for the Regional Board to charge these fees and then require cities to conduct and pay for inspections without providing funding.

### **B. The Receiving Water Body Requirements Render the Permit an Unfunded Mandate**

If strict compliance with state water quality standards in receiving water bodies is required—including state water quality standard-based wasteload allocations—in the MS4 itself or at outfall points and in receiving water bodies, the entire Permit will constitute an unfunded mandate because such a requirement clearly exceeds both the Federal standard and the requirements of prior permits, despite the fact no funding will be provided. *See Building Industry Assn. of San Diego County v. State Water Resources Control Bd.*, 124 Cal. App. 4th 866, 873, 884-85 (2004) (though the State and Regional Boards may require compliance with California state water quality standards pursuant to the Clean Water Act and state law, these requirements exceed the Federal Maximum Extent Practicable standard.)

### **C. The City Does Not Necessarily Have the Requisite Authority to Levy Fees to Pay for Compliance With the Order**

The ability to fund the Permit through bond measures or tax increases does not render the Permit's program ineligible for a subvention claim because such funding mechanisms are contingent upon voter approval, in some cases requiring supermajority votes. *Howard Jarvis*

*Taxpayers Assoc. v. City of Salinas*, 98 Cal. App. 4th 1351 (2002). The money available from other sources is both too speculative and limited to cover all or even some of the costs imposed by the Permit. Such speculative funding sources cannot count as viable sources of funding so as to preclude a subvention claim. Cal. Gov't Code, § 17556(f). Furthermore, even if some portions of the Permit's programs can be covered by user fees, these fees will not come close to covering all such costs, meaning permittees' general funds will have to be utilized to cover substantial portions of these costs. Cal. Gov't Code, § 17556(d) (the ability to charge fees only defeats a subvention claim where the fees are sufficient to fully fund the program.)

## **5. The Permit's Monitoring Program Exceeds the Requirements of Law**

The Permit's Receiving Water Monitoring Program is improper for going well beyond the scope of monitoring requirements authorized under Water Code Sections 13267 and 13383. The relevant portion of Water Code Section 13267 states:

“(b) (1) In conducting an investigation . . . the regional board may require that . . . any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports.”

The Regional Board's failure to conduct and communicate the requisite cost-benefit analysis pursuant to the monitoring requirements in the Permit constitutes an abuse of discretion. Water Code §§ 13267 and 13225(c).

The relevant portions of Water Code Section 13383 state:

“(a) The . . . regional board may establish monitoring, inspection, entry, reporting, and recordkeeping requirements . . . for any person who discharges, or proposes to discharge, to navigable waters. . . .

(b) The . . . or the regional boards may require any person subject to this section to establish and maintain monitoring equipment or methods, including, where appropriate, biological monitoring methods, sample effluent as prescribed, and provide other information as may be reasonably required.”

The Permit goes far beyond a requirement that a permittee “monitor” the effluent from its own storm drains. The Permit's Receiving Water Monitoring Program seems to require a complete hydrogeologic model found in the receiving water body, which will in many cases be miles away from many of the individual permittees' jurisdictions. To the extent the Permit requires individual permittees to compile information beyond their jurisdictional control, they are unauthorized. Although Water Code Section 13383(b) permits the Regional Board to request “other information”, such requests can only be “reasonably” imposed. Cal. Water Code § 13383(b). The information requested by the Regional Board is unreasonable. It is not just limited to each individual copermitttee's discharge. Rather, the Permit requires copermitttees to analyze discharges and make assumptions regarding factors well beyond their individual

boundaries. This is not reasonable, and is therefore not permitted under Water Code Sections 13225, 13267, and 13383. It is equally unreasonable to require the monitoring of authorized or unknown discharges. *See* Permit at p. 108.

**6. The Permit Exceeds the Regional Board's Authority by Requiring the City to Enter into Contracts and Coordinate With Other Copermittees**

The Regional Board cannot require the City to enter into agreements or coordinate with other copermittees. The requirements that permittees engage in interagency agreements (Permit at p. 39) and coordinate with other copermittees as part of their stormwater management program (Permit at p. 56-58) are unlawful and exceed the authority of the Regional Board. The Regional Board lacks the statutory authority to mandate the creation of interagency agreements and coordination between permittees in an NPDES Permit. *See* Water Code §§ 13374 and 13377. The Permit creates the potential for City liability in circumstances where the permittee cannot ensure compliance due to the actions of third party state and local government agencies over which the City has no control. Such requirements are not reasonable regulations, and thus violate state law. *Communities for a Better Environment v. State Water Resources Control Bd.*, 132 Cal. App. 4th 1313, 1330 (2005) (regulation pursuant to NPDES program must be reasonable.)

**7. The Permit Fails to Consider Economic Impacts As Required by Water Code Sections 13000 and 13241**

The Regional Board's failure to adequately consider the economic impacts of the Permit, as required by Water Code Sections 13000 and 13241, render the Permit invalid. Water Code Section 13241 requires the Regional Board to include "[e]conomic considerations" with its consideration of the Permit. As demonstrated above, the Regional Board is incorrect in its assertion that consideration of economics is not required in this Permit. *See* Permit at pp. 24-25. Because, as demonstrated above, the Permit requires new and higher levels of service in numerous key regards, consideration of economic factors is necessary. *City of Burbank v. State Water Resources Control Bd.*, 35 Cal. 4th 613, 618, 627 (2005).

The alleged facts in the economic consideration section of the Fact Sheet misrepresent the permittees' data and fail to consider the economic impact of new, costly aspects of the Permit. The Fact Sheet's open skepticism of municipal financial reports is troubling, and indicates the Regional Board has not taken permittees' actual expenses seriously.

It is also premature and improper to assume that permittees will obtain funding from proposed ballot measures and other sources of funding which have not even been approved, much less voted on by the public. *See* Fact Sheet at pp. F-142-43. If the Regional Board wants to rely on initiatives, such as the Los Angeles County Flood Control District's Water Quality Funding Initiative, as sources of funding to offset the costs of storm water management, it should delay its public hearing and approval of the Permit until after the voters have actually voted on such initiatives. Otherwise, if such initiatives fail to pass, the copermittees will be left to implement the Permit's requirements without the funds to do so. Even if the Water Quality Funding Initiative is approved by the voters, the funds generated by the Initiative would not even be available until 2014 – well after the deadline for a majority of the compliance deadlines set forth

in the Permit. Moreover, the Water Quality Initiative will not cover all the costs imposed on all permittees by the Permit.

The Permit also fails to consider the significant additional costs that TMDLs will impose. The incorporation of TMDLs and the massive expansion of monitoring requirements in the Permit, which also trigger the need for additional inspectors, will inevitably cause the copermitees' costs to skyrocket. Furthermore, speculations about what people may be willing to pay for cleaner water and social benefits from clean water have no real effect on cities' bottom lines. Finally, the Permit fails to account fully for all the expenses that implementing minimum control measures will impose. For all these reasons, the consideration of economic impact is entirely lacking, which violates state law.

**8. The Permit's Imposition of Joint and Joint and Several Liability for Violations is Contrary to Law**

The Permit appears to improperly impose joint liability and joint and several liability for water quality based effluent limitations and receiving water exceedances. It is both unlawful and inequitable to make a permittee liable for the actions of other permittees over which it has no control. A party is responsible only for its own discharges or those over which it has control. *Jones v. E.R. Shell Contractor, Inc.*, 333 F. Supp. 2d 1344, 1348 (N.D. Ga. 2004). Because the City cannot prevent another permittee from failing to comply with the Permit, the Regional Board cannot, as a matter of law, hold the City jointly or jointly and severally liable with another permittee for violations of water quality standards in receiving water bodies or for TMDL violations. Under the Water Code, the Regional Board issues waste discharge requirements to "the person making or proposing the discharge." Cal. Water Code § 13263(f). Enforcement is directed towards "any person who violates any cease and desist order or cleanup and abatement order . . . or . . . waste discharge requirement." Cal. Water Code § 13350(a). In similar fashion, the Clean Water Act directs its prohibitions solely against the "person" who violates the requirements of the Act. 33 U.S.C. § 1319. Thus, there is no provision for joint liability under either the California Water Code or the Clean Water Act.

Furthermore, joint liability is proper only where joint tortfeasors act *in concert* to accomplish some common purpose or plan in committing the act causing the injury, which will generally never be the case regarding prohibited discharges. *Kesmodel v. Rand*, 119 Cal. App. 4th 1128, 1144 (2004); *Key v. Caldwell*, 39 Cal. App. 2d 698, 701 (1940). For any such discharge, it would be unlawful to impose joint liability and especially joint and several liability. The issue of imposing liability for contributions to "commingled discharges" of certain constituents, such as bacteria, is especially problematic because there is no method of determining who has contributed what to an exceedance.

For receiving water body exceedances, the Permit should specify that the burden is on the Regional Board to show that any permittee's discharge caused or contributed to that exceedance. Requiring permittees to prove they did not cause or contribute an exceedance is both inequitable and unlawful. Permittees should not be required to prove they did not do something when the Regional Board has failed to raise even a rebuttable presumption that the contamination results from a particular permittee's actions. See Cal. Evid. Code § 500; *Sargent Fletcher, Inc. v. Able Corp.*, 110 Cal. App. 4th 1658, 1667-1668 (2003).

## **II. TECHNICAL COMMENTS**

### **1. Watershed Management Programs**

The City supports the Regional Board's approach to address high priority water quality issues through the development and implementation of Watershed Management Programs. However, we have concerns with the language contained in Part VI.C of the Permit. One of our biggest concerns is the proposed timeline for developing Watershed Management Programs. Agencies wishing to participate in Watershed Management Programs would have only one (1) year to develop a comprehensive Watershed Management Program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate the data, draft the plans, and obtain necessary City Council approvals.

Part VI.C of the Permit does not appear to provide cities wishing to participate in a Watershed Management Program the option of developing their own programs, outside of the Watershed Management Program, to remain consistent with the requirements of the Permit. For example, a watershed group may develop a Watershed Management Program for TMDL and Monitoring purposes, and choose to implement the Minimum Control Measures as currently prescribed by the Permit. This may not be appropriate for all cities participating in the Watershed Management Program. Individual permittees, when participating in a Watershed Management Program, should be able to choose which elements of the Program they will participate in and which elements they will opt out of, preferring to comply with those elements as stated in the Permit. The City therefore requests that the Permit include clarifying language enabling individual permittees to participate in certain elements of the Watershed Management Program while providing the individual permittees the flexibility to otherwise comply, on their own, with the Permit.

### **2. Storm Water Management Program Minimum Control Measures**

The City is concerned that the timelines for implementation of the Minimum Control Measures (MCMs) will not provide an adequate timeframe in which to implement the new and enhanced Permit conditions. Specifically, Permit Part D.1.b.i. states: "Unless otherwise noted in Part VI.D, each Permittee shall ensure implementation of the requirements contained in Part VI.D within thirty (30) days after the effective date of the Order." The City respectfully requests that the timelines for implementation be extended to one hundred eighty (180) days after the effective date of the Order, to allow permittees the necessary time to develop new programs and plans and enhance existing programs as prescribed in the Permit.

### **3. Development Construction Program**

The Permit will require projects of one (1) acre or greater to prepare an Erosion and Sediment Control Plan ("ESCP"). It is our understanding that the ESCP must include the same elements of a Stormwater Pollution Prevention Plan ("SWPPP"). This Permit requirement essentially places the burden of enforcement of the State Construction General Permit on the municipal permittees.

The State Construction General Permit already requires construction projects to prepare and submit a SWPPP to the State Water Resources Control Board for review and approval. The City

appreciates the language indicating that SWPPPs prepared in accordance with the requirements of the Constructional General Permit can be submitted in lieu of an ESCP. However, the burden of review and approval of SWPPPs is effectively shifted to the City with the addition of this requirement. The City lacks the resources necessary to review, approve, and enforce the State Construction General Permit.

Part VI.D.7.h.ii(9) requires permittees to develop and implement a checklist to be used to conduct and document review of each ESCP or SWPPP within thirty (30) days of the Permit's adoption. Currently there is no accepted standardized SWPPP review checklist for the State Construction General Permit. The burden of developing such a checklist falls solely to the permittees. In addition, the City will be required to allocate already limited resources to perform the mandatory construction site inspections, which represent a two hundred percent (200%) increase in the number of inspections required for sites greater than one (1) acre.

\*\*\*\*\*

The City is dedicated to the protection and enhancement of water quality. The City, however, has other functions that require funding as well. If this Permit is adopted as proposed, even in the best case scenario, spending cuts to other crucial services such as police, fire, and public works are certain. The permittees' dwindling general funds simply cannot take the financial hit the Permit is poised to impose on them. The City believes a more measured approach is necessary, especially regarding how compliance in this Permit is achieved.

As public agencies, all parties involved in the NPDES permitting process have the obligation to carry out their duties in a responsible, realistic, and reasoned manner. Requirements that tether public agencies to impractical positions are counterproductive and violate our sacred charge as representatives of the people. The City is committed to working with the State and Regional Boards in order to achieve our mutual goals and looks forward to engaging in a constructive dialogue with Regional Board staff on these issues.

Sincerely,

Cherie L. Paglia  
City Manager

Subject: Comment letter – Draft NPDES Permit (Draft Order) for MS4 Discharges within the Los Angeles County Flood Control District

Dear Mr. Ridgeway:

The City of Inglewood (City) appreciates the opportunity to provide comments on the Draft NPDES Permit (Draft Order) for MS4 Discharges within the Los Angeles County Flood Control District. The City has actively participated with the LA Permit Group in efforts to promote a constructive collaboration between the other municipalities and also the Los Angeles Regional Water Quality Control Board (LARWQCB). The City in addition to these comments is in support of the detailed comments submitted by the LA Permit Group.

As stated in letter dated July 10, 2012 (incorporated in this letter as attached), the City feels that the comment deadline of July 23, 2012 is far too short to address all the potential issues and concerns associated with the draft order. The City supports the need for regulations that are developed reasonably and can be complied with while protecting water quality in a cost-effective and science-based matter. The City feels that the draft order may place permittees in a vulnerable position for not being in immediate compliance with water quality standards. It is imperative that more time be given to review the permit and develop alternatives to the issues found in this draft order. In light of the restricted time period to comment given, the City has put together comments to address the most pertinent issues.

In addition to the comments that follow and are attached, please note that the contact information for the City of Inglewood as noted on page 4 of the draft order has changed. The contact information should be changed as follows:

Mailing Address: 1 W. Manchester Blvd, 3<sup>rd</sup> Floor  
Public Works Department  
Inglewood, CA 90301  
Facility Contact: Lauren Amimoto, Senior Administrative Analyst

One W Manchester Boulevard • Inglewood, CA • 90301 • Phone (310) 412-5333 • Fax (310) 412-5552 •  
[www.cityofinglewood.org](http://www.cityofinglewood.org)

Discharge Prohibitions:

The City, being a potable water distribution system and an MS4 is concerned with this section and feels that some clarifications need to be addressed. The notification and monitoring requirements are unclear as to whether they apply to any discharge or if they apply to a threshold of 1 acre-foot. The City believes that if these requirements apply to all discharges this would be excessive and a waste of City resources. The City believes that this section should be rewritten to address the issues that may arise for cities that own and operate a potable water distribution system and are also a MS4 permittee.

Receiving Water Limitations:

The City feels that the Receiving Water Limitation (RWL) language in the draft order is likely to create a liability to the City that is unnecessary and counterproductive. The City feels that if it is engaging in a good faith effort to implement the iterative process to correct any harm while diligently implementing its stormwater program then it should not be subject to non-compliance and open to litigation because of the proposed language. Especially in light of the United States Court of Appeals for the Ninth Circuit issued opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.*<sup>1</sup> (*NRDC v. County of LA*) that determined that a municipality is liable for permit violations if its discharges cause or contribute to an exceedance of a water quality standard. To address this issue the City is recommending that the CASQA RWL language (attached) be used instead of the controversial proposed language which creates counterproductive liability for the cities who are diligently implementing stormwater programs. The City believes it may be exposed to considerable vulnerability even though it has little control over the sources of pollutants that may create the vulnerability. Even when an adaptive management approach is taken, under the current language, the City may be exposed to enforcement action and third party lawsuits. This is in fact what happened to the City of Stockton. The City of Stockton was sued by a third party for violations of the cause/contribute prohibition even though they were implementing a comprehensive iterative process with specific pollutant load reduction plans. RWL language is a critical issue and must be modified to allow for an iterative/adaptive approach to meet water quality standards.

Total Maximum Daily Loads (TMDLs):

The City is concerned with the incorporation of the multiple TMDLs into the draft order. These TMDLs were developed based on the information available at the time, not the best information to solve the problems at hand. The TMDLs were developed on the understanding that there would be monitoring, special studies, and other information gathered to redefine the TMDLs and addressed through a TMDL reopener. Anticipated reopeners, like the Santa Monica Bay Beaches TMDL, have not been updated to address the evidence that was presented. The sophistication of the TMDLs varies widely along with the financial burden of complying with them. The City does not believe that the use of numeric limits should be used for final waste load allocations (WLAs), and that WLAs should be incorporated as non-numeric effluent limitations instead. WQBELS should be expressed as Best Management Practices (BMPs) to abate the discharge of pollutants. Once BMPs are implemented then monitoring data can be used to determine the effectiveness of the BMPs and appropriate adjustments can be made if the BMPs are not effective. The compliance option of implementing actions or BMPs in an adaptive iterative approach consistent with the Watershed Management Program should be included for the interim and final WLAs. If this compliance option of BMP implementation is not included and strict numeric limits are required for final WLAs, then, at the specified compliance date, no matter how much the permittee has done, how much the permittee has spent, and how close to complying with the numeric values, no matter if the

sources are in the permittees's control or not, the permittee may be considered out of compliance with the permit requirements and open to enforcement action and third party litigation.

In TMDLs where the compliance date has already passed, the proposed use of Time Schedule Orders seems to put permittees in immediate non-compliance and exposure to third party lawsuits. The City strongly believes that an adaptive management approach where TMDL reopeners are used to consider new data and other technical information to modify the TMDLs, including whether the TMDL schedule is appropriate, is the most straightforward way to address past due TMDLs. The LARWQCB should adjust the implementation timelines to reflect the practical and financial reality faced by municipalities. Final WLAs should be delayed until more scientific information is gathered and the TMDLs are reconsidered in light of information that was not available at the time when the TMDL was developed.

The four compliance options for both interim and final WLAs should be (1) Implement Actions/BMPs, (2) Compliance at the outfall, (3) Compliance in the receiving water, (4) No direct discharges.

#### Monitoring:

The proposed monitoring program seems to significantly increase from the current monitoring efforts. Receiving water monitoring should be consistent with SWAMP protocols including the requirement that ambient monitoring be conducted 2 days following a storm event instead of during a storm event. Regarding the regional studies, the City believes that these studies should be conducted by the Regional or State Board and not at an individual City level. Toxicity monitoring should be conducted at the receiving water and not the outfalls, but first it should be determined if toxicity is in fact an issue in the receiving waters. Conducting unnecessary monitoring would be costly and waste limited City resources. Insufficient time has been allotted to prepare the Coordinated Integrated Monitoring Plan (CIMP). Permittee should be allowed at least 12 months to submit a Memorandum of Agreement to participate in a CIMP and at least 24 months to submit the complete CIMP.

#### Minimum Control Measures:

The LARWQCB should develop a timeline for implementation and phasing in of the Minimum Control Measures requirements. A 12 month time schedule is recommended in order to transition from the current efforts to the new MCM requirements. The draft order seems to shift the States responsibilities regarding the State General Permits for Construction and Industrial Activities from the State to the municipalities. These elements that shift State responsibilities to the municipalities should be eliminated. Requiring the permittees to maintain a database that overlaps with the States SMARTS database is repetitive and adds additional costs to permittees that is unnecessary. Requiring the quantification of soil loss is also repetitive with the Construction General Permit and will add additional costs to permittee as well.

The City suggests that a technical guidance manual should be provided for implementing the suggested Low Impact Development (LID) provisions.

A number of concerns arise with the New Development provisions of the MCM section in the draft order. Requiring developers to choose between two equivalent design volume criteria, being, the 0.75 inch storm or the 85<sup>th</sup> percentile 24 hour storm- whichever is greater, makes little sense when these two design criteria were judged to be equivalent. This adds additional costs to any project that are unnecessary. The alternative compliance option of offsite mitigation is highly unlikely to be chosen because of the requirements for treating project site runoff to the levels in Table 11 in addition to being equivalent in pollutant load reduction as the original project site equates to the developer removing essentially twice as much pollutant loads as he would have accomplished on the project site if being able to retain the load onsite originally. This is unfair, we recommend that the developer be required to remove only the pollutant loads that would have been removed at

the project site at the mitigation site and if the mitigation site cannot meet that load reduction then the developer can implement treatment controls at the project site for the remaining differential. The section regarding post

Construction BMPs should be revised to reflect the developer's site pollutant of concern and the corresponding top performing BMPs that can meet the benchmarks given.

Permittees are being required to track and inspect post construction BMPs including LID measures. This seems like a tedious task for City staff as it would require significant staff time (ex. Plan reviews, purchase of a system to store data, data entry, letter preparation and enforcement). If permittees are required to inspect every LID BMP implemented, then during wet weather it would be unreasonable and cost prohibitive for the City to perform that many inspections. Tracking and inspection of BMPs should be limited only to conventional BMPs (ex. Detention basins, wetlands, etc.)

Attachment H which provides design specifications for biofiltration and bioretention BMPs should be optional. It is more productive for a performance standard to be required and the City will develop design specifications to meet the standard.

The requirement requires each permittee to install additional trash BMPs regardless of where the area is subject to a trash TMDL or not makes little sense. If a TMDL has not been established for that area then the purpose for additional trash management is unclear. The MCM already requires prioritization, cleaning, and inspection of catch basins as well as street sweeping and other management control measures to address trash.

#### Watershed Management Programs:

A big concern for the City with the Watershed Management Program section is the draft order's proposed timeline for developing the watershed management programs. The draft order only allows 1 year to develop a comprehensive watershed management program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate and run the models based on relevant data, draft the plans, and obtain necessary approvals from political bodies. A time period of at least 24 months should be allowed to develop a draft plan that is implementable.

The draft order is silent on the issue of sources of pollutants outside the authority of the permittees control (ex. Aerial deposition, upstream contributions, discharges allowed by another NPDES permit, etc.) Permittees should be allowed to demonstrate that some sources are outside the permittees control and they are not responsible for managing or abating those sources. Watershed management programs and the reasonable assurance analysis should be able to be applied for TMDL compliance purposes.

#### Cost Implications to the City

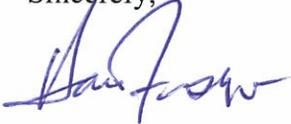

The draft order requires municipalities to exercise their authority to secure fiscal resources necessary to meet all the requirements of the permit. However, we have a limited amount of funds that are under local control. Any additional funds needed to raise money for stormwater programs would need to come from increased/new stormwater fees and grants. New fees for stormwater are regulated under the State's Prop 218 regulations, and require a public vote; so, this is an item that is not under direct control of the municipalities – the Permit language should reflect this. Furthermore in addition to clean water, local resources are also directed to a number of health, safety and quality of life factors. Thus, all these factors, health, safety, quality of life and clean water need to be developed in balance with each other. This requires a strategic process and that will take time to get right. We urge that the permit provisions are developed on conditions based on a reasonable timeframe in balance with the existing economy, fiscal resources available, and other health, safety, regulatory and quality of life factors that local agencies are responsible for.

The economic implications of the many proposed permit requirements are of critical importance. The cost for complying with both the stormwater regulations and TMDL requirements should be carefully considered. Although we have not had sufficient time to assess the cost for the new stormwater requirements, the County of Los Angeles has completed an analysis (using the Los Angeles County BMP Decision Support System model) to assess the effort required to implement low impact development retrofits throughout Los Angeles County to address all TMDLs and 303(d) listings. This model roughly estimated that, to meet these water quality standards, the area would have to spend between \$17 billion and \$42 billion. With these types of economic implications, it is critical that this Regional Board and their staff more carefully evaluate comments and provide additional, extended comment periods for these requirements.

The City is concerned with the issue of whether these permit requirements constitute an unfunded mandate claim and believes that this issue should be addressed.

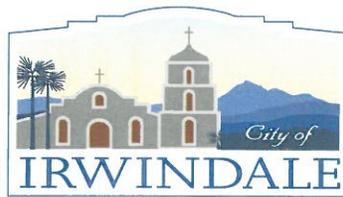

In closing the City thanks the LARWQCB for the opportunity to comment on the draft order and looks forward to discussing our comments and exploring alternative approaches. We request that the LARWQCB provides another revised draft tentative order with an additional review period of at least 180 days to discuss and review the full document. It is imperative that ample time be granted to review the entire document to better understand the relationships with the various provisions. Please feel free to contact Lauren Amimoto (310) 412-5192 [lamimoto@cityofinglewood.org](mailto:lamimoto@cityofinglewood.org) if you have any questions or require clarification regarding these comments.

Sincerely,

Harry Frisby, Jr.

Subject: Tentative MS4 Order Comments

Dear Mr. Ridgeway:

For your consideration, the City of Irwindale is pleased to submit the attached comments regarding Order No. R4-2012-XXXX NPDES Permit No. CAS004001.

Please note that the City also supports comments submitted to you from the Los Angeles Stormwater Permit (LASP) group. The City's comments are intended to compliment and address more specifically the issues raised in the LASP group letter. Additionally, the City's comment letter contains other issues not addressed in the LASP group letter.

We thank you for the opportunity to submit comments on this very important matter. Should you have any questions, please feel free to call me at 626/430-2211.

Sincerely,

Loretta Corpis  
Management Analyst

**Comments Regarding Los Angeles MS4 Tentative Order No. R4-2012-XXXX**  
**NPDES PERMIT NO. CAS004001 (issue date unspecified)**  
**Attachment E: Monitoring and Reporting Plan**

---

1. Receiving Water Monitoring

The purpose of receiving water monitoring is to:

- a. *Determine whether the receiving water limitations are being achieved,*
- b. *Assess trends in pollutant concentrations over time, or during specified conditions,*
- c. *Determine whether the designated beneficial uses are fully supported as determined by water chemistry, as well as aquatic toxicity and bioassessment monitoring.*

Receiving water monitoring is to be performed at various in-stream stations.

At issue is “a” because it serves to determine compliance with receiving water limitations. The Regional Board has no legal authority to compel compliance with receiving water limitations through in-stream monitoring. Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) clearly indicates:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

According to Clean Water Act §502, effluent monitoring is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2 defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

In short, effluent monitoring in a receiving water because cannot be required because it lies outside the bounds of the outfall.

Regarding monitoring purposes “b” and “c” no argument is raised here provided that it is understood that assessing trends in pollution concentrations would be: (1) limited to ambient water quality monitoring; and (2) permittees shall be not responsible for funding such monitoring. With respect to the latter, the Regional Board’s surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.

*Recommended Corrective Action:* Delete 1(a) and make it clear that 1(b) and (c) relate to ambient monitoring that is not the responsibility of MS4 permittees.

## 2. Stormwater Outfall Based Monitoring

The purpose of stormwater outfall based monitoring – including TMDL monitoring -- is to:

- a. *Determine the quality of a Permittee’s discharge relative to municipal action levels, as described in Attachment G of this Order,*
- b. *Determine whether a Permittee’s discharge is in compliance with applicable wet weather WQBELs derived from TMDL WLAs,*
- c. *Determine whether a Permittee’s discharge causes or contributes to an exceedance of receiving water limitations.*

Insofar as “a” is concerned, outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to replace TMDL WLAs as alternatives to addressing receiving water quality. As noted in the National Research Council Report to USEPA:

*The NSQD (Pitt et al., 2004) allows users to statistically establish action levels based on regional or national event mean concentrations developed for pollutants of concern. The action level would be set to define unacceptable levels of stormwater quality (e.g., two standard deviations from the median statistic, for simplicity). Municipalities would then routinely monitor runoff quality from major outfalls. **Where an MS4 outfall to surface waters consistently exceeds the action level, municipalities would need to demonstrate that they have been implementing the stormwater program measures to reduce the discharge of pollutants to the maximum extent practicable.** The MS4 permittees can demonstrate the rigor of their efforts by documenting the level of implementation through*

*measures of program effectiveness, failure of which will lead to an inference of noncompliance and potential enforcement by the permitting authority*

Instead of following the above Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs if necessary.

Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.

*Recommended Correction:* Either require substitution of TMDLs with MALs or eliminate MALs entirely.

As for stormwater outfall monitoring purpose “b”, such monitoring cannot be used to determine compliance with **wet weather WQBELs based on TMDL WLAs** for the following reasons:

1. The wet-weather WQBEL is based on a TMDL WLA in the receiving water that is non-ambient. As mentioned, federal regulations only require ambient monitoring in the receiving water, which by definition can never be deemed the same as wet weather monitoring. They are mutually exclusive. Regional Board staff has also incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a “numeric effluent limitation.” Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board’s clear opposition to numeric effluent limitations.

In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

2. The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Regarding purpose "b" it should also be noted that the Regional Board's setting of WQBELs to translate the TMDL WLA in the receiving water to the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.*

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit's fact sheet. According to USEPA's NPDES Permit Writers' Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>1</sup>*

---

<sup>1</sup>United States Environmental Protection Agency, NPDES Permit Writers' Manual, September, 2010, page 6-30.

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis.

Complicating the performance of a reasonable potential analysis is the absence of (1) outfall monitoring data; and (2) ambient water quality standards. Though federal regulations require monitoring at the outfall, the Regional Board has not required it up until now. Even if outfall monitoring data were available to determine whether pollutants concentrations in the discharge exceeded the water quality standard is not possible. This is because, as mentioned earlier, TMDL WLAs are not expressed as ambient standards. A TMDL is an enhanced water quality standard. As noted in the National Research Council's *Assessing the TMDL Approach to Water Quality Management*, a report commissioned by the United States Congress in 2001:

*... EPA is obligated to implement the Total Maximum Daily Load (TMDL) program, the objective of which is attainment of ambient water quality standards through the control of both point and nonpoint sources of pollution.*

*Recommended Correction:* Eliminate this requirement.

Regarding purpose "c", the determinant for a water quality standard exceedance is in the discharge from the outfall – not in the receiving water. The use of numeric WQBELs -- though incorrectly defined and established in this instance -- represents the compliance standard in discharges from the outfall. Adding a second compliance determinant in the receiving water is unnecessary and is not authorized under federal stormwater regulations because the receiving water lies outside the scope of the MS4.

*Recommended Corrective Action:* Eliminate this requirement.

### **3. Non-storm water outfall based monitoring**

The purposes of this type of monitoring are as follows:

- a. Determine whether a Permittee's discharge is in compliance with applicable dry weather WQBELs derived from TMDL WLAs.*
- b. Determine whether a Permittee's discharge exceeds non-storm water action levels, as described in Attachment G of this Order,*
- c. Determine whether a Permittee's discharge contributes to or causes an exceedance of receiving water limitations,*

- d. *Assist a Permittee in identifying illicit discharges as described in Part VI.D.9 of this Order.*

Regarding “a,” This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.

*Recommended Correction:* Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the ICDDE program.

With regard to “b”, see previous responses regarding MALs and the limitation of non-stormwater discharge prohibit to the MS4.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.

Regarding “c”, as mentioned, non-stormwater discharges cannot be applied to receiving water limitations because they are only prohibited to the MS4, not from or through it.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.

Regarding “d”, this requirement is reasonable and in keeping with federal regulations with the exception that the identification of illicit discharges must adhere to the field screening requirements in CFR 40 §122.26. No non-stormwater discharge monitoring shall occur unless flow is first discovered at the outfall. This would trigger the implementation of additional requirements that the tentative order does not include.

#### **4. New Development/Re-development effectiveness monitoring**

The purpose of this requirement is a dubious and is not authorized under federal stormwater regulations as it relates to monitoring. To begin with, requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4’s pollution contribution relative to exceeding ambient water quality standards. Without the determination of statistically significant exceedances of water quality standards, detected at the

outfall, the imposition of runoff infiltration requirements is arbitrary. Further, there is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.

Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines “effectiveness” -- effective relative to what standard? It is also not clear how such monitoring is to be performed.

*Recommended Correction:* Delete this requirement.

The MRP of the tentative order proposes regional studies “*to further characterize the impact of the MS4 discharges on the beneficial uses of the receiving waters. Regional studies shall include the Southern California Stormwater Monitoring Coalition (SMC) Regional Watershed Monitoring Program (bio-assessment), sediment monitoring for Pyrethroid pesticides, and special studies as specified in approved TMDLs (see Section XIX TMDL Reporting, below).*”

Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board’s SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County’s mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.

END COMMENTS

-----

**1. Numeric Water Quality Based Effluent Limitations (WQBELs) applied to dry and wet weather Total Maximum Daily Load (TMDLs) waste load allocations (WLAs) and to stormwater and non-stormwater municipal action levels (MALs) are not authorized under federal stormwater regulations and are not in keeping with State Water Resources Control Board (State Board) water quality orders (WQOs).**

The tentative order specifies that: *Each Permittee shall comply with applicable WQBELs as set forth in Part VI.E of this Order, pursuant to applicable compliance schedules.* The tentative order specifies two categories of WQBELs, one for USEPA adopted TMDLs and one for Regional Board/State adopted TMDLs. Regarding USEPA adopted TMDLs, it appears that BMP-WQBELs may be used to meet TMDL WLAs in the receiving water. For Regional Board/State-adopted TMDLs, the tentative order specifies a different compliance method: meeting a “numeric” WQBEL which is derived directly from the TMDL waste load allocation. For example, the wet weather numeric WQBEL for dissolved copper for the Los Angeles River is 17 ug/l.

- a. Issue: *Regional Board staff is premature in requiring any kind of WQBEL because no exceedance of any TMDL WLA at the outfall has occurred.* This is because outfall monitoring is not a requirement of the current MS4 permit or previous MS4 permits.

The Regional Board’s setting of WQBELs – any WQBEL -- to translate the TMDL WLA for compliance at the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.”*

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit’s fact sheet. According to USEPA’s NPDES Permit Writers’ Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and*

*explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.*<sup>1</sup>

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis -- a consequence of the fact that no outfall monitoring has been required of the Regional Board either in the current or previous MS4 permits for Los Angeles County. Outfall monitoring is a mandatory requirement under federal regulations at CFR 40 §122.22, §122.2 and §122.26. CFR 40 §122.22(C)(3) requires effluent and ambient monitoring:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

“Effluent monitoring,” according to Clean Water Act §502, is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2, defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

Conclusion: Because Regional Board staff has not required outfall monitoring, it could have not have detected an excursion above a water quality standard (includes TMDL WLAs). Therefore, it could not have conducted a reasonable potential analysis and, as further consequence, cannot require compliance with a WQBEL (numeric or BMP-based) or with any TMDL or MAL until those burdens have been met.

Recommended Correction: Eliminate all reference to comply with WQBELs until outfall monitoring and a reasonable potential analysis have been performed.

---

<sup>1</sup>United States Environmental Protection Agency, *NPDES Permit Writers' Manual*, September, 2010, page 6-30.

- b. Issue: Even if Regional Board staff conducted outfall monitoring and detected an excursion above a TMDL WLA and performed the requisite reasonable potential analysis, it cannot require a numeric WQBEL strictly derived from the TMDL WLA.

USEPA's 2010 guidance memorandum mentions that numeric WQBELs are permissible only if feasible.<sup>2</sup> This conclusion was reinforced by a memorandum from Mr. Kevin Weiss, Water Permits Division, USEPA (Washington D.C.). He explains:

*Some stakeholders are concerned that the 2010 memorandum can be read as advising NPDES permit authorities to impose end-of-pipe limitations on each individual outfall in a municipal separate storm sewer system. In general, EPA does not anticipate that end-of-pipe effluent limitations on each municipal separate storm sewer system outfall will be used frequently. Rather, the memorandum expressly describes "numeric" limitations in broad terms, including "numeric parameters acting as surrogates for pollutants such as stormwater flow volume or percentage or amount of impervious cover." In the context of the 2010 memorandum, the term "numeric effluent limitation" should be viewed as a significantly broader term than just end-of-pipe limitations, and could include limitations expressed as pollutant reduction levels for parameters that are applied system-wide rather than to individual discharge locations, expressed as requirements to meet performance standards for surrogate parameters or for specific pollutant parameters, or could be expressed as in-stream targets for specific pollutant parameters. Under this approach, NPDES authorities have significant flexibility to establish numeric effluent limitations in stormwater permits.<sup>3</sup>*

Reading the 2010 USEPA memorandum, together with Mr. Weiss's memorandum, creates the inescapable conclusion that (1) numeric WQBELs are permissible if "feasible" and (2) numeric WQBELs cannot be construed to only mean strict effluent limitations at the end-of-pipe (outfall) but more realistically must include surrogate parameters and other variants as well. Regional Board staff failed to examine alternative numeric WQBELs, along with BMP WQBELs, as a consequence of not conducting the appropriate analysis.

In any case, the feasibility of numeric WQBELs, whether strictly derived from TMDL WLAs or of the surrogate parameter type, the State Water Resources Control Board has determined that numeric effluent limitations are not feasible. In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require "strict compliance" with water quality standards through numeric effluent*

---

<sup>2</sup>Memorandum from James A. Hanlon, Director, Office of Waste Management, Revisions to the November 22, 2002 Memorandum *Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, November 12, 2010, page

<sup>3</sup>Memorandum from Kevin Weiss, Water Permits Division, USEPA (Washington D.C.), March 17, 2011.

*limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

The State Board’s decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Conclusion: The Regional Board does not have the legal authority to require numeric WQBELs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

- c. Issue: There cannot be a WQBEL to attain a dry weather TMDL WLA nor a WQBEL that addresses a non-stormwater municipal action level (MAL).

The foundation for this argument lies in the federal limitation of non-stormwater discharges to the MS4 – not from or through it as the tentative order concludes. Federal stormwater regulations only prohibit discharges to the MS4 and limits outfall monitoring to stormwater discharges. This is explained in greater detail under 4. *Non-stormwater Discharge Prohibitions.*

Conclusion: Regional Board does not have the legal authority to compel compliance with dry weather WQBELs or non-stormwater MALs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

2. **The tentative order has altered Receiving Water Limitation (RWL) language causing it to be overbroad and inconsistent with RWL in the current MS4 permit, the Ventura MS4 permit, State Board WQO 99-05, the draft Caltrans MS4 permit, and RWL language recommended by CASQA.**

- a. Issue: The proposed RWL language changes the “exceedance” determinant from water quality standards and objectives to receiving water limitations, thereby increasing the stringency of the requirement. The tentative order RWL version reads: *Discharges from the MS4 that cause or contribute to the violation of **receiving water limitations** are prohibited.*

Compare this with what is in the current MS4 permits for Los Angeles and Ventura Counties:

*Discharges from the MS4 that cause or contribute to a violation of **water quality standards** are prohibited.*

Whereas standard RWL language limits water quality standards to what is in the basin plan, and includes water quality objectives (relates to waters of the State), the tentative order uses revised language that replaces water quality standards with the following receiving water limitation criteria:

*Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38.*

It is unclear why Regional Board staff has removed water quality standards, which is a USEPA and State Board requirement, and replaced them with the more global receiving water limitation language that include additional compliance criteria (e.g., “or federal regulations including but not limited to 40 CFR § 131.38”). Other “federal regulations” could include CERCLA (Comprehensive Environmental Remediation and Compensation Liability Act).

Enlarging the scope of the RWL from water quality standards to a universe of other regulatory requirements exceeds RWL limitation language established in State Board WQO 99-05, a precedential decision. The order bases compliance on discharge prohibitions and receiving water limitations on the *timely implementation of control measures and other action in the discharges in accordance with the SWMP (stormwater management plan) and other requirements of the permit’s limitations*. It goes on to say that if exceedances of water quality standards or water quality objectives, collectively referred to as water quality standards

continues, the SWMP shall undergo an iterative process to address the exceedances. It should be noted that this language was mandated by USEPA.

It should be noted that the draft Caltrans MS4 permit is scheduled for adoption in September, as well as CASQA, proposes RWL language that is in keeping with WQO 99-05.

Conclusion: Regional Board does not have the legal authority to re-define RWL language to the extent it is proposing.

Recommended Correction: Replace RWL contained in the tentative order with the CASQA model or with language contained in the draft Caltrans MS4 permit.

- b. Issue: By eliminating water quality standards, the tentative order has created a separate compliance standard for TMDLs and for non-TMDLs. Standard RWL language in other MS4 permits designates the SWMP<sup>4</sup> as the exclusive determinant for achieving water quality standards in the receiving water. Since TMDLs are enhanced water quality standards, the SWMP (or in this case the SQMP) should enable compliance with TMDLs. Instead, the tentative order specifies compliance through implementation plans – including plans that were discussed in several State/Regional Board adopted TMDLs (e.g., the Los Angeles River Metals TMDL). The absence of water quality standards also creates a separate compliance standard for non-TMDLs. According to Regional Board staff, minimum control measures (MCMs) which make up the SQMP, are intended to meet non-TMDLs pollutants. Unclear is what defines non-TMDL pollutant. If there are no water quality standards referenced in the RWL then what are the non-TMDL pollutants that the MCMs are supported to address?

There is no authority under federal stormwater regulations to comply with any criterion other than water quality standards. The RWL language called-out in WQO 99-05, which was in response to a USEPA directive, makes it clear that water quality standards represent the only compliance criteria, not an expanded definition of receiving water limitations that exclude such criteria.

MS4 permits throughout the State include TMDL WLAs. None of them, however, has created a compliance mechanism that excludes water quality standards as a means of attaining them. Further, the State Board has, through the draft Caltrans MS4 permit and the draft Phase II MS4 permit, articulated its policy on compliance with water quality standards:

---

<sup>4</sup>USEPA and federal stormwater regulations use stormwater management program whereas the Los Angeles County MS4 permit uses stormwater quality management plan (SQMP). In effect they are the same. They consist of 6 core programs that must be implemented through MS4 permit.

they are to be met through the implementation of stormwater management programs. Equally noteworthy is that State Board has not created a dual standard for dealing with TMDLs and non-TMDLs. This is an obvious consequence of its adherence to WQO 99-05.

With regard to implementation plans contained in TMDLs, the Regional Board has no legal authority to include them into the MS4 permit. This issue discussed in greater detail later in these comments.

Conclusion: The tentative order must be revised to restore water quality standards in RWL language and, by extension, enable compliance with TMDLs and other water quality standards through the SQMP/MCMs.

Recommended Correction: Revise the tentative order to eliminate any reference to complying with anything else except water quality standards through the SQMP; and, therewith, eliminate any reference to complying with implementation plans contained in State/Regional Board TMDLs.

**3. The tentative order does not include the iterative process, a mechanism that is integral to RWL language which serves to achieve compliance with water quality standards.**

- a. Issue: The absence of the iterative process disables a safeguard to protect permittees against unjustifiably strict compliance with water quality standards – or in this case the expanded definition of receiving water limitations -- that is a requisite feature in all MS4 permits issued in California. The tentative order circumvents the iterative process by creating an alternative referred to as the adaptive/management process which is only available to those permittees that opt for a watershed management program.

Despite the fact RWL language in MS4 permits since the 90's have provided a description of an iterative process (the BMP adjustment mechanism), the term "iterative process" has only recently been specifically mentioned in them. The absence of this term resulted in the 9<sup>th</sup> Circuit Court Appeal's conclusion in *NRDC v. Los Angeles County Flood Control District* that there is no "textual support" in the current MS4 permit for the existence of an iterative process. This resulted in the court's conclusion that the LACFCD had exceeded water quality standards in the hardened portions of the Los Angeles and San Gabriel Rivers. More recent MS4 permit's issued in the State contain clear references to the iterative process.

Notwithstanding the absence of water quality standards in the tentative order, the iterative process must be included as required by Water Quality Orders 2001-15 and 2009-0008, wherein the State Board made

it clear that: we will generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.

Moreover, both the draft Caltrans MS4 permit and the draft Phase II MS4 permit contain references to the iterative process. The draft Caltrans MS4 permit refers to the iterative process in two places: finding 20, Receiving Water Limitations and in the Monitoring Results Report. Finding 20 states:

*The effect of the Department’s storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs).<sup>5</sup>*

Under the Monitoring Results Report section, the draft Caltrans MS4 permit reiterates the iterative process within the context of the following: *The MRR shall include a summary of sites requiring corrective actions needed to achieve compliance with this Order, and a review of any iterative procedures (where applicable) at sites needing corrective actions.*<sup>6</sup>

The draft Phase II MS4 references the iterative process in two places, in finding 35 and under its definition of MEP. Finding 35 states:

*This Order modifies the existing General Permit, Order 2003-0005-DWQ by establishing the storm water management program requirements in the permit and defining the minimum acceptable elements of the municipal storm water management program. Permit requirements are known at the time of permit issuance and not left to be determined later through iterative review and approval of Storm Water Management Plans (SWMPs).*

The draft Phase II MS4 permit also acknowledges the iterative process through the definition of maximum extent practicable (which is also included in the draft Caltrans MS4 permit), to the following extent:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may*

---

<sup>5</sup>See draft Caltrans MS4 permit (Tentative Order No. 2012-XX-DWQ NPDES No. CAS000003), page 10.

<sup>6</sup>Ibid., page 35.

*require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the “iterative approach.”<sup>7</sup>*

It should be clearly understood that the State Board is articulating clear policy on the iterative process through these two draft MS4 permits and that they must be followed by Regional Boards as subordinate jurisdictions.

Conclusion: The Regional Board has no authority to alter the iterative process/procedure by making a revised and diluted version of it available only to those MS4 permittees that wish to opt for watershed management program participation. Quite the contrary, the Regional Board is legally compelled to make the iterative process, as described herein, an undeniable requirement in the tentative order.

Recommended Correction: Regional Board staff should incorporate the iterative process into the tentative order in the findings section and in the RWL section. It should also be referenced again under a revised MEP definition.

3. **The tentative order incorrectly articulates the non-stormwater discharge prohibition to the MS4 to include discharges from and through it.**
  - a. Issue: The tentative order mentions prohibiting non-stormwater discharges not only to the MS4 but from and through it as well. Federal regulations did not authorize the non-stormwater discharge prohibition to go beyond “to” the MS4. This is a serious issue because extending the prohibition from or through the MS4 would subject non-stormwater discharges (including dry weather TMDL

---

<sup>7</sup> See State Water Resources Control Board Water Quality Order No. XXXX-XXXX-DWQ, NPDES General Permit No. CASXXXXXX, page

WLAs and non-stormwater municipal action levels) to pollutant limitations at the outfall.

The tentative order attempts to justify interpreting federal stormwater regulations to mean that non-stormwater discharges are prohibited not only to the MS4 but from it and through it as well by: (1) incorrectly stating the Clean Water Act §402(p)(B)(ii) of the Clean Water Act requires permittees effectively prohibit non-storm water discharges into watercourses (means receiving waters) as well as to the MS4; and (2) a misreading of Federal Register Volume 55, No. 222, 47990 (federal register) which contains an error with regard to the non-stormwater discharge prohibition.

§402(p)(B)(ii) does not, as the tentative order's fact sheet asserts, include watercourses, which according to Regional Board staff, means waters of the State and waters of the United States, both of which lie outside of the MS4. The original text of §402(p)(B)(ii) actually reads as follows: *Permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."*<sup>8</sup> There is no mention of watercourses.

The tentative order's fact sheet also relies on the afore-cited federal register which states: *402(p)(B)(3) requires that permits for discharges from municipal storm sewers require the municipality to "effectively prohibit" non-storm water discharges from the municipal storm sewer.* The fact sheet is correct about this. The problem is that the federal register is wrong here. It confuses 402(p)(B)(3), which addresses stormwater (not non-stormwater) discharges from the MS4, with 402(p)(B)(2), which once again prohibits non-stormwater discharges to the MS4. It should be noted that in the same paragraph above the defective federal register language, it says that ... *permits are to effectively prohibit non-storm water discharges to the municipal separate storm sewer system.*

In any case, this issue has been resolved since the federal register was published in November of 1990. All MS4 permits in the United States issued by USEPA prohibit non-stormwater discharges only to the MS4. USEPA guidance, such as the *Illicit Discharge Detection and Elimination: A Guidance Manual* bases investigation and monitoring on non-stormwater discharges being prohibited to the MS4. And, with the exception of Los Angeles Regional Board MS4 permits, MS4 permits issued by other Regional Boards also limit the MS4 discharge prohibition to the MS4. Beyond this, the

---

<sup>8</sup>Municipal storm sewers is a truncated version of municipal separate stormwater system (MS4).

draft Caltrans MS4 permit and draft Phase II MS4 permits also limit the non-stormwater prohibition to the MS4.

Conclusion: The Regional Board does not have the legal authority to extend the non-stormwater discharge prohibition from or through the MS4.

Recommended Correction: Revise the non-stormwater discharge prohibition to be limited to the MS4 only and delete all requirements that are based on the prohibition from or through the MS4. This includes the non-stormwater prohibition that is linked to CERCLA.

**Comments Regarding Los Angeles MS4 Tentative Order No. R4-2012-XXXX**  
**NPDES PERMIT NO. CAS004001 (issue date unspecified)**  
**Attachment E: Monitoring and Reporting Plan**

---

1. Receiving Water Monitoring

The purpose of receiving water monitoring is to:

- a. *Determine whether the receiving water limitations are being achieved,*
- b. *Assess trends in pollutant concentrations over time, or during specified conditions,*
- c. *Determine whether the designated beneficial uses are fully supported as determined by water chemistry, as well as aquatic toxicity and bioassessment monitoring.*

Receiving water monitoring is to be performed at various in-stream stations.

At issue is “a” because it serves to determine compliance with receiving water limitations. The Regional Board has no legal authority to compel compliance with receiving water limitations through in-stream monitoring. Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) clearly indicates:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

According to Clean Water Act §502, effluent monitoring is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2 defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

In short, effluent monitoring in a receiving water because cannot be required because it lies outside the bounds of the outfall.

Regarding monitoring purposes “b” and “c” no argument is raised here provided that it is understood that assessing trends in pollution concentrations would be: (1) limited to ambient water quality monitoring; and (2) permittees shall be not responsible for funding such monitoring. With respect to the latter, the Regional Board’s surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.

*Recommended Corrective Action:* Delete 1(a) and make it clear that 1(b) and (c) relate to ambient monitoring that is not the responsibility of MS4 permittees.

## 2. Stormwater Outfall Based Monitoring

The purpose of stormwater outfall based monitoring – including TMDL monitoring -- is to:

- a. *Determine the quality of a Permittee’s discharge relative to municipal action levels, as described in Attachment G of this Order,*
- b. *Determine whether a Permittee’s discharge is in compliance with applicable wet weather WQBELs derived from TMDL WLAs,*
- c. *Determine whether a Permittee’s discharge causes or contributes to an exceedance of receiving water limitations.*

Insofar as “a” is concerned, outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to replace TMDL WLAs as alternatives to addressing receiving water quality. As noted in the National Research Council Report to USEPA:

*The NSQD (Pitt et al., 2004) allows users to statistically establish action levels based on regional or national event mean concentrations developed for pollutants of concern. The action level would be set to define unacceptable levels of stormwater quality (e.g., two standard deviations from the median statistic, for simplicity). Municipalities would then routinely monitor runoff quality from major outfalls. **Where an MS4 outfall to surface waters consistently exceeds the action level, municipalities would need to demonstrate that they have been implementing the stormwater program measures to reduce the discharge of pollutants to the maximum extent practicable.** The MS4 permittees can demonstrate the rigor of their efforts by documenting the level of implementation through*

*measures of program effectiveness, failure of which will lead to an inference of noncompliance and potential enforcement by the permitting authority*

Instead of following the above Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs if necessary.

Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.

*Recommended Correction:* Either require substitution of TMDLs with MALs or eliminate MALs entirely.

As for stormwater outfall monitoring purpose “b”, such monitoring cannot be used to determine compliance with **wet weather WQBELs based on TMDL WLAs** for the following reasons:

1. The wet-weather WQBEL is based on a TMDL WLA in the receiving water that is non-ambient. As mentioned, federal regulations only require ambient monitoring in the receiving water, which by definition can never be deemed the same as wet weather monitoring. They are mutually exclusive. Regional Board staff has also incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a “numeric effluent limitation.” Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board’s clear opposition to numeric effluent limitations.

In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require “strict compliance” with water quality standards through numeric effluent limitations, and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

2. The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Regarding purpose "b" it should also be noted that the Regional Board's setting of WQBELs to translate the TMDL WLA in the receiving water to the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.*"

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit's fact sheet. According to USEPA's NPDES Permit Writers' Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>1</sup>*

---

<sup>1</sup>United States Environmental Protection Agency, NPDES Permit Writers' Manual, September, 2010, page 6-30.

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis.

Complicating the performance of a reasonable potential analysis is the absence of (1) outfall monitoring data; and (2) ambient water quality standards. Though federal regulations require monitoring at the outfall, the Regional Board has not required it up until now. Even if outfall monitoring data were available to determine whether pollutants concentrations in the discharge exceeded the water quality standard is not possible. This is because, as mentioned earlier, TMDL WLAs are not expressed as ambient standards. A TMDL is an enhanced water quality standard. As noted in the National Research Council's *Assessing the TMDL Approach to Water Quality Management*, a report commissioned by the United States Congress in 2001:

*... EPA is obligated to implement the Total Maximum Daily Load (TMDL) program, the objective of which is attainment of ambient water quality standards through the control of both point and nonpoint sources of pollution.*

*Recommended Correction:* Eliminate this requirement.

Regarding purpose "c", the determinant for a water quality standard exceedance is in the discharge from the outfall – not in the receiving water. The use of numeric WQBELs -- though incorrectly defined and established in this instance -- represents the compliance standard in discharges from the outfall. Adding a second compliance determinant in the receiving water is unnecessary and is not authorized under federal stormwater regulations because the receiving water lies outside the scope of the MS4.

Recommended Corrective Action: Eliminate this requirement.

### **3. Non-storm water outfall based monitoring**

The purposes of this type of monitoring are as follows:

- a. Determine whether a Permittee's discharge is in compliance with applicable dry weather WQBELs derived from TMDL WLAs.*
- b. Determine whether a Permittee's discharge exceeds non-storm water action levels, as described in Attachment G of this Order,*
- c. Determine whether a Permittee's discharge contributes to or causes an exceedance of receiving water limitations,*

- d. *Assist a Permittee in identifying illicit discharges as described in Part VI.D.9 of this Order.*

Regarding “a,” This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.

*Recommended Correction:* Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the ICDDE program.

With regard to “b”, see previous responses regarding MALs and the limitation of non-stormwater discharge prohibit to the MS4.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.

Regarding “c”, as mentioned, non-stormwater discharges cannot be applied to receiving water limitations because they are only prohibited to the MS4, not from or through it.

*Recommended Correction:* Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.

Regarding “d”, this requirement is reasonable and in keeping with federal regulations with the exception that the identification of illicit discharges must adhere to the field screening requirements in CFR 40 §122.26. No non-stormwater discharge monitoring shall occur unless flow is first discovered at the outfall. This would trigger the implementation of additional requirements that the tentative order does not include.

#### **4. New Development/Re-development effectiveness monitoring**

The purpose of this requirement is a dubious and is not authorized under federal stormwater regulations as it relates to monitoring. To begin with, requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4’s pollution contribution relative to exceeding ambient water quality standards. Without the determination of statistically significant exceedances of water quality standards, detected at the

outfall, the imposition of runoff infiltration requirements is arbitrary. Further, there is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.

Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines “effectiveness” -- effective relative to what standard? It is also not clear how such monitoring is to be performed.

*Recommended Correction:* Delete this requirement.

The MRP of the tentative order proposes regional studies “*to further characterize the impact of the MS4 discharges on the beneficial uses of the receiving waters. Regional studies shall include the Southern California Stormwater Monitoring Coalition (SMC) Regional Watershed Monitoring Program (bio-assessment), sediment monitoring for Pyrethroid pesticides, and special studies as specified in approved TMDLs (see Section XIX TMDL Reporting, below).*”

Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board’s SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County’s mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.

END COMMENTS

-----

**1. Numeric Water Quality Based Effluent Limitations (WQBELs) applied to dry and wet weather Total Maximum Daily Load (TMDLs) waste load allocations (WLAs) and to stormwater and non-stormwater municipal action levels (MALs) are not authorized under federal stormwater regulations and are not in keeping with State Water Resources Control Board (State Board) water quality orders (WQOs).**

The tentative order specifies that: *Each Permittee shall comply with applicable WQBELs as set forth in Part VI.E of this Order, pursuant to applicable compliance schedules.* The tentative order specifies two categories of WQBELs, one for USEPA adopted TMDLs and one for Regional Board/State adopted TMDLs. Regarding USEPA adopted TMDLs, it appears that BMP-WQBELs may be used to meet TMDL WLAs in the receiving water. For Regional Board/State-adopted TMDLs, the tentative order specifies a different compliance method: meeting a “numeric” WQBEL which is derived directly from the TMDL waste load allocation. For example, the wet weather numeric WQBEL for dissolved copper for the Los Angeles River is 17 ug/l.

- a. Issue: *Regional Board staff is premature in requiring any kind of WQBEL because no exceedance of any TMDL WLA at the outfall has occurred.* This is because outfall monitoring is not a requirement of the current MS4 permit or previous MS4 permits.

The Regional Board’s setting of WQBELs – any WQBEL -- to translate the TMDL WLA for compliance at the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.*”

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit’s fact sheet. According to USEPA’s NPDES Permit Writers’ Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and*

*explain how the state's anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.*<sup>1</sup>

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis -- a consequence of the fact that no outfall monitoring has been required of the Regional Board either in the current or previous MS4 permits for Los Angeles County. Outfall monitoring is a mandatory requirement under federal regulations at CFR 40 §122.22, §122.2 and §122.26. CFR 40 §122.22(C)(3) requires effluent and ambient monitoring:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

“Effluent monitoring,” according to Clean Water Act §502, is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2, defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

Conclusion: Because Regional Board staff has not required outfall monitoring, it could have not have detected an excursion above a water quality standard (includes TMDL WLAs). Therefore, it could not have conducted a reasonable potential analysis and, as further consequence, cannot require compliance with a WQBEL (numeric or BMP-based) or with any TMDL or MAL until those burdens have been met.

Recommended Correction: Eliminate all reference to comply with WQBELs until outfall monitoring and a reasonable potential analysis have been performed.

---

<sup>1</sup>United States Environmental Protection Agency, *NPDES Permit Writers' Manual*, September, 2010, page 6-30.

- b. Issue: Even if Regional Board staff conducted outfall monitoring and detected an excursion above a TMDL WLA and performed the requisite reasonable potential analysis, it cannot require a numeric WQBEL strictly derived from the TMDL WLA.

USEPA's 2010 guidance memorandum mentions that numeric WQBELs are permissible only if feasible.<sup>2</sup> This conclusion was reinforced by a memorandum from Mr. Kevin Weiss, Water Permits Division, USEPA (Washington D.C.). He explains:

*Some stakeholders are concerned that the 2010 memorandum can be read as advising NPDES permit authorities to impose end-of-pipe limitations on each individual outfall in a municipal separate storm sewer system. In general, EPA does not anticipate that end-of-pipe effluent limitations on each municipal separate storm sewer system outfall will be used frequently. Rather, the memorandum expressly describes "numeric" limitations in broad terms, including "numeric parameters acting as surrogates for pollutants such as stormwater flow volume or percentage or amount of impervious cover." In the context of the 2010 memorandum, the term "numeric effluent limitation" should be viewed as a significantly broader term than just end-of-pipe limitations, and could include limitations expressed as pollutant reduction levels for parameters that are applied system-wide rather than to individual discharge locations, expressed as requirements to meet performance standards for surrogate parameters or for specific pollutant parameters, or could be expressed as in-stream targets for specific pollutant parameters. Under this approach, NPDES authorities have significant flexibility to establish numeric effluent limitations in stormwater permits.<sup>3</sup>*

Reading the 2010 USEPA memorandum, together with Mr. Weiss's memorandum, creates the inescapable conclusion that (1) numeric WQBELs are permissible if "feasible" and (2) numeric WQBELs cannot be construed to only mean strict effluent limitations at the end-of-pipe (outfall) but more realistically must include surrogate parameters and other variants as well. Regional Board staff failed to examine alternative numeric WQBELs, along with BMP WQBELs, as a consequence of not conducting the appropriate analysis.

In any case, the feasibility of numeric WQBELs, whether strictly derived from TMDL WLAs or of the surrogate parameter type, the State Water Resources Control Board has determined that numeric effluent limitations are not feasible. In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require "strict compliance" with water quality standards through numeric effluent*

---

<sup>2</sup>Memorandum from James A. Hanlon, Director, Office of Waste Management, Revisions to the November 22, 2002 Memorandum *Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, November 12, 2010, page

<sup>3</sup>Memorandum from Kevin Weiss, Water Permits Division, USEPA (Washington D.C.), March 17, 2011.

*limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

The State Board’s decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Conclusion: The Regional Board does not have the legal authority to require numeric WQBELs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

- c. Issue: There cannot be a WQBEL to attain a dry weather TMDL WLA nor a WQBEL that addresses a non-stormwater municipal action level (MAL).

The foundation for this argument lies in the federal limitation of non-stormwater discharges to the MS4 – not from or through it as the tentative order concludes. Federal stormwater regulations only prohibit discharges to the MS4 and limits outfall monitoring to stormwater discharges. This is explained in greater detail under 4. *Non-stormwater Discharge Prohibitions.*

Conclusion: Regional Board does not have the legal authority to compel compliance with dry weather WQBELs or non-stormwater MALs.

Recommended Correction: Eliminate all references to comply with numeric WQBELs.

2. **The tentative order has altered Receiving Water Limitation (RWL) language causing it to be overbroad and inconsistent with RWL in the current MS4 permit, the Ventura MS4 permit, State Board WQO 99-05, the draft Caltrans MS4 permit, and RWL language recommended by CASQA.**

- a. Issue: The proposed RWL language changes the “exceedance” determinant from water quality standards and objectives to receiving water limitations, thereby increasing the stringency of the requirement. The tentative order RWL version reads: *Discharges from the MS4 that cause or contribute to the violation of **receiving water limitations** are prohibited.*

Compare this with what is in the current MS4 permits for Los Angeles and Ventura Counties:

*Discharges from the MS4 that cause or contribute to a violation of **water quality standards** are prohibited.*

Whereas standard RWL language limits water quality standards to what is in the basin plan, and includes water quality objectives (relates to waters of the State), the tentative order uses revised language that replaces water quality standards with the following receiving water limitation criteria:

*Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38.*

It is unclear why Regional Board staff has removed water quality standards, which is a USEPA and State Board requirement, and replaced them with the more global receiving water limitation language that include additional compliance criteria (e.g., “or federal regulations including but not limited to 40 CFR § 131.38”). Other “federal regulations” could include CERCLA (Comprehensive Environmental Remediation and Compensation Liability Act).

Enlarging the scope of the RWL from water quality standards to a universe of other regulatory requirements exceeds RWL limitation language established in State Board WQO 99-05, a precedential decision. The order bases compliance on discharge prohibitions and receiving water limitations on the *timely implementation of control measures and other action in the discharges in accordance with the SWMP (stormwater management plan) and other requirements of the permit’s limitations*. It goes on to say that if exceedances of water quality standards or water quality objectives, collectively referred to as water quality standards

continues, the SWMP shall undergo an iterative process to address the exceedances. It should be noted that this language was mandated by USEPA.

It should be noted that the draft Caltrans MS4 permit is scheduled for adoption in September, as well as CASQA, proposes RWL language that is in keeping with WQO 99-05.

Conclusion: Regional Board does not have the legal authority to re-define RWL language to the extent it is proposing.

Recommended Correction: Replace RWL contained in the tentative order with the CASQA model or with language contained in the draft Caltrans MS4 permit.

- b. Issue: By eliminating water quality standards, the tentative order has created a separate compliance standard for TMDLs and for non-TMDLs. Standard RWL language in other MS4 permits designates the SWMP<sup>4</sup> as the exclusive determinant for achieving water quality standards in the receiving water. Since TMDLs are enhanced water quality standards, the SWMP (or in this case the SQMP) should enable compliance with TMDLs. Instead, the tentative order specifies compliance through implementation plans – including plans that were discussed in several State/Regional Board adopted TMDLs (e.g., the Los Angeles River Metals TMDL). The absence of water quality standards also creates a separate compliance standard for non-TMDLs. According to Regional Board staff, minimum control measures (MCMs) which make up the SQMP, are intended to meet non-TMDLs pollutants. Unclear is what defines non-TMDL pollutant. If there are no water quality standards referenced in the RWL then what are the non-TMDL pollutants that the MCMs are supported to address?

There is no authority under federal stormwater regulations to comply with any criterion other than water quality standards. The RWL language called-out in WQO 99-05, which was in response to a USEPA directive, makes it clear that water quality standards represent the only compliance criteria, not an expanded definition of receiving water limitations that exclude such criteria.

MS4 permits throughout the State include TMDL WLAs. None of them, however, has created a compliance mechanism that excludes water quality standards as a means of attaining them. Further, the State Board has, through the draft Caltrans MS4 permit and the draft Phase II MS4 permit, articulated its policy on compliance with water quality standards:

---

<sup>4</sup>USEPA and federal stormwater regulations use stormwater management program whereas the Los Angeles County MS4 permit uses stormwater quality management plan (SQMP). In effect they are the same. They consist of 6 core programs that must be implemented through MS4 permit.

they are to be met through the implementation of stormwater management programs. Equally noteworthy is that State Board has not created a dual standard for dealing with TMDLs and non-TMDLs. This is an obvious consequence of its adherence to WQO 99-05.

With regard to implementation plans contained in TMDLs, the Regional Board has no legal authority to include them into the MS4 permit. This issue discussed in greater detail later in these comments.

Conclusion: The tentative order must be revised to restore water quality standards in RWL language and, by extension, enable compliance with TMDLs and other water quality standards through the SQMP/MCMs.

Recommended Correction: Revise the tentative order to eliminate any reference to complying with anything else except water quality standards through the SQMP; and, therewith, eliminate any reference to complying with implementation plans contained in State/Regional Board TMDLs.

**3. The tentative order does not include the iterative process, a mechanism that is integral to RWL language which serves to achieve compliance with water quality standards.**

- a. Issue: The absence of the iterative process disables a safeguard to protect permittees against unjustifiably strict compliance with water quality standards – or in this case the expanded definition of receiving water limitations -- that is a requisite feature in all MS4 permits issued in California. The tentative order circumvents the iterative process by creating an alternative referred to as the adaptive/management process which is only available to those permittees that opt for a watershed management program.

Despite the fact RWL language in MS4 permits since the 90's have provided a description of an iterative process (the BMP adjustment mechanism), the term "iterative process" has only recently been specifically mentioned in them. The absence of this term resulted in the 9<sup>th</sup> Circuit Court Appeal's conclusion in *NRDC v. Los Angeles County Flood Control District* that there is no "textual support" in the current MS4 permit for the existence of an iterative process. This resulted in the court's conclusion that the LACFCD had exceeded water quality standards in the hardened portions of the Los Angeles and San Gabriel Rivers. More recent MS4 permit's issued in the State contain clear references to the iterative process.

Notwithstanding the absence of water quality standards in the tentative order, the iterative process must be included as required by Water Quality Orders 2001-15 and 2009-0008, wherein the State Board made it clear that: *we will*

generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.

Moreover, both the draft Caltrans MS4 permit and the draft Phase II MS4 permit contain references to the iterative process. The draft Caltrans MS4 permit refers to the iterative process in two places: finding 20, Receiving Water Limitations and in the Monitoring Results Report. Finding 20 states:

*The effect of the Department’s storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs).<sup>5</sup>*

Under the Monitoring Results Report section, the draft Caltrans MS4 permit reiterates the iterative process within the context of the following: *The MRR shall include a summary of sites requiring corrective actions needed to achieve compliance with this Order, and a review of any iterative procedures (where applicable) at sites needing corrective actions.*<sup>6</sup>

The draft Phase II MS4 references the iterative process in two places, in finding 35 and under its definition of MEP. Finding 35 states:

*This Order modifies the existing General Permit, Order 2003-0005-DWQ by establishing the storm water management program requirements in the permit and defining the minimum acceptable elements of the municipal storm water management program. Permit requirements are known at the time of permit issuance and not left to be determined later through iterative review and approval of Storm Water Management Plans (SWMPs).*

The draft Phase II MS4 permit also acknowledges the iterative process through the definition of maximum extent practicable (which is also included in the draft Caltrans MS4 permit), to the following extent:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP*

---

<sup>5</sup>See draft Caltrans MS4 permit (Tentative Order No. 2012-XX-DWQ NPDES No. CAS000003), page 10.

<sup>6</sup>Ibid., page 35.

*development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the “iterative approach.”*<sup>7</sup>

It should be clearly understood that the State Board is articulating clear policy on the iterative process through these two draft MS4 permits and that they must be followed by Regional Boards as subordinate jurisdictions.

Conclusion: The Regional Board has no authority to alter the iterative process/procedure by making a revised and diluted version of it available only to those MS4 permittees that wish to opt for watershed management program participation. Quite the contrary, the Regional Board is legally compelled to make the iterative process, as described herein, an undeniable requirement in the tentative order.

Recommended Correction: Regional Board staff should incorporate the iterative process into the tentative order in the findings section and in the RWL section. It should also be referenced again under a revised MEP definition.

4. **The tentative order incorrectly articulates the non-stormwater discharge prohibition to the MS4 to include discharges from and through it.**
  - a. Issue: The tentative order mentions prohibiting non-stormwater discharges not only to the MS4 but from and through it as well. Federal regulations did not authorize the non-stormwater discharge prohibition to go beyond “to” the MS4. This is a serious issue because extending the prohibition from or through the MS4 would subject non-stormwater discharges (including dry weather TMDL WLAs and non-stormwater municipal action levels) to pollutant limitations at the outfall.

The tentative order attempts to justify interpreting federal stormwater regulations to mean that non-stormwater discharges are prohibited not only to the MS4 but from it and through it as well by: (1) incorrectly stating the Clean Water Act §402(p)(B)(ii) of the Clean Water Act requires permittees effectively prohibit non-storm water discharges into

---

<sup>7</sup> See State Water Resources Control Board Water Quality Order No. XXXX-XXXX-DWQ, NPDES General Permit No. CASXXXXXX, page

watercourses (means receiving waters) as well as to the MS4; and (2) a misreading of Federal Register Volume 55, No. 222, 47990 (federal register) which contains an error with regard to the non-stormwater discharge prohibition.

§402(p)(B)(ii) does not (as the tentative order's fact sheet asserts) include watercourses, which according to Regional Board staff, means waters of the State and waters of the United States, both of which lie outside of the MS4. The original text of §402(p)(B)(ii) actually reads as follows: *Permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."*<sup>8</sup> There is no mention of watercourses.

The tentative order's fact sheet also relies on the afore-cited federal register which states: *402(p)(B)(3) requires that permits for discharges from municipal storm sewers require the municipality to "effectively prohibit" non-storm water discharges from the municipal storm sewer.* The fact sheet is correct about this. The problem is that the federal register is wrong here. It confuses 402(p)(B)(3), which addresses stormwater (not non-stormwater) discharges from the MS4, with 402(p)(B)(2), which once again prohibits non-stormwater discharges to the MS4. It should be noted that in the same paragraph above the defective federal register language, it says that ... *permits are to effectively prohibit non-storm water discharges to the municipal separate storm sewer system.*

In any case, this issue has been resolved since the federal register was published in November of 1990. All MS4 permits in the United States issued by USEPA prohibit non-stormwater discharges only to the MS4. USEPA guidance, such as the *Illicit Discharge Detection and Elimination: A Guidance Manual* bases investigation and monitoring on non-stormwater discharges being prohibited to the MS4. And, with the exception of Los Angeles Regional Board MS4 permits, MS4 permits issued by other Regional Boards also limit the MS4 discharge prohibition to the MS4. Beyond this, the draft Caltrans MS4 permit and draft Phase II MS4 permits also limit the non-stormwater prohibition to the MS4.

Conclusion: The Regional Board does not have the legal authority to extend the non-stormwater discharge prohibition from or through the MS4.

Recommended Correction: Revise the non-stormwater discharge prohibition to be limited to the MS4 only and delete all requirements that are based on the prohibition from or through the MS4. This includes the non-stormwater prohibition that is linked to CERCLA.

---

<sup>8</sup>Municipal storm sewers is a truncated version of municipal separate stormwater system (MS4).

**5. The tentative order proposes to incorporate TMDL implementation plans, schedules, and monitoring requirements without legal authority.**

- a. Issue: Placing Regional Board/State Board TMDLs into the MS4 would result in serious consequences for permittees. For one thing, permittees subject to TMDLs that contain an implementation schedule with compliance dates for interim waste load allocations that have not been met, based on Los Angeles County mass emissions station or other data (e.g., from the Coordinated Monitoring Plan for the Los Angeles River Metals TMDL), will be in automatic non-compliance once the MS4 permit takes effect.

The tentative order proposes a safeguard in this event: coverage under a time schedule order (TSO). Essentially, a TSO is an enforcement action authorized under Porter-Cologne, the State's water code. The problem is that the Regional Board, at its discretion, could issue a clean-up and abatement order that could link permittees in the Dominguez Channel, Los Angeles River, and San Gabriel River Watersheds to the remediation of the Los Angeles and Long Beach Harbors which are currently CERCLA sites (caused by DDT, pesticides, metals, which are considered toxics, and other pollutants). Furthermore, the TSO, which is a State enforcement action, will not help with respect to a federal violation because of preemption. An exceedance will expose subject permittees to third party litigation under the Clean Water Act. NRDC would be able to take the matter straight to federal court.

In any case, the Regional Board has no legal authority under the Clean Water Act to incorporate implementation plans, schedules, or monitoring requirements into the MS4 permit. CWA §402(p)(B)(iii) simply states that controls are required *to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.* The application of this provision is limited to: (1) the implementation of BMPs specified in a stormwater management plan appropriated through the six core programs; and (2) outfall monitoring. Monitoring, as mentioned earlier, is limited to outfall and ambient monitoring. Ambient monitoring, which is receiving water-based, has been assumed by the Regional Board and is funded through a stormwater ambient monitoring program (SWAMP) surcharge on the annual MS4 permit fee. Federal stormwater regulations mention nothing about TMDL implementation plans and schedules in an MS4 permit.

In fact, the Regional Board/State Board TMDL implementation plans, implementation schedules, and monitoring should be voided and prevented

from being placed into the MS4 permit because (1) they set compliance determinant in the receiving water instead of the outfall; and (2) although the TMDL monitoring program requirements specify ambient monitoring that is to be performed by MS4 permittees, including Caltrans, the Regional Board has approved plans that treat wet weather monitoring as ambient monitoring, even though they are mutually exclusive. The Clean Water Act definition of ambient monitoring is the:

*Natural concentration of water quality constituents prior to mixing of either point or nonpoint source load of contaminants. Reference ambient concentration is used to indicate the concentration of a chemical that will not cause adverse impact to human health.*

The natural concentration of water quality constituents can only mean the state of a receiving water when it is not raining. This is further supported by the phrase “prior to mixing of either point or non-point source load of contaminants,” which can only mean stormwater discharges from an outfall. In other words, stormwater discharges from an outfall cannot be mixed with a receiving water during a storm event because the ambient condition would be lost. Outfall monitoring of stormwater discharges is evaluated against the ambient condition of pollutant constituents in the receiving water for the ostensible purpose of determining its pollutant contribution.

Conclusion: The tentative order lacks the legal authority to include TMDL implementation plans, schedules, or monitoring plans adopted as basin plan amendments. No permittee, subject to any TMDL that requires an implementation plan, schedule, or monitoring plan can be compelled to comply with any of them. Further, even if it were legally permissible for these TMDL elements to be incorporated into the MS4 permit, no permittee could be placed into a state of non-compliance because the legitimate compliance point is in the outfall. Because no outfall monitoring has occurred, no violation could arise and, therefore, there would be no need for a TSO.

Recommended Correction: Eliminate requiring TMDL implementation plans, schedules, and monitoring to be incorporated into the tentative order.

**6. The tentative order contains references to the federal Comprehensive Environmental Remediation Compensation and Liability Act (CERCLA) that would make them additional regulatory requirements.**

- a. Issue: The non-stormwater discharge prohibition under the tentative order states:

*Non-storm water discharges through an MS4 are prohibited unless authorized under a separate NPDES permit; authorized by USEPA*

*pursuant to Sections 104(a) or 104(b) of the federal comprehensive Environmental Response, Compensation and Liability Act (CERCLA).*

At first blush, the CERCLA provision appears innocuous. But what if non-stormwater discharge is not authorized under CERCLA? Conceivably the MS4 permittee could be held responsible for those discharges. And because CERCLA is referenced in the MS4 permit, it could become a potential third party litigation issue. The inclusion of the CERCLA provision is even more suspect when considering that no other MS4 in the State contains such a reference. Beyond this, how would a permittee know if a discharge is one covered under CERCLA?

Conclusion: CERCLA is an unnecessary reference in the MS4 permit and has the potential to expose permittees to third party litigation. Further, the non-stormwater discharge prohibition only “to” the MS4 makes this issue academic. A permittee’s only responsibility is to prohibit impermissible non-stormwater to the MS4, not through or from it; or to require the discharger to obtain permit coverage.

7. **The tentative order, under the effluent limitations section, contains technical effluent based limitations (TBELs) which typically are not included in MS4 permits and, in this particular case, does not appear to be purposeful.**
  - a. Issue: Part IV.A.1 of the tentative order states that TBELs shall reduce pollutants in storm water discharges from the MS4 to the maximum extent practicable (MEP).

It is not clear as to the reason for including TBELs into the tentative order because they are generally not required of Phase MS4 permits. TBELs are referenced in the tentative order, but are not found under section 402(p), which addresses storm water, nor anywhere else in federal regulations. It is a term used to collectively refer to best available technologies, but again not in 402(p).

TBEL is a term USEPA uses to denote the following: (1) Best Practical Control Technology Currently Available (BPT); (2) Best Conventional Pollutant Control Technology (BCT); and (3) Best Available Technology Economically Achievable (BAT). Since these provisions were established prior to stormwater provisions of the CWA §402(p), they were applied to industrial waste-water discharges (including construction activity which is an industrial category sub-set). A clarifier connected to the sewer system is a type of TBEL. POTWs are subject to TBELs example primary and secondary treatment.

According USEPA guidance:

*WQBELs are designed to protect water quality by ensuring that water quality standards are met in the receiving water. On the basis of the requirements of Title 40 of the Code of Federal Regulations (CFR) 125.3(a), additional or more stringent effluent limitations and conditions, such as WQBELs, are imposed when TBELs are not sufficient to protect water quality.*<sup>9</sup>

Since the MS4 permit proposes WQBELs (adapted to meet water quality standards at the outfall), it would appear that TBELs are irrelevant. In essence, the proposed WQBELs is an admission from Regional Board staff that TBELs are not sufficient to protect water quality.

Please note that the draft Caltrans and Phase II MS4 permits do not reference TBELs.

Conclusion: Clarification is needed to determine the purpose of referencing TBELs in the tentative order.

Recommended Correction: Either provide clarification and a justification requiring TBELs given that the tentative order requires WQBELs, a more stringent requirement. If clarification or justification cannot be provided, the TBEL provision should be removed.

## **8. Minimum Control Measures (MCMs)**

a. Issue: Generally, MCMs should not be detailed in the tentative order. Instead, specific BMPs and other information should be placed in the Stormwater Quality Management Plan (SQMP), which is the case under the current MS4 permit. Federal guidance specifies that the core programs are to be implemented through the SQMP as a means of meeting water quality standards. More importantly, placing the specifics in the SQMP makes it easier to revise. If specific BMPs remain in the tentative order, and they are in error or need to be revised (e.g., to set BMP-WQBELs), a re-opener would be required. For example, in Part I. *Facility Information, Table 2.*, the permittee contact information is out of date. It would be better to place this and other detailed information in the SQMP where it can be updated regularly without having to re-open the permit.

b. Issue: SUSMP

The tentative order replaces the Development Planning/SUSMP with Planning and Land Development Program. However, the SUSMP is mandated through a precedent-setting WQO issued by the State Board. Nothing in the order's fact sheet provides an explanation of why the SUSMP needs to be replaced. So doing would incur an unnecessary cost

---

<sup>9</sup> NPDES Permit Writers' Manual, September, 2010, page 5-40.

to revise the SQMP and SUSMP guidance materials. This is not to suggest that the Regional Board may not, in the final analysis, have the legal authority to change the SUSMP to its MCM equivalent. Nevertheless, it would be helpful from an administrative convenience standpoint to explain the need for the change in the fact sheet. It could be argued that the low impact development (LID) techniques have been successfully implemented through the SUSMP program for over five years.

- c. Issue: Retrofitting existing developments through the Land Use Development Program is not authorized under federal stormwater regulations. CFR 40 122.26 only authorizes retrofitting with respect to flood control devices which is to be explained in the MS4 permit as the following indicates:

*A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible.*

- d. Issue: The MCMs in the tentative order require off-site infiltration for groundwater recharge purposes. The tentative order is a stormwater permit, not a groundwater permit. As mentioned, 402(p)(3)(iii) of the Clean Water Act:

*Permits ... shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.*

The use of other infiltration controls that do not promote groundwater recharge have already demonstrated effectiveness in significantly reducing pollutants to the maximum extent practicable (MEP). Requiring infiltration anywhere for the purpose of recharging groundwater exceeds the scope of the MS4 since infiltrating to such an extent would add costs to the developer or permittee without significantly improving pollutant removal performance. Further, this requirement is unwarranted and premature because of the absence of outfall monitoring data that would demonstrate the need for groundwater-recharge oriented infiltration controls to address water quality standards and TMDLs vis-à-vis their intended purpose of protecting beneficial uses in a receiving water.

Conclusion: Requiring infiltration controls to facilitate groundwater recharge is not authorized under federal stormwater regulations. Further, many permittees are situated upstream of spreading grounds and other macro-infiltration basins that would obviate the need for this requirement.

Recommended Correction: Eliminate this requirement from the order.

**9. The Maximum Extent Practicable (MEP) definition needs to be revised to reflect is updated definition found in the draft Phase II MS4 permit and in the draft Caltrans MS4 permit.**

- a. Issue: The order's MEP reference is a carry-over from the 2001 MS4 permit. A great deal has happened over the decade to warrant an update. Fortunately, the State Board, through the draft Phase II and Caltrans MS4 permits, has revised the MEP definition to be in keeping with current realities. To that end it has proposed the following definition:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the "iterative approach."<sup>10</sup>*

Conclusion: The order's MEP is out of data and inconsistent with State Board policy.

Recommended Correction: Replace order's MEP definition with the above-mentioned language.

**10. The tentative order inappropriately includes the Middle Santa Ana River Bacteria TMDL.**

- a. Issue: It should be abundantly clear that the Regional Board cannot accept a TMDL adopted by another jurisdiction for implementation through the MS4 permit unless the Board includes into its basin plan as an

---

<sup>10</sup>Op. Cit., page 35.

amendment. This argument has been raised by legal counsel for the City of Claremont.

Conclusion: The Regional Board lacks legal authority to incorporate the Middle Santa Ana River bacteria TMDL into the proposed order.

Recommended Correction: Eliminate the requirement.

**11. Tentative order incorrectly asserts that its provisions do not constitute unfunded mandates under the California Constitution.**

- a. Issue: Contrary to what the order asserts, it contains provisions that exceed federal requirements in several places, thereby creating potential unfunded mandates. They include: (1) requiring wet and dry weather monitoring in the receiving water; (2) requiring numeric WQBELs; (3) requiring compliance with TMDL-related implementation plans, schedules, and monitoring; (4) requiring the non-stormwater discharge prohibition to include through and from the MS4; (5) revising the receiving water limitation language to include overbroad compliance requirements; (6) requiring groundwater recharge; and (7) monitoring for non-TMDL constituents at completed development project sites.

Conclusion: The order patently proposes requirements that create unfunded mandates.

Recommended Correction: Delete all of the aforementioned requirements that exceed federal regulations.

Los Angeles, CA 90013-2343

Attention Mr. Ivar Ridgeway

Dear Mr. Unger:

### **LOS ANGELES COUNTY FLOOD CONTROL DISTRICT – COMMENTS ON THE DRAFT NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT FOR MUNICIPAL SEPARATE STORM SEWER SYSTEMS WITHIN THE COUNTY OF LOS ANGELES**

The Los Angeles County Flood Control District (LACFCD) appreciates the opportunity to comment on the draft tentative Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit (Draft Permit) and supporting documents released on June 6, 2012. The enclosed comments are being submitted to meet the submission deadline of July 23, 2012, as required in the Notice for Public Comment. We further incorporate by reference the comments submitted by the County of Los Angeles.

The LACFCD has implemented many programs to improve stormwater and urban runoff quality in compliance with current MS4 Permit. These will continue to be implemented under the new MS4 Permit. The LACFCD is committed to improving the health of our water bodies. Our goal is to seek a permit that will allow permittees the flexibility to work together and focus their efforts on identified pollutants so that available resources are used most effectively. To that end, we not only offer the enclosed comments to the Draft Permit but also offer an alternative approach to compliance for consideration by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board).

### Draft Permit

Since the start of the permit renewal process in May 2011, Regional Board staff has expressed a willingness to work with stakeholders. However, permittees were not advised of the full scope of the proposed permit terms until the issuance of the full draft, and then were given only 45 days to comment. It is our strong belief that the 45-day public comment period does not provide sufficient time to conduct a thorough review of a highly complex permit over 500 pages long. Many crucial issues in the Draft Permit remain unresolved. The key issue, as explained in detail in the enclosed comments, is that the Draft Permit contains receiving water limitations language that essentially renders compliance impossible. The Regional Board cannot legally adopt a permit that permittees cannot comply with.

We believe that given sufficient time, this issue as well as most, if not all, issues can be resolved, avoiding the need to address them at the hearing. To address this and other critical issues in the Draft Permit, the LACFCD would like the opportunity to work with staff to develop creative solutions to address concerns of all stakeholders, including Regional Board members and the environmental community.

We also urge the Regional Board to postpone adoption of the Draft Permit in light of the case pending in front of the U.S. Supreme Court, *LACFCD v. Natural Resources Defense Council*. We expect that the U.S. Supreme Court will hear oral arguments in this matter in early December 2012. As the Regional Board is aware, the ruling in the case could clarify the scope of this permit. The Regional Board should not be adopting a new permit while there is uncertainty over it. There is no pending need for the Regional Board to act precipitously prior to the U.S. Supreme Court's hearing, which is only 90 to 120 days from the currently scheduled date for the consideration of the permit.

For these reasons, we request that the Regional Board extend the current public comment period by 90 days to allow the parties to fully comment on the Draft Permit's provisions. We further request that, after the first period of public comment, the Regional Board issue a second Draft Permit and reopen public comment on that second Draft Permit for 60 days. This will allow the permittees and the public to be advised of the Regional Board staff's position with respect to the initial comments made and to respond to any proposed revisions in light of those initial comments. It will also allow the parties additional time to work with staff in an attempt to resolve the outstanding issues that currently exist.

### Alternative Approach

With the recent release of the Draft Permit, we see an opportunity to evolve current and traditional thinking. This permit can change the way this region thinks about the MS4. One of the biggest obstacles to efficient and cost-effective stormwater discharge management is the fact that the MS4 is designed to provide flood protection by conveying as much water away from urbanized, developed areas into receiving waters. The traditional design of the MS4 has created a situation where pollutants must be prevented at the source, treated at the “end of pipe,” or must otherwise be diluted before reaching receiving waters. Under this system, pollutants that cannot or are not prevented at the source become an immediate problem for those charged with managing water quality in the MS4. Once pollutants enter the system, permittees may have no control over the journey the pollutants take and whether the pollutants may be addressed before reaching the receiving water. In addition, once pollutants enter the system, it may be impossible to determine their source. Monitoring, therefore, serves only to highlight the fact of a potential discharge and offers no guidance for preventing discharges in the future.

To date, the Water Boards have addressed receiving waters limitations through a combination of a prohibition on discharges and an iterative process to assist permittees. However, we believe that the current approach does little to assist permittees in truly addressing water quality by attacking discharges on a more site-specific basis. The end result is that monitoring is used to punish, rather than encourage, permittees to identify and address problems.

The current Draft Permit looks to old methods of pollutant control and is based upon a punitive, not incentive, mentality. We would like to see a permit that offers solutions to control the discharge of pollutants, not one that merely imposes consequences for exceedances of water quality standards. We hope that staff will allow us time to suggest a more regional approach towards MS4 management and pollutant prevention. We believe that incorporating such an alternative into this permit will increase stormwater management and reuse and thereby will meet numerous goals beyond improving water quality. Such an approach can increase water supply, protect resources downstream of the MS4, reduce treatment costs, and encourage permittees to address discharges both at the source and before they exit the MS4.

At the outset, let us be clear that we have no intention of eliminating TMDL requirements or the Receiving Water Limitations (RWL) language. However, we believe there is room to allow for an alternative track to compliance with water quality standards that will complement the current Best Management Practice-based iterative process.

Just as the Regional Board has looked to the development community to implement Low-Impact Development (LID) management methods to reduce runoff, we believe that permittees can be incentivized to better utilize stormwater reuse to reduce runoff and treat pollutants before they are discharged into receiving waters. The next MS4 Permit offers an opportunity to guide municipal stormwater permittees towards a program of increased water quality and increased stormwater reuse opportunities as an alternative method to the traditional iterative RWL approach. However, it is not enough to simply encourage permittees to do so. In order to bring together the expertise, funding, and cooperation of the many local agencies required to implement a regional plan, the Regional Board must offer permittees the opportunity to identify and implement solutions for both private and public development.

As the Regional Board is aware, the Southern California Water Committee Storm Water Task Force, of which the Flood Control District is a leading member, has issued a white paper on stormwater capture opportunities and how they might be implemented through municipal stormwater permits. One focus of the white paper is an examination of the advantages and disadvantages of having permittees explore two complementary strategies to manage stormwater, using onsite LID as well as regional stormwater capture and infiltration. Permittees should be encouraged to design facilities to accept stormwater flows from proposed developments as well as existing developments and to locate them in areas that maximize water supply benefits.

The approach we advocate is consistent with efforts already underway within the region through local agencies and nongovernmental organizations. For example, nongovernmental organizations are working to identify areas lacking open space, where public lands could be used to effectively capture and treat polluted runoff. Those areas are converted into parks, habitat, and other recreation lands, which use soil and plants to capture and naturally filter and clean polluted runoff through. The end result benefits the region in numerous ways. Urban communities, which are often "park-poor," gain open space, parks, and wild land habitat. Municipalities achieve compliance with Regional Board requirements, and at the same time, the cleaned runoff can be stored for reuse, thereby recharging water supply for a region that heavily depends upon groundwater pumping. The LACFCD, together with the City of Los Angeles, constructed the award-winning Sun Valley Park Infiltration Project. The project resolved chronic flooding in a neighborhood by capturing stormwater and infiltrating it into the groundwater through infiltration basins constructed in a local park. This project resolved local flooding, improved water quality, increased the local water supply, and improved recreational amenities in the park.

Projects such as those described above can provide permittees a roadmap to better manage their stormwater runoff in a way that delivers many beneficial and tangible results. Working cooperatively, permittees, the Regional Board, and affected communities could expand this concept into areas that contribute various constituents of concern into coastal watersheds and other receiving waters. Stormwater management tools such as bioretention and infiltration can address many constituents that are already subject to TMDLs and other requirements, providing a single solution to many problems, rather than a constituent-by-constituent approach. This regional approach can also address those priority pollutants that are not currently covered by TMDLs.

By using public lands, in addition to LID on private development, permittees can capture and treat a much higher volume of runoff. The technology can also be applied to public roadways, which are a chronic contributor of various constituents of concern (including metals) to receiving waters. By including this type of approach within the MS4 Permit, the Regional Board will encourage permittees to adopt regional solutions to address their contributions to water quality problems.

In addition, as the Regional Board is aware, the LACFCD has an extensive history of stormwater infiltration through its extensive network of spreading grounds. For almost 100 years, spreading grounds throughout the region serve to replenish groundwater, which provides one-third of our local water supply.

Given the work performed by the LACFCD, the Southern California Water Committee Storm Water Task Force, and others, to date, we believe that a regional approach should be incorporated into the MS4 Permit and are prepared to work with staff to craft requirements to effect this alternative approach to meeting effluent limitations for receiving water requirements. We hope that staff will allow us the opportunity to do so. Although we are requesting additional time to develop the details, we offer some initial concepts.

As mentioned earlier, we have no intention of eliminating TMDL requirements or the RWL language. However, we suggest that the next Draft Permit include an alternative requirement in the RWL section that would set forth a procedure for permittees to develop and implement a stormwater infiltration and reuse program as a path to compliance. We envision an approach similar to the LID Technical Guidance Manual required in the current Ventura MS4. That is, the permit would allow participating permittees to develop a stormwater infiltration and reuse manual within 18 months of permit adoption. More extensive monitoring would allow permittees to set Numeric Action Levels for pollutants of concern, which, in turn, would drive project prioritization. The program and manual would be subject to the Executive Officer's approval. Once implementation of the program is complete, the permittee will be deemed in full compliance with the RWL section requirements.

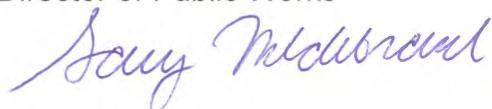

Mr. Samuel Unger  
July 23, 2012  
Page 6

Thus, we see the potential for a two-track road to compliance with water quality standards. Permittees who choose to continue to follow the current iterative process may do so with the additional requirements set by TMDLs. But Permittees who believe that a more effective method exists to reduce massive amounts of pollutant loads by simply reducing the amount of runoff will be encouraged to implement stormwater reuse projects. Some permittees, together with others in the water supply community, are willing to invest the substantial financial resources necessary to monitor, study, and implement a regional stormwater recharge/reuse plan. However, permittees and Regional Board staff need time to work together to determine how such a program may exist within the framework of the currently proposed MS4 Permit. The LACFCD believes that allowing permittees to develop and implement stormwater infiltration and reuse as a path to compliance would go further to address water quality problems within the MS4 than the region has been able to achieve under the current iterative process. We also believe that in a time of limited resources, it makes sense to increase the reuse of natural resources while we carefully invest and prioritize our limited financial resources. We look forward to working with the Regional Board to find a way to effect such a program on such a revolutionary scale.

If you have any questions, please contact me at (626) 458-4300 or [ghildeb@dpw.lacounty.gov](mailto:ghildeb@dpw.lacounty.gov) or your staff may contact Ms. Angela George at (626) 458-4325 or [ageorge@dpw.lacounty.gov](mailto:ageorge@dpw.lacounty.gov).

Very truly yours,

GAIL FARBER  
Director of Public Works

GARY HILDEBRAND  
Assistant Deputy Director  
Watershed Management Division

**Los Angeles County Flood Control District Comments**  
**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

General Comments			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
1	Request for Extension of Time in Which to Submit Comments and to Continue the Hearing		<p>The LACFCD requests that the current public comment period be extended by 90 days to allow the parties to fully comment on the draft Permit’s provisions. We further request that, after that period of public comment, the Regional Board issue a second draft, tentative Permit and reopen public comment on that second draft Permit for 60 days. The hearing on the Permit can occur 30 to 60 days after comments are submitted on the second draft, or at another time as the Regional Board finds appropriate.</p> <p>This request is made because the 45 day period that has been currently given to the Permittees has been inadequate. This request is also made because the Regional Board should not conduct a hearing on a new permit while a case that could directly impact the scope of the new Permit, <i>Los Angeles County Flood Control District v. Natural Resources Defense Council</i>, is pending before the United States Supreme Court.</p> <p>First, the current 45 day period that has been provided for comments on the draft Permit is grossly inadequate, such that it amounts to a violation of due process. The draft Permit and its accompanying documents are over 500 pages long. The draft Permit is highly complex, requiring extensive analysis of the obligations it imposes. The proposed Permit will impose significant costs on the Permittees, costs which must be fully analyzed and considered. Although Regional Board staff held some workshops on permit proposal, the LACFCD had no knowledge of the Permit’s definitive terms until it was issued on June 6, 2012, and its issuance was the first time a complete permit, rather than merely proposed portions subject to revision, was issued to the Permittees and the public.</p> <p>As a public agency with a responsibility to protect the public fiscal resources, the LACFCD must fully consider all aspects of the draft Permit and consult with many different departments before providing a full response. The 45 day period does not provide sufficient time for the LACFCD to do so. It also does not allow the LACFCD to adequately prepare and submit its evidence on the duties and costs proposed under the Permit.</p>

<b>General Comments</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
1 (cont.)	Request for Extension of Time in Which to Submit Comments and to Continue the Hearing		<p>Second, there is currently pending in the United States Supreme Court the case of <i>Los Angeles County Flood Control District v. Natural Resources Defense Council</i>. We expect that the Supreme Court will hear oral arguments in this matter in early December 2012. As the Regional Board is aware, the ruling in the case could clarify the reach of the Permit. The Regional Board should not be adopting a new permit while there is a cloud over hanging it. There is no pending need for the Board to act precipitously prior to the Supreme Court's hearing which is only 90 to 120 days from the currently scheduled date for the consideration of the Permit.</p> <p>For these reasons, we request that the Regional Board extend the current public comment period by an additional 90 days, issue of a second draft permit for public comment, and hold the hearing on the draft Permit be held 30 to 60 days after close of the comments on the second tentative draft, or at another time as the Regional Board finds appropriate.</p>
2	Incorporation of Previous Comments		To the extent that they have not been incorporated, the LACFCD reiterates and incorporates by reference our comments submitted on February 9, 2012, April 12, 2012, April 18, 2012, and May 14, 2012 (see Exhibits A, B, C, D, and O).
3	Incorporation of County of Los Angeles Comments		We incorporate by reference the comments submitted by the County of Los Angeles.

Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>General Comments</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
4	LACFCD Permit		<p>The LACFCD has submitted a Report of Waste Discharge requesting an individual MS4 permit. Placing the LACFCD in a combined permit without its consent is unlawful. The Regional Board has no discretion to issue a combined permit over an applicant’s objection.</p> <p>The Clean Water Act provides that permits for discharges from municipal storm sewers may be issued on a system-wide or jurisdiction-wide basis. 33 U.S.C. § 1342(p)(3)(B)(i). The federal regulations implementing the Act similarly provide that permits for stormwater discharges can be issued either through “one system-wide permit” or through “distinct permits,” including for “individual discharges from municipal separate storm sewers within the system.” 40 C.F.R. § 122.26(a)(3)(ii).</p> <p>The draft Permit states that the Regional Water Board has “discretion as the permitting authority” to determine whether to issue a system-wide permit or individual permit. This position is legally erroneous. The Regional Board cannot require a permittee to participate in a system-wide permit over the Permittee’s objection. Pursuant to 40 C.F.R. § 122.26(a)(3)(iii), the operator of a municipal separate storm sewer may either participate in a joint application with other operators or “[s]ubmit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible.” 40 C.F.R. § 122.26(a)(3)(iii)(B). Thus, the federal MS4 regulations give an individual municipality or public entity operating a municipal separate storm sewer the right to obtain an individual stormwater permit. The regulations do not authorize the Regional Water Board to issue a permit for which a municipality or entity has not applied and over their objection.</p> <p>Additionally, the draft Permit states that the Regional Water Board is issuing a system-wide permit and justifies its actions on that finding. The finding, however, is factually erroneous. The Board is not issuing a system-wide permit. The Regional Water Board has specifically excluded the City of Long Beach from this draft Permit, even though that city’s MS4 is as much a part of the “system” (and its area as much a part of the watersheds ) as any of the Permittees included in the draft Permit. The draft Permit is not a system-wide permit.</p>

<b>General Comments</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
4 (cont.)	LACFCD Permit		<p><u>Recommendation</u> Delete the LACFCD from the draft Permit and issue the LACFCD a separate permit, or include a separate chapter that clearly describes the requirements applicable to the LACFCD as set forth in Exhibit V - Proposed LACFCD Findings for 2012 MS4 permit (clean) and Exhibit W - FCD Chapter (Proposed MCM) 5-1-12 (rev2).docx.</p>
5	Title of the Permit	Title [Page 1]	<p>The draft Permit is currently titled "Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges Within the Los Angeles County Flood Control District, including the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach." This title is not accurate. The Permit covers several MS4 systems and there are discharges within the LACFCD's jurisdiction that are not covered by this Permit.</p> <p><u>Recommendation</u> To be accurate, the title should be "Waste Discharge Requirements for 84 Incorporated Cities Within the County of Los Angeles, the County of Los Angeles, and the Los Angeles County Flood Control District."</p>

<b>Part II. Findings</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
8	Primary Pollutants of Concern	II.A. [Page 13]	<p>The Findings list the primary pollutants of concern as identified in by the Los Angeles County Flood Control District Integrated Receiving Water Impacts Report from 1994-2000 as indicator bacteria, nutrients, total dissolved solids, turbidity, total suspended solids, total aluminum, dissolved cadmium, copper, lead, total mercury, nickel, zinc, cyanide, bis(2-ethylhexyl)phthalate, polycyclic aromatic hydrocarbons (PAHs), diazinon, and chloropyrifos. A more recent report from 1994-2005 determined constituents of concern based on the more recent mass emission monitoring data and should be referenced in the findings.</p> <p><u>Recommendation</u> Reference the more recent 1994-2005 report that indicates the constituents of concern are: indicator bacteria, total aluminum, copper, lead, zinc, diazinon, and cyanide.</p>
9	Debris and Trash	II.A. [Page 13]	<p>The finding states that stormwater and non-stormwater discharges of debris and trash are also a pervasive water quality problem in the Los Angeles Region. This finding apparently ignores the tremendous efforts made on the various Trash TMDLs.</p> <p><u>Recommendation</u> Include a statement that the trash TMDLs and the significant efforts on the part of the Permittees have reduced trash generation in the various watersheds.</p>
10	Use of LACFCD area as jurisdictional boundary	II.B, D, Table 6, Table 7 [Pages 13, 15, 20, 23]	<p>The current language, "...84 Cities within the Los Angeles County Flood Control District..." appears to imply the LACFCD has jurisdiction or oversight over the municipalities. The LACFCD boundary is merely a service area boundary. See Comment No. 6.</p> <p><u>Recommendation</u> Revise to read:</p> <p>"...84 Cities within <del>the</del> Los Angeles County <del>Flood Control District</del>..."</p>

<b>Part II. Findings</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
11	Permit Application	II.C [Pages 14-15]	<p>This Finding asserts that the Regional Water Board considered the “appropriateness of permitting discharges from MS4s on a system-wide or jurisdiction-wide basis or a combination of both” but concluded that “one system-wide permit is appropriate.” The draft Permit proposes to combine the LACFCD, the County and 84 cities (but not the City of Long Beach) in a single combined permit.</p> <p>The Finding also asserts that “as the primary owner and operator of the Los Angeles County MS4, the LACFCD should remain a Permittee in the single system-wide permit.”</p> <p>As discussed in greater detail in the General Comments section of these comments, the LACFCD has submitted a report of waste discharge requesting an individual MS4 permit. Placing the LACFCD in a combined permit without its consent is unlawful. The Regional Board has no discretion to issue a combined permit over an applicant’s objection.</p> <p>The Clean Water Act provides that permits for discharges from municipal storm sewers may be issued on a system-wide or jurisdiction-wide basis. 33 U.S.C. § 1342(p)(3)(B)(i). The federal regulations implementing the Act similarly provide that permits for stormwater discharges can be issued either through “one system-wide permit” or through “distinct permits,” including for “individual discharges from municipal separate storm sewers within the system.” 40 C.F.R. § 122.26(a)(3)(ii).</p>

**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

Part II. Findings			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
11 (cont.)	Permit Application	II.C [Pages 14-15]	<p>The draft Permit states that the Regional Water Board has “discretion as the permitting authority” to determine whether to issue a system-wide permit or individual permit. This position is legally erroneous. The Regional Board cannot require a permittee to participate in a system-wide permit over the Permittee’s objection. Pursuant to 40 C.F.R. § 122.26(a)(3)(iii), the operator of a municipal separate storm sewer may either participate in a joint application with other operators or “[s]ubmit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible.” 40 C.F.R. § 122.26(a)(3)(iii)(B). Thus, the federal MS4 regulations give an individual municipality or public entity operating a municipal separate storm sewer the right to obtain an individual stormwater permit. The regulations do not authorize the Regional Water Board to issue a permit for which a municipality or entity has not applied and over their objection.</p> <p>Additionally, the draft Permit states that the Regional Water Board is issuing a system-wide permit and justifies its actions on that finding. The finding, however, is factually erroneous. The Board is not issuing a system-wide permit. The Regional Water Board has specifically excluded the City of Long Beach from this draft Permit, even though that city’s MS4 is as much a part of the regional storm sewer “system” (and its area as much a part of the watersheds) as those MS4s and cities included under the Permit. The Regional Water Board has provided no justification for excluding Long Beach.</p> <p>Finally, the LACFCD, while a significant MS4 operator in the County, is not the “primary owner and operator of the Los Angeles County MS4.” First, the LACFCD owns and operates <i>only</i> its own MS4. The County and the 84 cities named in the Permit each own and operate their own MS4s. The LACFCD further objects to the term “Los Angeles County MS4,” since it assumes the existence of a single MS4 instead of a collection of separate MS4s system which, or which may not, be interconnected. Second, even were the county-wide MS4 to be considered a single system (which it is not), since city streets form the single most significant part of the count MS4, and the LACFCD owns or operates no streets, there would be no support for such a finding. Other municipalities, including the City of Los Angeles, own or operate a significant portion of the MS4 in the urbanized areas of the County.</p>

<b>Part II. Findings</b>			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
12	Permit Application	II.C [Pages 14-15]	<p><u>Recommendation</u> Delete language referring to the “combined” Permit and regarding the LACFCD as the “primary owner and operator of the Los Angeles County MS4”; issue the LACFCD its requested individual permit. Also, wherever in the draft Permit the term “Los Angeles County MS4” appears, delete and replace with “MS4s subject to this Order.”</p>
13	Primary owner and operator of MS4	II.C. [Page 15]	<p>The finding states that the LACFCD should remain a Permittee in a single system-wide permit because it is the primary owner and operator of the Los Angeles County MS4. This statement is misleading since it does not acknowledge that MS4 also includes streets and roads, and as such, other Permittees also own and operate a significant portion of the Los Angeles County MS4.</p> <p><u>Recommendation</u> Revise to read:</p> <p>“The Regional Water Board also determined that <del>as the primary owner and operator of the Los Angeles County MS4</del>, <u>because it operates MS4 infrastructure in each watershed management area</u>, the LACFCD should remain a Permittee in the single system-wide permit;...”</p>
14	Permit Coverage and Facility Description	II.D. [Page 15-16]	<p>This section inappropriately singles out the LACFCD when it should address the area being covered by this draft Order. There are areas within the service area of the LACFCD that are not covered under this Order.</p> <p>This paragraph should also state that the MS4 also includes the street networks from all Permittees.</p>

**Los Angeles County Flood Control District Comments**  
**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

Part II. Findings			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
14 (cont.)	Permit Coverage and Facility Description	II.D. [Page 15-16]	<p><u>Recommendation</u>            Revise the last paragraph of Part II.D as follows:</p> <p>The <del>Los Angeles County Flood Control District</del> <u>area covered under this Order</u> encompasses more than 3000 square miles. <del>The LACFCD</del> <u>This area</u> contains a vast drainage network...Maps depicting the major drainage infrastructure of the <del>LA County MS4</del> <u>area covered under this Order</u> are included in Attachment C <del>of this Order</del>.</p>
15	Total Maximum Daily Loads	Part II.J.1 [Pages 20-23]	<p>The County and the LACFCD are concerned that final WLAs for State-adopted TMDLs have been incorporated as numeric effluent limitations that apply at the point of discharge from the MS4 and, where applicable, as receiving water limitations. The more appropriate approach is to incorporate interim and final WLAs as BMP-based effluent limitations defined as TMDL Control Measures required in the Watershed Management Program.</p> <p><u>Recommendation</u>            Refer to the attached file titled "Exhibit F - LACMS4 Redlined TMDL Excerpts 20Jul2012Rev" for language in the Findings section that addresses this concern.</p>

**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

Part III. Discharge Prohibitions			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
16	Prohibitions of Non-Storm Water Discharges – Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Discharges	III.A.1.b & Attachment F – IV.A.5 [Page 26 & Pages F-25 – F-26]	<p>As proposed, all discharges authorized by the USEPA under CERCLA, including well development and redevelopment of extraction wells, which normally require coverage under General NPDES Permit No. CAG994004 – Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties would be exempt. CERCLA discharges may fall under CAG914004 – Discharges of Treated Groundwater from Investigation and/or Cleanup of Volatile Organic Compounds Contaminated Sites to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, or CA834001 – Waste Discharge Requirements for Treated Groundwater and Other Wastewaters from Investigation and/or Cleanup of Petroleum Fuel-Contaminated Sites to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties. There should be no exception for CERCLA discharges to comply with permit requirements that other dischargers must follow. MS4 Permittees do not have such waivers when compliance is not practicable; other dischargers should be held to the same standards.</p> <p>In addition, although discharges are required to comply with applicable water quality standards, the requirement can be waived if compliance is not practicable. The Permit also waives prior notification for unplanned discharges, and only requires notification within 24 hours after the unplanned discharge has occurred. Such waivers can have significant impacts to MS4 Permittees as they are held liable for discharges to their MS4. Lack of notification prior to an unplanned discharge can also impact LACFCD operations and system capacity, as well as endanger field staff and contractors working in its storm drains and channels.</p> <p><u>Recommendation</u>            Require CERCLA dischargers to seek coverage under the appropriate NPDES Permit and comply with all requirements. In addition, dischargers must notify MS4 Permittees prior to unplanned discharges, and comply with any requirements issued by the MS4 Permittee.</p>

<b>Part III. Discharge Prohibitions</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
17	All Discharge Categories – Segregation of Flows, Notification	Table 8, Attachment F – IV.A.5 [Page 33, Page F-26]	<p>As written, the Permit would require segregation of conditionally exempted discharges from potential sources of pollutants. Since the MS4 can receive flows from multiple discharges and sources, segregating the conditionally exempt flows may not be feasible.</p> <p>The Permit also would require that the Los Angeles County Flood Control District require dischargers of one acre-foot (325,581 gallons) or more to provide advance notification to potentially affected MS4s, including, at minimum, the District and the Permittee with land use jurisdiction of the originating discharge.</p> <p>It is not the sole responsibility of the LACFCD to require advanced notification. The LACFCD is not necessarily in a position to know when one acre-foot or more of discharge will be entering its MS4. The point of initial contact with the “MS4” will in many cases be the street or gutter, which are owned by the municipality, not the LACFCD. Also, a number of entities operate significant MS4 systems, so there is no reason for the requirement to single out the LACFCD. This should be the responsibility of all the MS4 Permittees.</p> <p>Also, most residential swimming pools hold from 20,000 to 22,000 gallons of water, and decorative fountains even less. Is the one-acre foot threshold intended to exempt residential swimming pools and most decorative fountains from advanced notification? This notification would only apply to lakes dewatering and municipal/county/commercial swimming pools that are approximately half the size of an Olympic-sized swimming pool (approximately 660,000 gallons). Notification should be set at 30,000 gallons.</p>

<b>Part III. Discharge Prohibitions</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
18	Table 8 – Conditions and BMPs – Prescriptive and Resource Intensive	Table 8, Attachment F – IV.A.5 [Pages 33-36, Page F-27 – F-28]	<p>First, the use of the word “ensure” in the conditions/BMPs should be deleted, since the requirement is being asked of a third-party discharger, not the Permittee. A Permittee cannot “ensure” the conduct of a third-party discharger. The provision should use the term “require” instead.</p> <p>Second, the Permit would add tremendous burden on MS4 Permittees to address exempt non-storm water discharges which are generally perceived to be low risk. Specifically, Section III.A.2.b combined with Table 8 would require Permittees to develop and implement procedures to ensure discharges meet very prescriptive and often highly resource intensive BMPs. For the dewatering of lakes, swimming pools/spas, and decorative fountains, the requirement to inspect and clean the MS4 inlet and MS4 outlet to the receiving water immediately prior to discharge raises significant practical problems. The owner/operator of the outlet often is different from the owner/operator of the inlet or the initial MS4 (such as the street), and thus not aware of the discharge. The MS4 outlet may also not be easily identifiable by the discharger or the initial MS4 owner/operator. This requirement is logistically infeasible, impractical, highly resource-intensive, and expensive. Moreover, since the outlet (which is discharging water from numerous sources) is constantly discharging, there should not be a need to clean it out.</p>

<b>Part V. Receiving Water Limitations</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
19	The Receiving Water Limitations Section Must be Revised	V.A. [Pages 37-38]	<p>The Receiving Water Limitation section of the draft Permit is both unlawful and unwise. The draft:</p> <ul style="list-style-type: none"> <li>• turns upside down prioritization of efforts to reduce stormwater pollution under the Permit by emphasizing those pollutants of less significance over those of greater significance;</li> <li>• fails to include provisions that would incentivize Permittees to coordinate their efforts under this section with the TMDLs as well as other goals of the Permit;</li> <li>• is an abuse of discretion because it is impossible to comply with; and</li> <li>• creates inordinate liability for Permittees due to third party lawsuits.</li> </ul> <p>All of these deficiencies can be remedied, and this section of the Permit improved, by making this section consistent with the approach to TMDLs set forth in Part VI.E.</p> <p>According to the draft Fact Sheet issued in support of the draft Permit, a Permittee can be found in violation of Parts 1 and 2 of the receiving water limitations, even though the Permittees are complying in good faith with the iterative process set forth in Part 3. In contrast, where there are exceedances of pollutants addressed by TMDLs, a Permittee is not considered to be in violation of the Permit if it is in compliance with an approved watershed management program. The combination of these two parts of the Permit results in the Permit turning upside down the prioritization of efforts to address pollutants in stormwater.</p> <p>As a result of the draft Permit’s approach to receiving water limitations, a Permittee must give priority to those pollutants whose exceedances cause a violation of the receiving water limitation section. Otherwise the Permittee would be in violation of the Permit. Those exceedances, however, are exceedances which the Regional Board has considered to be of lesser priority as not warranting the preparation of a TMDL as of this time.</p>

**Los Angeles County Flood Control District Comments**  
**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Part V. Receiving Water Limitations</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
19 (cont.)	The Receiving Water Limitations Section Must be Revised	V.A. [pages 37-38]	<p>On the other hand, it is the pollutants which are the subject of the TMDL that have been found to be of greater significance. Accordingly, it is to those pollutants to which the parties' efforts should be most directed. The approach set forth in the receiving water limitation section, however, turns this prioritization upside down.</p> <p>To remedy this circumstance, the draft Permit should provide that pollutants not covered by TMDLs but whose presence violates receiving water limitations should be addressed by the Permittees in conjunction with their watershed management program when one is being developed or exists, and compliance with that watershed management program is compliance with receiving water limitations. By doing so, Permittees can incorporate and prioritize their efforts to address exceedances of non TMDL pollutants with their efforts to address pollutants addressed by TMDLs.</p> <p>Second, the receiving water limitation section fails to provide any incentive for innovative programs that might address exceedances of receiving water limitations. The LACFCD recommends that an incentive be included to develop new, innovative approaches, particularly those that will result in greater infiltration of stormwater before it reaches the MS4. Accordingly, we propose that a paragraph be added to the receiving water limitation section that would provide that a Permittee can be deemed in compliance if it is developing projects that will result in greater infiltration of stormwater in the watersheds where the water limitations are being exceeded.</p> <p>Third, the receiving water limitations section, as drafted, is unlawful and an abuse of discretion. The section, as written, is impossible to comply with.</p>

**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Part V. Receiving Water Limitations</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
19 (cont.)	The Receiving Water Limitations Section Must be Revised	V.A. [pages 37-38]	<p>It is well recognized that stormwater is variable and that municipal stormwater Permittees do not have control over stormwater flows. As a result, it is difficult, and at times impossible, to engineer solutions or adopt programs to fully address the pollutants in stormwater. The State Water Board’s Blue Ribbon Panel found in 2006, “it is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban discharges.” (see Exhibit G - State Water Board Blue Ribbon Panel Final Report) In response to public comment dated April 27, 2012, regarding the draft tentative order for the renewal of the MS4 Permit for the California Department of Transportation, State Water Board staff cited this finding of the Blue Ribbon Panel and endorsed it.</p> <p>The current draft of the receiving water limitations, however, does not recognize the finding by the State Water Board’s Blue Ribbon Panel and there is no evidence in the fact sheet that supports a finding that the Permittees can comply with this section. On the contrary, our analysis of available outfall monitoring data supports the Blue Ribbon Panel’s conclusion. Because storm drain outfall monitoring has not been conducted in Los Angeles County in the past, we conducted an analysis of available outfall monitoring data from urbanized areas similar to Los Angeles County. The purpose of the analysis was to compare real outfall monitoring results from urban areas with applicable Water Quality Standards. The results, summarized in Exhibit H - Outfall Data Summary, show that storm drain discharges can and do exceed Water Quality Standards. For example, discharges exceeded the e. Coli and other bacterial Water Quality Objectives 50 to 100 percent of the time. Unless a water body has an established bacterial TMDL – and there are currently no bacterial TMDLs for Dominguez Channel and San Gabriel River – it is not possible for Permittees to comply with the receiving water limitations.</p>

Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Part V. Receiving Water Limitations</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
19 (cont.)	The Receiving Water Limitations Section Must be Revised	V.A. [pages 37-38]	<p>Finally, the receiving water limitations language, as drafted, creates inordinate legal liability for Permittees due to third-party law suits. In the past, Regional Board staff has said that they would exercise prosecutorial discretion with respect to enforcement, but those statements provide no comfort to Permittees. Exhibit I - Stockton Summary 2012-07-20 is a technical memorandum that discusses how a Permittee subject to similar language, the City of Stockton, was subject to a lawsuit even though it was in full compliance with the iterative process.</p> <p>As discussed above, the Permit recognizes this issue with respect to those pollutants addressed by TMDLs. There is no reason why a different standard should apply to the pollutants not addressed by TMDLs.</p> <p><u>Recommendation</u> Part V should include the following paragraph:</p> <p style="padding-left: 40px;">In lieu of preparing an integrated monitoring compliance report set forth in Part V.A.3.a. a Permittee may address discharges from the MS4 that cause or contribute to a violation of receiving water limitations in their watershed management program applicable to the receiving water. The Permittee shall not be considered to be in violation of Part V.A. of this Order if it is in compliance with that watershed management program.</p> <p>Part V should also add the following:</p> <p style="padding-left: 40px;">If a Permittee is found to have discharges from its MS4 causing or contributing to an exceedance of an applicable water quality standard or causing a condition of nuisance in the receiving water, the Permittee shall be deemed in compliance with Parts 1 and 2 above, unless it fails to implement the requirements provided in Parts 3 and 4 as otherwise covered by a provision of this order specifically addressing the constituent in question, as applicable.</p>

<b>Part V. Receiving Water Limitations</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
19 (cont.)	The Receiving Water Limitations Section Must be Revised	V.A. [pages 37-38]	Alternatively, the LACFCD is supportive of the proposed CASQA Receiving Water Limitation language in Exhibit J - CASQA proposal - Receiving Water Limitation Provision to Stormwater NPDES Permits.
20	Definition of Receiving Water Limitations	V.A. & Attachment A - Definitions [Pages 37-38 and A-8]	<p>The definition of receiving water limitation includes any applicable numeric or narrative water quality objective or <i>criterion</i> contained in the “water quality control plan for the Los Angeles Region (Basin Plan), water quality control plans <i>or policies</i> adopted by the State Water Board, or federal regulations, including but not limited to 40 C.F.R. § 131.38.” Draft Permit, p. A-8 (emphasis added).</p> <p>The reference to “policies” adopted by the State Water Resources Control Board is ambiguous. The State Board adopts water quality objectives and water quality control plans, not policy resolutions. See Water Code § 13170. It is not clear what is meant by policies.</p> <p>Additionally, the definition should not reference “criterion” under federal regulations. Permittees are not required to comply with federal water criteria. A Permittee is only required to comply with water quality standards adopted by the state or federal government that are applicable to the particular waterbody. In referring to “criterion” that might be under federal regulations, the definition could be construed as referring to criteria with which Permittees are not required to comply. It creates ambiguity in the definition.</p> <p><u>Recommendation</u> The reference to “policies” adopted by the State Board and “criterion” should be deleted from the definition of receiving water limitation.</p>
21	Notification for Exceedances	V.A.3.a. Footnote 23 [Page 37]	<p>30 days does not provide sufficient time to do the data analysis and determination.</p> <p><u>Recommendation</u> For footnote 23, revise to read: “Within <del>30</del><u>90</u> days of receipt of analytical results from the sampling date.</p>

<b>Part VI.C. Watershed Management Program</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
22	General	VI.C.1 [Page 45]	<p>While the Fact Sheet indicates the Watershed Management Program can be performed individually or collectively (Page F-39), the language in the Watershed Management Program Provisions (Part VI.C.) should clearly affirm that Watershed Management Programs can be done by one single Agency and/or a Watershed Group.</p> <p><u>Recommendation</u>            In VI.C.1., add language that states “Permittees may participate in the Watershed Management Program individually or collectively” so that the Fact Sheet and Provision language are consistent.</p>
23	Adaptive Management Process for Watershed Management	VI.C. [Pages 45-56]	<p>Related to our Comment No. 19 for Part V Receiving Water Limitations, the draft Permit needs to be revised to address pollutants not covered by TMDLs but whose presence violates receiving water limitations. Such exceedances should be addressed by Permittees in conjunction with their watershed management program or jurisdictional storm water management program, and compliance with that program should equate compliance with receiving water limitations. This allows Permittees to incorporate and prioritize their efforts to address exceedances of non-TMDL pollutants with their efforts to address pollutants addressed by TMDLs.</p> <p><u>Recommendation</u>            Add the following to the end of Part VI.C.1.b.:</p> <p>“and to address discharges that cause or contribute to receiving water limitations exceedances not covered under a TMDL.</p>
24	Sizing of Structural Controls	VI.C.3.b.iv.(4).(c) of working proposal [Page 52 of tentative order]	<p>The staff working proposal required that structural controls be sized <i>at a minimum</i> to treat the volume of stormwater runoff from the 85th percentile, 24-hour storm. However, the tentative order removed this item. To be consistent with the TMDL requirement (E.2.d.4, page 113), re-insert this item and remove the “at minimum” language.</p> <p><u>Recommendation</u>            Re-insert item c from the working proposal and delete the "at minimum" language.</p>

<b>Part VI.D.1. Storm Water Management Program Minimum Control Measures</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
25	Receiving Water Limitations Exceedances Addressed by the Adaptive Management Process	VI.C.6.a.ii.(1) & 6.b.ii.(1) [Pages 55 & 56]	<p>Related to our Comment No. 19, we recommend the following as a remedy to address pollutants not covered by TMDLs but whose presence violates receiving water limitations. Such exceedances should be addressed by Permittees in conjunction with their watershed management program or jurisdictional storm water management program, and compliance with that program should equate compliance with receiving water limitations. This allows Permittees to incorporate and prioritize their efforts to address exceedances of non-TMDL pollutants with their efforts to address pollutants addressed by TMDLs.</p> <p><u>Recommendation</u>            Add "The Permittee shall not be considered in violation of a Receiving Water Limitation (Part V.A.) or a Water Quality Based Effluent Limitation if it is implementing the adaptive management process."</p>
26	General Requirements	VI.D.1.a. [Page 56]	<p>This section states that each Permittee may implement customized actions within each general category of control measures as set forth in an approved Watershed Management Program. The deadline to submit a draft Watershed Management Program Plan is one year after the effective date of the Permit and the final Plan is due 3 months after receipt of the Regional Board's comments. That means that it could easily take 1½ years or more for Permittees to have an approved Watershed Management Program. It is not clear if the Permittees are expected to implement all of the minimum control measures in the draft tentative order until their customized actions are approved.</p> <p><u>Recommendation</u>            For those Permittees that have indicated their intent to customize their minimum control measures through a Watershed Management Program, allow them to continue implementing the Stormwater Quality Management Program requirements per the current (2001) Permit.</p>

**Los Angeles County Flood Control District Comments**  
**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Part VI.D.1. Storm Water Management Program Minimum Control Measures</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
27	Timelines for Implementation	VI.D.1.b.i [Page 56]	<p>This section states that unless otherwise noted, each Permittee shall ensure implementation of requirements contained in Part VI.D within 30 days after the effective date of the Order. Most of the requirements in the section do not have a separate time schedule noted and would need to be implemented within 30 days of the effective date. While immediate implementation is feasible for such requirements that exist in the current (2001) Permit, it is not feasible to implement most new requirements, such as the Integrated Pest Management Program. Such new requirements should be allotted more time to develop and ultimately implement.</p> <p><u>Recommendation</u>            Clarify the language such that the 30 day timeline only applies to carryover requirements from the current (2001) Permit and development of new requirements are to begin within 30 days of the effective date.</p>

**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Part VI.D.4. Public Information and Participation Program</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
28	General	VI.D.4.a.i [Page 58]	<p>This section requires that a PIPP must be implemented “that includes, but is not limited to, the requirements listed in this part.” (emphasis supplied.) This is problematic language, because it purports to state that a PIPP must include unspecified additional requirements that could be found wanting by the RWQCB or a court.</p> <p><u>Recommendation</u>            Modify to read “Each Permittee shall implement a Public Information and Participation Program (PIPP) that includes, <del>but is not limited to</del> <u>at a minimum</u>, the requirements listed in this Part VI.D.4.”</p>
29	Residential Outreach	VI.D.4.d.i.(3) [Page 60]	<p>Same as Comment No. 28.</p> <p><u>Recommendation</u>            Modify to read "Distribute activity specific stormwater pollution prevention public education materials to, <del>but is not limited to</del> <u>at a minimum</u>, the following points of purchase:"</p>

**Los Angeles County Flood Control District Comments**  
**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Part VI.D.8. Public Agency Activities Program</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
30	Public Facility Inventory	VI.D.8.c.i. [Page 94]	<p>This requirement states that each Permittee shall maintain an updated inventory of all Permittee- owned or operated facilities within its jurisdiction that are potential sources of storm water pollution, including storm water management facilities (e.g., detention basins). We do not agree that our stormwater management facilities themselves are potential sources of stormwater pollution. In addition, there are requirements under the Monitoring and Reporting Program to map open channels and underground pipes.</p> <p><u>Recommendation</u> Delete the requirement to inventory storm water management facilities.</p>
31	Flood Management Projects	VI.D.8.e.ii. [Page 96]	<p>This requirement states that each Permittee shall implement the following measures for Permittee-owned and operated flood management projects: (1) Develop procedures to assess the impacts of flood management projects on the water quality of receiving water bodies. (2). Evaluate existing structural flood control facilities to determine if retrofitting the facility to provide additional pollutant removal from storm water is feasible. It is our understanding that these requirements apply only to flood management <i>projects</i> and do not require a comprehensive evaluation of all existing stormwater facilities.</p> <p><u>Recommendation</u> For clarity, revise as follows:</p> <p>(1) Develop procedures to assess the impacts of <u>future</u> flood management projects on the water quality of receiving water bodies.</p> <p>(2) Evaluate existing–structural flood control facilities <u>during the planning phases of major maintenance or rehabilitation projects</u> to determine if retrofitting to provide additional pollutant removal from stormwater is feasible.</p>

**Los Angeles County Flood Control District Comments**  
**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Part VI.D.8. Public Agency Activities Program</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
32	Storm Drain Maintenance	VI.D.8.h.viii [page 102]	<p>The title of this section is misleading as the requirements pertain to open channels and not underground storm drains.</p> <p><u>Recommendation</u> Rename the section to “Open Channel Maintenance”</p>
33	Storm Drain Maintenance	VI.D.8.h.viii (1) & (2) [page 102]	<p>These requirements state that visual monitoring of Permittee-owned open channels and other drainage structures, including debris basins, for debris needs are to be done at least annually and trash and debris are to be removed at minimum once per year. Maintenance of debris basins is already regulated under separate permits including the California Regional Water Quality Control Board’s Water Quality Certification for Proposed County Debris Basin Maintenance Project (159 Basins) (Corps’ File No. 94-01558-CSC), Los Angeles County (File No. 02-144-2008 Renewal), State Water Resources Control Board Order No. 2003-0017-DWQ General Waste Discharge Requirements for Dredge and Fill Discharges That Have Received State Water Quality Certification, US Army Corps of Engineers, Los Angeles District Regional General Permit SPL-2003-00411-KW, and the Department of Fish and Game Final Lake or Streambed Alteration Agreement Notification No. 1600-2008-0290-R5. The Water Quality Certification specifically authorizes sediment removal only under three conditions, based on the condition of the watershed or other special circumstances.</p> <p><u>Recommendation</u> Revise to read:</p> <p>(1) Visual monitoring of Permittee-owned open channels and other drainage structures <del>including debris basins</del>, for debris at least annually.</p> <p>(2) Removal of trash and debris from open channels <del>and debris basins</del> a minimum of once per year before the wet season.</p>

<b>Part VI.E. Total Maximum Daily Load Provisions</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
35	The Final WQBEL Effluent Limitations and WLAs Should be Reflected as BMPs, Not Numeric Effluent Limits	VI.E.2.e. [Page 114]	If WQBELs or TMDL WLAs are included in the Permit they are not required to be reflected in the form of numeric effluent limits. With respect to this Permit, it is an abuse of discretion to do so. If WQBELs or TMDL WLAs are included in the Permit, they should be reflected in the form of BMPs.

<b>Part VI.E. Total Maximum Daily Load Provisions</b>			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
36	Final WQBELs and/or Receiving Water Limitations	VI.E.2.e. [Page 114]	<p>The LACFCD is very concerned with staff's proposal to express final TMDL WLAs as strict numeric WQBELs and/or Receiving Water Limitations in the Permit. The State Water Board's Blue Ribbon Panel (see Exhibit G - State Water Board Blue Ribbon Panel Final Report) found in 2006 that "it is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban discharges." As mentioned in our Comment No. 19 regarding the proposed RWL language, in its response to public comments dated April 27, 2012, regarding the Draft Tentative Order for the renewal of the Caltrans MS4 Permit, State Water Board staff cited the Blue Ribbon Panel's findings in defending its decision to not incorporate NELs in that Permit (see Exhibit G - State Water Board Blue Ribbon Panel Final Report). State Water Board staff stated, "Consistent with the findings of the Blue Ribbon Panel and precedential State Water Board orders (State Water Board Orders Nos. WQ 91-03 and WQ 91-04), this Order allows the Department [Caltrans] to implement BMPs to comply with the requirements of this Order." (SWRCB Comment Response Report, for Caltrans MS4 Permit, April 27, 2012, Page 2 of 110).</p> <p>State Water Board staff further noted that "in November 12, 2010, USEPA issued a revision to a November 22, 2002 memorandum in which the USEPA had 'affirm[ed] the appropriateness of an iterative, adaptive management best management practice (BMP) approach' for improving stormwater management over time. In the revisions, USEPA recommended that, in the case the permitting authority determines that MS4 discharges have the reasonable potential to cause or contribute to a water quality excursion, the permitting authority, where feasible (<i>emphasis added</i>), include numeric effluent limitations as necessary to meet water quality standards. However, the revisions recognized that the permitting authority's decision as to how to express water quality based effluent limitations (WQBELs), i.e. as numeric effluent limitations or BMPs, would be based on an analysis of the specific facts and circumstances surrounding the Permit. Moreover, USEPA has since invited comment on the revisions to the memorandum and will be making a determination as to whether to 'either retain the memorandum without change, to reissue it with revisions, or to withdraw it.'" (<i>ibid</i>).</p>

<b>Part VI.E. Total Maximum Daily Load Provisions</b>			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
36 (cont.)	Final WQBELs and/or Receiving Water Limitations	VI.E.2.e. [Page 114]	<p>The Regional Board is not required to reflect the final WQBELs as numeric effluent limits. 40CFR 122.44(k)(2) and (3) specifically authorizes the use of BMPs. The State Water Board, in its response to comments on the proposed Caltrans Permit, specifically said that it may “impose BMPs for control of storm water discharges in lieu of numeric effluent limitations,” citing section 122.44(k)(2) and (3). It has not been demonstrated that it is feasible to reflect the final WQBELs as numeric effluent limits. In addition, it has not been proven that these final WQBELs can currently be met.</p> <p>In this regard, although Regional Board staff stated during the May 3 workshop that it is feasible to incorporate NELs at this time, staff did not provide evidence to substantiate the feasibility of NELs. In assessing the feasibility of NELs in stormwater permits, the Blue Ribbon Panel based its evaluation on four criteria: (1) The ability of the State Water Board to establish appropriate objective limitations or criteria; (2) how compliance determinations would be made; (3) the ability of dischargers and inspectors to monitor for compliance; and (4) the technical and financial ability of dischargers to comply with the limitations or criteria (<i>emphasis added</i>). In response to a Regional Board member question regarding the cost to comply with TMDLs, staff responded that cost analyses were completed as part of TMDL development (see Exhibit G - State Water Board Blue Ribbon Panel Final Report). Significantly, the analysis of costs in the TMDLs did not address the question of the financial ability of dischargers to comply with the limitations or criteria. Nor did the analysis include a cost-benefit analysis or address whether the means to comply with the TMDL was cost effective. The analyses in the TMDLs specifically did not include a cost benefit analysis or a determination of whether it was cost effective. It is also important to note that staff’s cost analyses were not held to the “reasonable assurance” standard, and no quantitative analyses were done to demonstrate that the BMPs assumptions used by staff would have a reasonable assurance of meeting TMDL standards. In fact, during TMDL development, many Permittees made comments to this end regarding staff’s cost analyses for TMDLs. The LACFCD agrees with State Water Board staff that NELs, numeric WQBELs and/or Receiving Water Limitations currently are not feasible in stormwater permits. Los Angeles Region MS4 dischargers should not be held to enforceable NELs when discharges into the MS4, such as from Caltrans and construction sites, are not being held to the same standard.</p>

<b>Part VI.E. Total Maximum Daily Load Provisions</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
36 (cont.)	Final WQBELs and/or Receiving Water Limitations	VI.E.2.e. [Page 114]	<p>The Regional Board staff has submitted no evidence that demonstrates that compliance with numeric WQBELs or WLAs is feasible. The fact sheet contains no evidence. Instead the fact sheet solely cites unidentified work allegedly performed in adopting the TMDLs. That work is not set forth in the fact sheet, and no such work demonstrating feasibility has been performed. Indeed, when preparing the TMDLs, no analysis was performed as to whether TMDLs could be achieved under the MEP standard, or any other standard, and no analysis was performed of whether the implementation was feasible.</p> <p>To further evaluate the feasibility of the numeric approach and explore possible alternatives, the LACFCD conducted an extensive review and analysis of other Phase I permits, EPA guidance documents and policies, and other pertinent information. The results of these analyses and additional related comments are contained in Exhibit K - TMDLs into SW Permits Review 20Jul12, Exhibit Q – Comments TM LACMS4 TMDLs 21Jul2012, and Exhibit R – TMDL Compliance Assessment 21Jul2012, and hereby incorporated as part of this comment.</p> <p><u>Recommendation</u> Revise the draft Permit to implement final TMDL WLAs using BMPs. See Exhibit F – LACMS4 Redlined TMDL Excerpts 20Jul2012Rev for suggested language.</p> <p>Alternatively, insert new section E.2.e.ii:</p> <p>“Two years before the compliance deadline for an applicable final water quality-based effluent limitation and/or final receiving water limitation, Regional Board shall evaluate progress made by Permittees toward compliance with the standard, including review of the results from Permittees’ adaptive management process (VI.C.6.), to determine whether the compliance timeline should remain unchanged, or if the Order should be revised to incorporate a new compliance timeline.”</p>

Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Part VI.E. Total Maximum Daily Load Provisions</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
37	The Permit Should not Contain Final WQBELs Based on TMDLs Where Compliance with the TMDL Will Occur After the Expiration Date of This Permit		<p>The Permit is a five year permit. Many of the TMDLs incorporated into the draft Permit contain compliance dates more than five years from the hearing on this Permit. The Regional Board is not required to include WQBELs and WLAs that are applicable only after the expiration of the Permit. The fact sheet and draft Permit contain no reason for doing so.</p> <p>It is an abuse of discretion for the Permit to contain WQBELs and WLAs that are applicable after the termination of the Permit. It is also not good policy, as it could restrict the flexibility of the Regional Board and the Permittees to address these matters in subsequent permits.</p> <p><u>Recommendation</u> Delete all references to final WQBELs or final WLAs that are not applicable until after the five year termination date of this Permit.</p>
38	The Permit Should Require Compliance with State Adopted TMDLs Where Final Compliance Dates Have Passed Through Implementation of BMPs Not Numeric Effluent Limits	VI.E.4. [Page 116]	<p>For the reasons set forth above, the Permit is not required to reflect interim or final TMDL WLAs as numeric effluent limits. The State Water Board's Blue Ribbon Panel has found that it is not feasible to set numeric effluent limits at this time, and there is no evidence that the Permittees can comply with final wasteload allocations set forth in those TMDLs whose final compliance dates have passed. There is no evidence and the fact sheet contains no reference to any such evidence.</p> <p>At the time the TMDLs were adopted, there was no evidence submitted that the TMDLs wasteload allocations could be reached on the adopted, final compliance dates. No analysis was made as to whether they could be accomplished through implementation of programs that met the MEP or any other standard.</p> <p>It is an abuse of discretion for this Regional Board to adopt a permit with which the Permittees cannot comply. If this Regional Board is going to require compliance with state adopted TMDLs where the adopted final compliance deadline has passed, then the Regional Board should require compliance through implementation of BMPs whether than numeric effluent limits.</p>

Attachment A. Definitions			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
39	Definition of Receiving Water Limitations	V.A. & Attachment A - Definitions [Pages 37-38 and A-8]	<p>The definition of receiving water limitation includes any applicable numeric or narrative water quality objective or <i>criterion</i> contained in the “water quality control plan for the Los Angeles Region (Basin Plan), water quality control plans or <i>policies</i> adopted by the State Water Board, or federal regulations, including but not limited to 40 C.F.R. § 131.38.” Draft Permit, p. A-8 (emphasis added).</p> <p>The reference to “policies” adopted by the State Water Resources Control Board is ambiguous. The State Board adopts water quality objectives and water quality control plans, not policy resolutions. See Water Code § 13170. It is not clear what is meant by policies.</p> <p>Additionally, the definition should not reference “criterion” under federal regulations. Permittees are not required to comply with federal water criteria. A Permittee is only required to comply with water quality standards adopted by the state or federal government that are applicable to the particular waterbody. In referring to “criterion” that might be under federal regulations, the definition could be construed as referring to criteria with which Permittees are not required to comply. It creates ambiguity in the definition.</p> <p><u>Recommendation</u>  The reference to “policies” adopted by the State Board and “criterion” should be deleted from the definition of receiving water limitation.</p>

<b>Attachment E. Monitoring and Reporting Requirements</b>			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
40	Coordinating Receiving Water and Storm water Outfall Monitoring	VI.C.1.c. & VIII.B.1.b.iv; Attachment F – XIII.C.2  [Pages E-15, E-18, & F-108]	<p>The draft Permit proposes to require taking receiving water samples within 6 hours of taking storm water outfall samples. Coordinating trigger conditions between many outfall and receiving water sites will be time consuming and burdensome, requiring complex telemetry and data management systems to ensure that triggering times are coordinated. This condition is too prescriptive.</p> <p>This section could create conflicts if a Permittee decides to submit an IMP and other Permittees within the watershed submitted a CIMP. The trigger for sampling in the receiving water for the IMP and the CIMP could be different and therefore generate inconsistent results.</p> <p><u>Recommendation</u> Eliminate this requirement and allow affected agencies to coordinate trigger conditions between outfall and receiving water sites using an approach that is reasonable and practical. The IMP or CIMP would include recommendations on the start of receiving water monitoring in relation to the start of outfall-based monitoring.</p>
41	MS4 Map	VII.A [Page E-16]	<p>“MS4 Map” appears to be a misnomer. MS4 also includes municipal streets, curb and gutters, ditches, etc. If only open channels and underground storm drains are required to be mapped, “MS4” map should be revised.</p> <p><u>Recommendation</u> Revise to “Storm Drain and Channels Map.”</p>

Attachment E. Monitoring and Reporting Requirements			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
42	Prioritized Source Identification	IX.E.2 & Attachment F – XIII.F [Pages E-21 – E-22 & F-122]	<p>"The schedule shall ensure that source IDs are conducted for no less than 25% of the outfalls in the inventory within three years of the effective date of this order and 100% of the outfall within 5 years of the effective date of this order."</p> <p>Outfall inventory activities are ongoing and can change over time. For example if 10 outfalls are found in 2012, then by 2017, all 10 should be source ID'ed. Current language doesn't account for outfalls that may have new sources of non-stormwater discharges. For example, 50 outfalls are found in 2017. Does this mean all 50 have to be sourced ID'ed that same year, based on it being 5 years from the effective date of the order?</p> <p><u>Recommendation</u>  This provision should be reworded as follows: "The schedule shall ensure that <del>source IDs are conducted for no less than 25% of the outfalls in the inventory within three years of the effective date of this order</del> <u>25% of outfalls are source ID'ed from date of inventory</u>, and 100% of outfalls <del>within 5 years of the effective date of this order</del> <u>are source ID'ed from date of inventory</u>."</p>
43	Rain Gauge Data Availability	XVIII A.2.a. [Page E-42]	<p>As written, the Permit requires that precipitation data shall be obtained from LACDPW rain gauge stations available on LA County Department of Public Works Water Resources Division's website. LACDPW maintains 148 manually observed non-mechanical (Standard) rain gages and 126 ALERT (Automatic Local Evaluation in Real Time)/Automatic rain gages. Only the ALERT gauges can provide the information being requested by the Regional Board. However, the ALERT gages are not considered official or final rainfall data, can be prone to transmission errors, and there is no guarantee of accuracy of the data provided. It should also be noted that it is not the LACDPW's mission or mandate to collect and provide rainfall data to other public agencies or to the public. Including such a requirement in the Permit in effect requires the LACDPW to do so. In the event of diminished fiscal resources, the number of locations monitoring by ALERT gauges may be reduced.</p>

Attachment F. Fact Sheet			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
44	Introduction	Fact Sheet [Page F-3]	<p>The second paragraph in the introduction to the Fact Sheet states:</p> <p>This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for dischargers in California. Only those sections or subsections of this Order that are specifically identified as “not applicable” have been determined not to apply to the Dischargers covered by this Order. Sections or subsections of this Order not specifically identified as “not applicable” are fully applicable to the Dischargers.</p> <p>The LACFCD has concerns regarding this statement, as a number of provisions in the Permit do not apply to various dischargers. For example, provisions relating to industrial/commercial facilities and new development, among others, do not apply to the LACFCD, since it is not a municipality and has no governmental authority over businesses or residences.</p> <p><u>Recommendation</u> Revise as follows:</p> <p><del>“This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for dischargers in California.” Only those sections or subsections of this Order that are specifically identified as “not applicable” have been determined not to apply to the Dischargers covered by this Order. Sections or subsections of this Order not specifically identified as “not applicable” are fully applicable to the Dischargers.</del></p>
45	Use of LACFCD area as jurisdictional boundary	Tables F-1, F-3, F-4 [Page F-3, F-14, F-18]	<p>The current language, “...84 incorporated cities within the Los Angeles County Flood Control District...” appears to imply the LACFCD has jurisdiction or oversight over the municipalities. The LACFCD boundary is merely a service area boundary. See Comment No. 6.</p> <p><u>Recommendation</u> Revise to read:</p> <p>“...84 incorporated cities within <del>the</del> Los Angeles County <del>Flood Control District”</del></p>

**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Attachment F. Fact Sheet</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
45 (cont.)	History of LACFCD	II.A. [Page F-5]	<p>The first full paragraph on F-5, relating to the history of the LACFCD and the development of the MS4, contains numerous errors. In fact, the genesis of the LACFCD was serious flooding that occurred in 1914, prior to major development of the Los Angeles County watersheds.</p> <p><u>Recommendation</u>            We request that the existing paragraph be replaced by the following:</p> <p>“As a result of serious flooding which affected Los Angeles County in 1914, the legislature adopted the Los Angeles County Flood Control Act in 1915, which created the LACFCD. Due to the location of the urbanized area in a coastal watershed adjacent to steep local mountain ranges, serious Pacific Ocean storms created frequent flooding conditions. Starting in the 1930s, federal funding through the U.S. Army Corps of Engineers allowed for the re-routing of the many of the historic waterways in the County and their redevelopment with engineered channels, including their lining with concrete.”</p>
46	Facility Description	II.A. [Page F-5]	<p>The current language, “The Los Angeles County Flood Control District boundaries encompass...85 incorporated cities...and approximately 2.1 million land parcels” appears to imply the LACFCD has jurisdiction or oversight. The LACFCD is merely a service area boundary. See Comment No. 45 above.</p> <p><u>Recommendation</u>            Revise to read: “The Los Angeles County Flood Control District <del>boundaries</del> <u>service area</u>...”</p>
47	LACFCD Facilities	II.A. [Page F-6]	<p>The first and third full paragraphs describe facilities owned or operated by the LACFCD. These facilities are very limited and occupy a tiny area of the entire urbanized watershed. Various large municipalities that are Permittees, such as the City of Los Angeles, operate extensive maintenance yards and facilities as well as numerous city-owned buildings that are more extensive than those operated by the LACFCD. There is no justification for the description of LACFCD facilities being included in the Fact Sheet, and these references should be deleted.</p> <p><u>Recommendation</u>            Delete first and third paragraphs on F-6.</p>

**Los Angeles County Flood Control District Comments**

Attachment F. Fact Sheet			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
48	LACFCD Infrastructure	II.A. [Page F-6]	<p>On F-6, the second full paragraph states in part:</p> <p>The Los Angeles County Flood Control District’s infrastructure receives storm water and non-storm water flows from various sources. These flows come from MS4s owned by other Permittees covered by this Order and other public agencies that connect to the Los Angeles County Flood Control District’s infrastructure, NPDES permitted discharges, discharges authorized by the USEPA (including discharges subject to a decision document approved pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)), groundwater, and natural flows.</p> <p>These sentences are erroneous. The MS4 is operated by multiple Permittees, including the LACFCD, and each of these MS4s “receive storm water and non-storm water flows from various sources.” Again, the MS4 includes the streets and gutters, so every Permittee’s MS4 receives such non-stormwater and stormwater flows. It is thus inaccurate to specify the role of that part of the MS4 operated by the LACFCD. We request that this statement be corrected as follows:</p> <p><u>Recommendation</u>  We request that this statement be corrected as follows:</p> <p>“The <u>MS4s subject to this Order</u> <del>Los Angeles County Flood Control District’s infrastructure</del> receives storm water and non-storm water flows from various sources. These flows <u>include flows that</u> come from MS4s owned by other Permittees covered by this Order and other public agencies <del>that connect to the Los Angeles County Flood Control District’s infrastructure</del>, NPDES permitted discharges, discharges authorized by the USEPA (including discharges subject to a decision document approved pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)), groundwater, and natural flows.”</p>

Attachment F. Fact Sheet			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
51	Description of Assembly Bill 2554	III.D.1.a.iii. [Page F-16]	<p>Subparagraph iii on page F-16 consists of a discussion about Assembly Bill 2554 that is inaccurate and misleading. It is inaccurate in that the legislation does not authorize a parcel tax, it authorizes a property-related fee or charge. Further, the legislation requires that if any fee should be imposed, fifty percent of the fee revenues would be allocated to nine watershed authority groups as described, forty percent would be allocated to the cities and unincorporated areas subject to the fee for water quality improvement programs, and the LACFCD would retain ten percent of the fee revenues to administer the program and implement its own water quality improvement plans.</p> <p>In addition, the discussion of Assembly Bill 2554 is incorrect and misleading because the Regional Board should not be considering this legislation "in evaluating the five separate ROWDs and the structure of this Order." No fee under the bill has been adopted and there can be no expectation that any such fee will be adopted, so it would be improper for the Regional Board to consider that revenues from such a fee will be available to any permittees to fund work required by the Permit.</p> <p>The legislation merely provides limited authority for the LACFCD to impose a fee as described above. A fee cannot be imposed unless it has first been considered by the LACFCD's Board of Supervisors at a public hearing at which the property owners subject to the fee have the right to submit protests. If no majority protest is received and the Board of Supervisors approves the fee, it must then be submitted for voter approval at an election. The fee must be approved by either a majority vote of the property owners subject to the fee or a two-thirds vote of the electorate. These are significant hurdles to imposition of such a fee, and none of the steps outlined above have taken place.</p> <p><u>Recommendation</u></p> <p>Delete subparagraph iii on page F-16.</p>

54 (cont.)	LACFCD as Primary Owner and Operator of LA MS4	III.D.1.a. [Page F-17]	<p><u>Recommendation</u> We request that this language be corrected as follows:</p> <p>The Regional Water Board also determined that <del>as the primary owner and operator of the Los Angeles County MS4</del>, the LACFCD should remain a Permittee in the single-system wide permit; however, this Order relieves LACFCD of its role and responsibilities as Principal Permittee. This Order also specifies certain requirements specific to the LACFCD <del>in its role as the owner and operator of the majority of the Los Angeles County MS4</del>.</p>
55	Non-Storm Water Discharges Regulations	IV.A.3 [Page F-22]	<p>Section IV.A.3 uses language from the preamble the federal stormwater regulations to support an argument that “regulation of non-storm water discharges through an MS4 is not limited to the MEP standard in CWA section 402(p)(3)(B)(iii).”</p> <p>The preamble language quoted in this section defines “illicit discharge.” However, the actual definition of “illicit discharge,” contained in the Code of Federal Regulations, does not support this argument. “Illicit discharge” is defined in 40 CFR section 122.26(b)(2) to be: “Illicit discharge means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from firefighting activities.” (emphasis supplied). The plain language of this regulation controls over ambiguous comments in the Preamble.</p> <p>The use of “through” in the Preamble is ambiguous in this context, since the question being addressed in Section IV.A.3 are discharges “from the MS4.” And, other Preamble language contradicts the conclusions in Part IV.A.3 by indicating that the discharge from an MS4 system is also composed of “non-stormwater discharges.” See comment on Section IV.A.1 of the Fact Sheet, above.</p> <p><u>Recommendation</u> Section IV.A.3 should be deleted.</p>

**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Attachment F. Fact Sheet</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
56	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Discharges	IV.A.5 [Pages F-25 & F-26]	See Comment No. 16.
57	CERCLA Discharger Requirements & Notification of Unplanned CERCLA Discharge	IV.A.5 [Page F-25]	<p>The fact sheet contains USEPA requirements for CERCLA dischargers when discharging into the MS4. Such requirements should be part of the Tentative Order, not just the fact sheet. In addition, notification for unplanned dischargers must be made no later than 24 hours after the discharge has occurred. Notification for unplanned discharges, even if they are emergency discharges, must be made immediately. Such large-volume discharges will not only impact operations, but threaten the safety of MS4 Permittee field personnel that may be working within the storm drain system.</p> <p><u>Recommendation</u>            Replace “unplanned” with “emergency”, and remove “but no later than 24 hours after the discharge has occurred).”</p>
58	Segregation of Non-Storm Water Discharges	IV.A.5 [Page F-26]	See Comment No. 17.
59	Notification of Discharge from Utility Vaults and Underground Structures	IV.A.5 [Page F-27]	The fact sheet notes that dischargers permitted under NPDES No. CAG990002 are require to contact the appropriate Permittee(s) within 24 hours whenever there is a discharge of 50,000 gallons or more from utility vaults and underground structures to the MS4. The LACFCD has a process that requires notification of up to 72 hours in advance of the discharge. Depending on the discharge location and volume, the discharger may have to apply for a Flood Permit to discharge to LACFCD’s system.

**Los Angeles County Flood Control District Comments**  
**Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Attachment F. Fact Sheet</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
59 (cont.)	Notification of Discharge from Utility Vaults and Underground Structures	IV.A.5 [Page F-27]	<u>Recommendation</u> Remove “within 24 hours” from the notification requirement. Dischargers should contact the impacted MS4s to obtain all necessary authorizations to discharge.
60	Cleaning of MS4 Inlets and Outlets	IV.A.5 [Page F-27 – F-28]	See Comment No. 18.
61	BMPs for Discharges from Non-Commercial Car Washing	IV.A.5 [Page F-29]	The fact sheet includes BMPs not listed in Table 8 of the Tentative Order.  <u>Recommendation</u> Remove “....creating a temporary berm or block off the storm drains; using pumps or vacuums to direct water to pervious areas;...”
62	Illicit Discharge Source Investigation and Elimination – Diversion or Treatment	VI.C.9.b [Page F-78]	See Comment No. 34.
63	LACFCD Not Principal Permittee	XII.E.3 [Page F-107]	The tentative order cites the LACFCD’s lack of ownership or control over land from which most pollutants originate as the reason for relieving it of the Principal Permittee role. Although it is true that the LACFCD does not have land use authority, the reason it will no longer be the Principal Permittee because the request was made in the ROWD submitted November 2011.
64	Coordinating Receiving Water and Outfall Monitoring	XIII.C.2 [Page F-108]	See Comment No. 40.
65	Storm Drain System Map	XIII.D [Page F-110]	The mapping requirements included land use, impervious area, and effective impervious area (if available).

Draft Tentative Order No. R4-2012-XXXX, NPDES No. CAS004001**

<b>Attachment F. Fact Sheet</b>			
<b>Comment #</b>	<b>Permit Element/Issue/Concern</b>	<b>Location in Draft Tentative Order</b>	<b>Comment/Recommendation</b>
65 (cont.)	Storm Drain System Map	XIII.D [Page F-110]	<u>Recommendation</u> Remove "impervious area" from the mapping requirements.
66	Prioritized Source Identification	XIII.F [Page F-112]	See Comment No. 42.
67	Funding Sources – Assembly Bill 2554	XIV.D. [Pages F-142 – F-143]	<p>The Fact Sheet's discussion of funding sources (Pages F-142 and F-143) is in part inaccurate and misleading and should be deleted because there is no assurance that the fee will be adopted. First, Assembly Bill 2554 is not awaiting voter approval; it was adopted by the Legislature and became law on January 1, 2011. This legislation gave the LACFCD the authority to impose a fee for projects to improve water quality and reduce stormwater and urban runoff pollution within the LACFCD's jurisdiction.</p> <p>Second, no such fee has been imposed by the LACFCD and it cannot be imposed unless it has first been considered by the LACFCD's Board of Supervisors at a public hearing at which the property owners subject to the fee have the right to submit protests. If no majority protest is received and the Board of Supervisors approves the fee, it must then be submitted for voter approval at an election. The fee must be approved by either a majority vote of the property owners subject to the fee or a two-thirds vote of the electorate.</p> <p>Contrary to the Fact Sheet, no such fee is currently awaiting voter approval. The LACFCD's Board of Supervisors has only directed the LACFCD to prepare a proposal for a fee and to provide notice of a public hearing on the fee to all the property owners in the LACFCD's jurisdiction who would be subject to the fee. That hearing and opportunity to protest has not occurred, and the Board has not approved a fee or set it for the required election. An Engineer's Report is in preparation to calculate the fee amount each property owner would be required to pay annually should the Board of Supervisors decide to propose a fee and submit it for voter approval. The Board, however, has not yet determined the amount of the proposed fee, held the required public hearing, approved the fee or set an election on the fee.</p>

Attachment F. Fact Sheet			
Comment #	Permit Element/Issue/Concern	Location in Draft Tentative Order	Comment/Recommendation
67 (cont.)	Funding Sources – Assembly Bill 2554	XIV.D. [Pages F-142 – F-143]	<p>If all these steps are taken and a proposed fee receives the necessary voter approval, state law requires the LACFCD to allocate 40% of the revenues collected to all the cities within the boundaries of the LACFCD and 50% of the revenues to nine watershed authority groups that would be created to implement collaborative water quality improvement plans or programs in the watersheds. The LACFCD would retain 10% of the fee revenues to administer the program and implement its own water quality improvement plans.</p> <p>The revenue estimates provided in the Fact Sheet are speculative and are inconsistent with the preliminary projections prepared by LACFCD staff. Furthermore, the projected revenues are not "earmarked" for specific programs; the cities and watershed authority groups receiving 90% of the fee revenues would determine the uses of the fee revenues, subject to the limitations of the legislation and any implementing ordinance or regulations adopted by the County Board of Supervisors.</p> <p><u>Recommendation</u> Delete the discussion of AB 2554.</p>

Los Angeles, CA 90013

**Subject: Comment letter – Draft NPDES Permit (Draft Order) for MS4 Dischargers within the Los Angeles County Flood Control District**

Dear Mr. Ridgeway:

The City of Lakewood submits the following comment letter on the draft permit for the Los Angeles region. While the city supports the goals of improving surface water quality in our region, we would encourage the Los Angeles Regional Water Control Board to base all regulations on sound science, methodology, and to proceed in a manner that is not only practical but one that is achievable and cost-effective.

The City does not have a dedicated revenue source or enterprise fund to finance the storm water program. Propositions 13, 62, and 218, require that any storm water fee or tax be placed before the general electorate for approval. The laws further define most storm water fees as special taxes, subjecting them to a 2/3rd's voter approval. In these difficult economic times, Lakewood would have a difficulty of obtaining voter approval for a new special tax. It is therefore likely that Lakewood will need to finance the new permit with its General Fund. Our General Fund supports a variety of critical services, including sheriff, fire, public works, public facilities, street maintenance, and park maintenance. Absent new voter approved funds, the City will be required to reduce, eliminate or defer existing critical services to pay for the new storm water mandates in the permit.

Rather than restating the numerous technical comments, the City of Lakewood concurs with the issues addressed by the LA Permit Group (LAPG) comment letter dated July 23, 2012 sent to your attention, as if fully detailed herein.

In summary, I would like to thank the Los Angeles Regional Water Control Board for providing this opportunity to comment on the draft permit. Achieving compliance with this permit will be a complex, long-term and an extremely costly effort.

Sincerely,

A handwritten signature in blue ink that reads "Lisa A. Rapp". The signature is written in a cursive, flowing style.

[rpurdy@waterboards.ca.gov](mailto:rpurdy@waterboards.ca.gov)  
[iridgeway@waterboards.ca.gov](mailto:iridgeway@waterboards.ca.gov)

Dear Mr. Ridgeway:

The City of La Mirada ("City") submits the following comments to the Los Angeles Regional Water Quality Control Board's ("Regional Board") Tentative Order No. R4-2012-xxx, NPDES Permit No. CAS004001 ("Permit"). The LA Permit Group has submitted comments regarding the Permit which the City joins and incorporates herein. The City reserves the right to make additional legal comments on the Permit prior to the close of the public hearing to adopt the Permit and at the public hearing itself.

On behalf of the City of La Mirada, we hereby submit the following initial comments on the Permit:

**1. The Time Provided to Review the Permit Is Insufficient and Denies Permittees Due Process of Law**

The period provided to review and comment on the Permit has been unreasonably short given the breadth of the Permit. Beginning on March 28, 2012, Regional Board staff issued a series of Staff Working Proposals pertaining to key sections of the Permit. Regional Board staff has used their Staff Working Proposal workshops as a justification for the hurried manner in which the Permit was developed. The same justification was used by the Executive Director in denying the LA Permit Group's request for a time extension.

This justification, however, fails for several reasons. First, Regional Board staff gave the permittees only a few weeks to comment on each of the Staff Working Proposals. Furthermore, the Regional Board staff did not respond to any comments, leaving permittees to guess at which requirements would be incorporated into the Permit. Seeing the Permit in its entirety and having the opportunity to understand how each of the sections and programs work together is imperative in order for permittees to fully understand the Permit provisions and to prepare comments.

Second, despite all the working proposals, workshops, and meetings, the permittees are left with a Permit that cannot be complied with from the first day the Permit goes into effect, due to the Receiving Water Limitation (RWL) and the Waste Load Allocations (WLA) requirements that could subject the permittees to third party lawsuits.

We believe the Regional Board wants a review process that is open and transparent. Providing permittees only forty-five (45) days to comment makes this impossible. To develop and provide relevant and meaningful comments, each permittee must first:

- Read a 500 page Permit;
- Study the 500 page Permit to understand how the provisions work together;
- Compare it to the last Permit;
- Evaluate the resource needs to comply with the Permit;
- Determine the fiscal and organizational impacts on City services, which requires coordination with several City departments;
- Conduct technical and legal review of the Permit and prepare comments;
- Present information to and gather feedback from the City Council. Staff needs time to conduct a thorough review of the items listed above, prior to presenting them to the City Council; and
- Prepare written comments.

To ensure a proper review of the Permit, the City hereby requests an extension of 180 working days to include a Revised Tentative Permit to be released with a 45-day comment period. The intent of a Revised Tentative Permit is to ensure the permittees have the opportunity to review any changes made to the existing draft and provide comments prior to the Permit adoption hearing. Additionally, this extension request will resolve a conflict our City management and officials have with the current September 6-7, 2012 hearing date, which overlaps with the annual League of California Cities conference in San Diego.

The extreme speed with which the Permit is being circulated, reviewed, and proposed to be adopted amounts to a denial of the City's due process rights and is contrary to state and federal law. By denying the permittees a meaningful opportunity to review and comment on a Permit that so drastically affects the permittees' rights and finances, the Regional Board has denied the permittees due process rights under state and federal law. See *Spring Valley Water Works v. San Francisco*, 82 Cal. 286 (1890) (reasonable notice and opportunity to be heard are essential elements of "due process of law," whatever the nature of the power exercised.) Furthermore, under the Clean Water Act, a reasonable and meaningful opportunity for stakeholder participation is mandatory. See, e.g., *Arkansas Wildlife Fed'n v. ICI Ams.*, 29 F.3d 376, 381 (8th Cir. 1994) ("the overall regulatory scheme affords significant citizen participation, even if the state law does not contain precisely the same public notice and comment provisions as those found in the federal CWA.") For the reasons stated above, the Permit does not satisfy the Clean Water Act standard and violates the City's due process rights.

---

**2. The Permit Should Be Revised to Provide that Implementation of BMPs is Sufficient to Constitute Compliance with the Permit**

Permittees should be able to achieve compliance with the Permit through a best management practice (“BMP”) based iterative approach. Regional Board staff has previously indicated that it would not create a permit for which permittees would be out of compliance from the very first day the Permit goes into effect. This necessarily means the Permit cannot require immediate strict compliance with water quality standards. Yet the Fact Sheet states that a party whose discharge “causes or contributes” to an exceedance of a water quality standard is in violation of the Permit, even if that party is implementing the iterative process in good faith. See Fact Sheet at pp. F-35-38. These positions are incompatible and effectively render the iterative approach meaningless.

As written, the Permit requires that all discharges to receiving waters must immediately meet water quality standards to avoid violating the Permit. This presents an impossible standard for permittees to meet, especially given the fact that thirty-three (33) TMDLs have been incorporated into the Permit. This means that numerous water bodies that currently do not meet water quality standards will be governed by the Permit and permittees will be subject to potential liability immediately. Even for TMDLs for which the Regional Board issues time scheduling orders, such orders will not protect a permittee from third-party lawsuits for measured exceedances, based on the Permit’s current language. Even if such lawsuits are unfounded, the legal costs to defend such suits are enormous. For this same reason, final wasteload allocations should not be incorporated into the Permit, especially where we are dealing with TMDLs that have been rushed through due to the *Browner* consent decree with the understanding that they would be refined over time with reopeners as new information becomes available.

A BMP-based approach should be utilized in the Permit, as outlined in EPA’s November 12, 2010 Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on those WLAs.” (“EPA Memorandum”). See also 40 C.F.R. § 122.44(k).

To accomplish this purpose, the City supports using the receiving water limitation language proposed by CASQA, which is similar to the language in the Draft Caltrans Permit. Otherwise, cities are potentially vulnerable to third party lawsuits such as those brought against the City of Stockton and the County of Los Angeles by third parties within the last five years.

Furthermore, the EPA Memorandum is clear that an increased reliance on numerics should be coupled with the “disaggregation” of different storm water sources within permits. See EPA Memorandum at pp. 3-4. The Permit currently aggregates multiple sources of storm water runoff while additionally imposing numeric standards. This will

---

result in a system whereby the innocent will be punished alongside the guilty for numeric standard exceedances. The Regional Board should not allow this inequitable and legally unjustifiable result to occur.

Another reason for adopting a BMP-based approach is the fact that new and existing conditionally exempt non-stormwater discharges may also contribute to measured exceedances. This inequitable result means the exempt discharges may nonetheless contribute to permittee liability.

**3. The Permit Improperly Intrudes Upon the City's Land Use Authority in Violation of the Tenth Amendment of the U.S. Constitution**

To the extent that this Permit relies on federal authority under the Clean Water Act to impose land use regulations and dictate specific methods of compliance, it violates the Tenth Amendment of the U.S. Constitution. Furthermore, to the extent the Permit requires a municipal permittee to modify its city ordinances in a specific manner, it also violates the Tenth Amendment. According to the Tenth Amendment:

“The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.”

Article XI, section 7 of the California Constitution California also guarantees municipalities the right to “make and enforce within [their] limits all local police, sanitary and other ordinances and regulations not in conflict with general laws.” See also *City of W. Hollywood v. Beverly Towers*, 52 Cal. 3d 1184, 1195 (1991). Furthermore, the United States Supreme Court has held that the ability to enact land use regulations is delegated to municipalities as part of their inherent police powers to protect the public health, safety, and welfare of its residents. See *Berman v. Parker*, 348 U.S. 26, 32-33 (1954). Because it is a constitutionally conferred power, land use powers cannot be overridden by State or federal statutes.

Even so, both the Clean Water Act and the Porter-Cologne Act provisions regarding NPDES permitting do not indicate that the Legislature intended to preempt local land use authority. *Sherwin Williams Co. v. City of Los Angeles*, 4 Cal. 4th 893 (1993); *California Rifle & Pistol Assn. v. City of West Hollywood*, 66 Cal. App. 4th 1302, 1309 (1998) (Preemption of police power does not exist unless “Legislature has **removed** the constitutional police power of the City to regulate” in the area); see Water Code §§ 13374 and 13377 and 33 U.S.C. § 1342 (b)(1)(B).

If the Permit is adopted, the City believes that this Permit could establish the Regional Board as a “super municipality” responsible for setting zoning policy and requirements throughout Los Angeles County. The prescriptive and one-size-fits-all nature of this policy will ensure that any resident or business challenging the conditions set forth in

---

this Permit would not only sue the municipality charged with implementing these requirements, but would also have to sue the Regional Board itself to obtain the requested relief. The City does not believe this is the intent of the Regional Board. Rather than adopting programs that dictate the precise method of compliance, the Regional Board should collaborate with the City and other permittees to develop a range of model programs that each municipality could then modify and adopt according to its own individual circumstances.

#### **4. The Permit Constitutes an Unconstitutional Unfunded Mandate**

The Permit contains mandates imposed at the Regional Board's discretion that are unfunded and go beyond the specific requirements of either the Clean Water Act or the EPA's regulations implementing the Clean Water Act, and thus exceed the "Maximum Extent Practicable" ("MEP") standard. Accordingly, these aspects of the Permit constitute non-federal state mandates. See *City of Sacramento v. State of California*, 50 Cal. 3d 51, 75-76 (1990). Indeed, the Court of Appeals has previously held that NPDES permit requirements imposed by the Regional Board under the Clean Water and Porter-Cologne Acts can constitute state mandates subject to claims for subvention. *County of Los Angeles v. Commission on State Mandates*, 150 Cal. App. 4th 898, 914-16 (2007).

The Permit goes beyond federal law, as the Permit is at least twice as long, and in some cases, three times as long as other MS4 permits developed by other Regional Boards in the State of California, such as the Lahontan Regional Board and the Central Valley Regional Board, not to mention permits developed by EPA. This means that either some Regional Boards are failing to impose federally mandated requirements pursuant to the Clean Water Act, or the more likely explanation is that the Regional Board is imposing requirements that go beyond federal law.

##### **A. The Permit's Minimum Control Measure Program is an Unfunded State Mandate**

The Permit's Minimum Control Measure program ("MCM Program") qualifies as a new program or a program requiring a higher level of service for which state funds must be provided. The particular elements of the MCM Program that constitute unfunded mandates are:

- The requirements to control, inspect, and regulate non-municipal permittees and potential permittees (Permit at pp. 38-40);
  - The public information and participation program (Permit at pp. 58-60);
  - The industrial/commercial facilities program (Permit at p. 63);
  - The public agency activities program (Permit at pp. 56-63); and
  - The illicit connection and illicit discharge elimination program (Permit at pp. 106-109).
-

The MCM Program requirement that the permittees inspect and regulate other, non-municipal NPDES permittees is especially problematic and clearly constitutes an unfunded mandate. (See, e.g., Permit at pp. 38-40.) These are unfunded requirements which entail significant costs for staffing, training, attorney fees, and other resources. Notably, the requirement to perform inspections of sites already subject to the General Construction Permit is clearly excessive. Permittees would be required to perform pre-construction inspections, monthly inspections during active construction, and post-construction inspections. The requirements of this Permit exceed past permits, meaning that the Regional Board is requiring a higher level of service than in prior permits.

Furthermore, there are no adequate alternative sources of funding for inspections. User fees will not fully fund the program required by the Permit. Cal. Gov't Code, § 17556(d). NPDES permittees already pay the Regional Water Quality Control Boards fees that cover such inspections in part. It is inequitable to both cities and individual permittees for the Regional Board to charge these fees and then require cities to conduct and pay for inspections without providing funding.

**B. The Receiving Water Body Requirements Render the Permit an Unfunded Mandate**

If strict compliance with state water quality standards in receiving water bodies is required—including state water quality standard-based wasteload allocations—in the MS4 itself or at outfall points and in receiving water bodies, the entire Permit will constitute an unfunded mandate because such a requirement clearly exceeds both the Federal standard and the requirements of prior permits, despite the fact no funding will be provided. See *Building Industry Assn. of San Diego County v. State Water Resources Control Bd.*, 124 Cal. App. 4th 866, 873, 884-85 (2004) (though the State and Regional Boards may require compliance with California state water quality standards pursuant to the Clean Water Act and state law, these requirements exceed the Federal Maximum Extent Practicable standard.)

**C. The City Does Not Necessarily Have the Requisite Authority to Levy Fees to Pay for Compliance With the Order**

The ability to fund the Permit through bond measures or tax increases does not render the Permit's program ineligible for a subvention claim because such funding mechanisms are contingent upon voter approval, in some cases requiring supermajority votes. *Howard Jarvis Taxpayers Assoc. v. City of Salinas*, 98 Cal. App. 4th 1351 (2002). The money available from other sources is both too speculative and limited to cover all or even some of the costs imposed by the Permit. Such speculative funding sources cannot count as viable sources of funding so as to preclude a subvention claim. Cal. Gov't Code, § 17556(f). Furthermore, even if some portions of the Permit's programs can be covered by user fees, these fees will not come close to covering all such costs, meaning permittees' general funds will have to be utilized to cover

---

substantial portions of these costs. Cal. Gov't Code, § 17556(d) (the ability to charge fees only defeats a subvention claim where the fees are sufficient to fully fund the program.)

**5. The Permit's Monitoring Program Exceeds the Requirements of Law**

The Permit's Receiving Water Monitoring Program is improper for going well beyond the scope of monitoring requirements authorized under Water Code Sections 13267 and 13383. The relevant portion of Water Code Section 13267 states:

“(b) (1) In conducting an investigation . . . the regional board may require that . . . any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports.”

The Regional Board's failure to conduct and communicate the requisite cost-benefit analysis pursuant to the monitoring requirements in the Permit constitutes an abuse of discretion. Water Code §§ 13267 and 13225(c).

The relevant portions of Water Code Section 13383 state:

“(a) The . . . regional board may establish monitoring, inspection, entry, reporting, and recordkeeping requirements . . . for any person who discharges, or proposes to discharge, to navigable waters. . . .

(b) The . . . or the regional boards may require any person subject to this section to establish and maintain monitoring equipment or methods, including, where appropriate, biological monitoring methods, sample effluent as prescribed, and provide other information as may be reasonably required.”

The Permit goes far beyond a requirement that a permittee “monitor” the effluent from its own storm drains. The Permit's Receiving Water Monitoring Program seems to require a complete hydrogeologic model found in the receiving water body, which will in many cases be miles away from many of the individual permittees' jurisdictions. To the extent the Permit requires individual permittees to compile information beyond their jurisdictional control, they are unauthorized. Although Water Code Section 13383(b) permits the Regional Board to request “other information”, such requests can only be “reasonably” imposed. Cal. Water Code § 13383(b). The information requested by the

---

Regional Board is unreasonable. It is not just limited to each individual copermittée's discharge. Rather, the Permit requires copermittées to analyze discharges and make assumptions regarding factors well beyond their individual boundaries. This is not reasonable, and is therefore not permitted under Water Code Sections 13225, 13267, and 13383. It is equally unreasonable to require the monitoring of authorized or unknown discharges. See Permit at p. 108.

**6. The Permit Exceeds the Regional Board's Authority by Requiring the City to Enter into Contracts and Coordinate With Other Co-Permittees**

The Regional Board cannot require the City to enter into agreements or coordinate with other co-permittees. The requirements that permittees engage in interagency agreements (Permit at p. 39) and coordinate with other copermittées as part of their stormwater management program (Permit at p. 56-58) are unlawful and exceed the authority of the Regional Board. The Regional Board lacks the statutory authority to mandate the creation of interagency agreements and coordination between permittees in an NPDES Permit. See Water Code §§ 13374 and 13377. The Permit creates the potential for City liability in circumstances where the permittee cannot ensure compliance due to the actions of third party state and local government agencies over which the City has no control. Such requirements are not reasonable regulations, and thus violate state law. *Communities for a Better Environment v. State Water Resources Control Bd.*, 132 Cal. App. 4th 1313, 1330 (2005) (regulation pursuant to NPDES program must be reasonable.)

**7. The Permit Fails to Consider Economic Impacts As Required by Water Code Sections 13000 and 13241**

The Regional Board's failure to adequately consider the economic impacts of the Permit, as required by Water Code Sections 13000 and 13241, render the Permit invalid. Water Code Section 13241 requires the Regional Board to include "[e]conomic considerations" with its consideration of the Permit. As demonstrated above, the Regional Board is incorrect in its assertion that consideration of economics is not required in this Permit. See Permit at pp. 24-25. Because, as demonstrated above, the Permit requires new and higher levels of service in numerous key regards, consideration of economic factors is necessary. *City of Burbank v. State Water Resources Control Bd.*, 35 Cal. 4th 613, 618, 627 (2005).

The alleged facts in the economic consideration section of the Fact Sheet misrepresent the permittees' data and fail to consider the economic impact of new, costly aspects of the Permit. The Fact Sheet's open skepticism of municipal financial reports is troubling, and indicates the Regional Board has not taken permittees' actual expenses seriously.

---

It is also premature and improper to assume that permittees will obtain funding from proposed ballot measures and other sources of funding which have not even been approved, much less voted on by the public. See Fact Sheet at pp. F-142-43. If the Regional Board wants to rely on initiatives, such as the Los Angeles County Flood Control District's Water Quality Funding Initiative, as sources of funding to offset the costs of storm water management, it should delay its public hearing and approval of the Permit until after the voters have actually voted on such initiatives. Otherwise, if such initiatives fail to pass, the co-permittees will be left to implement the Permit's requirements without the funds to do so. Even if the Water Quality Funding Initiative is approved by the voters, the funds generated by the Initiative would not even be available until 2014 – well after the deadline for a majority of the compliance deadlines set forth in the Permit. Moreover, the Water Quality Initiative will not cover all the costs imposed on all permittees by the Permit.

The Permit also fails to consider the significant additional costs that TMDLs will impose. The incorporation of TMDLs and the massive expansion of monitoring requirements in the Permit, which also trigger the need for additional inspectors, will inevitably cause the copermitees' costs to skyrocket. Furthermore, speculations about what people may be willing to pay for cleaner water and social benefits from clean water have no real effect on cities' bottom lines. Finally, the Permit fails to account fully for all the expenses that implementing minimum control measures will impose. For all these reasons, the consideration of economic impact is entirely lacking, which violates state law.

#### **8. The Permit's Imposition of Joint and Joint and Several Liability for Violations is Contrary to Law**

The Permit appears to improperly impose joint liability and joint and several liability for water quality based effluent limitations and receiving water exceedances. It is both unlawful and inequitable to make a permittee liable for the actions of other permittees over which it has no control. A party is responsible only for its own discharges or those over which it has control. *Jones v. E.R. Shell Contractor, Inc.*, 333 F. Supp. 2d 1344, 1348 (N.D. Ga. 2004). Because the City cannot prevent another permittee from failing to comply with the Permit, the Regional Board cannot, as a matter of law, hold the City jointly or jointly and severally liable with another permittee for violations of water quality standards in receiving water bodies or for TMDL violations. Under the Water Code, the Regional Board issues waste discharge requirements to "the person making or proposing the discharge." Cal. Water Code § 13263(f). Enforcement is directed towards "any person who violates any cease and desist order or cleanup and abatement order . . . or . . . waste discharge requirement." Cal. Water Code § 13350(a). In similar fashion, the Clean Water Act directs its prohibitions solely against the "person" who violates the requirements of the Act. 33 U.S.C. § 1319. Thus, there is no provision for joint liability under either the California Water Code or the Clean Water Act.

---

Furthermore, joint liability is proper only where joint tortfeasors act *in concert* to accomplish some common purpose or plan in committing the act causing the injury, which will generally never be the case regarding prohibited discharges. *Kesmodel v. Rand*, 119 Cal. App. 4th 1128, 1144 (2004); *Key v. Caldwell*, 39 Cal. App. 2d 698, 701 (1940). For any such discharge, it would be unlawful to impose joint liability and especially joint and several liability. The issue of imposing liability for contributions to "commingled discharges" of certain constituents, such as bacteria, is especially problematic because there is no method of determining who has contributed what to an exceedance.

For receiving water body exceedances, the Permit should specify that the burden is on the Regional Board to show that any permittee's discharge caused or contributed to that exceedance. Requiring permittees to prove they did not cause or contribute an exceedance is both inequitable and unlawful. Permittees should not be required to prove they did not do something when the Regional Board has failed to raise even a rebuttable presumption that the contamination results from a particular permittee's actions. See Cal. Evid. Code § 500; *Sargent Fletcher, Inc. v. Able Corp.*, 110 Cal. App. 4th 1658, 1667-1668 (2003).

\*\*\*\*\*

The City is dedicated to the protection and enhancement of water quality. The City, however, has other functions that require funding as well. If this Permit is adopted as proposed, even in the best case scenario, spending cuts to other crucial services such as police, fire, and public works are certain. The permittees' dwindling general funds simply cannot take the financial hit the Permit is poised to impose on them. The City believes a more measured approach is necessary, especially regarding how compliance in this Permit is achieved.

As public agencies, all parties involved in the NPDES permitting process have the obligation to carry out their duties in a responsible, realistic, and reasoned manner. Requirements that tether public agencies to impractical positions are counterproductive and violate our sacred charge as representatives of the people. The City is committed to working with the State and Regional Boards in order to achieve our mutual goals and looks forward to engaging in a constructive dialogue with Regional Board staff on these issues.

Sincerely,

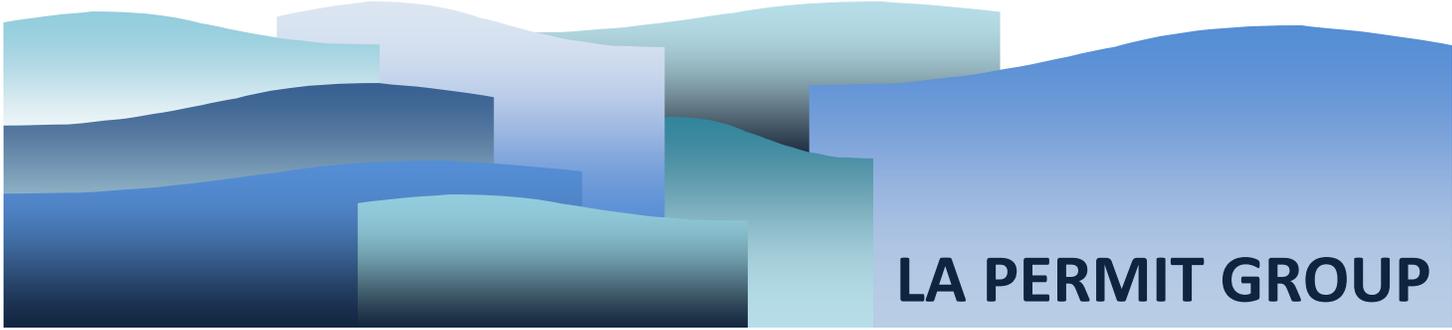

**CITY OF LA MIRADA**

Steve Forster  
Public Works Director

SF:jb

---

# LA PERMIT GROUP

July 23, 2012

**SUBJECT:       Comments on the Draft NPDES Permit (Draft Order), Order No. R4-2012-XXXX; NPDES Permit NO. CAS004001, for MS4 Dischargers within the Los Angeles County Flood Control District**

The LA Permit Group (LAPG) appreciates the opportunity to provide comments on the subject Draft Order for the Los Angeles region. The Los Angeles Permit Group is a consortium of municipalities that was formed to ensure Los Angeles' stormwater is managed properly, both for flood control and water quality protection (LA Permit Group agencies list provided in Exhibit A).

The LA Permit Group was formed, to accomplish several important objectives, including:

- Promoting constructive collaboration and problem-solving between the regulated community (municipalities) and the Los Angeles Regional Water Quality Control Board (LARWQCB);
- Assisting in development of a new NPDES Permit that is capable of integrating the protection of water quality with other watershed objectives in a cost-effective and science-based manner;
- Focusing limited municipal resources on implementation of water quality protection activities that are efficient, effective and sustainable.

Over 62 Los Angeles County municipalities have actively participated in the effort to develop negotiations points and provide comments throughout the MS4 NPDES Permit development process. Comments and negotiations points are developed by each of the LA Permit Group's four Technical Sub-Committees (Development Programs, Reporting & CORE Programs, Monitoring, and TMDLs), which are then approved by the LA Permit Group. The group's consensus is represented by the Negotiations Committee. This comment letter and accompanying exhibits reflect a collaborative effort to develop a permit that will lead to water quality protection in a cost effective manner. We have a number of major and minor concerns with the Draft Order. Our comments are organized around the following major issues:

- Receiving Water Limitations
- TMDLs
- Monitoring
- MCMs
- Watershed Management Program
- Cost Implications

Our recommendations for each issue are noted in **bold** in this letter and our detailed comments on the Draft Order are provided in the Exhibits to this letter (Exhibit B).

We also want to note that the Draft Order contains a number of errors and inconsistencies. This is not surprising given the sheer magnitude of the draft document, which is the basis for our multiple requests for more time to review the more than 500 pages of Permit. As stated in our letter dated July 2, 2012 (incorporated in this letter as attached – Exhibit C) and in Public Comments at the July 12, 2012 Regional Board Meeting, the comment deadline of July 23, 2012 is far too short to address all the potential issues and concerns. On several occasions, the Regional Board staff has used the Staff Working Proposal process and workshops as a justification for the expeditious manner in which the Draft Order was developed and the curtailed 45-day public comment period. This justification is misplaced for several reasons:

- Each Staff Working Proposal was issued with only a few weeks for stakeholders to provide comments on what may be considered the most significant increase in public effort to address water quality issues in the past 20 years;
- Although we provided comments on the working proposal, it is unclear to us how the Regional Board staff addressed our comments. In some cases changes were made and other cases no changes were made. In both cases no explanation was provided. As a result we have attached our previous comment letters for the record (Exhibit D);
- By rolling out different working proposals at different times it was difficult to understand how the key provisions interacted with each other. It was only after the full draft Order was issued did we see the interaction (or lack of interaction) of the provisions;
- It is the LA Permit Group's goal to cooperatively develop the MS4 Permit to support the Regional Board's policy goal of a permit that would reduce the need for litigation. This goal is important to us as we believe that good policy and regulations are those that are developed reasonably, that Permittees are capable of complying with. Even though we have worked hard and in good faith with Regional Board staff to try to develop a Permit that is protective of water quality in a cost-effective and science-based manner, the draft Order places the Permittees in a very vulnerable position for not immediately complying with water quality standards (see our discussion below regarding Receiving Water Limitations);
- It is also important to note that stormwater managers have an obligation to adequately inform other municipal departments, legal counsel, city management and elected officials on the fiscal impact of this draft Order. The time to properly evaluate the Permit, assess its financial, legal, and personnel impacts, and inform our cities cannot be accomplished in the 45 day review period; and
- We have also heard from many cities that their executives and elected officials had registered for the League of California Cities Conference on September 5-7, 2012, months prior to the Permit adoption hearing notice. We request that the adoption hearing be rescheduled after September 6-7, 2012 to allow for elected officials and executive of the Permitted agencies to attend the hearing; it is imperative that the adoption hearing be scheduled at a time that municipal decision makers have the opportunity to attend and provide comments at the hearing.

It is essential that municipalities be given an additional 180 days to review the Permit and develop alternatives for the substantial issues found in this Draft Order. Based on the issues listed above and as communicated in our July 2<sup>nd</sup> letter and at the July 12<sup>th</sup> Regional Board meeting, we request that the our appeal for additional time be reconsidered. This could be accomplished by an additional review of a tentative Order before an adoption hearing is held.

### ***Receiving Water Limitations***

As previously outlined in our 05/14/12 comment letter on the working proposal, the Receiving Water Limitations (RWL) language in the Draft Order creates a liability to the municipalities that is unnecessary and counterproductive. We have the following significant concerns with the RWL language included in the Draft Order:

- Recent court decisions have created a new interpretation of the RWL that creates a liability for the Permittees without a commensurate increase in protection of water quality.
- The RWL as written is not a federal requirement so it is not necessary to maintain the current language.
- The RWL as written is contradictory to the Watershed Management Program.
- Alternative approaches are available to address the concerns and maintain the intent of the language in the approach; we request that RWQCB utilize this alternative language.

We feel that the RWL as included in not necessary and does not support the improvement of water quality as discussed in more detail below.

### **Creation of Unwarranted Liability**

The proposed language for the receiving water limitations provision is almost identical to the language that was litigated in the 2001 Permit. On July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.*<sup>1</sup> (*NRDC v. County of LA*) that determined that a municipality is liable for Permit violations if its discharges cause or contribute to an exceedance of a water quality standard. This represents a fundamental change in interpretation of policy and contrasts sharply with the Board's own understanding as expressed in a 2002 letter from then-Chair Diamond answering questions about the 2001 MS4 Permit in which she articulated this collective understanding that a violation of the Permit would occur only when a municipality fails to engage in good faith effort to implement the iterative process to correct the harm<sup>2</sup>. In light of the 9<sup>th</sup> Circuit's decision and based on the significant monitoring efforts being conducted by other municipal stormwater entities, municipal stormwater Permittees would be considered to be in non-compliance with their NPDES Permits. Accordingly, municipal stormwater Permittees will be exposed to considerable vulnerability, even though municipalities have little control over the sources of pollutants that create the vulnerability. Basically, the draft Order language again exposes the municipalities to enforcement action (and third party law suits) even when the municipality is engaged in an adaptive management approach to address the exceedance.

---

<sup>1</sup> No. 10-56017, 2011 U.S. App. LEXIS 14443, at \*1 (9th Cir., July 13, 2011).

<sup>2</sup> January 30, 2002. Letter from Francine Diamond, Chair, Los Angeles Regional Water Quality Control Board

The LA Permit Group would like to more fully address Board Member Glickfeld's question raised at the May 3rd workshop about how the RWL language as currently written puts cities in immediate non compliance, either individually or collectively. As noted above, significant monitoring by other MS4s in the state had demonstrated that MS4 discharges pose water quality issues and with the proposed outfall monitoring detailed in the Draft Order we would expect the runoff characteristics to be similar to other MS4 discharges in the State. As the RWL language is currently written, municipalities cannot cause or exceed water quality standards in the basin plan as soon as this Permit is adopted. While the Regional Board staff has noted that enforcement action is unlikely if the Permittees are implementing the iterative process, the reality is that municipalities are immediately vulnerable to third party lawsuits in addition to enforcement action by the Regional Board. This is in fact what happened to the City of Stockton. The City of Stockton was sued by a third party for violations of the cause/contribute prohibition even though the City was implementing a comprehensive iterative process with specific pollutant load reduction plans. This was a series of pollutants not covered by a TMDL, but that dealt with water quality exceedances. Cities will have no warning or time to react to any water quality exceedances, but still be vulnerable to third party lawsuits even when cities are diligently working to address the pollutants of concern. This will be disastrous public policy, creating a chilling effect on productive storm water programs. Also in the Santa Monica Bay, cities were sent Notices of Violation that, in essence, stated that all cities in the watershed were guilty until they proved their innocence when receiving water violations were found, in some cases miles away. The "cause and contribute" language was quoted prominently in those NOVs as justification for why the Regional Board could take such action.

It is inherently unfair and poor public policy to put cities in non-compliance on day one of the Permit without the opportunity for the cities to develop a plan of action, develop source identification, and implement a plan to address the concern. With the very recent legal interpretation that fundamentally changes how these Permits have been traditionally implemented, please understand that adjusting the Receiving Water Limitations language is a critical issue. Again, the receiving water limitation language must be modified to allow for the integrated approach (iterative/adaptive management) to address numerous TMDLs and non-TMDL water quality problems within the watershed based program in a systematic way. This is a fair and constructive approach to meet water quality standards.

### **Receiving Water Limitation Language as Written is Not Required under Federal Law**

We believe Federal Law does not require that the RWL language be written as presented in the Tentative Permit. Based on the language presented in other Permits throughout the United States, the proposed language is not the only option. The RWL provision as crafted in the contested 2001 Los Angeles permit is unique to California. Recent USEPA developed Permits (e.g. Washington D.C.<sup>3</sup>) do not contain similar limitations. Thus, we would submit that the decision to include such a provision and the structure of the provision is a State policy and therefore an opportunity exists for the Regional and State Boards to reaffirm the iterative process as the preferred approach for long-term water quality improvement.

### **Receiving Water Limitation Language as Written is Contradictory to the Watershed Management Program**

Beyond the legal/liability aspect of the RWLs we would submit that in a practical sense the RWL, as currently written, does not support the Permit's goal of protecting water quality and works against the Watershed Management Program proposal. On the one hand, the municipalities will develop watershed management

---

<sup>3</sup> NPDES Permit No. DC0000221, October 7, 2011, issued by USEPA Region 3.

programs that are based on the highest priority water quality issues within the watershed. Consistent with the Draft Order provision for the Watershed Management Program, we would expect the focus to be on TMDLs and the pollutants associated with those TMDLs. However, under the current RWL working proposal, the municipality will need to direct their resources to any and all pollutants that may cause or contribute to exceedances of water quality standards. Based on a review of other municipal outfall monitoring results in the State, there will be occasional exceedances of other non-TMDL pollutants (e.g. aluminum, iron, etc.). These exceedances may only occur once every 10 storms, but according to the current RWL proposal the municipalities must address these exceedances with the same priority as the TMDL pollutants. The LA Permit Group views this as unreasonable and ineffective use of limited municipal resources.

**We have requested that this language be revised on several occasions including written comments, workshop comments, and meetings with staff; however this issue has not yet been resolved in the Tentative Permit. An explanation is requested as to why this language remains as presented in the Draft Order is requested. Alternative Approaches are Available to Address Concerns.**

The RWL language is a critical issue for municipalities statewide and has been highlighted to the State Water Resources Control Board for consideration. Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue.

The California Association of Stormwater Quality (CASQA) has developed draft language that we feel should be used in lieu of the current language. The language provides specificity in compliance and subjects Permittees who are not engaged in good faith in the iterative process to enforcement without unnecessary and counterproductive liability for the majority of Permittees who are diligently implementing stormwater programs. We feel that the CASQA language maintains the intent of the current RWL while addressing the concerns outlined above.

**Recommendation: Develop Receiving Water Limitation language consistent with the California Association of Stormwater Quality language that was submitted in a comment letter on Caltrans Permit (Exhibit E) and on the Statewide Phase II Permit which defines action thresholds, an iterative/adaptive management process, and avoids unnecessary liability.**

### ***Total Maximum Daily Loads***

As outlined in our May 12, 2012 comment letter on the TMDL working proposal, the incorporation of TMDL WLAs into the Tentative Permit is of critical importance to the LASP. **WLAs should be incorporated using a BMP-based approach that includes an iterative approach to attain the WLAs and provides flexibility to the Permittees to address the complexities of addressing multiple TMDLs within a watershed.** The best mechanism to achieve water quality standards is by implementing BMPs, evaluating their effectiveness and implementing additional BMPs as necessary to meet TMDL WLAs. Without this process, and due to the requirement in the Draft Order to meet numeric values, our ability to effectively implement BMPs is hampered by the legal issues associated with Permit compliance.

The Draft OrderDraft Order proposes to incorporate more TMDLs than any other Permit in California issued to date. As a result, the manner in which the TMDLs are incorporated into the Permit is a critical issue to the LA Permit Group and will likely set a significant precedent for future MS4 Permits.

The rate of development of TMDLs in the Los Angeles Region was unparalleled in California, and likely the nation. A settlement agreement necessitated the much accelerated time schedule for these TMDLs. The TMDLs were developed based on the information available at the time, not the best information to identify or solve the problem. As a result, the sophistication of the TMDLs vary widely, meaning that not all TMDLs are created equal regarding knowledge of the pollutant sources, confidence in the technical analysis, availability of control measures sufficient to address the pollutant targets, etc. Additionally, the majority of the TMDLs were developed with the understanding that monitoring, special studies, and other information would be gathered during the early years of the TMDL implementation to refine the TMDLs. As such, many MS4 dischargers were told during TMDL adoption that any concerns they may have over inaccuracies in the TMDL analysis would be addressed through a TMDL reopener. The recent experience with the Santa Monica Bay Beaches Bacterial TMDL reopener demonstrates just how difficult, if not impossible, obtaining serious reconsideration of established TMDLs, irrespective of the weight of evidence presented. The proposed method of incorporating TMDL waste load allocations (WLAs) as outlined in the Draft OrderDraft Order does not effectively allow for addressing this phased method of implementing TMDLs; nor does it recognize the time, effort and complexities involved in addressing MS4 discharges; and places municipalities into non-compliance risk.

We recognize and appreciate that TMDLs must be incorporated in such a way as to require action to improve water quality. However, the Permit should recognize the articulated goal of many of the TMDLs to be adaptive management documents, using the iterative approach to achieve the goals, and consider the challenges of trying to address the non-point nature of stormwater. As such, it is imperative to have flexibility in selecting an approach to address the TMDLs and the time frame by which to implement the approach. We would like to thank Board staff for providing the opportunity to submit an implementation schedule and BMPs in context of a Watershed Management Plan to attain EPA TMDL WLAs. The same flexibility is also necessary to address Regional Board adopted TMDLs.

The LA Permit Group would submit that the Regional Board staff is making two policy decisions that have massive financial impacts to the region (studies show in the range of billions of dollars) with regards to incorporating TMDLs into a stormwater NPDES Permit:

- The inclusion of numeric effluent limitations for final TMDL WLAs.
- The use of time schedule orders to address Regional Board adopted TMDLs for which the compliance points have passed.

### **Numeric Effluent Limitations for Final TMDL WLAs**

The LA Permit Group opposes the incorporation of final WLAs solely as numeric effluent limitations in the proposed Permit language. Although staff has discretion to include numeric limits where feasible, it is not required and the use of numeric limits results in contradictions and compliance inconsistencies with the rest of the Permit requirements. Court decisions (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)<sup>4</sup>), State Board orders (Order WQ 2009-0008, In the Matter of the Petition of County of Los

---

<sup>4</sup> See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

Angeles and Los Angeles County Flood Control District, at p. 10)<sup>5</sup> have affirmed that WLAs can be incorporated as non-numeric effluent limitations.

Under 40 CFR Section 122.44 (k), the Regional Board may impose BMPs for control of storm water discharges in lieu of numeric effluent limitations when numeric limits are infeasible. It states that best management practices may be used to control or abate the discharge of pollutants when numeric effluent limitations are infeasible. In 2006, the State Board convened Blue Ribbon Panel made recommendations to the State Water Resources Control Board concluding that it was not feasible to incorporate numeric limits into Permits to regulate storm water, and at best, there could be some action level to focus on problematic drainage sheds<sup>6</sup>. Very little has changed in the technology and the feasibility of controlling storm water pollutants since 2006. What has changed is that a legally compelled, long list of TMDLs has been adopted in the LA Region in a very short time period. The draft stormwater Permit for CalTrans also states “Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 Code of Federal Regulations section 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water Permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP. To assist in determining if the BMPs are effectively achieving MEP standards, this Order requires effluent and receiving water monitoring. The monitoring data will be used to determine the effectiveness of the applied BMPs and to make appropriate adjustments or revisions to BMPs that are not effective.” The LAPG requests similar consideration as the Draft Order is a much more variable and complicated MS4 than CalTrans.

Additionally, during the May 3, 2012 MS4 Permit workshop, Regional Board staff seemed to indicate that the basis for incorporating the final WLAs as numeric effluent limitations is EPA’s 2010 memorandum pertaining to the incorporation of TMDL WLAs in NPDES Permits<sup>7</sup>. This memorandum (which is currently being reconsidered by U.S. EPA) states that “EPA recommends that, *where feasible*, the NPDES permitting authority *exercise its discretion* to include numeric effluent limitations as necessary to meet water quality standards” (emphasis added). This statement highlights the basic principle that the Regional Board has discretion in how WLAs are incorporated into a MS4 Permit. Regional Board staff commented during the workshop that staff have evaluated data and have determined numeric effluent limitations are now feasible. However, no information refuting the Blue Ribbon Panel report recommendations has been provided that demonstrates how the appropriateness of using strict numeric limits was determined and why these limits are considered feasible now even though historically both EPA and the State have made findings that developing numeric limits was likely to be infeasible.

Given the discretion available to Regional Board staff and the variability among the TMDLs with respect to understanding of the pollutant sources, confidence in the technical analysis, and availability of control measures sufficient to address the pollutant targets, **it is critical to use non-numeric water quality based**

---

<sup>5</sup> “[i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California’s NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board’s findings *supporting either the numeric or non-numeric* effluent limitations contained in the permit.” (Order WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)

<sup>6</sup> Storm Water Panel Recommendations to the California State Water Resources Control Board “The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities. June 19, 2006.

<sup>7</sup> U.S. EPA, *Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, Memorandum from U.S. EPA Director, Office of Wastewater Management James A. Hanlon and U.S. EPA Director, Office of Wetlands, Oceans, and Watershed Denise Keehner (Nov. 10, 2010).

**effluent limitations for final WLAs in this Permit.** The proposed Watershed Management Program will require quantitative analysis to select actions that will be taken to achieve TMDL WLAs. For the entire length of the TMDL compliance schedule, Permittees will be required to demonstrate compliance with interim WLAs by implementing actions that they have estimated to the best of their knowledge will result in achieving the WLAs and water quality standards. However, unless final WLAs are also expressed in this Permit as action-based water quality based effluent limitations, and if instead strict numeric limits are required for final WLAs, then, at the specified final compliance date, no matter how much the Permittee has done, no matter how much money has been spent, no matter how close to complying with the numeric values, no matter what other sources outside the Permittees' control have been identified and quantified, and no matter what other information has been developed and submitted to the Regional Board, the Permittee will be considered out of compliance with the Permit requirements. Furthermore, because of the structure established in this Permit, the Regional Board staff will have to consider all Permittees in this situation as being out of compliance with the Permit provisions if the strict numeric limits have not been met, regardless of the actions taken previously. This approach is inconsistent with the goals of good public policy, fair enforcement, fiscal responsibility and holding Permittees responsible only for discharges over which they have individual control.

#### **TMDLs Where Compliance Date Has Already Occurred**

The LA Permit Group is also concerned with the major policy decision related to the use of Time Schedule Orders for Regional Board adopted TMDLs for which the compliance date has already occurred prior to the approval of the NPDES Permit. There is a fundamental problem with the TMDL process whereby new information is not being incorporated into TMDLs. The ideal phased TMDL implementation process whereby dischargers can collect information, submit it to the Regional Board, and obtain revisions to the TMDL requirements to address data gaps and uncertainties has not occurred. As evidenced by the number of overdue Permits, the workload commitments of Regional Board staff are significant and TMDL reopeners seldom occur. Because the majority of the TMDLs have not been incorporated into Permit requirements until now, MS4 Permittees have been put in the position of trying to comply with TMDL requirements without knowing how compliance with those TMDLs would be determined and without knowing when or if promised considerations of modifications to the TMDL would occur. So Permittees would be expected to be in immediate compliance with new Permit provisions irrespective of most precedent, guidance regarding incorporation of TMDLs into MS4 Permits, and irrespective of what actions Permittees have taken to try and meet the TMDL requirements. This is neither fair nor consistent as requesting a TSO would place a Permittee in immediate non-compliance with the Permit and expose the Permittee to risk of third party lawsuits.

The LA Permit Group strongly believes that the adaptive management approach envisioned during TMDL development, whereby TMDL reopeners are used to consider new monitoring data and other technical information to modify the TMDLs, including TMDL schedules as appropriate, is the most straightforward way to address past due TMDLs. The Regional Board should use the reopener as an opportunity to adjust the implementation timelines to reflect the practical and financial reality faced by municipalities. Final WLAs should be delayed until serious reconsideration of the data that established the TMDLs so that the TMDLs can reflect information gathered during the implementation period. This will allow critically important data to be utilized to selectively modify time schedules in the TMDLs. Final compliance with TMDL Permit conditions should not occur prior to these additional TMDL reconsiderations. Additionally, the Permit should reflect any modifications to the TMDL schedules made through the reopener process, either through a delay in the issuance of the Permit until the modified TMDLs become effective, or by using its discretion to establish a specific compliance process for these TMDLs in the Permit. Providing for compliance with these TMDLs

through implementation of BMPs defined in the watershed management plans as we have requested for all other TMDLs is a feasible, fair and consistent way to achieve this goal.

#### **Recommendation:**

- **Provide a provision which requires that a TMDL be reconsidered in light of information that was not available when the TMDL was developed before the final WLAs become effective.** Whenever the reconsideration has been completed, the Permit should be reopened to make changes to any wasteload allocation, time schedules, and other pertinent information.
- **Translate WLAs into WQBELs, expressed as BMPs.**
- **State that the implementation of the BMPs using an iterative process will place the Permittee into compliance with the MS4 Permit.**
- **Provide for four compliance options for both interim and final WLAs:**
  - **Implement Actions/BMPs consistent with Watershed Management Program**
  - **Compliance at the outfall (end of pipe)**
  - **Compliance in the receiving water (river, creek, ocean)**
  - **No direct discharges**
- **Allow for the adaptive management approach to be utilized for TMDL compliance, consistent with the timelines identified in the Watershed Management Programs.**

#### **Monitoring**

The proposed monitoring program requirements have significantly increase compared to our current required efforts. Although we understand the need for monitoring to support the Permit, we believe there are number of issues within the MRP that need to more fully vetted and discussed. These issues include:

- **Receiving water monitoring should be consistent with SWAMP protocols including the requirement that ambient monitoring be conducted two days following a storm event.** Currently the receiving water monitoring is proposed to be conducted during storm events. Such an approach will not support the need to assess the receiving water quality consistent with the SWAMP approach that is used as the basis for 303(d) listing.
- **The focus and scope of non-stormwater monitoring is not commensurate with the environmental issues associated with dry weather flows.** We believe the non-stormwater monitoring should be to help identify illicit discharges and not for assessing the multitude of objectives noted in the MRP, II.E.a – c. Furthermore we would submit that the MS4s should focus its non-stormwater monitoring on discharges “into” our MS4 and not on discharges “through” or from our MS4s that may cause or contribute to exceedances of water quality standards. This is consistent with CWA section 402(p)(B).
- Regarding regional studies (MRP XI.A – B), the LAPG would submit that these studies should be conducted by the Regional or State Board. But if the Permit does require special studies, **the Permit needs to establish the mechanism/option for Permittees to participate in the studies without having to conduct the studies on an individual basis.** Furthermore, the Regional Board should be the agency to lead and coordinate these studies. The MRP appears to read that each and every Permittee must conduct the regional studies.
- **Toxicity monitoring should be limited to the receiving water only and not at the outfalls.** It’s important to establish whether is a toxicity issue in the receiving water before conducting this

expensive monitoring at the outfalls. Furthermore, recent Department of Pesticide Regulations<sup>8</sup> has severely limited the use of pyrethroid based pesticides, thus calling into question the need for expensive toxicity monitoring, especially at outfalls. And finally, should a study be deemed necessary, the Regional Board should lead this study.

- Insufficient time is allotted to prepare Coordinated Integrated Monitoring Plans (CIMP). Since the monitoring for TMDLs should continue per the TMDL schedules, the Permittees should be allowed sufficient time to prepare the CIMPs. To prepare a CIMP the Permittees will need more than a Letter of Intent to proceed. **We recommend that the Draft Order be modified to allow 12 months to submit a Memorandum of Agreement to participate in a CIMP and 24 months to submit the complete CIMP.** The time required to award the monitoring contract is 3 months, at least 6 months are needed to obtain Los Angeles County Flood Control Encroachment Permits, thus at least 9 months is needed before commencing monitoring.

### ***Minimum Control Measures***

In order to further water quality improvements, the Permit needs to set clear goals, while allowing flexibility with the programs and BMPs implemented. This is accomplished through integrated watershed planning and monitoring. This strategy has been requested by the LA Permit Group as it will allow Permittees to look at the larger picture and develop programs and BMPs based on addressing multiple pollutants. In doing so, limited local resources can be concentrated on the highest priorities. The LA Permit Group has on numerous occasions expressed our support of a watershed based approach to stormwater management. It would appear from a read of Provision VI.C.1.a (page 45) that the Board also supports this approach. We believe the opportunity for a municipality to customize the MCMs to reflect the jurisdiction's water quality conditions is absolutely critical if municipalities are to develop and implement stormwater programs that will result in environmental improvement. **We, however, suggest that the Permit ultimately establish criteria that will be used to support any customization of MCMs.** The criteria should be comprehensive but flexible. We suggest some flexibility in the criteria because the management of pollutants in stormwater is a challenging task and that the science and technology to help guide customizing MCMs are still developing. Furthermore, the municipal stormwater performance standard to reduce pollutants to the maximum extent practicable is not well defined and will depend on a number of factors<sup>9</sup>. This constraint, as well as USEPA position<sup>10</sup> that the iterative process is the basis for good stormwater management, supports the need to provide flexibility in defining the criteria for customizing MCMs. **Also, for clarification, the terms of adaptive management approach and the iterative approach need to be defined as equivalent and that they can be used interchangeably.**

### **Timeline for Implementation**

The Draft Order does not provide adequate and reasonable timelines for the start-up and implementation of the Minimum Control Measure requirements. For example, the Draft Order in provision VI.D.1.b.i requires the majority of MCMs to begin within 30 days, unless otherwise noted in the order. There are a number of new/enhanced provisions and it is fair to say that there will be a transition period between the time the Permit becomes effective and the time that the municipalities will have to modify their current stormwater management programs to be in compliance with the new Permit provisions. At the same time, consideration should be given to the time required to develop watershed based "customized" programs. The LA Permit

<sup>9</sup> See E. Jennings 2/11/93 memorandum to Archie Mathews, State Water Resources Control Board.

<sup>10</sup> See Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 FR 43761 (Aug. 26, 1996).

Group requests that the Regional Board provide a revised timeline for implementation and phasing-in of the Minimum Control Measure requirements. **We request that the Permit allow a 12 month time schedule to transition from our current efforts to the new and enhanced MCMs requirements.**

### **Shifting of State Responsibility to the MS4**

The Draft Order shifts much of the State responsibilities regarding the State's General s for Construction and Industrial Activities to the municipalities. These new responsibilities have significant financial responsibilities on the permittees (ex. plan reviews, inspections time, reporting, enforcement, etc.). This is especially true for the Statewide General Construction Activities Permit (GCASP) and Provision VI.D.7. A few examples of where the Draft Order either shifts the responsibility or actually exceeds the requirements of the GCASP are listed below:

- Maintaining a database that overlaps with the States' own SMARTS database. Asking Permittees to collect the same data adds unnecessary time and expense with no benefit to water quality;
- Requiring the quantification of soil loss is redundant with the GCASP and adds additional MS4 costs.
- **Inspections will be increased by more than 200% and are redundant since the State should be responsible for implementation of its own permit particularly in light of the fact that the State collects a permit fee for implementation.**

**Those elements that shift State responsibility should be eliminated and the MCMs should be coordinated with other state and federal requirements, with particular attention to GCASP and General Industrial Activities Permit requirements.**

### **MCMs Should Reflect Effective Current Efforts**

The LA Permit Group understands that the new Permit must reflect current understanding of stormwater management and water quality issues. Where the current stormwater management effort is assessed to be inadequate, then additional efforts are warranted. However, when current efforts are assessed to be adequate for protecting water quality, then the MCMs should reflect current efforts. One significant area where the LA Permit Group believes that the current effort is protective of water quality is in the new development program. The City and County of Los Angeles as well as the City of Santa Monica have developed and adopted Low Impact Development ordinances and significant work, technical analysis, and public input have gone into the development of these ordinances. Each of these ordinances required tailoring of standards to address the unique characteristics of their city (ex. size, land uses, soils, groundwater, watershed(s), hydrology, etc.). **The Permit should reference the type of program and flexibility needed to accommodate the unique and vastly varying characteristics throughout the County.** Instead of providing detailed information in the text of the Permit, the LID provisions should outline general requirements of the program, and the details should be contained in a technical guidance manual. This point was reiterated by several speakers at the April 5, 2012 workshop, including BIA. Ultimately, it may be more constructive if the Regional Board created a template for the Permittees to use.

### **New Development MCM**

Notwithstanding our comments above, the LA Permit Group has a number of concerns with the New Development provision of the MCMs. While the LA Permit Group has concerns and need for clarification with the other MCMs we find the New Development MCM the most challenging and unsupportable. The provision is difficult to follow and the BMP selection hierarchy is confusing and at times in conflict. We have provided specific comments on this provision but it suffice to say that the LA Permit Group believes this provision should be redrafted. We have significant concerns with the following parts of the New Development MCM:

- Storm design criteria
- Alternative compliance option offsite mitigation
- Treatment control performance benchmarks
- BMP tracking and inspection
- BMP specificity and guidance
- Hydromodification

#### *Storm Design Criteria*

The Draft Order in Provision D.6.c.i (page 70) requires the developer to retain the stormwater quality design volume as calculated by either the 0.75 inch storm or the 85<sup>th</sup> percentile 24 hour storm whichever is greater. We take exception to the requirement to select the largest calculated volume. In all Permits to date in California these two design criteria were judged to be equivalent. **We recommend that the Draft Order be modified to specify that the two criteria are equivalent.** In fact, the current stormwater 2001 Permit for Los Angeles County includes four design criteria to choose from for the stormwater volume. The additional effort to assess every project to choose between two equivalent design criteria makes little sense and adds cost to any project. We recommend that the developer be allowed to choose between the two criteria without the need to calculate the largest.

#### *Alternative Compliance Option - Offsite Mitigation*

The Draft Order goes into great detail discussing an alternative compliance option to full on- site retention of the design storm volume. The alternative option takes the form of an offsite mitigation project. As currently structured it is highly unlikely that anyone will opt for this alternative compliance option. Probably the biggest hurdle for developers to overcome if they are to pursue offsite mitigation is the requirements that they must treat the project site runoff to the levels identified in Table 11. This combined with the requirement that the offsite mitigation project must be equivalent in pollutant load reduction as the original project site equates to the developer removing essentially twice as much pollutant loads as he would had accomplished on the project site had the site been able to retain the load onsite originally. This is inherently unfair. **We would recommend that the developer be required to remove only the pollutant loads that would have been removed at the project site at the mitigation site and if the mitigation site cannot meet that load reduction then the developer can implement treatment controls at the project site for the remaining differential.** Such an approach is fair and will be more readily accepted by the development community than the current proposal.

#### *Treatment Control Performance Benchmarks*

The concept of establishing benchmarks for post construction BMPs was initially developed in the 2009 Ventura MS4 Permit. However, there is a significant different between the Permits. The Ventura County's NPDES MS4 Permit requires the project developer to determine the pollutant of concern(s) for the development project and use this pollutant as the basis for selecting a top performing BMP. In the case of the Draft Order, there is no determination of the pollutant of concern for the development project. Instead post construction BMPs must meet all the benchmarks established in Table 11. Unfortunately, no one traditional post construction BMP (non-infiltration BMPs) is capable of meeting all the benchmarks and thus the developer will not be able to select a BMP. **We recommend that provision VI.D.6.c.iv.(1)(a) (page 74) be modified so that the selection of post construction BMPs is consistent with the Ventura Permit and is based**

**on the development site's pollutant of concern(s) and the corresponding top performing BMP(s) that can meet the Table 11 benchmarks.**

#### *BMP Tracking and Inspection*

In the Draft Order provision VI.D.6.d the Permittees are being required to track and inspect post construction BMPs including LID measures. The provision does allow that such effort can be addressed by the project developer but even with this consideration the provision is onerous for city staff as this would still require significant staff time (ex. plan reviews, data entry, letter preparation and enforcement, etc.). This is especially true for LID measures which if planned and designed correctly will include a large number of measures (planter boxes, infiltration trenches, swales, etc.) on every site. Furthermore most of the LID measures will be infiltration type measures which are difficult to inspect and should be only inspected in wet weather when one can ascertain that the LID measures are operating correctly. This inspection concept when taken to the extreme will mean that municipalities will be inspecting LID measures all over the community and only during rain events. This is just flat unreasonable and cost prohibitive for the municipality. Furthermore, the cost for implementation (e.g. inspection, monitoring, enforcement, etc.) are not shown to be commensurate with any corresponding improvement in water quality. **We recommend that the tracking and inspection of post construction BMPs be limited to only the conventional BMPs (e.g. detention basins, wetlands, etc.); alternatively require the MS4 to spot check a limited number of LID measures to ascertain how well they are operating.**

#### *BMP Specificity*

The Draft Order in Attachment H provides detail specifications for biofiltration and bioretention BMPs. The LA Permit Group believes that such specificity, although well intended, is counterproductive. Such specificity is equivalent to a wastewater NPDES Permit specifying the grain size in the multimedia filtration unit. It is more appropriate to establish the performance standard for the BMP and to allow the MS4 to develop design specifications to meet the standard. **We recommend that Attachment H be removed and a provision be established that establishes a collaborative approach to promote a technical guidance manual that would include the design specifications for bioretention/biofiltration.**

#### *Hydromodification*

The LAPG would submit that it is premature to change the hydromodification criteria, specifically the interim criteria. In our current 2001 order, Permittees were required to develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study. **We believe it more constructive to keep with the previously developed hydromodification criteria and not revised it for the interim until the final criteria can be developed by the State.** A change now and then one later on just adds confusion to the development process and creates additional work for a limited or non-existent water quality improvement. The effort under the 2001 Permit should be sufficient until such time the final criteria are developed.

#### **Public Agency MCM**

The Draft Order identifies a number of requirements for public agency MCMs. Our detailed comments are attached, but there are two issues we want to highlight here. First is provision VI.D.8.h.vii (page 102) which specifies additional trash BMPs regardless of whether the area is subject to a trash TMDL. We take exception to this approach, as the MCM requires prioritization, cleaning and inspection of catch basins as well as street sweeping and other management control measures to address trash at public events. And then even if the

Municipality is controlling trash through these control measures, the Municipality must still install trash excluders (see page 102 regarding “additional trash management practices”). This makes little sense and **the LA Permit Group would submit that if the initial control measures are successful, then the “additional trash management practices” are unnecessary (as evident by the lack of a TMDL).**

The second issue pertains to provision VI.D.8.d (page 94) regarding retrofitting opportunities. Provision VI.D.8.d.i requires that the MS4 develop an inventory of retrofit opportunities within the public right of way but then in provision VI.D.8.d.ii, the Draft Order requires the Permittees screen existing area of development. Furthermore in provision VI.D.8.d.iii the MS4 must prioritize all existing areas of development. Reading these provisions in whole would seem to indicate that the MS4 must identify all potential retrofit sites (private or publically owned) and to prioritize the sites. This is a contentious issue and should be addressed carefully. Stormwater regulations (40 CFR 122.26.(d)(2)(iv)(4) requires consideration of retrofitting opportunities, but the consideration is limited to flood management projects (i.e. public right of way) and does not require consideration of private areas. **We recommend that for this Permit term that the retrofit provision (i.e. inventory, screening, and prioritization) be limited to public right of ways lands only.**

### **ID/IC MCM**

The Draft Order identifies a number of provisions that are fundamental to an Illicit Connection/Illegal Discharge program. These provisions include

- III. Discharge Prohibition,
- VI.A.2 Standard Provisions – Legal Authority,
- VI.D. 9 IC/ID Elimination Program,
- Attachments E, Monitoring and Reporting and
- Attachment G Non-stormwater Action Levels.

When combined, the ID/IC program will require a significant effort and not always effective. We have provided specific comments on these provisions in the Exhibit to this letter but we would like to highlight two of the more significant issues. First, is the magnitude of the dry weather monitoring being required. The TMDLs monitoring programs have already identified, to a large extent, a comprehensive non-stormwater monitoring program. **As such, the TMDL monitoring program should be the basis for the “non-stormwater outfall based monitoring program” and both should be identified in an Integrated Watershed Monitoring Program.**

The second issue pertains to the non-stormwater action levels established in Attachment G. One of the goals of establishing non-stormwater action levels is to assist Permittees in identifying illicit connections and/or discharges at outfalls. Exceedances of action levels can help Permittees prioritize and focus resources on areas that are having a real impact on water quality. Unfortunately, as currently drafted, the non-stormwater action levels do not accomplish this goal. The action levels established in the Draft Order are derived from Basin Plan, CTR, or COP water quality objectives. The non-stormwater action levels do not facilitate the consideration of actual impacts (e.g., excess algal growth), have no nexus to receiving water conditions, and do not address NAL issues unrelated to illicit discharges (e.g., groundwater). The action levels and the associated monitoring specified in the Monitoring and Reporting Program would require Permittees to investigate and address issues on an outfall-by-outfall basis, even if the receiving water is in compliance with all water quality standards. This will not assist Permittees in prioritizing resources on outfalls that are clearly having an impact on water quality. **We recommend that the Permit allow the Watershed Management Programs to guide the customization of the NALs based on the highest water quality priorities in each**

**watershed and to establish them at a level that would provide better assurance that illicit discharges can actually be found and not have every outfall become a high priority outfall.** If NALs are not established through the Watershed Management Programs, or Permittees should be required to use the default NALs and approach identified in Attachment G.

### ***Watershed Management Programs***

Overall, the LA Permit Group supports the Regional Board's proposed approach to address high priority water quality issues through the development and implementation of a Watershed Management Program. However, one of our biggest concerns continues not be addressed, is the Draft Order proposed timeline for developing the watershed management program(s). The Draft Order allows the municipalities only one year to develop a comprehensive watershed management program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate and run the models based on relevant data, draft the plans, and obtain necessary approvals from political bodies. As a comparison, the City of Torrance required two years to prepare a comprehensive water quality plan that addressed a suite of TMDLs, similar to what is being considered in the watershed management program. **We believe that it will require at least 24 months to develop a draft plan that is comprehensive, analytically supported, and implementable. Alternatively we would suggest a phased approach where some initial efforts (e.g. MOUs, retrofit inventory) could be completed and submitted within 12 months but allow 24 month timeline for the more complicated or resource intensive efforts.**

We also offer the following comments regarding the Watershed Management Program (our line item by line item review and comments are attached):

- The Draft Order seems to be silent on the critical issue of sources of pollutants outside the authority of MS4 Permittees (e. g. aerial deposition, upstream contributions, discharges allowed by another NPDES permit, etc.). **We request that Permittees be allowed to demonstrate that some sources are outside the Permittee's control and not responsible for managing or abating those sources.**
- **The Permit needs to clearly state that watershed management programs and the reasonable assurance analysis can be used for TMDL compliance purposes.**
- **The Permit should clarify that the adaptive management process is equivalent to the iterative process described in the Receiving Water Limitation provision and provide the legal justification for the adaptive management process.**
- More careful consideration should be given to the frequency and extent of the reporting and adaptive management assessments. The current Draft Order results in a significant annual effort and the LA Permit Group members question the value of such an effort. Current reporting appears to overwhelm Regional Board staff resources and has provided limited feedback to the municipalities. We believe that the reporting can be streamlined and that the jurisdictional and watershed reporting should be combined. **Furthermore, we recommend that the adaptive management process be applied every two years instead of the every year frequency noted in the Draft Order.**
- It is unclear how the current implementation of our stormwater program and TMDL compliance will be handled during the interim period before development of the watershed management program. For those entities that choose this path, **the LA Permit Group requests that current, significant efforts in our existing programs and implementation plans be allowed to continue while we evaluate new MCMs as part of the watershed management program.**

- **Consideration of the technical and financial feasibility of complying with water quality standards should be included in the watershed management program.**
- **The timing of revising the Watershed Management Programs is in conflict and confusing. There should only be one revision to the Watershed Management Program, and only when adaptive management/iterative process demonstrates that the modification is warranted.**
- **The adaptive management/iterative approach and timing should be consistent between individual Permittees (“jurisdictional watershed management program”) and the watershed management program.**

### ***Cost/Economic Implications***

Regarding fiscal resources, the LA Permit Group would like to reemphasize the limited parameters in which municipalities operate. The Draft Order (page 40) requires municipalities to exercise its authority to secure fiscal resources necessary to meet all of the requirements of the Permit. We have reservations as to whether this provision is legal given that it appears to violate the State Constitution, Article XVI, Section 18. That being said, Permittees have a limited amount of funds that are under local control. Any additional funds needed to raise money for stormwater programs would need to come from increased/new stormwater fees and grants. **New fees for stormwater are regulated under the State’s Prop 218 regulations, and require a public vote. Therefore, raising new fees is an item that is not under direct control of the municipalities – the Permit language should reflect this.** Furthermore, in addition to clean water, local resources are also directed to a number of health, safety and quality of life factors. Thus, all these factors need to be developed in balance with each other. This requires a strategic process and that will take time to get right. We request that the Regional Board develop the Permit conditions based on a reasonable timeframe in balance with the existing economy and other health, safety, regulatory and quality of life factors that local agencies are responsible for.

The LA Permit Group also wants to address the issue of whether or not these Permit requirements constitute an unfunded mandate. The Fact Sheet makes a unilateral statement that the Regional Board has determined that the Permit requirements do not exceed Federal requirements and therefore are not unfunded mandates. No back up information is provided to substantiate this claim. Our request is for the Regional Board to substantiate this statement for each section of the Permit. We also want to point out that the court decisions on unfunded mandates claims are still on appeal, and it is premature to conclude on the merits of the appeal.

As previously discussed at workshops, and in comment letters, and requested by many Board Members, the economic implications of the many proposed Permit requirements are of critical importance. It is also worth noting that the cost for complying with both the stormwater regulations and TMDL requirements should be carefully considered. This point is highlighted in the March 20, 2012 memo<sup>11</sup> from OMB to heads of executive departments and agencies (including USEPA) which clarified Presidential Executive Order 13563. This Order requires the agencies to take into account among other things, and to the extent practicable, the costs of cumulative regulations. This is particularly relevant for this Draft Order where we have the convergence of TMDLs and stormwater regulations. Although we have not had sufficient time to assess the cost for the new stormwater requirements, the County of Los Angeles has completed an analysis (using the Los Angeles County BMP Decision Support System model) to assess the effort required to implement low impact development retrofits throughout Los Angeles County to address all TMDLs and 303(d) listings. This model roughly estimated that, to meet these water quality standards, the area would have to spend between \$17 billion and

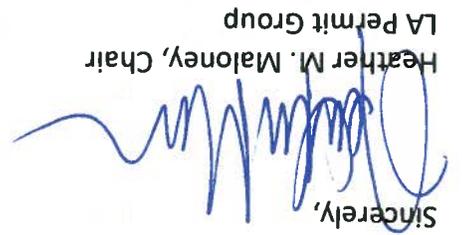

---

<sup>11</sup> Cass R. Sunstein, Executive Office of the President, OMB memorandum for the Heads of Executive Departments and Agencies regarding Cumulative Effects of Regulations, March 20, 2012.

\$42 billion. Los Angeles River Watershed Bacteria TMDL could cost up to \$5.4 billion for full, inclusive, implementation costs for that watershed alone for only one pollutant. Even if the Water Quality Funding Initiative passes (and it is far from guaranteed to pass), it would take a full 20 years dedicating the entire fund to the Los Angeles River Bacteria TMDL to pay for these requirements. It would require over 60 years paying for the larger estimate. In the fact sheet, Regional Board staff stated that the TMDL costs were considered during the TMDL adoption process. However, given Executive Order 13563, we would submit that the Board should consider all costs associated with the management of stormwater. With these types of economic implications, it is critical that this Regional Board and their staff more carefully evaluate comments and provide additional, extended comment periods for these requirements.

In closing, we thank you for the opportunity to comment on the Draft Order and we look forward to meeting with you to discuss our comments and to explore alternative approaches. However, we must reiterate the need for more time to review and analyze this Draft Order. In spite of the Regional Board staff statement<sup>12</sup> that there has been a myriad of opportunities to present our concerns and comments, we believe otherwise. The LAPG would submit that we have not had an opportunity to voice our concerns to the Regional Board members themselves as we have been limited (in some cases prevented) in responding to questions posed by the Board members during different workshops. Consequently, we respectfully request that the Board provide another complete second draft Tentative Order with an additional review period to allow Permittees to have at least a total of 180 days to discuss and review the full document. We believe it important to review the entire draft Permit to better understand the relationship among the various provisions; this is especially true for the monitoring provision and its relationship to the watershed management program. We also believe that the Regional Board staff will be hard pressed to consider and respond to all the comments that will be submitted on the Draft Order. Thus, it is advantageous to all parties that more time is provided to craft a permit that is implementable and protective of water quality. We request the issues presented in our letter are resolved in a revised Permit draft. Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,

Heather M. Maloney, Chair  
LA Permit Group

**Exhibit B:**

**LA Permit Group Detailed Comments re: Draft Order**

Agency/Reviewer: LA Permit Group

Comment No.	Doc. Reference		Comments	
	Page	Section	Apr-12	Jul-12
1	General	General	Any TMDL, for which compliance with a waste load allocation (WLA) is exclusively set in the receiving water, shall be amended by a re-opener to also allow compliance at the outfall to allow that flexibility, or other end-of-pipe, that shall be determined by translating the WLA into non-numeric WQBELs, expressed as best management practices (BMPs). While the TMDL re-opener is pending, an affected Permittee shall be in compliance with the receiving water WLA through the implementation of permit requirements	Same comment
2	17	Findings	Not clear on what "discharges from the MS4 for which they are owners and/or operators" means.	The Tentative Order, states " ... each Permittee shall maintain the necessary legal authority to control the contribution of pollutants to its MS4 and shall include in its storm water management program a comprehensive planning process that includes intergovernmental coordination, where necessary." If the MS4/catch basin is owned by the LACFCD, does this mean that the LACFCD needs to control the contribution of pollutants?
3	pages 111 - 123 and Attachments K - R	TMDL	<p>Santa Monica Bay Beaches Bacteria TMDL (SMBBB TMDL) is currently being reconsidered. As part of that reconsideration, the summer dry weather targets must be revised to be consistent with the reference beach/anti-degradation approach established for the SMBBB TMDL and with the extensive data collected over that past seven years since original adoption of the SMBBB TMDL. This data clearly shows that natural and non-point sources result in 10% exceedances during dry weather. Data collected at the reference beach since adoption of the TMDL, as tabulated in Table 3 of the staff report of the proposed revisions to the Basin Plan Amendment, demonstrate that natural conditions associated with freshwater outlets from undeveloped watersheds result in exceedances of the single sample bacteria objectives during both summer and winter dry weather on approximately 10% of the days sampled.</p> <p>Thus the previous Source Analysis in the Basin Plan Amendment adopted by Resolution No. 02-004 which stated that "historical monitoring data from the reference beach indicate no exceedances of the single sample targets during summer dry weather and on average only three percent exceedance during winter dry weather" was incorrect and based on a data set not located at the point zero compliance location. Continued allocation of zero summer dry weather exceedances in the proposed Basin Plan Amendment is in direct conflict with the stated intent to utilize the reference beach/anti-degradation approach and ignores the scientifically demonstrated reality of natural causes and non-point sources of indicator bacteria exceedances.</p>	This is a critical issue that was not addressed in the recent reopener. The reference reach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included
4	pages 111 - 123 and Attachments K - R	TMDL	Continued use of the zero summer dry weather exceedance level will make compliance with the SMBBB TMDL impossible for the Jurisdictional agencies. This is also in conflict with the intent of the Regional board as expressed in finding 21 of Resolution 2002-022 "that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas".	This is a critical issue that was not addressed in the recent reopener. The reference reach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included
5	pages 111 - 123 and Attachments K - R	TMDL	The SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) was approved by the Regional Board staff and that CSMP should be incorporated into the TMDL monitoring requirements of the next MS4 Permit. The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week, thus it is highly confusing and misleading to refer to "daily monitoring". The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week.	The problem with sites monitored two days a week has not been corrected. Please provide clarification that this issue could be addressed and would supersede the TMDL if submitted in an integrated monitoring plan. This is critical for summer dry weather and 5-day per week sites.

6	pages 111 - 123 and Attachments K - R	TMDL	This discussion in this section devoted to the SMBBB TMDL seems to create confusion regarding the meaning of the terms "water quality objectives or standards," "receiving water limitations," and "water quality-based effluent limitations". Water quality objectives or water quality standards are those that apply in the receiving water. Water Quality Effluent Based Limits apply to the MS4. So the "allowable exceedance days" for the various conditions of summer dry weather, winter dry weather, and wet weather should be referred to as "water quality-based effluent limitations" since those are the number of days of allowable exceedances of the water quality objectives that are being allowed for the MS4 discharge under this permit. While the first table that appears under this section at B.1 (b) should have the heading "water quality standards" or "water quality objectives" rather than the term "effluent limitations".	In effect the effluent limitations are stricter than the receiving water standards. This is inconsistent with law and creates a situation in which permittees are out of compliance at the effective date of this permit. Please adjust so that limits are consistent with standards and not exceeding standards.
7	pages 111 - 123 and Attachments K - R	TMDL	While it makes sense for the Jurisdictional Groups previously identified in the TMDLs to work jointly to carry out implementation plans to meet the interim reductions, only the responsible agencies with land use or MS4 tributary to a specific shoreline monitoring location can be held responsible for the final implementation targets to be achieved at each individual compliance location. An additional table is needed showing the responsible agencies for each individual shoreline monitoring location.	A table is still needed and should be developed. Perhaps referred to in this section but placed in the Watershed Management Plan and then approved by Executive Officer with the plan.
8	pages 111 - 123 and Attachments K - R	TMDL	The Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4 based on estimates from limited data on existing stormwater discharges which resulted in a waste load allocation for stormwater that is lower than necessary to meet the TMDL targets, in the case of DDT far lower than necessary. EPA stated that "If additional data indicates that existing stormwater loadings differ from the stormwater waste load allocations defined in the TMDL, the Los Angeles Regional Water Quality Control Board should consider reopening the TMDL to better reflect actual loadings." [USEPA Region IX, SMB TMDL for DDTs and PCBs, 3/26/2012]	Same comment
9	pages 111 - 123 and Attachments K - R	TMDL	In order to avoid a situation where the MS4 permittees would be out of compliance with the MS4 Permit if monitoring data indicate that the actual loading is higher than estimated and to allow time to re-open the TMDL if necessary, recommend as an interim compliance objective WQBELs based on the TMDL numeric targets for the sediment fraction in stormwater of 2.3 ug DDT/g of sediment on an organic carbon basis, and 0.7 ug PCB/g sediment on an organic carbon basis.	Same comment
10	pages 111 - 123 and Attachments K - R	TMDL	Although the Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4, they should be translated as WQBELs in a manner such that watershed management areas, subwatersheds and individual permittees have a means to demonstrate attainment of the WQBEL. Recommend that the final WLAs be expressed as an annual mass loading per unit area, e.g., per square mile. This in combination with the preceding recommendation for an interim WQBEL will still serve to protect the Santa Monica Bay beneficial uses for fishing while giving the MS4 Permittees time to collect robust monitoring data and utilize it to evaluate and identify controllable sources of DDT and PCBs.	Please clarify that this situation would be covered under the new provisions for USEPA established TMDLs opens the door for allowing Permittees to address this through their plans.
11	pages 111 - 123 and Attachments K - R	TMDL	The Machado Lake Trash WQBELs listed in the table at B.3 of Attachment N in the Tentative Order appear to have been calculated from preliminary baseline waste load allocations discussed in the July 11, 2007 staff report for the Machado Lake Trash TMDL, rather than from the basin plan amendment. In some cases the point source land area for responsible jurisdictions used in the calculation are incorrect because they were preliminary estimates and subsequent GIS work on the part of responsible agencies has corrected those tributary areas. In other cases some of the jurisdictions may have conducted studies to develop a jurisdiction-specific baseline generation rate. The WQBELs should be expressed as they were in the adopted TMDL WLAs, that is as a percent reduction from baseline and not assign individual baselines to each city but leave that to the individual city's trash reporting and monitoring plan to clarify.	Same comment

12	pages 111 - 123 and Attachments K - R	TMDL	<p>The WLAs in the adopted Machado Lake Trash TMDL were expressed in terms of percent reduction of trash from Baseline WLA with the note that percent reductions from the Baseline WLA will be assumed whenever full capture systems are installed in corresponding percentages of the conveyance discharging to Machado Lake. As discussed in subsequent city-specific comments, there are errors in the tributary areas originally used in the staff report, but in general, tributary areas are available only to about three significant figures when expressed in square miles. Thus the working draft should not be carrying seven significant figures in expressing the WQBELs as annual discharge rates in uncompressed gallons per year. The convention when multiplying two measured values is that the number of significant figures expressed in the product can be no greater than the minimum number of significant figures in the two underlying values. Thus if the tributary area is known to only three or four significant figures, and the estimated trash generation rate is known to four significant figures, the product can only be expressed to three or four significant figures.</p> <p>Thus there should be no values to the right of the decimal place and the whole numbers should be rounded to the correct number of significant figures.</p>	Same comment
13	pages 111 - 123 and Attachments K - R	TMDL	<p>The Machado Lake Nutrient TMDL provides for a reconsideration of the TMDL 7.5 years from the effective date prior to the final compliance deadline. Please include an additional statement as item C.3.c of Attachment N: "By September 11, 2016 Regional Board will reconsider the TMDL to include results of optional special studies and water quality monitoring data completed by the responsible jurisdictions and revise numeric targets, WLAs, LAs and the implementation schedule as needed."</p>	Same comment
14	pages 111 - 123 and Attachments K - R	TMDL	<p>Table C is not provided in the section on TMDLs for Dominguez Channel and Greater LA and Long Beach Harbors Toxic Pollutants. Please clarify and reference that Attachment D Responsible Parties Table RB4 Jan 27, 12 which was provided to the State Board and responsible agencies during the SWRCB review of this TMDL, and is posted on the Regional Board website in the technical documents for this TMDL, is the correct table describing which agencies are responsible for complying with which waste load allocations, load allocations and monitoring requirements in this VERY complex TMDL. Attachment D should be included as a table in this section of the MS4 Permit.</p>	Partially addressed--the table provided in the Tentative Order is not the detailed Attachment D which clarifies which agencies are responsible for which portions of the TMDL--need to include that table.
15	pages 111 - 123 and Attachments K - R	TMDL	<p>The Dominguez Channel and Greater LA and Long Beach Harbor Waters Toxic Pollutants TMDL provides for a reconsideration of the TMDL targets and WLAs. Please include an additional statement as item E.5 of Attachment N: "By March 23, 2018 Regional Board will reconsider targets, WLAs and LAs based on new policies, data or special studies. Regional Board will consider requirements for additional implementation or TMDLs for Los Angeles and San Gabriel Rivers and interim targets and allocations for the end of Phase II."</p>	Same comment
16	pages 111 - 123 and Attachments K - R	TMDL	<p>City of Hermosa Beach is only within one watershed, the Santa Monica Bay Watershed, and so should not be shown in italics as a multi-watershed permittee</p>	Addressed in Table K-3 of the Tentative Order but not in Table K-2 of the Tentative Order.
17	pages 111 - 123 and Attachments K - R	TMDL	<p>Recommend not listing specific water bodies in E.5.b.i.(1).(c) because then it risks becoming obsolete if new TMDLs are established for trash, or if they are reconsidered. Furthermore, it is not clear why Santa Monica Bay was left out of this list since the Marine Debris TMDL allows for compliance via the installation of for full capture devices.</p>	Not addressed, still don't know why Santa Monica Bay Marine Debris was not included in the list at E.5.b.i.(1).(c) but it is listed in E.5.a.ii and Attachment M Section B.
19	pages 111 - 123 and Attachments K - R	TMDL	N/A	Suggest wet weather compliance be partially defined by a design storm.

20	pages 111 - 123 and Attachments K - R	TMDL	N/A	<p>Regional Board staff has incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a "numeric effluent limitation." Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board's clear <del>opposition</del> reluctance to use numeric effluent limitations.</p> <p>In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: <i>we will generally not require "strict compliance" with water quality standards through numeric effluent limitations," and instead "we will continue to follow an iterative approach, which seeks compliance over time" with water quality standards .</i></p> <p>[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]</p> <p>More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:</p> <p><i>Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. <u>This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.</u></i></p> <p>The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the <i>Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.</i></p>
21	pages 111 - 123 and Attachments K - R	Table K-8	Please remove, in its entirety, the Santa Ana River TMDLs	Same comment
22	pages 111 - 123 and Attachments K - R	E.1.c	Permittees under the new MS4 permit (those in LA County) need to be able to separate themselves from Orange County cities. Since the 0.941 kg/day is a total mass limit, it needs to be apportioned between the two counties. Also, the MS4 permit needs to contain language allowing permittees to convert group-based limitations to individual permittee based limitations.	Same comment
23	111	E.2	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions.	Same comment
24	111	E.2.a.i	N/A	This provision creates confusion and inconsistency with the language in the rest of the permit. By stating that the permittee <b>shall</b> demonstrate compliance through compliance monitoring points, it appears to preclude determining compliance through other methods as outlined in other portions of the permit. This provision does not reference any of the other compliance provisions in the TMDL section, and could therefore be interpreted on its own as a separate compliance requirement. Additionally, the requirement to use the TMDL established compliance monitoring locations regardless of whether an approved TMDL monitoring plan or Integrated plan has been developed is not consistent with the goal of integrated monitoring outlined in the permit. This provision would be more appropriate as a monitoring and reporting requirement for the TMDL section with modified language such as "Monitoring locations to be used for demonstrating compliance in accordance with Parts VI.E.2.d or VI.E.2.e shall be established at compliance monitoring locations established in each TMDL or at locations identified in an approved TMDL monitoring plan or in accordance with an approved integrated monitoring program per Attachment E Part VI.C.5 (Integrated Watershed Monitoring and Assessment)."

25	112	E.2.b.iv	For "each Permittee is responsible for demonstrating that its discharge did not cause or contribute to an exceedance," how is this going to be possible? There is allowed non-storm water discharges, a commingled system, and the LA County region is practically urbanized (impervious landscape). Additionally, a gas tanker on local freeways often discharges onto freeway drains, which connect to MS4 permittee drains - the point here is a private party as the actual discharger should be held responsible and not the MS4 permittee. Lastly, the Construction General Permit cannot establish numeric limitations without the Regional/State Boards clearly demonstrating how compliance will be achieved - the MS4 permit is overly conditioned in terms of achieving compliance and subjects MS4 permittees to violations/enforcement, and given these circumstances, the Boards need to clearly demonstrate how compliance will be achieved.	Same comment
26	112	E.2.b.v.(2)	N/A	This provision should not require that the permittee demonstrate that the discharge from the MS4 <b>is treated</b> to a level that does not exceed the applicable water quality-based effluent limitation. Permittees may achieve the applicable WQBELs through means other than treatment and they should be able to demonstrate that their discharge does not exceed the applicable water quality-based effluent limitation through monitoring or other means than demonstration of treatment.
28	113	E.2.d.i.4.b.	Is this in effect setting a design storm for the design of structural BMPs to address attainment of TMDLs, or is it simply referring to SUSMP/LID type structural BMPs? If it is in effect setting a design storm, there needs to be some sort of exception for TMDLs in which a separate design storm is defined, e.g., for trash TMDLs where the 1-year, 1-hour storm is used.	This is not clarified, but it is still a problem as not all retrofit projects which might be used to address TMDLs may be able to handle the full 85th percentile 24-hour storm, there should be some provision for doing this through a combination of BMPs, e.g., LID plus retrofit.
29	114	E.2.e	Please add the language from interim limits E.2.d.4 a - c and EPA TMDLs to the Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations to ensure sufficient coordination between all TMDLs and the timelines and milestones that will be implemented in the Watershed Management Program.	Same comment
30	116	E.4.a	This provision states "A-Permittees shall comply immediately ... for which final compliance deadlines have passed pursuant to the TMDL implementation schedule." This provision is unreasonable. First, various brownfields/abandoned toxic sites exists, some of which were permitted to operate by State/Federal agencies - nothing has or will likely be done with these sites that contribute various pollutants to surface and sub-surface areas. Additionally, this permit is going to require a regional monitoring program - this program will yield results on what areas are especially prone to particular pollutants. Until these results are made known, MS4 Permittees will have a hard time knowing where to focus its resources and particularly, the placement of BMPs to capture, treat, and remove pollutants. For these reasons, this provision should be revised to first assess pollutant sources and then focus on compliance with BMP implementation.	Same comment
31	116-123	E.5	Please clarify that cities are not responsible for retrofitting.	Same comment
32	116-123	E.5.a - c	Recommend not listing specific waterbody/trash TMDLs here, but simply leave the reference to Attachments to identify the Trash TMDLs. Otherwise, this may have to be revised in the future. Again, Santa Monica Bay Marine Debris TMDL was not included in this list, it is unclear whether it was an oversight or intentional?	Same comment
33	116-123	E.5.b.ii.2	Define "partial capture devices", define "institutional controls". Permittees need to have clear direction of how to attain the "zero" discharges which will have varying degrees of calculations regardless of which compliance method is followed. Explain the Regional Board's approval process for determining how institution controls will supplement full and partial capture to attain a determination of "zero" discharge.	Same comment
34	116-123	E.5.b.ii.(4)	MFAC and TMRP should be an option available to the Los Angeles River.	Same comment
35	116-123	E.5.c.i.(1)	For reporting compliance based on Full Capture Systems, what is the significance of needing to know "the drainage areas addressed by these installations?" Unfortunately, record keeping in Burbank is limited to the location and size of City-owned catch basins. A drainage study would need to be done to define these drainage areas. As such, we do not believe this requirement serves a purpose in regards to full capture system installations and their intended function.	Same comment
36	Attachment L	D.3 a - c	Please change the Receiving Water Limitations for interim and final limits to the TMDL approved table. There should be no interpretation of the number of exceedance days based on daily for weekly sampling with, especially with no explanation of the ratio or calculations, and no discussion of averaging. Please revert to the original TMDL document.	The table was adjusted, but did not eliminate the interpretation of number of exceedance days that are not expressly completed in the Santa Clara River TMDL. Remove all interpretation of number of exceedance days other than what has been expressed in the original TMDL number of days of exceedances without interpretation or recalculation.

37	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For the Freshwater portion of the Dominguez Channel: There are no provisions for BMP implementation to comply with the interim goals. The wording appears to contradict Section E.2.d.i.4 which allows permittees to submit a Watershed Management Plan or otherwise demonstrate that BMPs being implemented will have a reasonable expectation of achieving the interim goals.	Same comment
38	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For Greater LA Harbor: Similar to the previous comment regarding this section. The Table establishing Interim Effluent Limitations, Daily Maximum (mg/kg sediment), does not provide for natural variations that will occur from time to time in samples collected from the field. Given the current wording in the proposed Receiving Waters Limitations, even one exceedance could potentially place permittees in violation regardless of the permittees level of effort. Reference should be made in this section to Section E.2.d.i.4 which will provide the opportunity for the Permittee to develop BMP-base compliance efforts to meet interim goals.	Same comment
39	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For the freshwater portion of the Dominguez Channel: the wording should be clarified. Section 5.a states that "Permittees subject to this TMDL are listed in Attachment K, Table K-4." Then the Table in Section E.2.b Table "Interim Effluent Limitations--- Sediment", lists all permittees except the Fresh water portion of the Dominguez Channel. For clarification purposes, we request adding the phase to the first row: "Dominguez Channel Estuary (below Vermont)"	Same comment
40	Attachment O, Page 3	C	For the LA River metals. Some permittees have opted out of the grouped effort. This section needs to detail how these mass-based daily limitations will be reapportioned.	Same comment
41	Attachment O, Page 7	D.4	Why are "Receiving Water Limitations" being inserted here? None of the other TMDLs seem to follow that format.	Same comment
42	Attachment P	TMDLs in the San Gabriel River WMA	It is the permittees understanding that the lead impairment of Reach 2 of the San Gabriel River has been removed. It should be removed from the MS4 permit.	Same comment

1	General	General	While it may be appropriate to have an overall design storm for the NPDES Permit and TMDL compliance, this element seems to address individual sites. Recommend developing more prominently in the areas of the Permit that deals with compliance that the overall Watershed Management Program should deal with the 85th percentile storm and that beyond that, Permittees are not held responsible for the water quality from the much larger storms. However, requiring individual projects to meet this standard is limiting as there may be smaller projects implemented that individually would not meet 85th percentile, but collectively would work together to meet that standard. Please clearly indicate cities are only responsible for the 85th percentile storm for compliance and that individual projects may treat more of less than number.	Changes were made but it is unclear that the overall program would be collectively only held to the 85th percentile storm if working in multiple areas, and individual sites only if the Watershed Management Program states that individual sites would be responsible.
2	46	Process	Please clarify that Permittees will only be responsible for continuing existing programs and TMDL implementation plans during the interim 18 month period while developing the Watershed Management Program and securing approval of those programs	Same comment
3	46-47	Table 9 and Process	Please allow 24 months for development of the Watershed Management Program to provide sufficient time for calibration and the political process to adopt these programs.	Same comment. However, there could be a phased approach in which a permittee could submit early actions within this timeline, while more time is offered for the resource intensive aspects.
4	46-53	various	The Table (TBD) on page 2 states implementation of the Watershed Program will begin upon submittal of final plan. Page 11, section 4 Watershed Management Program Implementation states each Permittee shall implement the Watershed Management Program upon approval by the Executive Officer. Page 13 section iii says the Permittee shall implement modifications to the storm water management program upon acceptance by the Executive Officer. All three of these elements should be consistent and state upon approval by the Executive Officer. The item on page 13 should be changed to reflect the Watershed Management Program, or clarify that the Watershed Management Program is the storm water management program.	Table 9 and Watershed Management Implementation are still inconsistent. The table says submittal and the Watershed Management Program Implementation states upon approval. Please make these consistent
5	47	Program Development	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions.	Same comment
6	48	3.a.ii	Pollutants in category 4 should not be included in this permit term, request elimination of any evaluation of category 4. Request elimination of category 3, as work should focus on the first two categories at this point	Thank you for removing category 4. Category 3 puts a burden on cities during this permit cycle. In the next permit term, when permittees have a better understanding of sources and location of the high priority pollutant additional actions may be warranted. At this time including category 3 adds an investigative burden that is unwarranted given the substantial increase in requirements and monitoring that are already included in this draft tentative order.
7	52	Reasonable Assurance Analysis	Reasonable assurance analysis and the prioritization elements should also include factors for technical and economic feasibility	Same comment
8	112	E.2.b.iii	For the "group of Permittees" having compliance determined as a whole, this should only be the case if the group of Permittees have moved forward with shared responsibilities (MOAs, cost sharing, a Watershed Management Program). It would not be fair to have one entity not be a part of the "group" and be the main cause of exceedances/violations.	In the Tentative Order, permittees must notify the Regional Board 6 months after the Order's effective date on whether it plans to participate in the development of a Watershed Management Program. Given this, a sub-watershed will not know whether all permittees will participate or not. It should also be noted that allowed non-stormwater discharges and other NPDES permit discharges may be the cause of exceedances/violations and not the "group of permittees."

1	37-38	All	Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue	There are several NPDES Permits, including the Caltrans Permit and others, that adjust the Receiving Water Limitation language in response to new interpretations. Currently, the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. LASP has provided the Regional Board staff with sample language. It is imperative that the Regional Board works with the State Board on this very important issue. It is critical that the LA draft tentative order Receiving Water Limitation language be adjusted to ensure cities working in good faith are not subject to enforcement and third party litigation.

1	13-26	Findings	several related		<p>Please add findings regarding the iterative process.</p> <p>The iterative process is a process of implementing, evaluating, revising, or adding new BMPs to attain water quality standards, including total maximum daily load (TMDL) waste load allocations (WLAs). The State Water Resources Control Board (State Board) has affirmed, in several precedential water quality orders (including WQ 99-05 and 2001-15), the inclusion of the iterative process in MS4 permits. As the State Board noted in WQ 2001-15:</p> <p>This Board has already considered and upheld the requirement that municipal storm water discharges must not cause or contribute to exceedances of water quality objectives in the receiving water. We adopted an iterative procedure for complying with this requirement, wherein municipalities must report instances where they cause or contribute to exceedances, and then must review and improve BMPs so as to protect the receiving waters.</p> <p>The iterative process goes hand-in-hand with the Receiving Water Limitation provision of this order, which is intended to address a water quality standard exceedance. An MS4 permit is a point source permit, which is defined by §40 CFR 122.2 to mean outfall or end-of-pipe. Attainment of a water quality standard in stormwater discharge is achieved in the effluent or discharge from the MS4 through the implementation of BMPs contained in a Stormwater Quality Management Plan (SQMP). If a water quality standard is frequently exceeded as determined by outfall monitoring relative to an ambient condition of the receiving water (during the 5-year term of the Order) the permittee shall be required to propose better-tailored BMPs to address the exceedance. The process includes determining (1) if the exceedances are statistically significant and if so, would require the permittee to (2) identify the source of the exceedance; and (2) propose new or intensified BMPs to be implemented in the next MS4 permit – unless the Executive Officer determines that a more immediate response is required.</p> <p>(continued from previous page) The iterative process does not apply to non-stormwater discharges. Section 402(p)(3)(B)(ii) of the Clean Water Act only prohibits non-stormwater discharges to the MS4 and not from it as is the case with stormwater discharges. This is because Congress set two standards for MS4 discharges: one stormwater and one for non-stormwater. As noted in WQO 2009-008, the Clean Water Act and the federal storm water regulations assign different performance requirements for storm water and non-storm water discharges. These distinctions in the guidance document, the Clean Water Act, and the storm water regulations make it clear that a regulatory approach for storm water - such as the iterative approach we have previously endorsed - is not necessarily appropriate for non-storm water.</p>

2	24 and Attachment F, Pages 146-149	Unfunded Mandates Section of Fact Sheet and Permit	several related	It is incorrect to assert an outcome on the unfunded mandates issue in a permit; this has nothing to do with protecting water quality. The unfunded mandates process has not completed a process and these assertions are opinion. Since the Fact Sheet is part of the permit, remove this section. There are many errors and incorrect assumptions, especially around the level of effort required for this permit when compared to the current permit, and the economic issues that are incorrect.

1	General	General	It is appropriate to have an exemption for a Permittee from a violation of RWL and or WQBELs caused by a non-stormwater discharge from a potable water supply or distribution system not regulated by an NPDES permit but required by state or federal statute; this should clearly apply to all NPDES permits issued to others within, or flow through, the MS4 permittees jurisdiction. We would request that also included in this category should be emergency releases caused by water line breaks which are not necessary, but are unexpected and have to be dealt with as an emergency. MS4 permittees should be exempt from RWL or WQBEL violations associated with any permitted NPDES discharges that are effectively authorized by LARWQCB under the Clean Water Act.
2	General	General	Since it could take 6 months for an agency to decide if they want to join in the development of a Watershed Management Plan or just modify their current Stormwater Management Program to comply with the new permit MCMs, the implementation of the new MCMs should follow this timeline. In the interim the permittees will be required to continue implementing their current Stormwater Management Program.
3	26	A.	<p>RB staff proposed language requires the permittees to “prohibit non-stormwater discharges <b>through the</b> MS4 to receiving waters” except where authorized by a separate NPDES permit or conditionally. This prohibition is inconsistent with legal authority provisions in the federal regulations since 40 CFR 122.26(d)(1)(ii) which requires legal authority to control discharges <b>to</b> the MS4 but not <b>from</b> the MS4. Additionally, with respect to the definition of an illicit discharge at 40 CFR 122.26(b)(2), an illicit discharge is defined as “a discharge <b>to</b> the MS4 that is not composed entirely of stormwater”. In issuing its final rulemaking for stormwater discharges on Friday, November 16, 1990[1], USEPA states that:</p> <p><i>“Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT) and the Best Conventional Pollutant Control Technology (BCT) and where necessary, water quality-based controls), but permits for <b>discharges from</b> municipal separate storm sewer systems must require controls to the maximum extent practicable, and where necessary water quality-based controls, and must include a requirement to effectively prohibit non-stormwater <b>discharges into</b> the storm sewers.”</i></p> <p>This is further illuminated by the section on Effective Prohibition on Non- Stormwater Discharges[2]:</p> <p><i>“Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water discharges <b>into the storm sewers</b> . Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather, an ‘effective prohibition’ would require separate NPDES permits for non-storm water discharges to municipal storm sewers”</i></p> <p>The rulemaking goes on to say that the permit application:</p> <p><i>“requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems.”</i></p> <p>Nowhere in the rulemaking is the subject of prohibiting discharges from the MS4 discussed. Furthermore, USEPA provides model ordinance language on the subject of discharge prohibitions: <a href="http://www.epa.gov/owow/NPS/ordinance/mol5.htm">http://www.epa.gov/owow/NPS/ordinance/mol5.htm</a>. Section VII Discharge Prohibitions of this model ordinance provides discharge prohibition language as follows:</p> <p><i>“No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.”</i></p> <p>Thus we recommend that staff eliminate the “from” language at both Part III.A.1.a. and Part III.A.2.</p>
4	28	A.2.b.vi	The conditional exemption of street/sidewalk water is inconsistent with the requirement in the industrial/commercial MCM section that street washing must be diverted to the sanitary sewer. Sidewalk water should definitely be conditionally exempt, but so also should patios and pool deck washing. If street washing has to be diverted to the sanitary sewer for industrial/commercial facilities, then it should for all facilities and so should parking lot wash water as they are similar in their pollutant loads.
5	33-36, Table 8	Discharge Prohibitions	Enforcing NPDES permits issued for the various NSWDS referenced in this table should be the responsibility of the State/Regional Board, not the MS4 permittee. Therefore, it is inappropriate to include a condition that places a responsibility on the MS4 permittee to ensure requirements of NPDES permits are being implemented or effective in order for the pertaining NSWDC category to be exempt. Proper enforcement of the various NPDES permits mentioned in this table should ensure impacts from these discharges are negligible.

6	39	A.2.a.i	<p>Staff proposal states: "Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites."</p> <p>It appears the intent of this language is to transfer the State's inspection and enforcement responsibilities to municipalities through the MS4 permit. When a separate general NPDES permit is issued by the Regional or State Board it should be the responsibility of that agency collecting such permit fees to control the contribution of pollutants, not MS4 permittees.</p>
7	39	A.2.a.vii	<p>Staff proposal states: "Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Co-permittees."</p> <p>The intention of this statement is unclear and should be explained, and a definition of "shared MS4" should be provided. How would an inter-agency agreement work with an upstream and downstream agency? This is not practical - this agreement should have been done before the interconnection of MS4 systems occurred. An example of this agreement should be provided within the Permit. The permittee will not agree to the responsibility of an exceedance without first having evidence of the source and its known origin (in other words, an IC/ID is a private "culprit" and not the cause of the City).</p>
8	39	A.2.a.xi	<p>Staff proposal states: "Require that structural BMPs are properly operated and maintained."</p> <p>MS4 agencies can control discharges through an illicit discharge program, and conditioning new/redevelopment to ensure mitigation of pollutants. Unless the existing development private property owners/tenants are willing or in the process of retrofitting its property, the installation and O&amp;M of BMPs is not practical and cannot be legally enforceable against an entity that does not own or control the property, such as a municipal entity.</p>
9	39	A.2.a.xii	<p>Staff proposal states: "Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4."</p> <p>It is difficult, if not impossible, to accurately quantify the exact effectiveness of a particular set of BMP's in reducing the discharge of pollutants. Some discharges may be reduced over time given reductions in industrial activity, population in a particular portion of the community feeding into the MS4, or for other reasons not directly related to implementation of structural BMPs. Given that the County of LA is generally urbanized and thus impervious, a lethargic economic climate (meaning development and redevelopment is not occurring in an expeditious manner), and that several pollutants do not have known BMPs effective at removing/reducing the content (i.e., metals, toxics, pesticides), the effectiveness of BMPs should not be required and instead should only be used for research, development, and progress of BMP testing.</p>
10	40	A.2.b	<p>Staff proposal states: "Permittee must submit a statement certified by its chief legal counsel that the Permittee has the legal authority within its jurisdiction to implement... Each permittee shall submit this certification annually..."</p> <p>To sign this statement, chief counsel will have to analyze this 500 page Permit, analyze the municipal code, and prepare a statement as to whether actions can be commenced and completed in the judicial system. An annual certification is redundant and unnecessary in addition to being extraordinarily costly. At most, legal analysis should be done once during the Permit term. Otherwise, please delete this requirement.</p>
11	40	A.3	<p>The staff proposal includes a section on Fiscal Resources. Most MS4's do not have a storm water quality funding source, and even those that do have a funding source are not structured to meet the requirements of the proposed MS4 requirements (for instance, development funds may be collected to construct an extended detention basin, but not for street sweeping, catch basin cleaning, public right-of-way structural BMPs, etc).</p>
12	40	A.3.a	<p>Staff proposal states: "Each Permittee shall exercise its full authority to secure the fiscal resources necessary to meet all requirements of this Order"</p> <p>This sentence has no legally enforceable standard. What exactly does the exercise of "full authority" mean when the exercise of a city's right to tax comes with consequences and no guarantee of success? Municipal entities must adjust for a variety of urgent needs, some federally mandated in a manner that cannot be ignored. So, if we seek the fiscal resources to fund the programs required in the permit and the citizens say "No", then a municipality will have a limited ability to comply with "all requirements of this Order".. Can the language be changed to state: "Each permittee shall make its best efforts given existing financial and budget constraints to secure fiscal resources necessary to meet all requirements of this Order"?</p>
13	40	A.3.c	<p>Staff proposal states: "Each permittee shall conduct a fiscal analysis... to implement the requirements of this Order."</p> <p>Most MS4's do not have adequate funding to meet all requirements of the Tentative MS4 Permit. A Permit requirement to secure funding is overreach. Please delete this section.</p>
14	58	D.4.a.i.(2)	<p>Staff proposal states: "To measurably change the waste disposal and storm water pollution generation behavior of target audiences..."</p> <p>Define the method to be used to measure behavior change. As written, this requirement is vague and open to interpretation.</p>
15	60	D.4.d.i.(2).(b)	<p>Staff proposal states: "... including personal care products and pharmaceuticals)"</p> <p>The stormwater permit should pertain only to stormwater issues. Pharmaceuticals getting into waters of the US are typically a result of waste treatment processes. All references to pharmaceuticals should be removed from this MS4 permit.</p>
16	60	D.4.d.i.(3)	<p>The Regional Board assumes that all of the listed businesses will willingly allow the City to install displays containing the various BMP educational materials in their businesses. If the businesses do allow the installations then the City must monitor the availability of the handouts because the business will not monitor or keep the display full or notify the City when the materials are running out. If the business will not allow the City to display the educational material must we document that denial? Will that denial indicate that the City is not in compliance?</p>
17	63-66	D.5.d-f	<p>These sections pertain to inspecting critical source facilities where it appears the intent is to transfer the State's Industrial General Permit inspection and enforcement responsibilities to municipalities through the MS4 permit. We request eliminating these sections OR revise to exclude all MS4 permittee responsibility for NPDES permitted industrial facilities.</p>

19	67	D.6.a.i.(3)	The stated objective of mimicking the predevelopment water balance is not consistent with the requirement that the entire design storm be managed onsite. Please consider allowing subtracting the predevelopment runoff from the design volume or flow.
20	69	D.6.b.ii.(1).(a)	Please clarify whether this paragraph applies to what is existing on the site or what is being redeveloped.
21	70	D.6.c.i.(2).(b)	Consider removing the "whichever is greater" wording. The two methods are considered equivalent and the 85 <sup>th</sup> percentile was calculated to be the 0.75-inch for downtown Los Angeles. Currently, the 0.75-inch storm criterion has been used throughout the County for uniformity. While requiring the 85 <sup>th</sup> percentile to be used instead appears more technically appropriate, requiring calculating both criteria and using the greater value appears punitive.
22	70	D.6.c.i.(4)	Consider deleting this sentence since it is redundant with item VI.D.6.c.i.1 and green roofs are not feasible not only based on the provisions of this order but also due to regional climate and implementability considerations.
23	70	D.6.c.ii.(2)	Add "lack of opportunities for rainwater use" as one of the technical infeasibility criteria to acknowledge the fact that most of the type of development projects cannot utilize the captured volume of water.
24	72	D.6.c.iii.(1).(b). (ii)	The requirement for raised underdrain placement to achieve nitrogen removal is inconsistent with standard industry designs and is based on limited evidence that this change will improve nitrogen removal. Furthermore, by raising the underdrain, other water quality problems may result such as low dissolved oxygen and bacterial growth due to the septic conditions that will be created.
25	72	D.6.c.iii.(2).(b)	The requirement to provide treatment for the project site runoff when offsite mitigation is provided is punitive and unfair considering that an alternative site needs to be retrofitted to retrain the equivalent volume. Please consider removing the on-site requirement when mitigation occurs in an offsite location.
26	72	D.6.c.iii.(4)	The conditions listed for offsite projects are overly restrictive. Also, considering legal and logistical constraints regarding offsite mitigation, this alternative is not very feasible.
27	75	Table 11	The concept of establishing benchmarks for post construction BMPs was initially developed in the 2009 Ventura MS4 permit. However there is a significant different between the permits. The Ventura County's NPDES MS4 permit requires the project developer to determine the pollutant of concern(s) for the development project and use this pollutant as the basis for selecting a top performing BMP. In the case of the Draft Order, there is no determination of the pollutant of concern for the development project. Instead post construction BMPs must meet all the benchmarks established in Table 11. Unfortunately, no one traditional post construction BMP (non-infiltration BMPs) is capable of meeting all the benchmarks and thus the developer will not be able to select a BMP. We recommend that provision VI.D.6.c.iv.(1)(a) (page 74) be modified so that the selection of post construction BMPs is consistent with the Ventura permit and is based on the development site's pollutant of concern(s) and the corresponding top performing BMP(s) that can meet the Table 11 benchmarks.
28	75	D.6.c.v.(1).(a). (i)	Erosion Potential (Ep) is not a widely used term in our region, and may not be the most appropriate term to be used as an indicator of the potential hydromodification impacts.
29	76	D.6.c.v.(1).(a). (iv)	The requirement for development of a new Interim Hydromodification Control Criteria is unnecessary considering there is already peak storm control requirements in the existing MS4 Permit and that the State Water Board is finalizing the statewide Hydromodification Policy.
30	77	D.6.c.v.(1).(c). (i).1	The requirement to retain on site the 95 <sup>th</sup> percentile storm is excessive and inconsistent with all other storm design parameters that appear in this order. It may also not be an appropriate storm in terms of soil deposits for the soil deprived streams such as Santa Clara Creek. Again, consider referring to the statewide policy for a consistent and technical basis of the hydromodification requirements.
31	80	D.6.d.i.1	The requirement of 180 days for the "Local Ordinance Equivalence" may be difficult to be met due to the typical processing and public review period for changes to local municipal codes. Consider revising this provision to require immediate start of this effort instead.
32	83	D.7.a.iii	MEP should be changed to BAT and BCT for consistency with the State's General Construction Permit (GCASP).
33	83	D.7.d	Consider introducing a minimum threshold for construction sites such as those for grading permits. As proposed, minor repair works or trivial projects will be considered construction projects and will unnecessarily be subject to these provisions.
34	83	Table 12	Some of the listed BMPs will not be applicable for all construction sites. Consider replacing the title of the Table 12 to "Applicable Set of BMPs for Construction Sites"
35	84-91	D.7.e-j	All these provisions refer to construction sites of greater than one acre. These sites are subject to the General Construction Permit provisions and within the authority of the State agencies. Towards ensuring compliance with these regulations, the State is collecting a significant fee that covers inspection and tracking of these facilities. We are disputing the need to establish an unnecessary parallel enforcement scheme for these sites. This is consistent with the RWQCB member(s) voice at one of the workshops.
36	84-91	D.7.g-j	Refer to the State's GCASP and its SWPPP requirements to avoid delicacy.
37	85	D.7.g.ii.(9)	There is no need to introduce a new term/document of Erosion and Sediment Control Plan for construction sites that are already subject to GCASP's SWPPP requirements.
38	87	Table 13	Delete. This table is the same as Table 12.
39	90	Table 17	The suggested inspections could not possibly be accommodated based on current resources because of the concurrent need to visit all sites. However, if the GCASP funding is transferred for locally-based enforcement, an increase number of inspections may be accommodated.
40	90	D.7.j.ii.(2).(a)	Consider deleting this requirement as being unnecessary. The placement of BMPs may not be needed based on the season of construction and the planned phases.
41	94	D.8.d	If there is a specific pollutant to address, retrofitting or any other BMP would best be accomplished through a TMDL, which is for the Permittees to determine rather than a prescribed blanket approach. As written, this is too broad of a requirement with unknown costs that is attempting to solve a problem before there is a problem. Please delete VI.D.8.d.
42	94	D.8.d.i	Staff proposal states: "Each Permittee shall develop an inventory of retrofitting opportunities that meets the requirements of this Part VI.8.D... The goals of the existing development retrofitting inventory are to address the impacts of existing development through regional or sub-regional retrofit projects that reduce the discharges of storm water pollutants into the MS4 and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards."  This process would require land acquisition, a feasibility analysis, no impacts to existing infrastructure, proper soils, and support of various interested stakeholders. Additionally, if a property or area is being developed/redeveloped, retrofitting the site for water quality purposes makes sense, but not for an area where no development/redevelopment is planned. Finally, the LID provisions have already included provisions for off-site mitigation, in which we recommend that regional water quality projects be considered in lieu of local-scale water quality projects that will prove difficult to upkeep, maintain, and replace, let alone have existing sites evaluated as feasible. For these reasons, this requirement should be removed.

43	95	D.8.d.v	Any retrofit activities should be the result of either an illicit discharge investigation or TMDL monitoring follow-up and will need to be addressed on a site-by-site basis. A blanket effort as proposed in a highly urbanized area is simply not feasible at this time.
44	96	D.8.e.ii	Staff proposal states: "Each Permittee shall implement the following measures for...flood management projects"  Flood management projects need to be clearly defined.
45	102	D.8.h.vii.(1)	This requirement appears to be an "end-run" around the lack of catch basin structural BMPs in areas not covered by Trash TMDLs. The requirement has the potential to be extraordinarily economically burdensome. If an area is NOT subjected to a Trash TMDL, then the need for any mitigation devices is baseless. The MS4 permit requirements should not circumvent nor minimize the CWA 303(d) process.
46	103	D.8.h.ix	Staff proposal requires: "Infiltration from Sanitary Sewer to MS4 / Preventive Maintenance...."  The State Water Board has implemented a separate permit for sewer maintenance activities. Additional sewer maintenance requirements are redundant and unnecessary. Please delete this requirement.
47	106-110	D.9	A definition of "outfall" is required for clarity. An "outfall" for purposes of "non-stormwater outfall-based monitoring program" should be defined as "major outfall" pursuant to Clean Water Act 40 CFR 122.26. Please revise each mention of "outfall" to read "major outfall" when discussing "non-stormwater outfall-based monitoring program".
48	107	D.9.b.i	Please revise the proposed language to "Permittee/Permittees shall develop written procedures for conducting investigations to identify the source of <b>suspected</b> illicit discharges, including procedures to eliminate the discharge once source is located." It is not known if a discharge is illicit until the investigation is completed.
49	107	D.9.b.iii.(1)	"Illicit discharges suspected of being sanitary sewage... shall be investigated first." ICID inspectors should be allowed to make the determination of which event should be investigated first. For example, a toxic waste spill or a truck full of gasoline spill should take precedence over a sewage spill. This requirement should be amended to the "most toxic or severe threat to the watershed" shall be investigated first.
50	Attachment A	Definitions	The Definition of: "Development", "New Development" and "Re-development" should be added. The definitions in the existing permit should be used:  <i>"Development" means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i>  <i>"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.</i>  <i>"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i>  The last of the three "routine maintenance" activities listed above should exclude projects related to existing streets since typically you are not changing the "purpose" of the street to carry vehicles and should not be altered.
51	Attachment A, Page 1	Definitions	The biofiltration definition limits the systems that allow incidental infiltration. Many municipal ordinances and established engineering practices will not allow even incidental infiltration if the planter boxes are located adjacent to a building structure. Thus, this definition will exclude the most common types of planter boxes which logically have to be placed next to the building to collect roof runoff. For this reason, consider allowing biofiltration to include planter boxes without incidental infiltration since they may be the only applicable BMPs.
52			Some small cities do not have digital maps. In the "General" category of Section 11, please provide a 1 year time schedule for cities to create digital maps OR provide the municipality the ability to develop comprehensive maps of the storm sewer system in any format.
53			Omit the comment, "Each mapped MS4 outfall shall be located using geographical positioning system (GPS) and photographs of the outfall shall be taken to provide baseline information to track operation and maintenance needs over time." This requirement is cost prohibitive and of little value because many City outfalls are underground and could not be accurately located or photographed. Photographs of outfalls in channels have little value since data required is already included on "As-Built" drawings. Geographic coordinates can easily be obtained using Google Earth or existing GIS coordinate systems.  "The contributing drainage area for each outfall should be clearly discernible..." The scope of this requirement would involve thousands of records of drainage studies. The Regional Board should be aware that this requirement would be very labor intensive, time consuming, and very costly.
54			Storm drain maps should show watershed boundaries which by definition provide the location and name of the receiving water body. Please revise (3) to read "The name of all receiving water bodies from those MS4 major outfalls identified in (1).
55			The LA Permit Group proposes "non-stormwater outfall-based monitoring program" to be flow based monitoring. Please revise item (4) of 11.c.i. to read "(4) monitoring flow of unidentified or authorized non-stormwater discharges, and..."
56			"Monitoring of unknown or authorized discharges" "Authorized" discharges are exempted or conditionally exempted for various reasons. Monitoring authorized discharges is monitoring for the sake of monitoring and offers no clear goal or water quality benefit. Please delete this requirement. If the source of a discharge is unknown, then monitoring may be used as an optional tool to identify the culprit.

Comment	Doc. Reference		Comments
No.	Page	Section	Jul-12
1	Multiple	Multiple	The use of the HUC-12 watershed for limits is a good start but there needs to be some flexibility in its use to insure that the HUC-12 truly reflects the actual watershed boundary.
2	Multiple	Multiple	The rain gages to be used for determining a wet versus dry weather day should be selected by the agencies and approved by the Regional Board. Since monitoring plans will be on a regional basis the use of 50% of County rain gages in a watershed may not be necessary. Plus, predictions do not necessarily use County rain gages.
3	Attachment E, Page 3	II.A.1	Omit as a primary objective to assess the "biological impacts" of discharges from the MS4. The MS4 Permit is to regulate water quality. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to assess biological impacts of discharges and to set water quality regulations to prevent adverse biological impacts. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
4	Attachment E, Page 4	II.E.1	<p>Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) indicates:</p> <p><i>The permit requires all <b>effluent</b> and <b>ambient</b> monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.</i></p> <p>The only definition of "ambient" monitoring is defined by SWAMP protocol as being 72 hours after a storm event.</p> <p>Regarding monitoring purposes "b" and "c" assessing trends in pollution concentrations should be: (1) limited to ambient water quality monitoring; and (2) Regional Board's surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.</p> <p><i>Recommended Corrective Action:</i> Clarify that RWL monitoring is only in the ambient condition as defined by SWAMP and that ambient monitoring is performed as part of the SWAMP and is not the responsibility of MS4 permittees.</p>
5	Attachment E, Page 4	II.E.1.c	Omit Item c. The MS4 Permit is to regulate water quality. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to "Determine whether the designated beneficial uses are fully supported as ...aquatic toxicity and bio-assessment monitoring." This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
6	Attachment E, Page 4	II.E.2.a	<p>Outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to monitor progress towards achieving TMDL WLAs that are expressed in the receiving water. Instead, Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs, if necessary.</p> <p>Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.</p> <p><i>Recommended Correction:</i> Either utilize MALs, in lieu of numeric WQBELs, to measure progress towards achieving TMDL WLAs expressed in the receiving water or eliminate MALs entirely.</p>
7	Attachment E, Page 4	II.E.3.a	<p>Regarding "a," This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.</p> <p><i>Recommended Correction:</i> Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the IC/ID program.</p>
8	Attachment E, Page 4	II.E.3.b	<p>With regard to "b", see previous responses regarding MALs and the limitation of the non-stormwater discharge prohibition to the MS4.</p> <p><i>Recommended Correction:</i> Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.</p>
9	Attachment E, Page 4	II.E.3.c	<p>Regarding "c", as mentioned, non-stormwater discharges cannot be applied to receiving water limitations because they are only prohibited to the MS4, not from or through it.</p> <p><i>Recommended Correction:</i> Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.</p>

10	Attachment E, Page 4	II.E.4	<p>Omit Item 4. Monitoring of Development/Re-development BMPs is the responsibility of the Developers. Requirements for monitoring Developer BMPs should be part of Section VI.D.6. <i>Planning and Land Development Program</i> and the responsibility of the Developer.</p> <p>The purpose of this requirement is not authorized under federal stormwater regulations as it relates to monitoring. Requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4's pollution contribution relative to exceeding ambient water quality standards. There is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.</p> <p>Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines "effectiveness" -- effective relative to what standard? It is also not clear how such monitoring is to be performed.</p> <p><i>Recommended Correction:</i> Delete this requirement.</p>
11	Attachment E, Page 5	II.E.5	<p>Omit Item 5. The MS4 Permit is to regulate discharges to receiving water. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to conduct Regional Studies for Southern California Monitoring Coalition, bio-assessment and Pyrethroid pesticides. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.</p> <p>Requiring 85 jurisdictions to conduct regional monitoring is duplicative and inefficient and should be conducted by a Regional authority.</p> <p>Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board's SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County's mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.</p>
12	Attachment E, Pages 5-6	III.F & G	Omit Items F. & G. Specifying Sampling Methods and Analytical Procedures in the permit adds unnecessary liability for Cities for work that is already described in USEPA Protocols and per approved TMDLs. These Items should be combined and state to follow USEPA Protocols or per approved TMDLs.
13	Attachment E, Page 6	III.H.3	There is a typo for Item 3. Item 3. should read "...requirements identified in Part XVIII.A.5. and Part XVIII.A.7 of this MRP."
14	Attachment E, Pages 7-8	IV.C.1	More time is needed to prepare Coordinated Integrated Monitoring Plans due to the number of agencies involved. Since existing monitoring programs will proceed as Coordinated Integrated Monitoring Plans are being prepared, then there is no need for accelerated schedules. Revise Item 1. to provide twelve (12) months for each Watershed Group to submit a Memorandum of Understanding to work with other agencies for a Coordinated Integrated Monitoring Plan. A letter of intent allows a Permittee to drop out of the process at any time and 12 months are required to process a Memorandum of Understanding with County and State agencies.
15	Attachment E, Page 8	IV.C.2	Revise Item 2. to require "Each Permittee not participating in a Coordinated Integrated Monitoring Plan to submit an Integrated Monitoring Plan..."
16	Attachment E, Page 8	IV.C.3	Revise to allow participating Permittees 24 months to submit a Coordinated Integrated Monitoring Plan. It will take a minimum of 12 months to process a Memorandum of Understanding with County and State agencies and that agreement is required before any Permittee will award a contract to a consultant to prepare a Coordinated Integrated Monitoring Plan. It takes 3 months to issue Request for Proposals and award a contract and then 9 months for a consultant to prepare a Coordinated Integrated Monitoring Plan. Since existing monitoring programs will proceed as Coordinated Integrated Monitoring Plans are being prepared, then there is no need for accelerated schedules.

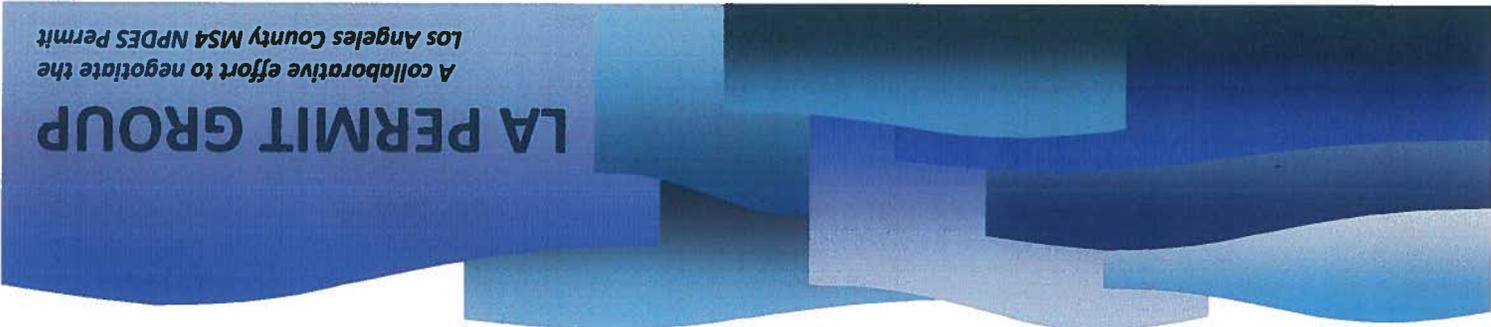

17	Attachment E, Page 8	IV.C.5	Revise to allow 9 months after approval of an IMP or CIMP by the Executive Officer to commence monitoring. It takes 3 months to issue Request for Proposals and award a contract for monitoring. It takes an additional 6 months to obtain permits from the Los Angeles County Flood Control District to access monitoring locations on their systems.
----	-------------------------	--------	--

18	Attachment E, Page 8	IV.C.7	<p>Both the current permit shoreline monitoring program (CI-6948) and the SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) are being incorporated into the new permit. <b>The CI-6948 shoreline monitoring requirements, Section II.D – page T-11, is redundant to the CSMP.</b> All stations monitored in the CI-6948 are also monitored in the CSMP. Furthermore, the SMBBB TMDL specifies that the agencies are to select sampling frequency and the CSMP states that the agencies have selected weekly sampling frequency. However, CI-6948 requires several stations to be monitored up to 5 days per week and with the addition of the CSMP additional stations will be monitored two days per week.</p> <p>Paragraph II.D.b) of the CI-6948 shoreline monitoring section specifies that the sampling frequency at 28th Street (DHS 113), also SMB-5-2, and Herondo storm drain (DHS 115), also SMB-6-1, be increased to 5 times per week. Paragraph II.D.e) states that monitoring sites are to be monitored 5 days per week if the historical water quality is worse than the reference beach. However, no evidence was presented to the responsible agencies that this was the case for the SMB-5-2 or 6-1.</p> <p>An evaluation of historical data was presented by the Regional Board Staff Report for the reconsideration of the SMBBB TMDL dated May 2012. Further evaluation of this data shows that SMB-5-2 and SMB-6-1 should not be subject to the increase frequency for the following reasons:</p> <ol style="list-style-type: none"> <li>1. Of the 67 stations being monitored as part of the CSMP, SMB-5-2 and 6-1 are ranked 57 and 43 respectively in the percent of exceedances during the summer dry weather period.</li> <li>2. 37 stations being monitored only weekly or two days per week had a higher summer-dry weather exceedance percentage than SMB-6-1.</li> <li>3. The Reference Beach monitoring station (SMB-1-1) had a summer dry weather period exceedance percentage of 10.2% versus 6.9% and 3.2% for SMB-5-2 and 6-1, respectively.</li> <li>4. The Reference Beach monitoring station (SMB-1-1) had an average year-round exceedance percentage of 12.1% versus 14.6% and 11.4% for SMB-5-2 and 6-1, respectively. Although exceedance rate for SMB 5-2 is higher than the Reference Beach monitoring station based on year round results, it is lower during the critical summer-dry weather period.</li> <li>5. Of the 8 stations being monitored five days per week SMB-6-1 and 5-2 have the lowest summer dry weather period exceedance percentage (top 6 ranged from 40.9% to 8.5% compared to 6.9% and 3.2% for SMB-5-2 and 6-1).</li> </ol> <p>In addition, the inclusion of both the CI-6948 shoreline monitoring program and CSMP into the permit will result in 5 (SMB-5-1, 5-3, 5-5, 6-5, and 6-6) of the other 9 monitoring stations in SMBBB TMDL Jurisdictional Groups 5 and 6 being monitored 2 days per week which is not the case for any of the other CSMP stations.</p> <p>For all of the above reasons, the shoreline monitoring provisions of CI-6948 should be removed from the new permit monitoring program. However, at a minimum, paragraph D.1.b) should be removed and paragraph D.1.e).(1) should be modified to remove stations S13 (SMB-5-1), S14 (SMB-5-3) S15 (SMB-5-5), S17 (SMB-6-5) and S18 (SMB-6-6).</p> <p>The following is proposed wording modification to Attachment E, Section IV.C.7:</p> <p>"7. Monitoring requirements pursuant to Order No. 01-182, except Section D.1.b) is removed and Section D.1.e).(1) is modified to removed sites S13, S14, S15, S17 and S18 of the Monitoring and Reporting Program - CI-6948, shall remain in effect until the Executive Officer of the Regional Water Board approves a Permittee(s) IMP and/or CIMP plan(s)."</p>
19	Attachment E, Page 14	VI.C.1.b	Monitoring should be performed per approved IMP or CIMP or approved TMDL. The IMP and CIMP should identify rain gauges to use in the appropriate watershed.
20	Attachment E, Page 15	VI.C.1.d	Omit iv. The TMDLs will specify if TSS or SSC monitoring is required, otherwise sediments are needed for beach replenishment and the naturally occurring transport of sediments should not be regulated.
21	Attachment E, Page 15	VI.C.1.d	Omit vi. This imposing of State and Federal responsibilities on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
22	Attachment E, Page 15	VI.D.1.a	Omit the requirement for "One of the monitoring events shall be during the month with the historically lowest instream flows." This data does not exist and it would be simpler to specify the historically driest month.
23	Attachment E, Page 15	VI.D.1.b	Revise item i. and ii. to simply be on days with no measurable rain. There are sufficient days of no measurable rain in Southern California and any rain event could result in isolated stormwater run off.
24	Attachment E, Page 16	VII.A	Revise the description to include database, "The IMP and/or CIMP plan(s) shall include a map <b>and/or database</b> of the MS4 to include the following information:" GIS maps all come with database(s) that include much of the required information.
25	Attachment E, Page 17	VIII.A.2.e	Include the option to monitor "upstream of the actual outfall or downstream of a political boundary". Sometimes the best location to do monitoring is at the next manhole downstream from a city boundary.
26	Attachment E, Page 17	VIII.B.1.a	Omit "except aquatic toxicity, which shall be monitored once per year...". This imposing of State and responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
27	Attachment E, Page 18	VIII.B.1.b	Omit Item ii. and iii. Monitoring should be performed per approved IMP or CIMP or approved TMDL.
28	Attachment E, Page 18	VIII.B.1.c	Omit Item iv. The TMDLs will specify if TSS or SSC monitoring is required, otherwise sediments are needed for beach replenishment and the naturally occurring transport of sediments should not be regulated.
29	Attachment E, Page 18	VIII.B.1.c	Omit vi. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
30	Attachment E, Page 19	IX.A.2	Include "natural flows" or "natural sources" as a potential source of non-storm water flow.
31	Attachment E, Page 22	IX.E.2	Revise last sentence to read, "100% of the outfalls <b>in the inventory</b> within 5 years..."

32	Attachment E, Page 22	IX.F.2	Omit the requirement to report to the Regional Board "within 30 days of determination" because there are too many report submittals that could lead to a Notice of Violation that will have no impact on water quality. Reporting source identifications in the annual report provides central location for submittals.
33	Attachment E, Page 23	IX.G.3 & 4	Outfalls not subject to dry weather TMDLs that have significant dry weather flows should have continuous flow monitoring done for a quarter with water quality sampling done once at the beginning of that time period. If the water quality sampling indicates pollutant concentrations that exceed water quality standards, then the IC/ID investigation procedures should begin. If no water quality standards are exceeded or the IC/ID investigation eliminates the source of pollutants, then that flow has been demonstrated NOT to cause or contribute to pollutant loading and should be stopped. To continue monitoring a site that is known NOT to cause or contribute to pollutant loading is a waste of resources and an un-funded mandate.
34	Attachment E, Page 24	X	This section should be moved to Section VI.D.6.d.iv. for clarity.
35	Attachment E, Page 25	XI	Omit this section. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform Pyrethroid and SCCWRP regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
36	Attachment E, Page 28	XII	Omit this section. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform aquatic toxicity regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
37	Attachment E, Page 38	XIV.I.1 & 2	It is not reasonable to force Permittees to make changes to approved Monitoring and Reporting Programs based on the whim of an "interested" party or "as deemed necessary by EO". This provides unlimited power to interested parties or EO. Recommend these items be revised to include a caveat that there would be no additional costs or as approved by Regional Board, to make those changes open and transparent.
38	Attachment E, Page 39	XIV.M	Omit section M. as it is redundant to section L.
39	Attachment E, Page 44	XVIII.A.5	Omit Items b. & c. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform aquatic toxicity regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
40	Attachment E, Pages 49-52	XIX.B	Only include schedules for IMP and CIMP for USEPA established TMDLs and revise those schedules to be 9 months for IMP and 24 months for CIMP. Having due dates for Monitoring and Reporting plans for IMP and CIMP past the due date established by the TMDL creates confusion.

**Exhibit C:**

**LA Permit Group Comment Letters re: Working Proposals**

February 9, 2012

Sam Unger, Executive Officer  
Los Angeles Regional Water Quality Control Board  
320 West Fourth Street, Suite 200  
Los Angeles, CA 90013

**SUBJECT: LA Permit Group Comments Regarding the 1/23/12 Workshop on Monitoring and TMDLs**

Dear Mr. Unger:

The LA Permit group appreciates the opportunity to provide comments regarding the Regional Board's January 23, 2012 Workshop on the proposed Monitoring and TMDL programs for the upcoming Los Angeles County MS4 NPDES permit. Detailed comments and recommendations regarding each of these programs are attached (Monitoring Program Comments – Exhibit A and TMDL Program Comments – Exhibit B). The LA Permit Group recognizes that the upcoming MS4 NPDES permit is a very difficult and complicated permit to develop, especially given the integration of many TMDLs. However, the permit must contain provisions that are economically achievable and sustainable and that will not expose permittees to unreasonable compliance issues. We look forward to continued discussion and collaboration with you and your staff in order to cooperatively develop economically achievable and sustainable permit provisions.

The LA Permit Group is a collaborative effort developed to negotiate the Los Angeles County MS4 NPDES Permit. Over 60 Los Angeles County municipalities are actively participating in the effort to develop and provide comments and recommendations throughout the MS4 NPDES Permit development process. Comments and recommendations are developed by each of the LA Permit Group's four Technical Sub-Committees (Land Development, Reporting & Core Programs, Monitoring, and TMDLs) which are then approved by the LA Permit Group; the group's consensus is represented by the Negotiations Committee. The LA Permit Group's comments and recommendations contained in Exhibits A and B of this letter have been developed by the Monitoring and TMDL Technical Sub-Committees and were approved by the LA Permit Group at our February 8, 2012 meeting.

Thank you for the opportunity to comment on the proposed Monitoring and TMDLs programs and we look forward to meeting with you to discuss our comments and recommendations presented in this letter. Please feel free to contact me at (626) 932-5577 or hmaloney@ci.monrovia.ca.us if you have any questions regarding our comments.

Sincerely,  
  
Heather M. Maloney  
Chair, LA Permit Group

**LA Permit Group  
Comments on Monitoring Provisions Proposed at RWQCB Workshop on 1/23/12**

The LA Permit group appreciates the opportunity to provide comments regarding the Regional Board's 1/23/12 workshop on the proposed monitoring program for the upcoming NPDES permit. The comments are organized to provide our overall general comments regarding the monitoring program and then our specific comments on the details presented in the workshop.

**General Comments**

In our 11/10/11 presentation to the Regional Board, The LA Permit Group identified an integrated Watershed Monitoring Program (IWMP) approach supporting a comprehensive and focused monitoring program. Although the Board staff indicated interest in the approach, we were disappointed to see the approach was not well captured in the 01/23/12 workshop. We still would submit that the overarching monitoring program should be based on the concepts found in an IWMP (see attached proposal for an IWMP, p.5 & 6).

**Regional Monitoring Programs**

1. Duplicative efforts. The proposed regional monitoring programs appears to duplicate ongoing studies/activities by other permittees in southern California, thus, we question what new and useful information will be provided that is not already being developed.

*Recommendation: Modify the requirement for regional monitoring programs to account for existing and on-going regional monitoring efforts (also see our Special Comments on this issue).*

**Stormwater and Non-stormwater Monitoring Programs**

1. Need to Promote a Watershed Approach. The proposed monitoring strategy appears to minimize instead of promote a watershed approach to monitoring and provides little insights into the water quality issues within a watershed. Instead it focuses exclusively on individual permittees.

*Recommendation: It is recommended that the monitoring program be based on a watershed and TMDL and that it:*

- a. evaluates the current conditions in impaired water bodies (identified by effective TMDLs), facilitates the attainment of WLAs and assessment of effectiveness and improvement of BMPs to effectively address each impairment to the extent it is potentially contributed by the MS4, and
- c. identifies the extent to which the impairment may be caused by factors or sources other than discharges from the MS4
- d. promotes the IWMP and provides time schedule incentives.

*The LA Permit Group has developed a position paper that captures this fundamental strategy (see attachment). The strategy, we believe, would better serve as the framework for the monitoring program than the one currently being considered by the Regional Board.*

2. Lack of Clear Goals and Objectives. The proposed strategy for stormwater and non-stormwater lacks well defined goals and management questions. Instead the strategy appears to be a resource-intensive, far reaching attempt to collect monitoring data for collection sake without any explanation as to how the data will be used to guide management decisions. The monitoring program must be designed to answer specific management questions and/or objectives. The program must provide a comprehensive but focused attempt to address a number of management

questions. Furthermore the proposed strategy isolates the stormwater/non-stormwater monitoring from other elements of the monitoring program such as receiving water and tributary monitoring. As a result it is difficult to understand the overall relationships between the various monitoring efforts and limits the Permittees' ability to direct their monitoring efforts according to local and watershed specific concerns.

*Recommendation: We strongly recommend that the Regional Board revisit the stormwater monitoring programs to incorporate an integrated watershed monitoring strategy that addresses water quality management based questions and TMDLs. Similarly, we recommend that the monitoring program reflect an adaptive management approach such that we have the ability to modify our monitoring efforts as monitoring data and information are gathered.*

### Specific Comments

Although we have fundamental concerns with the overall approach provided in the 1/23/12 workshop and strongly recommend modifications in the approach, we have none-the-less developed specific comments on the Regional Board approach. These comments are provided below.

### Regional Monitoring Programs

1. Pyrethroid Study. We suggest that the Surface Water Ambient Monitoring Program would be a better vehicle for assessing the overall impacts of pesticides (pyrethroids) in the watersheds than the MS4 stormwater programs. This is especially true since pyrethroid is a statewide issue and not just a potential Los Angeles area issue.
2. Hydromodification Study. Many municipalities discharge directly or indirectly into concrete channels thus calling into question the value of a hydromodification study for these municipalities. Furthermore, the Southern California Coastal Water Research Project (SCCWRP) has a number of studies focused on hydromodification including one that assesses the impacts of hydromodification and identifies management practices that could offset the impacts<sup>1</sup>. Thus we would suggest that the proposed hydromodification study for the LA permittees be eliminated and instead allow SCCWRP efforts in this area to be the base studies.
3. Low Impact Development Study. As with the hydromodification study we believe that there is already ongoing research with LID and that the proposed study for the LA permittees is unwarranted. The Southern California Monitoring Coalition had previously identified this area for research and received grant monies to assess the effectiveness of LID strategies. This work was recently conducted by the SCM. In addition, the SCM Coalition conducted a study to identify impediments to LID implementation and this study is also just now being completed. Thus we question the value of LA permittee specific studies for LID.

*Recommendation: Modify the requirement for regional monitoring programs to account for existing and ongoing regional monitoring efforts.*

**Stormwater and Non-stormwater Monitoring Programs**

1. Clear Logic Needed for Deciding Monitoring Efforts. The logic for both stormwater and non-stormwater monitoring efforts is confusing and in some cases appears to be in conflict. Furthermore, there appears to be little nexus between TMDLs and the proposed monitoring effort. *Recommendation: It is absolutely necessary that a logical decision tree be developed to guide the Permittees. The development of a decision tree could be part of the integrated watershed monitoring plan.*

2. Confusing objectives for non-stormwater monitoring. The proposed non-stormwater monitoring (slides 21-23?) does not address the stated requirement in slide 24 to determine the relative flow contribution of other permitted discharges. Also it is unclear what will be gained by the extensive monitoring effort. Furthermore the time line proposed to complete this work is woefully inadequate (9 months). If the purpose of the non-stormwater monitoring is to assess the categorical exemptions, then the current framework is inadequate.

*Recommendation: We recommend that a well defined regional study be incorporated into the IWMP that already includes flow monitoring in numerous locations to assess categorical exemptions instead of the each permittee based approach currently proposed.*

3. Aquatic Toxicity Monitoring. Slide 18 indicates that stormwater monitoring includes aquatic toxicity monitoring. We would submit that it is premature to conduct outfall toxicity monitoring until it has been established that toxicity is present in the receiving water. Furthermore we would submit that should toxicity monitoring be required, acute toxicity is the appropriate toxicity test given the short duration of stormwater discharges.

*Recommendation: Toxicity monitoring should be acute and be limited to the receiving water and not be a part of an outfall monitoring program unless dictated by a TMDL. Aquatic Toxicity monitoring is required by a number of TMDLs and could be extracted from IWMP.*

4. Technical concerns include the following:

- a. Unclear how baseline non-stormwater flows are established.
- b. Possible conflicting criteria regarding the use of land uses to identify outfalls and the minimum number of outfalls (slides 15-16).
- c. Need better definition for "significant" non-stormwater flows. The requirement noted in slide 21 regarding 10% above the lowest rolling average needs to be evaluated more closely as it appears that all outfalls will qualify under this criteria.

<sup>2</sup> Slide numbers are based on Regional Board 1/23/12 presentation by PG Environmental.

- d. When are field measurements and grab samples collected during a storm event? Logistically it will be difficult and costly to require grab samples in addition to the flow weighted samples. Most stormwater data are categorized as event mean concentrations which is a flow weighted composite sample. Grab samples do not reflect EMC but rather just a point in time concentrations.

- e. The use of bacteria as a monitoring parameter to identify sources of sewage is questionable given bacteria is ubiquitous in our environment and difficult to track. Bacteria source tracking should be addressed in the TMDL on a case by case situation.
- f. Without receiving water data the MS4 is limited in its ability to determine whether non-stormwater discharges are causing or contributing to exceedances of water quality standards. However there is no receiving water monitoring coupled with the non-stormwater monitoring.

- g. The 1/23/12 presentation introduced some new as well as some not so new terms. Given the relatively early stage of development of the stormwater permitting program, it is important to clearly define these terms to avoid confusion and misunderstanding during the permit approval process. We realize that the adopted Permit will have a definition section but to assist in the permit development and adoption stage it would be useful to provide definitions upfront including the definition for outfalls, major or otherwise.

*Recommendation: Conduct case studies for Torrance and the Los Angeles River watersheds and others as appropriate to address a range of different conditions (e.g. size, receiving waters, TMDLs, etc.). These case studies will likely clarify the purpose and approach of the monitoring and lead to improvements in the monitoring program. Furthermore we believe it would be constructive to have PG Environmental participate in these discussions.*

**Closing**

The LA Permit Group again appreciates the opportunity to provide these comments and look forward to working with the Regional Board especially in evaluating case studies to better craft a long term, constructive and cost effective monitoring program.

LA Permit Group, proposal for

**INTEGRATED WATERSHED MONITORING PLANS**

It is the MS4 Co-Permittees' intent to utilize Total Maximum Daily Load (TMDL) monitoring as the primary monitoring program requirement in the next MS4 Permit. The Co-Permittees support a TMDL-driven monitoring program that:

- evaluates the current conditions of recognized impaired water bodies (identified by the 303d List),
- facilitates the attainment of WLAs and assessment of effectiveness and improvement of BMPs to effectively address each impairment to the extent it is potentially contributed by the MS4, and
- identifies the extent to which the impairment may be caused by factors or sources other than discharges from the MS4

The Co-Permittees wish to work cooperatively with the assistance of outside experts, e.g., Council for Watershed Health<sup>3</sup> or consulting firm, to prepare Integrated Watershed Monitoring Plans to meet TMDL monitoring requirements. Currently the adopted TMDLs require each agency or subwatershed group to submit separate TMDL Monitoring and Reporting Plans and to prepare individual annual monitoring reports for each TMDL. The end result will be numerous monitoring plans that are not coordinated, with redundancies between monitoring programs, without standard sampling or analysis methods to ensure data comparability, and with the potential for data gaps, which will create a multitude of annual reports which must be reviewed by Regional Board staff that do not provide a comprehensive picture of watershed health.

The goal of Integrated Watershed Monitoring Plans would be to provide:

- TMDL objective-driven monitoring plan designs,
- comprehensive data management and reporting,
- SWAMP-compatible QA/QC and data validation,
- data synthesis and interpretation on a watershed scale, and
- single, comprehensive annual monitoring reports for each watershed addressing all the adopted TMDLs in that watershed.

Integrated Watershed Monitoring Plans will be developed and implemented for each major watershed in the County. The Co-Permittees recognize the efficiencies that can be obtained by preparing Integrated Watershed Monitoring Plans that address all TMDLs for that watershed. During the process of developing the Integrated Watershed Monitoring Plans the Co-Permittees would bring together watershed stakeholders, compile an inventory of existing or pending monitoring efforts, develop a comprehensive list of monitoring questions to address the identified watershed impairments and design coordinated monitoring programs. The provisions of the 3rd term permit Monitoring and Reporting Program and the relevant TMDL monitoring requirements will be incorporated into each Integrated

<sup>3</sup> The Council for Watershed Health (Council) has worked with the Wastewater Treatment Plants to prepare coordinated monitoring plans for the Los Angeles and San Gabriel River watersheds.

LA Permit Group, proposal for

INTEGRATED WATERSHED MONITORING PLANS, cont.

Watershed Monitoring Plan and the requirement for implementing individual TMDL monitoring plans would be eliminated once they have been incorporated into the approved Integrated Watershed Monitoring Plan. The Co-Permittees would need to develop a Memorandum of Understanding to contract for preparation of the Integrated Watershed Monitoring Plans and Annual Reports.

The Co-Permittees recognize the value of having Integrated Watershed Monitoring Plans to assess the extent of MS4 contribution to TMDL-listed impairments and to design and evaluate BMPs to reduce those contributions to attain WLA, but also recognize that the same monitoring data can be used by the Regional Board to issue Notices of Violation and/or for Third Party lawsuits. Such regulatory and legal actions would be counterproductive and would obstruct the iterative adaptive process needed to efficiently and effectively improve water quality, thus the co-permittees request that the MS4 Permit language for Monitoring and TMDLs be written to require Integrated Watershed Monitoring Plans but to clearly state that so long as a Co-Permittee is carrying out its obligations in implementing measures in accordance with the provisions of an approved TMDL Implementation Plan and participating in a cooperative MOA to carry out the Integrated Watershed Monitoring Plans, that during this Permit term exceedances of Water Quality Standards, TMDL Waste Load Allocations, or Effluent Limits will not constitute a Permit violation. Integrated Watershed Monitoring Plans approved by the Executive Officer would supersede previously approved TMDL Monitoring and Reporting Plans.

Permittees that do not want to participate in the Integrated Watershed approach shall develop and/or utilize existing or future TMDL monitoring plans and schedules. Existing TMDLs should have the option to be included in the Integrated Watershed approach, and resulting timeframe adjustments, if they so chose.

**LA Permit Group**  
**Draft Comments on TMDL Provisions Proposed at RWQCB Workshop on 1/23/12**

The Los Angeles Permit Group appreciates the opportunity to provide input to RWQCB staff on the elements of TMDL WLA incorporation into the MS4 permit as provided in the presentation and handouts during the workshop on 1/23/12.

The group supports many of the concepts outlined in the presentation, particularly the multiple methods of demonstrating compliance, which includes the implementation of rigorous implementation plans using an adaptive management strategy as a method of compliance. However, the group has a few key concerns with the proposal that we would like to share.

**Reasonable Assurance Plan**

We request that the Reasonable Assurance Plan (RAP) not be used as the mechanism for identifying the BMPs that will be used to comply with the TMDL WLAs. Rather, we request that the requirements to meet TMDL WLAs be incorporated into the Stormwater Quality Management Plan, as described below.

1. Stormwater Quality Management Plans, based on the TMDL implementation plans and other elements, can be developed with a watershed/sub watershed based or individual permittee approach rather than a "one size fits all" approach.

a. Permittees shall develop a process to evaluate BMPs that will fall under one or more of the following categories:

- i. Operational source control BMPs that prevent contact of pollutants with rainwater or stormwater runoff;
- ii. Runoff reduction BMPs;
- iii. Treatment control BMPs where effectiveness information is available;
- iv. True source control BMPs that eliminate or greatly reduce a potential pollutant at the original source pursuant to a legislative or regulatory time schedule; or
- v. Research and development for pollutant types where effective BMPs have not been identified.

b. These categories will be incorporated as part of the Stormwater Quality Management Plans.

c. Stormwater Quality Management Plans will identify effective BMPs to be implemented in an iterative manner to attain the WLAs based on the design storm.

2. Stormwater Quality Management Plans designed to attain the TMDL WLAs will include:

- a. specific, targeted steps scheduled to attain the WLAs through the use of BMPs;
- b. specific procedures for evaluating BMP effectiveness; and
- c. provisions for special studies if needed.

The Stormwater Quality Management Plans can incorporate BMPs identified in implementation plans to address the TMDL requirements.

TMDL Compliance

Our second, and primary concern, is the way in which compliance with TMDL permit provisions is being discussed. It is our understanding from the presentation, that at the end of a TMDL implementation schedule, if a permittee is not meeting the numeric values assigned as WLAs in the TMDL, the permittee will be considered out of compliance with the permit requirements. We have significant concerns with this approach to developing the permit for a number of reasons.

It is our understanding that this approach would result in the inclusion of numeric effluent limitations as the mechanism for incorporating the TMDL WLAs. For those TMDLs whose compliance dates have passed, permittees would be considered in violation of the permit if they are not meeting the numeric effluent limitations from the moment the permit is effective. If warranted, the Regional Board would use a Time Schedule Order (TSO) to provide some additional time for coming into compliance. If this is the proposed approach, in essence, the permittees would be going from complying with the current permit that includes only a few TMDL requirements to potentially being out of compliance for requirements that have never been in their permit.

Permittees are planning on taking actions as outlined in the Stormwater Quality Management Plan above to make significant progress towards improving water quality. However, we have concerns that requirements being proposed go beyond MEF given the economic and staff resources available to achieve the WLAs for an unprecedented number of TMDLs being incorporated into this permit. These concerns are based on a number of factors including but not limited to:

- TMDLs were developed using inadequate data with the intent that TMDL provisions would be revised through TMDL reconsiderations and special studies. Most of the TMDLs have not been reconsidered.
- Other sources may prevent attainment of standards in the receiving water no matter what actions are taken by the MS4 permittees.
- Many WLAs cannot be met within the permit term.
- Regulation of the sources of some pollutants are outside of MS4 permittees control.
- The design storm has not yet been defined and implementation of BMPs to ensure compliance under all conditions, including extreme storm events, could be extremely costly and technically infeasible.

Although we recognize that additional requirements and rigor need to be added to the permit to address TMDLs, we feel that there are straightforward ways to do this that do not represent such a significant shift in the regulation of stormwater discharges and place dischargers into an untenable situation of potentially being out of compliance with their permit from the effective date.

To address these concerns, the group would like to propose the following approach for compliance with TMDL WLAs.

1. Implement TMDL WLAs as BMP-based water quality based effluent limitations (WQBELs) in the permit. This is consistent with federal regulations (40 CFR 122.44(d)(1)(vii)(B) which require inclusion of effluent limits, defined at 40 CFR 122.2 as "any restriction imposed by the Director on quantities, discharge rates, and concentrations of "pollutants" which are "discharged" from

- "point sources", which are "consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA."
2. Define BMP-based WQBELs as "implementation of BMPs included in a Regional Board Executive Officer approved Stormwater Quality Management Plan. The Stormwater Quality Management Plan (SQMP) shall describe the proposed BMPs and the documentation demonstrating that when implemented, the BMPs are expected to attain the WLAS, and a process for evaluating BMP effectiveness and implementing additional actions if necessary to meet the TMDL WLAS." This is consistent with other recently adopted permits in California and with the requirements as described in the 1/23/12 RWQCB presentation.
  3. Consistent with the four methods for demonstrating compliance with TMDLs as presented in the 1/23/12 RWQCB presentation, a co-permittee which is achieving WLAs at the outfall (or equivalent point of compliance within the drainage system) or in receiving waters may cease implementing additional BMPs if appropriate.
  4. Violations of the BMP based WQBEL provisions would consist of the following provisions, in keeping with the 1/23/12 RWQCB presentation:
    - a. Not submitting the SQMP.
    - b. Not implementing all elements of the SQMP in accordance with the approved schedule.
    - c. Not implementing additional BMPs or revising the SQMP per the process outlined in the SQMP or on schedule.

We can provide example permit language to help expand upon the approach outlined above. We appreciate your consideration of this approach and would like to meet to discuss these important issues related to TMDLs.

#### Additional Comments on the Proposed Text

In addition to the general topics outlined above, we have some concerns about the draft language that was provided for the TMDLs. First, we request that a non-trash example be provided to allow a better understanding of how compliance will be determined for constituents that do not have a clear method of determining compliance outlined in the TMDL. Additionally, we feel that some of the language proposed is not consistent with the approach outlined in the presentation. We have highlighted the language of potential concern below.

#### Part 7. Total Maximum Daily Loads (TMDLs) Provisions

The second bullet states "The Permittees shall comply with the following effluent limitations and/or receiving water limitations..." This is followed by tables with the numeric WLAs.

We have three concerns with this language:

1. The language implies that the effluent limitations are strictly numeric.
2. The language does not include any reference to how compliance will be determined, with the exception of the trash TMDL.
3. The language refers to both effluent limitations and receiving water limitations for the Santa Clara River Bacteria TMDL. We feel this does not accurately reflect the language in the TMDL and creates confusion related to the receiving water limitations outlined in a separate portion of the document.

**EXHIBIT B**

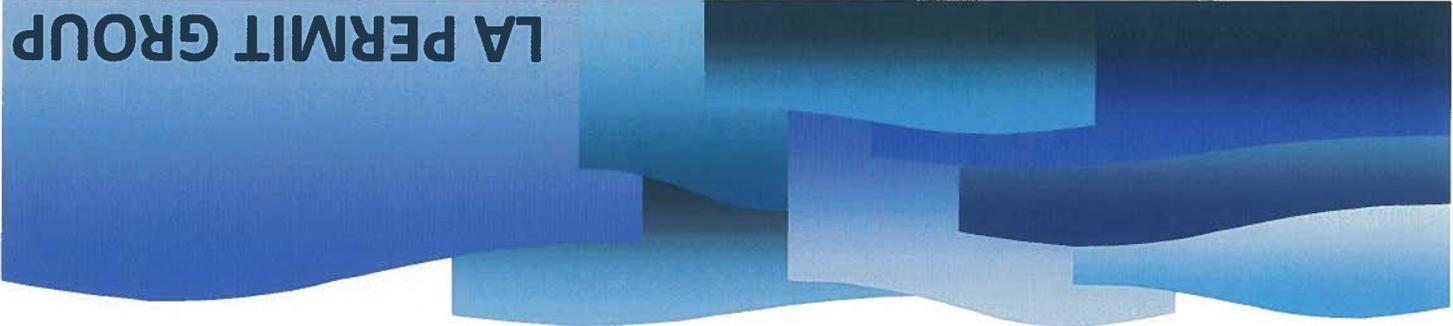

We feel that these concerns could be addressed through the approach outlined above for incorporation of TMDL WLAs.

*MS4 Permit Provisions to Implement Trash TMDLs*

We appreciate the incorporation of language to define alternative methods of compliance (i.e. full capture) and hope to see similar language for other constituents. However, we feel that some minor language modifications may be necessary to clearly show the linkage and ensure the permit is clear.

In B. (1)(d) Language regarding compliance through an MFAC program is not clearly defined. We feel that the language should clearly state that the permittee is deemed in compliance through implementing an approved MFAC program.

In B.(2), the language discussing violations of the permit should reference the previous section where compliance is defined.

**SUBJECT: Technical Comments on Los Angeles Regional Water Quality Control Board Staff Working Proposals for the Greater Los Angeles County MS4 Permit (Permit) – Watershed Management Programs, TMDLs and Receiving Water Limitations**

Dear Ms. Purdy and Mr. Ridgeway:

The Los Angeles Permit Group would like to take this opportunity to provide comments on the working proposals for Watershed Management Programs, Total Maximum Daily Loads, and Receiving Water Limitations. These documents were posted on the Regional Board website on April 23, 2012. The LA Permit Group appreciates the Regional Board staff's effort to develop the next NPDES stormwater permit and their commitment to meet with various stakeholders including our group. We look forward to continuing the dialogue with the Board staff on this very important permit. Our highest priorities on the Watershed Management Program, TMDLs and Receiving Water Limitations are:

- Provide additional time to develop the Watershed Management Program to integrate the 32 TMDLs and prioritize efforts.
- Prior to adopting the Los Angeles MS4 NPDES Permit, reopen TMDLs for reconsideration where final compliance periods have passed and initiate the Basin Plan Amendment process to extend compliance deadlines to coordinate with the Watershed Management Program and consider substantial amounts of new information available. While the TMDL reopeners are pending, an affected Permittee would be in compliance through the implementation of core programs and implementation plans.
- Initiate TMDL reopeners/reconsideration where compliance with a waste load allocation (WLA) is exclusively set in the receiving water to also include compliance at the outfall, or other end-of-pipe; while the TMDL reopener is pending, an affected Permittee would be in compliance with the receiving water WLA through the implementation of core programs and implementation plans.
- Develop Receiving Water Limitation language that supports implementing the Watershed Management Programs without unnecessary vulnerability.

- All compliance points (interim WLA, milestones, and final WLA) for all TMDLs should allow for compliance timelines and actions consistent with the Watershed Management Programs that will be developed, rather than with strict numeric limits to determine compliance.

As noted in discussions with you, the LA Permit Group requested additional time to review the working proposals presented at the May 3, 2012 Regional Board Workshop. Given the brief comment deadline, there are significant additional concerns that could not be fully explored or analyzed. Prior to issuing a tentative order, a complete administrative draft is needed to provide stakeholders (with a minimum 30 day review period) to allow the permittees to fully see how the various provisions of the permit will work together in order to gain a holistic view of the permit. This is essential in order to address the unprecedented policies and actions anticipated in the Los Angeles MS4 NPDES Permit.

These topics are further highlighted below. Detailed comments are attached for each Watershed Management Program, Receiving Water Limitations and TMDLs.

### **Watershed Management Programs**

Overall, the LA Permit Group supports the Regional Board's proposed approach to address high priority water quality issues through the development and implementation of a watershed management program. We believe the working proposal provides sufficient detail to guide the development of the programs without being overly prescriptive and constraining. However, one of our biggest concerns with the working proposal is the proposed timeline for developing the watershed management programs. As noted in the workshop, municipalities would have only one year to develop a comprehensive watershed management program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate the data, draft the plans, and obtain necessary approvals from political bodies. As a comparison, the City of Torrance required two years to prepare a comprehensive water quality plan that addressed a suite of TMDLs, similar to what is being considered in the watershed management program. The permit should provide that the time schedule for submittal of the Draft Plan be 24 months after permit adoption.

We also offer the following comments regarding the watershed management program (our line item by line item review and comments are attached):

- The working proposal seems to be silent on the critical issue of sources of pollutants outside the authority of MS4 permittees (e. g. aerial deposition, upstream contributions, discharges allowed by another NPDES permit, etc.). We request that permittees be allowed to demonstrate that some sources are outside the permittee's control.
- Reasonable assurance necessitates closer integration with TMDL and storm water monitoring programs. Currently the working proposal does not provide a sufficient tie-in between the monitoring and the watershed program. This lack of tie-in was acknowledged in the workshop by Board staff. It is expected that this tie-in will be addressed once the monitoring provisions are drafted.
- The watershed plan is obviously tied closely with the TMDLs which is reasonable and constructive. But we would suggest that staff broaden the definition of water quality issues to consider protection of and impacts to existing ecosystems in the analysis.
- More careful consideration should be given to the frequency and extent of the reporting and adaptive management assessments. The current proposal results in a significant annual effort and the LA Permit Group members question the value of such an effort. Current reporting appears to overwhelm state staff resources without providing the state with usable feedback on the significant efforts about our programs. We believe that the reporting can be streamlined and that the jurisdictional and watershed reporting should be combined.

- It is unclear how program implementation and TMDL compliance will be handled during the interim period before development of the watershed management program. For those entities that choose to develop a watershed management program, the LA Permit Group requests that current, significant efforts in our existing programs and implementation plans be allowed to continue while we evaluate new MCMs as part of the watershed management program.
- Consideration of the technical and financial feasibility of complying with water quality standards should be included in the watershed management program.

### Total Maximum Daily Loads

Of critical importance to this permit and to water quality is the incorporation of TMDLs into the NPDES permit. This NPDES permit proposes to incorporate more TMDLs than any other permit in California issued to date. As a result, the manner in which the TMDLs are incorporated into the permit is a critical issue for the LA Permit Group and will likely set a significant precedent for all future MS4 permits.

The rate of development of TMDLs in the Los Angeles Region was unparalleled in California, and likely the nation. A settlement agreement necessitated the much accelerated time schedule for these TMDLs. The TMDLs were developed based on the information available at the time, not the best information to identify or solve the problem. As a result, the sophistication of the TMDLs vary widely, meaning that not all TMDLs are created equal regarding knowledge of the pollutant sources, confidence in the technical analysis, availability of control measures sufficient to address the pollutant targets, etc. Additionally, the majority of the TMDLs were developed with the understanding that monitoring, special studies, and other information would be gathered during the early years of the TMDL implementation to refine the TMDLs. As such, many MS4 dischargers were told during TMDL adoption that any concerns they may have over inaccuracies in the TMDL analysis would be addressed through a TMDL reopener. The proposed method of incorporating TMDL WLAS, as outlined in the working proposal, does not effectively allow for addressing this phased method of implementing TMDLs, nor does it recognize the time, effort and complexities involved in addressing MS4 discharges, and it places municipalities into immediate compliance risk for permit requirements that have never been incorporated into the MS4 permit previously.

We recognize and appreciate that TMDLs must be incorporated in such a way as to require action to improve water quality. However, the permit should recognize the articulated goal of many of the TMDLs to be adaptive management documents and consider the challenges of trying to address the non-point nature of stormwater. As such, it is imperative to have flexibility in selecting an approach to address the TMDLs and the time frame by which to implement the approach.

Regional Board staff is making three significant policy decisions with regards to incorporating TMDLs into this permit that the LA Permit Group would like staff to reconsider:

1. The inclusion of numeric effluent limitations for final TMDL WLAS.
2. The use of time schedule orders to address Regional Board adopted TMDLs for which the compliance points have passed.
3. The use of time schedule orders for EPA adopted TMDLs with no implementation plans.

The first policy decision of concern is the incorporation of final WLAS solely as numeric effluent limitations in the proposed permit language. Although staff has discretion to include numeric limits, it is not required and the use of numeric limits results in contradictions and compliance inconsistencies with the rest of the permit requirements. Court decisions (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)<sup>1</sup>), State Board orders (Order

<sup>1</sup> See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

WQ 2009-0008, in the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10)<sup>2</sup> have affirmed that WLAS can be incorporated as non-numeric effluent limitations. Under 40 CFR Section 122.44 (k), the Regional Board may impose BMPs for control of storm water discharges in lieu of numeric effluent limitations when numeric limits are infeasible. It states that best management practices may be used to control or abate the discharge of pollutants when numeric effluent limitations are infeasible. In 2006, the Blue Ribbon Panel made recommendations to the State Water Resources Control Board concluding that it was not feasible to incorporate numeric limits into permits to regulate storm water, and at best there could be some action level, but not numeric waste load allocations. Very little has changed in the technology and the feasibility of controlling storm water pollutants since 2006. What has changed is that a legally compelled, long list of TMDLs has been adopted in the LA Region in a very short time period.

Additionally, during the May 3, 2012 MS4 Permit workshop, Regional Board staff seemed to indicate that the basis for incorporating the final WLAS as numeric effluent limitations is EPA's 2010 memorandum pertaining to the incorporation of TMDL WLAS in NPDES permits<sup>3</sup>. This memorandum (which is currently being reconsidered by U.S. EPA) states that "EPA recommends that, where feasible, the NPDES permitting authority exercise its discretion to include numeric effluent limitations as necessary to meet water quality standards" (emphasis added). This statement highlights the basic principle that the Regional Board has discretion in how the WLAS are incorporated into the MS4 Permit. Regional Board staff commented during the workshop that staff have evaluated data and have determined numeric effluent limitations are now feasible. However, no information refuting the Blue Ribbon Panel report recommendations has been provided that demonstrates how the appropriateness of using strict numeric limits was determined and why these limits are considered feasible now even though historically both EPA and the State have made findings that developing numeric limits was likely to be infeasible<sup>4</sup>.

Given the discretion available to Regional Board staff and the variability among the TMDLs with respect to understanding of the pollutant sources, confidence in the technical analysis, and availability of control measures sufficient to address the pollutant targets, it is critical to use non-numeric water quality based effluent limitations for both interim and final WLAS in this permit. The proposed Watershed Management Program will require quantitative analysis to select actions that will be taken to achieve TMDL WLAS. For the entire length of the TMDL compliance schedule, permittees will be required to demonstrate compliance with interim WLAS by implementing actions that they have estimated to be the best of their knowledge will result in achieving the WLAS and water quality standards. Additionally, permittees will be held responsible for compliance with actions to meet the core program requirements of the permit. However, unless final WLAS are also expressed in this permit as action-based water quality based effluent limitations, and if instead strict numeric limits are required for final WLAS, then, at the specified final compliance date, no matter how much the permittee has done, no matter how much money has been spent, no matter how close to complying with the numeric values, and no matter what other information has been developed and submitted to the Regional Board, the permittee will be considered out of compliance with the permit requirements. And because of the structure established in this permit, the Regional Board staff will have to consider all permittees in this situation as being out of compliance with the permit provisions if the strict numeric limits have not been met, regardless of the actions

<sup>2</sup> "[i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California's NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board's findings supporting either the numeric or non-numeric effluent limitations contained in the permit." (Order WQ 2009-0008, in the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)

<sup>3</sup> U.S. EPA, *Revisions to the November 22, 2002 Memorandum "Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs, Memorandum from U.S. EPA Director, Office of Wastewater Management James A. Hanlon and U.S. EPA Director, Office of Wetlands, Oceans, and Watershed Denise Keehner* (Nov. 10, 2010).  
<sup>4</sup> Storm Water Panel Recommendations to the California State Water Resources Control Board "The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities. June 19, 2006.

taken previously. This approach is inconsistent with the goals of good public policy, fair enforcement and fiscal responsibility.

To address this issue, the LA Permit Group recommends that:

- WLAs be translated into WQBELs, expressed as BMPs and that implementation of the BMPs will place the permittee into compliance with the MS4 Permit
- The WLAs be included as specific actions (BMPs) that will be designed to achieve the WLAs
- Include language that states that compliance with the TMDLs can be achieved through implementing BMPs defined in the watershed management plan

The second major policy decision of concern is the use of Time Schedule Orders for Regional Board adopted TMDLs for which the compliance date has already occurred prior to the approval of the NPDES permit. The ideal phased TMDL implementation process whereby dischargers can collect information, submit it to the Regional Board, and obtain revisions to the TMDL requirements to address data gaps and uncertainties has not occurred. As evidenced by the number of overdue permits, the workload commitments of Regional Board staff are significant and TMDL reopener seldom occur. Because the majority of the TMDLs have not been incorporated into permit requirements until now, MS4 permittees have been put in the position of trying to comply with TMDL requirements without knowing how compliance with those TMDLs would be determined and without knowing when or if promised considerations of modifications to the TMDL would occur. And now, they are expected to be in immediate compliance with new permit provisions which differ from most precedent and guidance regarding incorporation of TMDLs into MS4 permits, regardless of what actions they have taken to try and meet the TMDL requirements. This is neither fair nor consistent.

The LA Permit Group strongly believes that the adaptive management approach envisioned during TMDL development, whereby TMDL reopeners are used to consider new monitoring data and other technical information to modify the TMDLs, including TMDL schedules as appropriate, is the most straightforward way to address past due TMDLs. Some of the past due TMDLs are currently being considered for modifications and Regional Board staff should use this opportunity to adjust the implementation timelines to reflect the practical and financial reality faced by municipalities. There is no reason why the reopeners cannot reflect information gathered during the implementation period, including information that may be considered in developing the Time Schedule Orders in the future, to selectively modify time schedules in the TMDLs. Additionally, the permit should reflect any modifications to the TMDL schedules made through the reopener process, either through a delay in the issuance of the permit until the modified TMDLs become effective, or by using your discretion to establish a specific compliance process for these TMDLs in the permit. Providing for compliance with these TMDLs through implementation of BMPs defined in the watershed management plans as we have requested for all other TMDLs is a feasible, fair and consistent way to achieve this goal.

The third policy decision of concern is the manner in which EPA adopted TMDLs are being incorporated into the permit. The draft proposal requires immediate compliance with EPA TMDL targets. The effect of this approach is to put MS4 dischargers immediately out of compliance for TMDLs that may have only been adopted in March 2012. However, the Regional Board has the discretion to include a compliance schedule in the permit for EPA adopted TMDLs should they so choose. Federal law does not prohibit the use of an implementation schedule when incorporating EPA adopted TMDLs into MS4 permits. Additionally, State law may be interpreted to require the development of an implementation plan prior to incorporation of EPA adopted TMDLs into permits. Accordingly, the LA Permit Group recommends that the working proposal be modified to include compliance schedules for EPA adopted TMDLs in the permit.

## Receiving Water Limitations

The proposed Receiving Water Limitations (RWL) language creates a liability to the municipalities that we believe is unnecessary and counterproductive. The proposed language for the receiving water limitations provision is almost identical to the language that was litigated in the 2001 permit. On July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.*<sup>5</sup> (NRDC v. County of LA) that determined that a municipality is liable for permit violations if its discharges cause or contribute to an exceedance of a water quality standard.

In light of the 9<sup>th</sup> Circuit's decision and based on the significant monitoring efforts being conducted by other municipal stormwater entities, municipal stormwater permittees will now be considered to be in non-compliance with their NPDES permits. Accordingly, municipal stormwater permittees will be exposed to considerable vulnerability, even though municipalities have little control over the sources of pollutants that create the vulnerability. Fundamentally, the proposed language again exposes the municipalities to enforcement action (and third party lawsuits) even when the municipality is engaged in an adaptive management approach to address the exceedance.

The LA Permit Group would like to more fully address Board Member Glickfeld's question raised at the May 3rd workshop about how RWL language as currently written puts cities in immediate non compliance, either individually or collectively. As written, TMDLs as well as water quality standards in the basin plan would have to be specifically met as soon as this permit is adopted. Many of the adopted TMDLs include language that cities are jointly and severably liable for compliance.

While the Regional Board staff has noted that enforcement action is unlikely if the permittees are implementing the iterative process, the reality is that municipalities are immediately vulnerable to third party lawsuits as well as enforcement action by Regional Board staff. In the Santa Monica Bay, cities were sent Notices of Violation that, in essence, stated that all cities in the watershed were guilty until they proved their innocence when receiving water violations were found, in some cases miles away. The "cause and contribute" language was quoted prominently in those NOV's as justification for why the Regional Board could take such action. As another case in point the City of Stockton was sued by a third party for violations of the cause/contribute prohibition even though the City was implementing a comprehensive iterative process with specific pollutant load reduction plans. Cities will have no warning or time to react to any water quality exceedances, but still be vulnerable to third party lawsuits even when cities are diligently working to address the pollutants of concern. This will be disastrous public policy, creating a chilling affect on productive storm water programs.

It is not fair and consistent enforcement to put cities in a vulnerable situation to be determined out of compliance with water quality standards in the basin plan without time to develop a plan of action, develop source identification, and implement a plan to address the concern. With the very recent legal interpretation that fundamentally changes how these permits have been traditionally implemented, please understand that adjusting the Receiving Water Limitations language is a critical issue. Again, the receiving water limitation language must be modified to allow for the integrated approach to address numerous TMDLs within the watershed based program to solve prioritized water quality problems in a systematic way. This is a fair and focused method to enforce water quality standards.

The receiving water limitation provision as crafted in the contested 2001 Los Angeles permit is unique to California. Recent USEPA developed permits (e.g. Washington D.C.) do not contain similar limitations. Thus, we would submit that the decision to include such a provision and the structure of the provision is a State defined requirement and therefore an opportunity exists for the Regional and State Boards to reaffirm the iterative process as the preferred approach for long term water quality improvement.

<sup>5</sup> No. 10-56017, 2011 U.S. App. LEXIS 14443, at \*1 (9th Cir., July 13, 2011).

Beyond the legal/liability aspect of the receiving water limitations we would submit that in a practical sense the RWL works against the Watershed Management Program proposal. On the one hand the municipalities will develop watershed management programs that are based on the high priority water quality issues within the watershed. Consistent with the working proposal for the watershed management programs we would expect the focus to be on TMDLs and the pollutants associated with those TMDLs. However, under the current RWL working proposal the municipalities will need to direct their resources to any and all pollutants that may cause or contribute to exceedances of water quality standards. Based on a review of other municipal outfall monitoring results in the State there may be occasional exceedances of other non-TMDL pollutants (e.g. aluminum, iron, etc.). These exceedances may only occur once every 10 storms but according to the current RWL proposal, the municipalities must also address these exceedances with the same priority as the TMDL pollutants. The LA Permit Group views this as unreasonable and ineffective use of limited municipal resources.

The RWL language is a critical issue for municipalities statewide and has been highlighted to the State Water Resources Control Board for consideration. Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue.

As previously discussed at the May 3rd workshop, and requested by many Board Members, the economic implications of the many proposed permit requirements are of critical importance. The LA Permit Group will be providing the requested information in a subsequent submittal shortly. However, the short timeframe for commenting on these working proposals has precluded us from assembling the information before the comment deadline on May 14, 2012.

In closing, we thank you for the opportunity to comment on the working proposals and we look forward to meeting with you to discuss our comments and to explore alternative approaches. Furthermore we respectfully request that the Board provide a complete administrative draft of the Permit to stakeholders prior to the public issuance of the Tentative Order. Overall, the comment deadline was too short to address all the potential issues and concerns with the Watershed Management Program, TMDLs, and Receiving Water Limitation sections and that there are significant, additional concerns that could not be fully explored or analyzed given the comment deadline. Thus it is important to review the entire draft permit to better understand the relationship among the various provisions; this is especially true for the monitoring provision and its relationship to the watershed management program. We strongly encourage you to use your discretion on these matters to make the adjustments requested. Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,  
  
Heather M. Maloney, Chair  
LA Permit Group

Document Name: TMDL Working Proposal - April 23 2012

Agency/Reviewer: LA Stormwater Permit Group

Comment No.	Doc. Reference Page	Section	Comments	Rvwr (optional)	Author Response
1	5	B.1.c.(2)	Santa Monica Bay Beaches Bacteria TMDL (SMBBB TMDL) is currently being reconsidered. As part of that reconsideration the summer dry weather targets must be revised to be consistent with the reference beach/anti-degradation approach established for the SMBBB TMDL and with the extensive data collected over that past seven years since original adoption of the SMBBB TMDL. This data clearly shows that natural and non-point sources result in 10% exceedances during dry weather. Data collected at the reference beach since adoption of the TMDL, as tabulated in Table 3 of the staff report of the proposed revisions to the Basin Plan Amendment, demonstrate that natural conditions associated with freshwater outlets from undeveloped watersheds result in exceedances of the single sample bacteria objectives during both summer and winter dry weather on approximately 10% of the days sampled.		
1	5	B.1.c.(2)	Thus the previous Source Analysis in the Basin Plan Amendment adopted by Resolution No. 02-004 which stated that "historical monitoring data from the reference beach indicate no exceedances of the single sample targets during summer dry weather and on average only three percent exceedance during winter dry weather" was incorrect and based on a data set not located at the point zero compliance location. Continued allocation of zero summer dry weather exceedances in the proposed Basin Plan Amendment is in direct conflict with the stated intent to utilize the reference beach/anti-degradation approach and ignores the scientifically demonstrated reality of natural causes and non-point sources of indicator bacteria exceedances.		
1	5	B.1.c.(2)	Continued use of the zero summer dry weather exceedance level will make compliance the SMBBB TMDL impossible for the Jurisdictional agencies. This is also in conflict with the intent of the Regional board as expressed in finding 21 of Resolution 2002-022 "that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas".		

2		B.1.	<p>The SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) was approved by the Regional Board staff and that CSMP should be incorporated into the TMDL monitoring requirements of the next MS4 Permit. The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week, thus it is highly confusing and misleading to refer to "daily monitoring". The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week.</p>		
3		B.1.	<p>The SMBBB TMDL is currently being reconsidered at a hearing scheduled for June 7, 2012. The 4th term MS4 Permit should incorporate the revised waste load allocations which are to be adopted at that hearing, rather than the previous basin plan amendments.</p>		
4	5	B.1.c.(3)	<p>Description of SMB 5-5 under Beach Monitoring Location is incorrect (and seems to have been switched with the description of SMB 5-3). SMB 5-5 is a historic monitoring location "50 yards south of the Hermosa Pier" as described in the adopted basin plan amendment and in the Regional Board approved Coordinated Shoreline Monitoring Plan. Whereas SMB 5-3 has been relocated from the historic location 50 yards south of the Manhattan Beach Pier to the zero point of the southern storm drain outfall against the strand wall under the Pier, thus an apt description of that location would be: "Manhattan Beach Pier, southern drain".</p>		
5	1-6	B.1 throughout	<p>This discussion in this section devoted to the SMBBB TMDL seems to create confusion regarding the meaning of the terms "water quality objectives or standards, and "receiving water limitations" and "water quality-based effluent limitations". Water quality objectives or water quality standards are those that apply in the receiving water. Water Quality Effluent Based Limits apply to the MS4. So the "allowable exceedance days" for the various conditions of summer dry weather, winter dry weather and wet weather should be referred to as "water quality-based effluent limitations" since those are the number of days of allowable exceedances of the water quality objectives that are being allowed for the MS4 discharge under this permit. While the first table that appears under this section at B.1 (b) should have the heading "water quality standards" or "water quality objectives" rather than the term "effluent limitations".</p>		

6	5	B.1.c(3)	While it makes sense for the Jurisdictional Groups previously identified in the TMDLs to work jointly to carry out implementation plans to meet the interim reductions, only the responsible agencies with land use or MS4 tributary to a specific shoreline monitoring location can be held responsible for the final implementation targets to be achieved at each individual compliance location. An additional table is needed showing the responsible agencies for each individual shoreline monitoring location.		
7	6-7	B.2.	Santa Monica Bay Nearshore and Offshore Debris TMDL: An alternate compliance schedule is needed for responsible agencies that adopt local ordinances banning plastic bags, smoking in public places, and single-use expanded polystyrene by three years from the adoption date, or by November 4, 2013. Those agencies are to have a three year extension of the final compliance date, until March 20, 2023 to meet the final waste load allocations.		
8	7	B.3.	The Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4 based on estimates from limited data on existing stormwater discharges which resulted in a waste load allocation for stormwater that is lower than necessary to meet the TMDL targets, in the case of DDT far lower than necessary. EPA stated that "If additional data indicates that existing stormwater loadings differ from the stormwater waste load allocations defined in the TMDL, the Los Angeles Regional Water Quality Control Board should consider reopening the TMDL to better reflect actual loadings." [USEPA Region IX, SMB TMDL for DDTs and PCBs, 3/26/2012]		
8	7	B.3.	In order to avoid a situation where the MS4 permittees would be out of compliance with the MS4 Permit if monitoring data indicate that the actual loading is higher than estimated and to allow time to re-open the TMDL if necessary, recommend as an interim compliance objective WQBELs based on the TMDL numeric targets for the sediment fraction in stormwater of 2.3 ug DDT/g of sediment on an organic carbon basis, and 0.7 ug PCB/g sediment on an organic carbon basis.		

9	7	B.3	<p>Although the Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4, they should be translated as WQBELs in a manner such that watershed management areas, subwatersheds and individual permittees have a means to demonstrate attainment of the WQBEL. Recommend that the final WLAs be expressed as an annual mass loading per unit area, e.g., per square mile. This in combination with the preceding recommendation for an interim WQBEL will still serve to protect the Santa Monica Bay beneficial uses for fishing while giving the MS4 Permittees time to collect robust monitoring data and utilize it to evaluate and identify controllable sources of DDT and PCBs.</p>		
10	3	C.2.c)	<p>The Machado Lake Trash WQBELs listed in the table at C.2.c) in the staff working proposal appear to have been calculated from preliminary baseline waste load allocations discussed in the July 11, 2007 staff report for the Machado Lake Trash TMDL, rather than from the basin plan amendment. In some cases the point source land area for responsible jurisdictions used in the calculation are incorrect because they were preliminary estimates and subsequent GIS work on the part of responsible agencies has corrected those tributary areas. In other cases some of the jurisdictions may have conducted studies to develop a jurisdiction-specific baseline generation rate. The WQBELs should be expressed as they were in the adopted TMDL WLAs, that is as a percent reduction from baseline and not assign individual baselines to each city but leave that to the individual city's trash reporting and monitoring plan to clarify.</p>		

11	3	C.2.c)	<p>The WLAs in the adopted Machado Lake Trash TMDL were expressed in terms of percent reduction of trash from Baseline WLA with the note that percent reductions from the Baseline WLA will be assumed whenever full capture systems are installed in corresponding percentages of the conveyance discharging to Machado Lake. As discussed in subsequent city-specific comments, there are errors in the tributary areas originally used in the staff report, but in general, tributary areas are available only to about three significant figures when expressed in square miles. Thus the working draft should not be carrying seven significant figures in expressing the WQBELs as annual discharge rates in uncompressed gallons per year. The convention when multiplying two measured values is that the number of significant figures expressed in the product can be no greater than the minimum number of significant figures in the two underlying values. Thus if the tributary area is known to only three or four significant figures, and the estimated trash generation rate is known to four significant figures, the product can only be expressed to three or four significant figures. Thus there should be no values to the right of the decimal place and the whole numbers should be rounded to the correct number of significant figures.</p>		
12	3	C.2.c)	<p>The Regional Board's preliminary baseline trash generation rate for the City of Rolling Hills Estates was based on an assumed area of 1.22 square miles multiplied by the estimated trash generation rate of 5334 gallons of uncompressed trash per square mile per year. However as explained in the City's Trash Monitoring and Reporting Plan, subsequent GIS work performed by City and County of Los Angeles and confirmed by the City of Rolling Hills Estates' consultant identified a 2.76 square mile drainage area tributary to Machado Lake from the City of Rolling Hills Estates. Using this corrected area and the default trash generation rate of 5334 gallons of uncompressed trash per square mile per year would result in a corrected baseline of 14,700 gallons per year.</p>		
13	3	C.2.c)	<p>The Regional Board's preliminary baseline trash generation rate for the City of Rolling Hills was based on an assumed area of 0.56 square miles multiplied by the estimated trash generation rate of 5334 gallons of uncompressed trash per square mile per year. However as explained in the City's Trash Monitoring and Reporting Plan, subsequent GIS work performed by City and County of Los Angeles and confirmed by the City of Rolling Hills' consultant identified a 1.313 square miles drainage area tributary to Machado Lake from the City of Rolling Hills. Using this corrected area and the default trash generation rate of 5334 gallons of uncompressed trash per square mile per year would result in a corrected baseline of 7004 gallons per year.</p>		

14	3	C.3	The Machado Lake Nutrient TMDL provides for a reconsideration of the TMDL 7.5 years from the effective date prior to the final compliance deadline. Please include an additional statement as item: 3.c)(3)"By September 11, 2016 Regional Board will reconsider the TMDL to include results of optional special studies and water quality monitoring data completed by the responsible jurisdictions and revise numeric targets, WLAs, LAs and the implementation schedule as needed."		
15	4	C.5.a)	Table C is not provided in the section on TMDLs for Dominguez Channel and Greater LA and Long Beach Harbors Toxic Pollutants. Please clarify and reference that Attachment D Responsible Parties Table RB4 Jan 27, 12 which was provided to the State Board and responsible agencies during the SWRCB review of this TMDL, and is posted on the Regional Board website in the technical documents for this TMDL, is the correct table describing which agencies are responsible for complying with which waste load allocations, load allocations and monitoring requirements in this VERY complex TMDL. Attachment D should be included as a table in this section of the MS4 Permit.		
16	4-8	C.5.	The Dominguez Channel and Greater LA and Long Beach Harbor Waters Toxic Pollutants TMDL provides for a reconsideration of the TMDL targets and WLAs. Please include an additional statement as item: 4.e) "By March 23, 2018 Regional Board will reconsider targets, WLAs and LAs based on new policies, data or special studies. Regional Board will consider requirements for additional implementation or TMDLs for Los Angeles and San Gabriel Rivers and interim targets and allocations for the end of Phase II."		
17	1, 3, 15	Attach I	City of Hermosa Beach is only within one watershed, the Santa Monica Bay Watershed, and so should not be shown in italics as a multi-watershed permittee		
18	2	E.2.b.v.1.	Recommend using the same language from E.2.d.i.3 to describe the demonstration. Therefore substitute this for the current language at E.2.b.v.1: "Demonstrate that there is no direct or indirect discharge from the Permittee's MS4 to the receiving water during the time period subject to the water quality-based effluent limitation and/or receiving water limitation for the pollutant(s) associated with a specific TMDL."		

19	3	E.2.d.i.1.	Recommend clarifying this item by incorporating the footnote into the text and modifying this item to read as follows: "There are no violations of the interim water quality-based effluent limitation for the pollutant(s) associated with a specific TMDL at the Permittee's applicable MS4 outfall(s) which may include: a manhole or other point of access to the MS4 at the Permittee's jurisdictional boundary, a manhole or other point of access to the MS4 at a subwatershed boundary that collects runoff from more than one Permittee's jurisdiction, or may be an outfall at the point of discharge to the receiving water that collects runoff from one or more Permittee's jurisdictions."		
20	4	E.2.d.i.4.b.	Is this in effect setting a design storm for the design of structural BMPs to address attainment of TMDLs, or is it simply referring to SUSMP/LID type structural BMPs? If it is in effect setting a design storm, there needs to be some sort of exception for TMDLs in which a separate design storm is defined, e.g., for trash TMDLs where the 1-year, 1-hour storm is used.		
21	8	E.5.b.(c)	Recommend not listing specific water bodies in E.5.b.(c) because then it risks becoming obsolete if new TMDLs are established for trash, or if they are reconsidered. Furthermore, it is not clear why Santa Monica Bay was left out of this list since the Marine Debris TMDL allows for compliance via the installation of full capture devices.		
22	7	E.5.a.i-x	Recommend not listing specific waterbody/trash TMDLs here, but simply leave the reference to Attachments X through X to identify the Trash TMDLs. Otherwise this may have to be revised in the future. Again, Santa Monica Bay Marine Debris TMDL was not included in this list, not sure whether it was an oversight or intentional?		
23	2	E.2.b.ii	Not clear on what "discharges from the MS4 for which they are owners and/or operators" means.		
24	2	E.2.b.iii	For the "group of Permittees" having compliance determined as a whole, this should only be the case if the group of Permittees have moved forward with shared responsibilities (MOAs, cost sharing, a Watershed Management Program). It would not be fair to have one entity not be a part of the "group" and be the main cause of exceedances/violations.		

26	3	E.2.c.iii	For time schedule orders, the Burbank Water Reclamation Plant required a TSO since its interim permit limits expired, with the TSO bridging the gap between the time when the interim limits expired and when the new BWRP NPDES permit became effective. It should be noted that the Water-Effects-Ratio study was submitted in 2008 and it took the Regional Board nearly 2 years to complete its review of the study, which as a result required Burbank to request 2 1-year TSOs. Our concern with TSOs in the MS4 permit is that various efforts will be made to comply with the permit provisions and permit limits, including special studies for reopener purposes, and yet the TSO requests can either be delayed, or be limited to 1-year TSOs, placing extra burden on MS4 permittees to apply each year for the TSO, which requires a Regional Board hearing for adoption/approval.		
28	5	E.4.a	This provision states "A Permittee shall comply immediately ... for which final compliance deadlines have passed pursuant to the TMDL implementation schedule." This provision is unreasonable. First, various brownfields/abandoned toxic sites exists, some of which were permitted to operate by State/Federal agencies - nothing has or will likely be done with these sites that contribute various pollutants to surface and sub-surface areas. Additionally, this permit is going to require a regional monitoring program - this program will yield results on what areas are especially prone to particular pollutants. Until these results are made known, MS4 Permittees will have a hard time knowing where to focus its resources and particularly, the placement of BMPs to capture, treat, and remove pollutants. For these reasons, this provision should be revised to first assess pollutant sources and then focus on compliance with BMP implementation.		
29	12-13	E.5.c.i(1)	For reporting compliance based on Full Capture Systems, what is the significance of needing to know "the drainage areas addressed by these installations?" Unfortunately, record keeping in Burbank is limited to the location and size of City-owned catch basins. A drainage study would need to be done to define these drainage areas. As such, we do not believe this requirement serves a purpose in regards to full capture system installations and their intended function.		
30	7	E.5	Please clarify that cities are not responsible for retrofitting.		
31	4	E. 2. e	Please add the language from interim limits E.2.d.4 a - c to the Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations to ensure sufficient coordination between all TMDLs and the timelines and milestones that will be implemented in the Watershed Management Program.		

32	4	E.3	Instead of TSO, please include mechanisms that allow for time to complete Basin Plan Amendments for EPA Established TMDLs. This will protect cities from unnecessary vulnerability and allow for these TMDLs to be incorporated into the Watershed Management Programs. Incorporate permit language that will reopen the LA MS4 upon completion of the Basin Plan Amendments necessary for coordination with these programs.		
33	Santa Clara River	A. 4 c)	Please change the Receiving Water Limitations for interim and final limits to the TMDL approved table. There should be no interpretation of the number of exceedance days based on daily for weekly sampling with, especially with no explanation of the ratio or calculations, and no discussion of averaging. Please revert to the original TMDL document.		
34		1 E.2	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions		
35			Santa Ana River TMDLs should be removed; this TMDL is eliminated		
36	9	5.b.ii.2	Define "partial capture devices", define "institutional controls". Permittees need to have clear direction of how to attain the "zero" discharges which will have varying degrees of calculations regardless of which compliance method is followed. Explain the Regional Board's approval process for determining how institutional controls will supplement full and partial capture to attain a determination of "zero" discharge.		
37	10	5.b.ii.(4)	MFAC and TMRP should be an option available to the Los Angeles River.		
38	1 of 19	B	Substantial comments have been submitted for the Reopener of the SMBBB. Rather than restate these comments, please address these comments in the MS4.		
39	3 of 24	3.a)1	For the LA River metals. Some permittees have opted out of the grouped effort. This section needs to detail how these mass-based daily limitations will be reapportioned.		
40	6 of 24	4.d	Why are "receiving Water Limitations" being inserted here? None of the other TMDLs seem to follow that format.		
41	1 of 9	1.b	It is the permittees understanding that the lead impairment of Reach 2 of the San Gabriel River has been removed. It should be removed from the MS4 permit.		
42	1 of 9	1.c	Permittees under the new MS4 permit (those in LA County) need to be able to separate themselves from Orange County cities. Since the 0.941 kg/day is a total mass limit, it needs to be apportioned between the two counties. Also, The MS4 permit needs to contain language allowing permittees to convert grouped-base limitations to individual permittee based limitations.		

43	1	G	Please remove, in its entirety, the Santa Ana River TMDLs		
44	general	general	Any TMDL, for which compliance with a waste load allocation (WLA) is exclusively set in the receiving water, shall be amended by a re-opener to also include compliance at the outfall, or other end-of-pipe, that shall be determined by translating the WLA into non-numeric WQBELs, expressed as best management practices (BMPs). While the TMDL re-opener is pending, an affected Permittee shall be in compliance with the receiving water WLA through the implementation of core programs.		
45	4 of 8	C.5.b.1	For the Freshwater portion of the Dominguez Channel: There are no provisions for BMP implementation to comply with the interim goals. The wording appears to contradict Section E.2.d.i.4 which allows permittees submit a Watershed Management Plan or otherwise demonstrate that BMPs being implemented will have a reasonable expectation of achieving the interim goals.		
46	4 of 8	C.5.b.2	For Greater LA Harbor: Similar to the previous comment regarding this section. The Table establishing Interim Effluent Limitations, Daily Maximum (mg/kg sediment), does not provide for natural variations that will occur from time to time in samples collected from the field. Given the current wording for the proposed Receiving Waters Limitations, even one exceedance could potentially place permittees in violation regardless of the permittees level of effort. Reference should be made in this section to Section E.2.d.i.4 which will provide the opportunity for Permittee to develop BMP-based compliance efforts to meet interim goals.		
47	4 of 8	C.5.b.2	For the freshwater portion of the Dominguez Channel: the wording should be clarified. Section 5.a states that "Permittees subject to this TMDL are listed in Table C." Then the Table in Section C.5.b.2 Table "Interim Effluent Limitations-- Sediment", lists all permittees except the Fresh water portion of the Dominguez Channel. For clarification purposes, we request adding the phase to the first row: "Dominguez Channel Estuary (below Vermont)"		

Document Name: Watershed Management Program Working Proposal - April 23 2012

Agency/Reviewer: LA Stormwater Permit Group

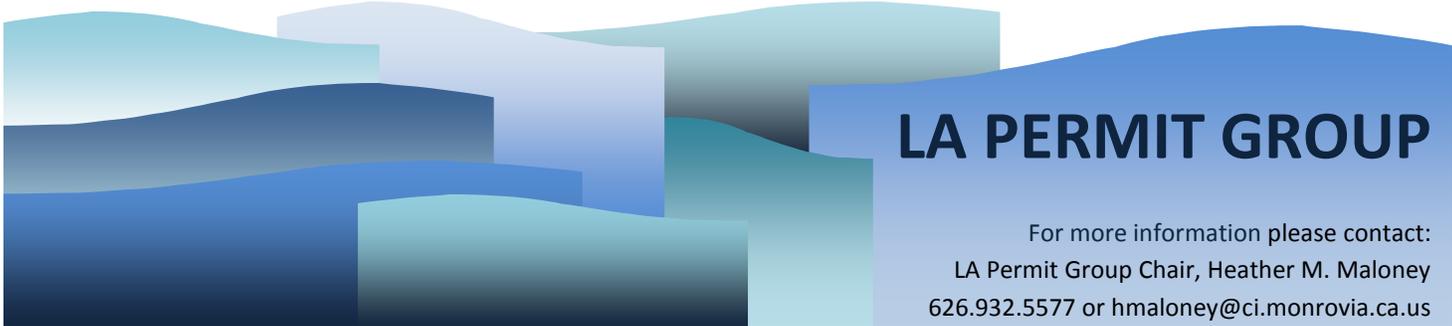

Comment		Doc. Reference		Comments	Rvwr (optional)	Author Response
No.	Page	Section				
1	4	(4)		Pollutants in category 4 should not be included in this permit term, request elimination of any evaluation of category 4. Request elimination of category 3, as work should focus on the first two categories at this point		
2	2, 11, 13	various		The Table (TBD) on page 2 states implementation of the Watershed Program will begin upon submittal of final plan. Page 11, section 4 Watershed Management Program Implementation states each Permittee shall implement the Watershed Management Program upon approval by the Executive Officer. Page 13 section iii says the Permittee shall implement modifications to the storm water management program upon acceptance by the Executive Officer. All three of these elements should be consistent and state upon approval by the Executive Officer. The item on page 13 should be changed to reflect the Watershed Management Program, or clarify that the Watershed Management Program is the storm water management program.		
3	2, 3	Table and C.2.a - d		Please allow 24 months for development of the Watershed Management Program to provide sufficient time for calibration and the political process to adopt these programs		
4	4	C.3.a.iii		Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions		
5	9	(5)		Reasonable assurance analysis and the prioritization elements should also include factors for technical and economic feasibility		
6	2	C.2		Please clarify that Permittees will only be responsible for continuing existing programs and TMDL implementation plans during the interim 18 month period while developing the Watershed Management Program and securing approval of those programs		

7	9	(4)(c)	<p>While it may be appropriate to have an overall design storm for the NPDES Permit and TMDL compliance, this element seems to address individual sites. Recommend developing more prominently in the areas of the Permit that deals with compliance that the overall Watershed Management Program should deal with the 85th percentile storm and that beyond that, Permittees are not held responsible for the water quality from the much larger storms. However, requiring individual projects to meet this standard is limiting as there may be smaller projects implemented that individually would not meet 85th percentile, but collectively would work together to meet that standard. Please clearly indicate cities are only responsible for the 85th percentile storm for compliance and that individual projects may treat more of less than than number.</p>

**SUBJECT: Technical Comments on Los Angeles Regional Water Quality Control Board Staff Working Proposals for the Greater Los Angeles County MS4 Permit (Permit) – Minimum Control Measures and Non-Stormwater Discharges**

Dear Ms. Purdy and Mr. Ridgeway:

The Los Angeles Permit Group would like to take this opportunity to provide comments on the working proposals for Minimum Control Measures (MCMs) and prohibitions for non-stormwater discharges. These documents were posted on the Regional Board website on March 21 and March 28, 2012 respectively. The LA Permit Group appreciates the Regional Board staff's effort to develop the next NPDES stormwater permit and their commitment to meet with various stakeholders including our group. We look forward to continuing the dialogue with the Board staff on this very important permit. Our overarching comments on the MCMs and non-stormwater discharges are highlighted in this letter. Detailed comments regarding the Staff Working Proposal for MCMs are attached. Detailed comments related to Non-stormwater Discharges will be submitted next week.

### **Watershed-Based Program and Maximum Extent Practical Standard**

In order to achieve further water quality improvements, the Permit needs to set clear goals, while allowing flexibility with the programs and BMPs implemented. The way to accomplish this is through integrated watershed planning and monitoring. This strategy has been presented by the LA Permit Group as it will allow permittees to look at the larger picture and develop programs and BMPs based on addressing multiple pollutants. In doing so, limited local resources can be concentrated on the highest priorities. The LA Permit Group has on numerous occasions expressed our support of a watershed based approach to stormwater management. It would appear in Provision VI.C.1.a that the Board proposal also supports this approach.

The permit should allow permittees to tailor actions as part of a Watershed Plan.. The permit should clearly indicate that permittees have the option of either adopting the MCMs as they are laid out within the permit or pursue a Watershed Plan that provides permittees with the flexibility to customize the MCMs. The opportunity for a municipality to customize the MCMs to reflect the jurisdiction's water quality conditions is absolutely critical if municipalities are to

develop and implement stormwater programs that will result in achievement of water quality standards and environmental improvement. We, however, feel the MCMs are overly prescriptive and suggest that the permit ultimately establish a criterion that will be used to support any customization of MCMs. The criteria should be comprehensive but flexible. We suggest flexibility in the criteria because the management of pollutants in stormwater is a challenging task and the science and technology to help guide customizing MCMs are still developing. Furthermore, the municipal stormwater performance standard to reduce pollutants to the maximum extent practicable is not well defined and will depend on a number of factors<sup>1</sup>. This constraint, as well as USEPA position<sup>2</sup> that the iterative/adaptive process is the basis for good stormwater management, supports the need to provide flexibility in defining the criteria for customizing actions.

We anticipate having further comments related to the MCMs once further information has been released regarding the permit structure and how the various aspects of the permit will work together. For example, it is difficult to fully comment on the MCMs until we are able to see them in the context of the compliance structure and the Watershed Plan section of the Permit.

### **Timeline and Fiscal Resources**

The Staff Working Proposal does not provide timelines for the start-up and implementation of the MCM requirements. It is fair to say that there will be a transition period between the time the Permit becomes effective and the time that the municipalities will have to modify their current stormwater management programs to be in compliance with the new Permit provisions. At the same time, consideration should be given to the time required to develop watershed based “customized” programs. The LA Permit Group requests that the Regional Board provide a draft timeline for implementation and phasing-in of the MCM requirements.

Regarding fiscal resources, the LA Permit Group would like to recognize the parameters in which municipalities operate. The Staff Working Proposal requires municipalities to exercise its authority to secure fiscal resources necessary to meet all of the requirements of the Permit (page 5). However, we have a limited amount of funds that are under local control. Any additional funds needed for stormwater programs would need to come from increased/new stormwater fees and grants. New fees for stormwater are regulated under the State’s Prop 218 regulations, and require a public vote so this is an item that is not under direct control of the municipalities – the Regional Board must take this into consideration and this provision should be removed from the permit. Furthermore in addition to clean water, local resources are also directed to a number of health, safety and quality of life factors. Thus, all these factors need to be developed in balance with each other. This requires a strategic process and that will take time to get right. We urge you to develop the permit conditions based on a reasonable timeframe in balance with the existing economy and other health, safety, regulatory and quality of life factors that local agencies are responsible for.

### **Shifting of State Responsibility to the MS4 Permittees**

The Staff Working Proposal shifts much of the State responsibilities to the Municipalities regarding the State’s General Permits for Construction Activities (CGP), Industrial Activities (IGP) and NPDES permits issued for non-stormwater discharges. Such examples are noted in our attached detailed comments.

In addition, there are requirements outlined in the Staff Working Proposal that exceed those required in the CGP and IGP. For example, the CGP compared to Provision 9.f which requires a ESCP for construction sites of all sizes. A few examples of where the Staff Working Proposal either shifts the responsibility or actually exceeds the requirements of the CGP are listed below:

---

<sup>1</sup> See E. Jennings 2/11/93 memorandum to Archie Mathews, State Water Resources Control Board.

<sup>2</sup> See Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 FR 43761 (Aug. 26, 1996).

- Maintaining a database that overlaps with the State's own SMARTS database. Asking Permittees to collect the same data adds unnecessary time and expense with no benefit to water quality.
- Maintaining a database for all types of permits is excessive and includes building permits that have little or no relevance to water quality protection.
- Requiring the development of a Rain Event Action Plan for small sites under 1 acre or for sites that would be categorized as Risk Level 1 under the CGP.

Those elements that shift State responsibility should be eliminated and the MCMs should be coordinated with other state and federal requirements, with particular attention to CGP and IGP requirements.

### **MCMs Should Reflect Effective Current Efforts**

The LA Permit Group understands that the new Permit must reflect current efforts of stormwater management and water quality issues. Where the current stormwater management effort is assessed to be inadequate, then additional efforts are warranted. However, when permittees' current efforts are assessed to be adequate for protecting water quality, then the MCMs should reflect permittees' current efforts. One significant area where the LA Permit Group believes that the current effort is protective of water quality is in the new development program. Both the City and County of Los Angeles have developed and adopted Low Impact Development Ordinances and significant work, technical analysis, and public input have gone into the development of these ordinances. Rather than developing more stringent standards, the Permit should use these pre-established Ordinances as a reference for the type of program and flexibility needed to accommodate the unique and vastly varying characteristics throughout the County. Instead of providing detailed information in the text of the Permit, the LID provisions should outline general requirements of the program, and the details contained in a technical guidance manual. This point was reiterated by several speakers at the April 5, 2012 workshop, including BIA and supported by several Regional Board Members.

### **"MCMs for New Development"**

Notwithstanding our comments above, the LA Permit Group has a number of concerns with the New Development provision of the MCMs. While the LA Permit Group has concerns and requests clarification with the other MCMs, we find the New Development MCMs the most challenging and unsupportable. These provisions are difficult to follow and the BMP selection hierarchy is confusing and at times in conflict. The LA Permit Group believes this provision should be redrafted. We have significant concerns with the following parts of the New Development MCMs:

- Selection hierarchy
- Infeasibility criteria
- Treatment Control Performance benchmarks (water quality based versus technology based)
- BMP tracking
- Inspection program
- BMP specificity

### **"MCMs for Public Agency Activities"**

The Staff Working Proposal identifies, in a number of provisions, requirements to address trash regardless of whether the area is subject to a trash TMDL. We take exception to this approach, as on the one hand the MCMs requires prioritization, cleaning and inspection of catch basins as well as street sweeping and some other management control measures to address trash at public events. And then, even if the municipality is controlling trash through these control measures, the municipality must still install trash excluders (see page 63 regarding "additional trash management practices"). This makes little sense and the LA Permit Group would submit that if the initial control measures are successful, then the "additional trash management practices" are unnecessary (as evident by the lack of a TMDL).

**“MCMs for ID/IC”**

The Staff Working Proposal identifies a significant non-stormwater outfall based monitoring program. The LA Permit Group submits that TMDLs monitoring programs have already identified, to a large extent, a comprehensive non-stormwater monitoring program. As such we suggest that the TMDL monitoring program be the basis for the “non-stormwater outfall based monitoring program” and both should be identified in an Integrated Watershed Monitoring Program.

The other critical issue in the ID/IC program is clarifying the responsibilities of the municipalities and the Regional Board. This is particularly important when dealing with ongoing illicit discharges (see page 71). When this type of discharge occurs, the ultimate responsibility in correcting the illicit discharge lies with the discharger. The municipalities and the Regional Board may need to work in tandem to address a recalcitrant discharger, but the fiscal responsibility should lie with the discharger and not the municipality or Regional Board.

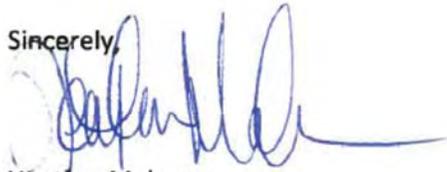

**Non-Stormwater Prohibitions**

The two overriding concerns associated with the proposed non-stormwater prohibition requirements is 1) the assumption that certain non-stormwater discharges should be conditioned to be allowed and 2) the need for further discussion and collaboration regarding potable water and fire operations and training activities discharges to MS4s. In the first case the LA Permit Group would submit that the monitoring data to support these conditions is lacking and should be the focus of the next Permit term. The LA Permit Group supports the need to place certain conditions on non-stormwater discharges when it has been shown that the discharge is an issue in the receiving water. Anything less than such a demonstration calls into question the water quality benefit for the additional cost to implement the conditions. Regarding our second observation, the LA Permit Group has worked closely with a group of community water systems and Fire Chiefs to discuss how potable water discharges should be addressed. While we have reached consensus on certain aspects, additional discussion and time is needed to work towards consensus.

In particular, the permit should differentiate between natural flows such as stream diversions, natural springs, uncontaminated groundwater and flows from riparian habitats and wetlands and urban discharges. Natural flows should not be held to a standard equal to urban discharges. The requirements to conduct appropriate monitoring and explore alternatives for the discharge are not commensurate with water quality concerns. Natural sources should not be conditioned in order to be allowed. The LA Permit Group recommends that the Regional Board continue the current permit format of categorizing natural sources separately from urban activity discharges.

Thank you for the opportunity to comment on the working proposals and we look forward to meeting with you to discuss our comments and to explore alternative approaches. Please feel free to contact me at (626) 932-5577 if you have any questions regarding our comments.

Sincerely,

Heather Maloney  
Chair, LA Permit Group

Attachment A: Specific Comments on the Regional Board Staff Working Proposal for the Greater Los Angeles County MS4 Permit

**LOS ANGELES PERMIT GROUP COMMENTS  
 MINIMUM CONTROL MEASURES – 3/28/2012 STAFF WORKING PROPOSAL  
 LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
<b>General</b>			
1	2	C.1.c	<p>The Definition of: "Development", "New Development" and "Re-development" should be added. The definitions in the existing permit should be used:</p> <p><i><b>“Development”</b> means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i></p> <p><i><b>“New Development”</b> means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.</i></p> <p><i><b>“Redevelopment”</b> means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i></p> <p>The last of the three "routine maintenance" activities listed above should exclude projects related to existing streets since typically you are not changing the "purpose" of the street to carry vehicles and should not be altered.</p>
<b>Legal Authority</b>			
2	4	2.a.i	<p>Staff proposal states: "Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites."</p> <p>It appears the intent of this language is to transfer the State's inspection and enforcement responsibilities to municipalities through the MS4 permit. When a separate general NPDES permit is issued by the Regional or State Board it should be the responsibility of that agency collecting such permit fees to control the contribution of pollutants, not MS4 permittees.</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

3	4	2.a.vii	<p>Staff proposal states: "Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Co-permittees."</p> <p>The intention of this statement is unclear and should be explained, and a definition of "shared MS4" should be provided. How would an inter-agency agreement work with an upstream and downstream agency? This is not practical - this agreement should have been done before the interconnection of MS4 systems occurred. An example of this agreement should be provided within the Permit. The permittee will not agree to the responsibility of an exceedance without first having evidence of the source and its known origin (in other words, an IC/ID is a private "culprit" and not the cause of the City).</p>
4	4	2.a.xi	<p>Staff proposal states: "Require that structural BMPs are properly operated and maintained."</p> <p>MS4 agencies can control discharges through an illicit discharge program, and conditioning new/redevelopment to ensure mitigation of pollutants. Unless the existing development private property owners/tenants are willing or in the process of retrofitting its property, the installation and O&amp;M of BMPs is not practical and cannot be legally enforceable against an entity that does not own or control the property, such as a municipal entity.</p>
5	5	2.a.xii	<p>Staff proposal states: "Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4."</p> <p>It is difficult, if not impossible; to accurately quantify the exact effectiveness of a particular set of BMP's in reducing the discharge of pollutants. Some discharges may be reduced over time given reductions in industrial activity, population in a particular portion of the community feeding into the MS4, or for other reasons not directly related to implementation of structural BMPs. Given that the County of LA is generally urbanized and thus impervious, a lethargic economic climate (meaning development and redevelopment is not occurring in an expeditious manner), and that several pollutants do not have known BMPs effective at removing/reducing the content (i.e., metals, toxics, pesticides), the effectiveness of BMPs should not be required and instead should only be used for research, development, and progress of BMP testing.</p>
<b>Fiscal Resources</b>			
6	5	3	<p>The staff proposal includes a section on Fiscal Resources. Most MS4's do not have a storm water quality funding source, and even those that do have a funding source are not structured to meet the requirements of the proposed MS4 requirements (for instance, development funds may be collected to construct an extended detention basin, but not for street sweeping, catch basin cleaning, public right-of-way structural BMPs, etc).</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

7	5	3.a	<p>Staff proposal states: "Each permittee shall exercise its full authority to secure fiscal resources necessary to meet all requirements of this Order"</p> <p>This sentence has no legally enforceable standard. What exactly does the exercise of "full authority" mean, when the exercise of a city's right to tax comes with consequences and no guarantee of success. Municipal entities must adjust for a variety of urgent needs, some federally mandated in a manner that cannot be ignored. So, if we seek the fiscal resources to fund the programs required in the permit and the citizens say "No", then a municipality will have a limited ability to comply with "all requirements of this Order".. Can the language be changed to state: "Each permittee shall make its best efforts given existing financial and budget constraints to secure fiscal resources necessary to meet all requirements of this Order"?</p>
<b>Public Information and Participation Program</b>			
8	6	6.a.iii	<p>Staff proposal states: "To measurably change the waste disposal and stormwater pollution generation behavior of target audiences..."</p> <p>Define the method to be used to measure behavior change. As written, this requirement is vague and open to interpretation.</p>
9	7	6.d.i.2.b	<p>Staff proposal states: "... including personal care products and pharmaceuticals)"</p> <p>The stormwater permit should pertain only to stormwater issues. Pharmaceuticals getting into waters of the US are typically a result of waste treatment processes. All references to pharmaceuticals should be removed from this MS4 permit.</p>
10	8	6.d.i.3	<p>The Regional Board assumes that all of the listed businesses will willingly allow the City to install displays containing the various BMP educational materials in their businesses. If the businesses do allow the installations then the City must monitor the availability of the handouts because the business will not monitor or keep the display full or notify the City when the materials are running out. If the business will not allow the City to display the educational material must we document that denial? Will that denial indicate that the City is not in compliance?</p>
<b>Industrial/Commercial Facilities Program</b>			
11	10	7.b.i.4	<p>Staff proposal states: "All other facilities tributary to waterbody segment addressed by a TMDL..."</p> <p>As written, this category is so vague that it could mean every single industrial or commercial facility. Please clearly define or revise this requirement. In this context, "commercial" refers to a currently unspecified category of facilities beyond those listed in VI.C.7.b.i.1 (page 9). Provide a precise definition for a commercial facility, or specify the extended category (or NAICSs/SICs) of facilities to be considered. Also, clarify how the Permittees will initially determine the pollutants generated for these facilities. A method that will promote consistency among Permittees is preferred, such as a table of potential pollutants based on business type or activities.</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

12	10	7.b.ii.6	<p>Staff proposal states: "A narrative description that describes the economic activities performed and principal products used at each facility"</p> <p>Since "economic activities" is an invasive question to ask of a facility, we suggest the following: "A narrative description of activities performed and/or principal products of each facility."</p>
13	11	7.d-f	<p>These sections pertain to inspecting critical source facilities where it appears the intent is to transfer the State's Industrial General Permit inspection and enforcement responsibilities to municipalities through the MS4 permit. We request eliminating these sections OR revise to exclude all MS4 permittee responsibility for NPDES permitted industrial facilities.</p>
14	17	7.e.i	<p>Staff proposal states: "...in the event a Permittee determines that a BMP is infeasible, Permittee shall require implementation of similar BMPs..." Judging a BMP to be "infeasible or ineffective" is subjective. Please delete this requirement.</p>
15	17	7.e.i	<p>Staff report states: "Facilities must implement the source control BMPs identified in the California Stormwater BMP Handbook, Industrial and Commercial, unless the pollutant generating activity does not occur. In the event that a Permittee determines that a BMP is infeasible at any site, the Permittee shall require implementation of similar BMPs that will achieve the equivalent reduction of pollutants in the stormwater discharges. Likewise, for those BMPs that are not adequately protective of water quality standards, a Permittee may require additional site-specific controls." It is not clear when source control BMPs would need to be implemented. Further, if the City implements low-flow diversions and an enhanced street sweeping program, it would not make sense to still require BMP retrofits to those catchment areas.</p>
<b>Development Planning</b>			
16	21	8.b.1	<p>This permit update would be a good opportunity to examine the type of developments that are subject to the permit. There should be a link between the selected categories and the water quality objectives. Perhaps a reworking of this section could provide that clear nexus.</p>
17	21	8.b.i.1.g	<p>Roadway construction projects that are part of a large development (i.e. track-home development) can be subjected to the associated residential or commercial/industrial development, making this requirement difficult to implement.</p>
18	21	8.b.i.1.g	<p>The proposed limit is too low for street construction projects by using the typical 10,000 square foot number that is used in several development projects. A street project that proposes to build 10,000 sq. ft. is an extremely small street project, as the requirement calls out overall area. It might consist of a one block extension of a street 60 feet wide by 166 feet long. When cities propose street extensions it is usually in terms of half mile or mile-long segments which involve more than 150,000 square feet (sq. ft.). For public works projects, the area of 50,000 sq. ft. is a more correct and appropriate threshold. Please delete this requirement.</p>
19	21	8.b.i.1.g	<p>Public Works roadway maintenance projects including the ones that expand the roadway capacity should not be subject to these provisions because of the limited opportunities for BMP incorporation. Existing roads incorporate a large number of utilities within them that limits the opportunities for BMP incorporation.</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

20	21	8.b.i.1.g	We support the use of opportunity-based BMP guidance for roadway projects such as the referenced USEPA's "Green Infrastructure: Green Streets", however calling for this implementation to the maximum control possible is contradictory.
21	24	8.c.i.1	It appears based on the language that the project performance criteria of c. is intended to apply to all categories of new development and redevelopment projects as listed in b.i and b.ii. Please clarify whether this is meant to apply to single family hillside homes with no size limit? A new definition of single family hillside home has not been provided in this working draft, so it is unclear whether this is the case. If the intention was to only require the narrative measures for single-family hillside homes as listed in 8.b.i.(1)k)-v, and not require to retain the design volume onsite, then that should be clarified by excluding them from the 8.c.i(1) statement.
22	24	8.c.i.2	The SWQDv definition should be modified to better reflect the purpose of the regulation as stated in 8.a.i(3) "... designing projects to minimize the impervious area footprint, and employing Low Impact Development (LID) design principles to mimic predevelopment water balance...". Modify as follows: "... the Stormwater Quality Design Volume (SWQDv) defined as the runoff from all impervious surfaces that are generated by a:..."
23	24	8.c.i.2.c	The "whichever is greater" requirement is unnecessary since both criteria are deemed to be equivalent. This requirement will only increase design time by having engineering staff perform multiple analyses.
24	24	8.c.i.5	Please define the term "wet-weather season".
25	24	8.c.i.5	The only reasonable and still beneficial rainwater harvesting approach would require the storage of the seasonal (winter-time) runoff for use when needed (spring and summer). This would increase the size of the rainwater harvesting BMPs. RWQCB should acknowledge that rainwater harvesting is both economically and technically infeasible for the vast majority of development projects in arid Los Angeles region climates.
26	24	8.c.i.6	The 72 hour drawdown requirement is counterproductive. Most irrigation practices do not irrigate landscaping within 72 hours after heavy/medium rainfall events because the ground could be saturated and the plants do not require water. Irrigating saturated ground could result in increase dry weather runoff because the water will not percolate into the saturated soil quick enough.
27	25-26	Table	The table provided lacks clarity and the use of $M_v$ parameter is not clear and is not defined. However it appears to require projects that cannot retain runoff on-site to seek alternative locations to retrofit. We anticipate that this requirement will be unfeasible for a number of legal, logistical and technical reasons and as a result the "Least Preferred Option" will be exercised in most cases. The "Least Preferred Option" requires the over-sizing of the biofiltration systems by a factor of 1.5. We recommend that any design be consistent with established design standards (i.e. California Stormwater Quality Association) for consistency and ease in its implementation.
28	25-26	Table	The requirements that are provided in this table seem to be overly prescriptive. The requirements are not water-quality driven but rather groundwater-recharge driven. A more balanced approach will allow the use of multiple BMP options and not excluding effective treatment technologies.
29	28	8.c.iii.3.b	The proposed language uses terms that may be understood by hydrologists, but most city engineers and development engineers would not know what a HUC-10 or an HUC-12 Hydrologic Area is. Please define these terms if they are going to be used in this regulatory permit.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

30	29	8.c.iii.3.c	The federal stormwater regulation place importance on water quality. Groundwater recharge is outside the purview of this permit. The requirement to prove equal benefit should be removed.
31	29	8.c.iii.3.g	This section introduces an arbitrary delay if a project opponent petitions the Executive Officer to review a projects off-site mitigation. The project proponent deserves to receive a response in a reasonable time when an appeal is filed with the Executive Officer. We respectfully request that lines of communications be opened between the Executive Officer and the project proponent within 15-days when a third party files an appeal of the local jurisdictions decision on a project.
32	30	8.c.iii.4	Requiring biofiltration systems to treat 1.5 times the SWQDv will not improve water quality during a 85th percentile storm event. The concentration leaving the system will not improve if the system is 50% larger. Biofilters are typically size by increasing the surface area as the flow increases. If the flow is lower than the design flow a small area of the system is utilized. The removal efficiency is the same for all flow rates below the design flow and therefore the concentration is the same for the design flow or below.
33	30	8.c.iii.5.b	Biofilters are not designed with detention volume. They are designed on a flow rate basis. The last portion of the paragraph regarding pore spaces and re-filter should be removed.
34	30	8.c.iv.1	New development/redevelopment project that are upstream of an offsite water quality mitigation project should be exempt from the requirements of this subsection. Requiring a project to mitigate their pollutant load twice is unnecessary. This subsection should only apply if the project would discharge to the receiving water without first draining to an offsite project.
35	31	8.c.iv - Table	The presence of benchmark tables, even for the projects that implement offsite mitigation is inappropriate. These standards for the great part are not attainable by existing technologies. Development projects instead should only be subject to design standards not performance standards. The idea of upgrading the treatment system to achieve compliance introduces unnecessary uncertainties to future development activities in our region.
36	33	8.c.v.1	Alternatives to the Ventura County Permit Hydromodification criteria should be considered such as those identified in the Los Angeles County Low Impact Development Standards Manual or maintain the “peak flow control” requirements as appear in the existing permit. Los Angeles County watersheds are significantly different than those of Ventura County. Los Angeles County has limited areas draining into natural drainage systems.
37	33	8.c.v.1.a	The use of Erosion Potential ( $E_p$ ) as a sole method for determining hydromodification impacts is inappropriate because of its limited use and difficulty to use. The existing Los Angeles County requirement to conduct hydrology and hydraulic analysis for SUSMP, 2-, 5-, 10-, 25-, and 50-year storm events and fully mitigate drainage impacts from these flow regimes is better understood.
38	37	8.c.vi	The Regional Board proposes an Annual Report item for each project that is approved with off-site mitigation. The calculations for the off-site mitigation should be easy to document, but the project performance without alternative compliance is not so clear. Please provide the information necessary to complete the annual report.
39	38	8.d.i	The proposed language as written would not accept existing LID Ordinances to be compliant with the applicable provisions of this Order. Please provide language that allows flexibility for existing LID ordinances and also provide criteria determining equivalency.
40	39	8.d.iv	It should be clarified that previously approved projects will not be subject to these requirements.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

41	40	8.d.iv.b	This requirement should be limited to the sites already visited as part of the “critical sources” program. Allow a self-inspection program where the property owners will be required to maintain their BMPs based on their type and maintenance needs. These requirements can be incorporated in the Covenant and Agreement (C & A). Property owners will be required to keep records of maintenance performed on these BMPs. Municipalities lack the resources to conduct the inspection. Municipalities can perform instead a review of the inspection records on a random and as-needed limited basis.
<b>Development Construction</b>			
42	41	9.d	Requiring this on all projects regardless of size is excessive. Small project will have minimal if any impact on water quality. A lower limit needs to be set for applicability such as 100 cubic yards of disturbed soil. It may be appropriate for projects to install a minimum set of BMPs without the need for a plan.
43	41	9.e.1.i	Maintaining the required database for all types of permits issued by the municipalities is excessive since not all permits require this type of information. In the City of Los Angeles for example about 35,000 building permits are issued annually.
44	42-43	9.f.ii	The number of elements for the ESCP should not be the same as those of the State SWPPP as required by the General Construction Permit. Existing Erosion Control Plans require the identification and placement of the BMPs in the engineering drawings and this has been identified as adequate.
45	43	9.f.ii.3.i	An example of how excessive it is to require these elements for the smaller sites is the requirement to prepare a Rain Event Action Plan (REAP). Under the Construction General Permit, a REAP is not required until the project reaches a Risk Level 2 status. It is not justifiable to say that a grading project, that does not disturb more than an acre and is not subject to a CGP, should be required to prepare a REAP.
46	43	9.f.ii.4	The requirement to discuss the rationale for the selection and design of the proposed BMPs (including soil loss calculations for the non-selected BMPs) is excessive and it dramatically increases the engineering costs of small construction projects. Please delete this requirement.
47	43	9.f.ii.5	The proposed language shifts much of the State responsibilities for sites greater than one acre to the Municipal Permittees without shifting the corresponding funding. Please consider setting-up a mechanism for the municipalities to operate the registration, fee collection, and inspection for sites that are under GCP coverage or revise the language so that Municipal Permittees are not made responsible parties for this activity.
48	43	9.f.ii.8	The proposed language asks cities to verify the approvals of the Army Corps of Engineers, Department of Fish and Game and the Regional Water Boards prior to the issuance of a grading or building permit. This requirement should not be implemented unless the Regional Board can provide a simple, easy to use system to accomplish the check. Furthermore, many projects reviewed every day do not require a 401, 404 or a 1600 certification to be allowed to grade on their site. The few cases where these certifications are required, they are taken care of in the EIR process rather than the Building or Grading permit process. This restriction should cite the Planning process rather than the building or grading process.
49	43-44	9.g.i	The Regional Board should not write this MS4 permit to overlap the CGP. A project that is required to have coverage under the CGP will deal with the Risk levels and apply the appropriate provisions of the CGP. Smaller sites that do not require coverage under the CGP should have lesser requirements than Risk Level 1 provisions.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

50	44	9.g.iv	The Regional Board is referring to an outdated set of BMP tables by referring to the 2003 version of the CASQA Manuals. CASQA has updated the manuals in 2010 and these are the manuals that should be referenced.
51	44-47	Tables	It appears that the Regional Board is taking the BMP tables from the CGP, without the language contained in the CGP that states that to avoid duplication each subsequent table needs to include or be added to the BMPs shown in the earlier list. Please include this language so that unfamiliar engineering, plan-checking, or inspection staff does not overlook the intent of the CGP.
52	48	Table	The proposed language would require municipalities to inspect GCP sites at least monthly. This constitutes a large increase in the inspection responsibilities for the municipalities for State responsibilities. Please delete or revise this requirement.
53	48	9.h.ii.2	The requirement to perform five inspections during the construction phase of a project, no matter how small, is excessive and serves no benefit. The only reasonable inspection would be during the grading phase and upon project completion as part of existing inspections.
54	50	9.h.ii.5.b	The language is all inclusive for the inspection portion of the permit. By asking the field inspector to "determine whether all BMPs have been selected, installed, implemented and maintained according to the approved plans." the Board is placing responsibility on the inspector which rightly should be the responsibility of the plan reviewer. If an inspector is having a dispute with the Contractor or builder of a project, the inspector can improperly raise the issue of BMP selection and cause great expense to the project. The Plan Reviewer should determine what BMPs are appropriate for the site and verify that they are properly designed. The inspector should verify that BMPs are install properly, and are being implemented and maintained as required by the field conditions; however, to allow the inspector to evaluate selection is overstepping his training and authority.
55	51	9.j	A more effective approach would be through a State mandate for a Statewide training program perhaps through the use of the contractor's license board. Because of their nomadic nature of construction activity, contractors move from City to City at will. For a City to be responsible for training the contractors that work within their city is not possible. This should either be a State responsibility, much like the QSD/QSP programs currently run by the State.
56	54	10.d	If there is a specific pollutant to address, retrofitting or any other BMP would best be accomplished through a TMDL, which is for the Permittees to determine rather than a prescribed blanket approach. As written, this is too broad of a requirement with unknown costs that is attempting to solve a problem before there is a problem. Please delete this VI.C.10.d.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

57	54	10.d	<p>Staff proposal states: "Each Permittee shall develop an inventory of retrofitting opportunities that meets the requirements of this Part. The goals of the existing development retrofitting inventory are to address the impacts of existing development through retrofit projects that reduce the discharges of stormwater pollutants into the MS4 and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards."</p> <p>This process would require land acquisition, a feasibility analysis, no impacts to existing infrastructure, proper soils, and support of various interested stakeholders. Additionally, if a property or area is being developed/redeveloped, retrofitting the site for water quality purposes makes sense, but not for an area where no development/redevelopment is planned. Finally, the LID provisions have already included provisions for off-site mitigation, in which we recommend that regional water quality projects be considered in lieu of local-scale water quality projects that will prove difficult to upkeep, maintain, and replace, let alone have existing sites evaluated as feasible. For these reasons, this requirement should be removed.</p>
58	56	10.d.v	<p>Any retrofit activities should be the result of either an illicit discharge investigation or TMDL monitoring follow-up and will need to be addressed on a site-by-site basis. A blanket effort as proposed in a highly urbanized area is simply not feasible at this time.</p>
59	56	10.e.ii	<p>Staff proposal states: "Each Permittee shall implement the following measures for flood management projects"</p> <p>Flood management projects need to be clearly defined.</p>
60	60	10.g.ii.7	<p>Staff proposal states: "Policies, procedures, and ordinances shall include commitments and a schedule to reduce the use of pesticides that cause impairment of surface waters..."</p> <p>The method which a pesticide that causes "impairment" to waterbodies needs to be defined.</p>
61	62	10.h.iv.1.c	<p>Staff proposal states: "Provide clean out of catch basins... 24 hours after event"</p> <p>Many public events happen on the weekends (i.e. Saturday). To avoid excessive overtime costs, please change the requirement to "next business day after the event" or "next business day."</p>
62	63	10.h.vii.1	<p>This requirement appears to be an "end-run" around the lack of catch basin structural BMPs in areas not covered by Trash TMDLs. The requirement has the potential to be extraordinarily economically burdensome. If an area is NOT subjected to a Trash TMDL, then the need for any mitigation devices is baseless. The MS4 permit requirements should not circumvent nor minimize the CWA 303(d) process.</p>
63	64	10.h.ix	<p>Staff proposal requires: "Infiltration from Sanitary Sewer to MS4 / Preventive Maintenance...."</p> <p>The State Water Board has implemented a separate permit for sewer maintenance activities. Additional sewer maintenance requirements are redundant and unnecessary. Please delete this requirement.</p>

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

<b>Illicit Connection and Illicit Discharge Elimination Program</b>			
64	-	11	In general the LA Permit Group would like the flexibility to determine where (i.e. outfall vs. receiving water) monitoring is conducted and how the program is developed. This flexibility is necessary due to the variability in the physical makeup from one watershed to the next, and perspectives/philosophy of one permittee to the next. The Group proposes to do “non-stormwater outfall-based monitoring program” as part of an Integrated Watershed Monitoring Program. There is ample dry weather monitoring in the TMDLs to address a “non-stormwater outfall-based monitoring program”. Please revise each mention of “ <i>Each Permittee</i> ” to “Permittee/Permittees” to allow the flexibility of doing a Watershed or by individual city program, and sufficient program flexibility for receiving waterbody monitoring in-lieu of outfall monitoring.
65	-	11	A definition of “outfall” is required for clarity. An “outfall” for purposes of “non-stormwater outfall-based monitoring program” should be defined as “major outfall” pursuant to Clean Water Act 40CFR 122.26. Please revise each mention of “ <i>outfall</i> ” to read “major outfall” when discussing “non-stormwater outfall-based monitoring program”.
66	68	11.a	Some small cities do not have digital maps. In the “General” category of Section 11, please provide a 1 year time schedule for cities to create digital maps OR provide the municipality the ability to develop comprehensive maps of the storm sewer system in any format.
67	68	11.b.i.1	Omit the comment, “ <i>Each mapped MS4 outfall shall be located using geographical positioning system (GPS) and photographs of the outfall shall be taken to provide baseline information to track operation and maintenance needs over time.</i> ” This requirement is cost prohibitive and of little value because many City outfalls are underground and could not be accurately located or photographed. Photographs of outfalls in channels have little value since data required is already included on “As-Built” drawings. Geographic coordinates can easily be obtained using Google Earth or existing GIS coordinate systems.  “The contributing drainage area for each outfall should be clearly discernable...” The scope of this requirement would involve thousands of records of drainage studies. The Regional Board should be aware that this requirement would be very labor intensive, time consuming, and very costly.
68	69	11.b.i.3	Storm drain maps should show watershed boundaries which by definition provide the location and name of the receiving water body. Please revise (3) to read “The name of all receiving water bodies from those MS4 major outfalls identified in (1).”
69	69	11.c.i	The LA Permit Group proposes “non-stormwater outfall-based monitoring program” to be flow based monitoring. Please revise item (4) of 11., c. i. to read “(4) monitoring flow of unidentified or authorized non-stormwater discharges, and...”
70	69	11.c.i.4	“Monitoring of unknown or authorized discharges” “Authorized” discharges are exempted or conditionally exempted for various reasons. Monitoring authorized discharges is monitoring for the sake of monitoring and offers no clear goal or water quality benefit. Please delete this requirement. If the source of a discharge is unknown, then monitoring may be used as an optional tool to identify the culprit.
71	70	11.d.i	Please revise the proposed language to “Permittee/Permittees shall develop written procedures for conducting investigations to identify the source of <b>suspected</b> illicit discharges, including procedures to eliminate the discharge once source is located.” It is not know if a discharge is illicit until the investigation is completed.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

72	70	11.d.ii	Please revise the proposed language to “At a minimum, each Permittee/Permittees shall <b>initiate</b> an investigation(s) to identify and locate the source within 48 hours of becoming aware of the <b>suspected</b> illicit discharge.” Due to the intermittent nature of illicit discharges, it is may not be possible to conduct the investigation within 48 hours.
73	70	11.d.iii.1	“Illicit discharges suspected of sanitary sewage... shall be investigated first.” ICID inspectors should be allowed to make the determination of which event should be investigated first. For example, a toxic waste spill or a truck full of gasoline spill should take precedence over a sewage spill. This requirement should be amended to the “most toxic or severe threat to the watershed” shall be investigated first.
74	70	11.d.iii.4	Please revise the proposed language to “If the source of the discharge is found to be authorized under a NPDES permit...” If the discharge is permitted, then it is not “illicit”.
75	70	11.d.iv.1	Please revise the first sentence of the proposed language to “If the source of the illicit discharge has been determined to originate within a Permittee’s jurisdiction, the Permittee shall immediately notify the responsible party of the problem, and require the responsible party to conduct all necessary corrective actions to eliminate the <b>illicit</b> discharge within 48 hours of notification.” “Non-stormwater” discharges do not equate to “illicit” discharges.
76	70	11.d.iv.2	Please revise the first sentence of the proposed language to “If the source of the <b>suspected</b> illicit discharge has been determined to originate within an upstream jurisdiction, the Permittee shall...” Unknown discharges are suspected of being illicit discharges, but may in fact prove to be authorized discharges.
77	71	11.d.v	<p>Please revise the proposed language <i>“the Permittee shall work with the Regional Water Board to provide diversion of the entire flow to the sanitary sewer or provide treatment. In either instance, the Permittee shall notify the Regional Water Board in writing within 30 days of such determination and shall provide a written plan for review and comment that describes the efforts that have been undertaken to eliminate the illicit discharge, a description of the actions to be undertaken, anticipated costs, and a schedule for completion.”</i> To “the Permittee shall work with and provide support to the Regional Water Board to continue Progressive Enforcement Policy of the Regional Board.”</p> <p>In the case that an Illicit Discharge is ongoing, then the discharger can be identified and the responsibility to clean up and eliminate the discharge lies with the discharger. Any illicit discharge for which the Permittee has exhausted their Progressive Enforcement Policy should be deferred to the Regional Water Quality Control Board for additional Progressive Enforcement or permitting.</p>
78	71	11.e.i	Please revise the first sentence to “Permittee/Permittees, upon discovery or upon receiving a report of a suspected illicit connection, shall <b>initiate</b> an investigation within 21 days...” The process to determine the source of an illicit connection or responsible party may take a considerable time should the suspected source be an unoccupied site.
79	71	11.e.ii	Please revise the “days of completion” from 90 to 180 days. Illicit connections need to be disconnected from the storm drain system in the street Right of Way, which will require plans and permitting. Permitting with in State Right of Way can take on average 60 to 120 days.

**LOS ANGELES PERMIT GROUP COMMENTS  
STAFF WORKING PROPOSAL - MINIMUM CONTROL MEASURES  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

80	71	11.f.i	Revise the proposed first sentence to “Permittee/Permittees shall promote, publicize and facilitate public reporting of illicit discharges or water quality impacts associated with discharges into the MS4s through a central contact point...” It is not possible to distinguish authorized discharges from illicit discharges at the outfalls.
81	71& 72	11.f.ii.1&2	Revise “PIPP” to “Hotline”. The subject of this item is “reporting hotline requirements”.
82	72	11.f.iii	Omit this section. “No Dumping” signs have already been posted at open channels.
83	72	11.f.iv	Omit the second sentence, “The procedures shall be evaluated annually to determine whether changes or updates are needed to ensure that the procedures accurately document the methods employed by the Permittee.” This is an unnecessary and burdensome requirement. Procedures should be updated and documented as needed.
84	73	11.h.i	Please revise this section to “Permittee/Permittees must continue to implement a training program regarding or require contractors to implement training for the identification of IC/IDs for all municipal field staff who as part of their normal job responsibilities (e.g. street sweeping, storm drain maintenance, collection system maintenance, road maintenance), may come into contact with or otherwise observe an illicit discharge or illicit connection to the storm drain system. Training program documents must be available for review by the permitting authority.” Cities can require contractors to train their staff, but should not be directing contractor staff. The requirement to put notification procedures in fleet vehicles is unnecessary and is covered by the required training.
85	74	"Attachment	On page 74, reference is made to Bioretention/Biofiltration Design Criteria and the Ventura County Technical Guidance Manual. This criterion is likely not fit for LA County given that soils, impervious surface amounts, engineered channels, and agricultural practices are completely different in one county versus the other.

**LOS ANGELES PERMIT GROUP COMMENTS  
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
1	1	III.A.1.a and III.A.2	<p>RB staff proposed language requires the permittees to “effectively prohibit non-stormwater discharges <b>into</b> the MS4 and <b>from</b> the MS4 to receiving waters” except where authorized by a separate NPDES permit or conditionally authorized in sections III.A.3-6.</p> <p>This may overstep the required legal authority provisions in the federal regulations since 40CFR122.26 (d)(1)(ii) requires legal authority to control discharges <b>to</b> the MS4 but not <b>from</b> the MS4. Additionally, with respect to the definition of an illicit discharge at 40CFR122.26(b)(2), an illicit discharge is defined as “a discharge <b>to</b> the MS4 that is not composed entirely of stormwater”. In issuing its final rulemaking for stormwater discharges on Friday, November 16, 1990<sup>1</sup>, USEPA states that:</p> <p style="text-align: center;"><i>Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT) and the Best Conventional Pollutant Control Technology (BCT) and where necessary, water quality-based controls), but permits for <b>discharges from</b> municipal separate storm sewer systems must require controls to the maximum extent practicable, and where necessary water quality-based controls, and must include a requirement to effectively prohibit non-stormwater <b>discharges into</b> the storm sewers.</i></p> <p>This is further illuminated by the section on Effective Prohibition on Non- Stormwater Discharges<sup>2</sup>:</p> <p style="text-align: center;"><i>“Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water</i></p>

<sup>1</sup> 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

<sup>2</sup> 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

**LOS ANGELES PERMIT GROUP COMMENTS  
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
			<p><i>discharges into the storm sewers. Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather, an ‘effective prohibition’ would require separate NPDES permits for non-storm water discharges to municipal storm sewers”</i></p> <p>The rulemaking goes on to say that the permit application:</p> <p><i>“requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems.”</i></p> <p>Nowhere in the rulemaking is the subject of prohibiting discharges <i>from</i> the MS4 discussed.</p> <p>Furthermore, USEPA provides model ordinance language on the subject of discharge prohibitions: <a href="http://www.epa.gov/owow/NPS/ordinance/mol5.htm">http://www.epa.gov/owow/NPS/ordinance/mol5.htm</a>. Section VII Discharge Prohibitions of this model ordinance provides discharge prohibition language as follows:</p> <p><i>No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.</i></p> <p>Thus we recommend that staff eliminate the “from” language at both Part III.A.1.a. and Part III.A.2.</p>
2	3	III.A.3.b	<p>This provisions outlined in this section are not clear. The provisions may be interpreted as the discharge being "exempt" as long as Table "X" does not contain an issue that is highlighted. Requiring the Permittees to look to Part V or Part VI.D or contact the Executive Officer to verify that there is no new information that will change the original permit determination is confusing.</p>

**LOS ANGELES PERMIT GROUP COMMENTS**  
**NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL**  
**LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
			We'd suggest that Table "X" be revised to include specific sections in Part V or VI.D that may modify the exempt determination. We'd respectfully request that, based on the Executive Officer's determination of a problem, a reopener clause is added so the Permit may be amended to account for changes exempt/conditionally exempt status.
3	3	III.A.3.b.i and III.A.3.b.ii	MS4 Permittees do not have the legal authority to divert and/or treat water from natural springs or riparian wetlands (including those which are spring fed) before they enter the MS4. We believe such flows should be unconditionally exempt from the discharge prohibitions.
4	3	III.A.3.b.iii	MS4 Permittees do not have the legal authority to override State or Regional Board authorized discharges from stream diversions. Once the State or Regional Board authorizes a discharge, the State or Regional Board becomes responsible for any pollutants in that discharge. For MS4 Permittees, this discharge should be unconditionally exempt.
5	4	III.A.3.b.x	The combination of gravity flow and a pumped flow is not appropriate. Gravity flow is not dewatering while pumped flow is dewatering. Please separate the two types of discharge. The installation of drain piping around a below grade foundation wall is intended to provide safety so that water pressure does not build up against a below grade wall. If the built-up water, which is generally not ground water but rather infiltrating rain water, then it can be drained by gravity which is not dewatering and therefore should not require an NPDES permit.
6	4	III.A.3.b.xv	The conditional exemption of street/sidewalk water is inconsistent with the requirement in the industrial/commercial MCM section that street washing must be diverted to the sanitary sewer. Sidewalk water should be conditionally exempt, but so also should patios and pool deck washing. If street washing has to be diverted to the sanitary sewer for industrial/commercial facilities, then it should for all facilities and so should parking lot wash water as they are similar in their pollutant loads.
7	4	III.A.3.b.xvi	Emergency fire fighting flows should be unconditionally exempt since they are necessary to protect life and property, regardless of whether or not they cause or contribute to an exceedance of RWL and/or WQBEL. To be consistent with the Ventura county permit, and because of the close link between emergency and non-emergency fire-fighting flows, we request all fire-fighting flows be unconditionally exempt or at minimum consider revising some of the proposed conditions of Table X to be more practicable and flexible.
8	4	III.A.3.b.xvi	Footnote No.10 which expressly prohibits building fire suppression system maintenance (e.g. fire line flushing) discharges to the MS4. With no viable alternative than discharging to the MS4, this prohibition directly conflict with California Health and Safety Code and the State Fire Marshall on the necessity to flush the system. Please delete this explicit prohibition.
9	6	III.A.5.c.i	The requirement to "eliminate irrigation overspray" is impossible to attain. An ordinance that

**LOS ANGELES PERMIT GROUP COMMENTS  
NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL  
LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

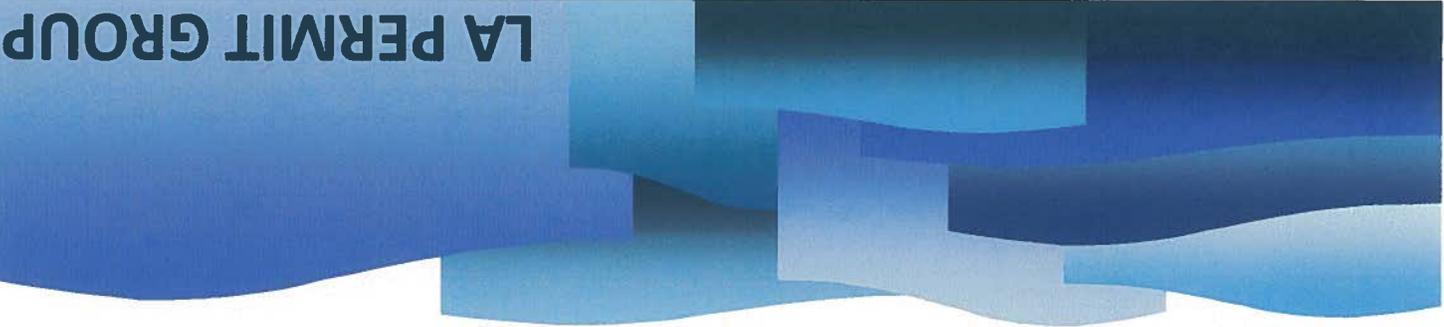

No.	Page	Citation	Comment
			requires Permittees to levy monetary fines against residents is overreach. Please delete this requirement.
10	6	III.A.6	The provision to require dischargers to notify the Permittee of the discharge, obtain local permits and implement BMPs may not be feasible for many dischargers such as car washing and sidewalk washing. Alternatively municipalities can be required to implement ordinances that require anyone within their jurisdiction to comply with a series of conditions when performing those tasks.
11	6	III.A.7	The requirement to determine whether any of the conditionally exempted non-stormwater discharges is a source of pollutants is a requirement to monitor every non-stormwater discharge. This requirement is overly burdensome on Permittee staff, very costly, and a responsibility that will come into question. Please delete this requirement.
12	7	III.A.8	The requirement of the Permittee to demonstrate that a specific non-stormwater discharge from a potable water supply caused an exceedance is a requirement to monitor every potable water supply discharge. This requirement places all the responsibility on the MS4 Permittees to monitor and test the samples. The burden of proof is placed on the Permittee for any exceedance until proven innocent by way of the monitoring results. Like emergency fire fighting discharges, potable water discharges should be exempt.
13	4	III.A.8	We support an exemption for a Permittee from a violation of RWL and or WQBELs caused by a non-stormwater discharge from a potable water supply or distribution system not regulated by an NPDES permit but required by state or federal statute. This should clearly apply to all NPDES permits issued to others within, or flow through, the MS4 Permittees jurisdiction. We would request that emergency releases caused by potable water line breaks, which are unexpected, and have to be dealt with as an emergency. MS4 permittees should be exempt from RWL or WQBEL violations associated with any permitted NPDES discharges that are effectively authorized by LARWQCB under the Clean Water Act.
14	8	III.A.9	The requirement of the Permittee to demonstrate that a specific non-stormwater discharge from a fire fighting activity caused an exceedance is a requirement to monitor every fire fighting activity, including location, date, time, duration, discharge pathway, and flow volume. This requirement places all the responsibility on the MS4 Permittees to monitor and test the samples, which is both labor intensive with limited personnel and extraordinarily costly. The burden of proof is placed on the Permittee for any exceedance until proven innocent by way of the monitoring results. It should be acknowledged by the Regional Board that fire fighting activity causes pollutants to be discharged. Discharges from all fire fighting activities should be unconditionally exempt, as protection of life and property is paramount.

**LOS ANGELES PERMIT GROUP COMMENTS**  
**NON-STORM WATER DISCHARGE PROHIBITION – 3/28/2012 STAFF WORKING PROPOSAL**  
**LOS ANGELES COUNTY MUNICIPAL STORMWATER PERMIT**

No.	Page	Citation	Comment
15	Table X	General	Enforcing NPDES permits issued for the various NSWDS referenced in this table should be the responsibility of the State/Regional Board, not the MS4 permittee. Therefore, it is inappropriate to include a condition that places a responsibility on the MS4 permittee to ensure requirements of NPDES permits are being implemented or effective in order for the pertaining NSWDS category to be exempt. Proper enforcement of the various NPDES permits mentioned in this table should ensure impacts from these discharges are negligible.
16	Table X	Rising Groundwater	The condition that an NPDES permit is required when rising groundwater occurs where a sump pump is necessary in basement of residential buildings may become a significant burden to the LARWQCB—the number of such occurrences in the LA Basin will be very large.
17	Table X	Landscape Irrigation	Conditions should distinguish new landscape installation from retrofits. These conditions are much easier to require on new landscapes than on existing landscapes.
18	Table X	Swimming Pool/spa dischargers	By imposing additional criteria for the proper discharge of swimming pool water, it greatly increases the complexity for the thousands of homeowners in Los Angeles county to comply with these conditions and may result in fewer amounts of these flows from being dechlorinated. Consider simplifying the proposed conditions.

**Exhibit D:**

**LA Permit Group Request for Extended Comment Period**

July 2, 2012

Maria Mehranian, Chairperson  
California Regional Water Quality Control Board  
Los Angeles Region  
320 West 4<sup>th</sup> St., Suite 200  
Los Angeles, CA 90013

**SUBJECT: Comment Period for Draft NPDES Permit for MS4 Discharges**

Honorable Chairperson Mehranian:

This letter is to request the Regional Board to provide sufficient time for review the draft NPDES Permit for MS4 Discharges needed to make this process **open and transparent**.

The LA Permit Group is in receipt of the Notice of Opportunity for Public Comment and Notice of Public Hearing for the Draft NPDES Permit for MS4 Discharges and of the draft permit. This draft permit is over 500 pages and incorporates provisions for 33 TMDLs and implementation requirements, new low impact development requirements and extensive new requirements for new water quality monitoring, however our permittees have been given only 45 days to provide written comments.

While we understand a new MS4 Permit is long overdue in LA County, we do not understand why the Regional Board would want to rush this landmark regulation through the approval process. It is in everyone's best interest to keep the permitting process as open and transparent as possible. Through this entire process, the LA Permit Group has committed to a process that would cooperatively develop the next MS4 Permit. We have made every effort to stay engaged in the process and have proactively sought involvement in all aspects of the Permit development. The LA Permit Group is appreciative of the efforts the Board and Staff has taken to review certain aspects of the Permit with permittees in workshops; however, upon release of the Tentative, many of the Permit provisions contained substantial changes from previous versions, or contained brand new sections that we had not yet seen throughout this process. Seeing the permit in its entirety and having the opportunity to understand how each of the sections and programs work together is imperative in order for permittees to fully understand the permit provisions and to prepare comments.

We believe the Regional Board wants a review process that is open and transparent; however, providing permittees only 45 days to comment makes it impossible for this process to be open and transparent. In order to develop and provide relevant and meaningful comments, each permittees must first:

- Read a 500 page permit,
- Study the 500 page permit to understand how the provisions work together,
- Compare it to the last permit,
- Evaluate the resource needs to comply with the permit,
- Determine the fiscal and organizational impacts on city services; this requires coordination with several city departments,
- Prepare legal review and comments,

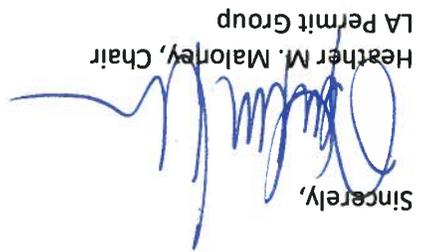

- Present information to and gather feedback from municipal governing body (the process of scheduling an item for a City Council Agenda requires at least 30-60 days in most cities). This does not allow staff time to conduct the following items listed above prior to presenting to their governing bodies, and then
- prepare written comments

Additionally, emphasis on coordination of comments has been called out in the Notice of Opportunity for Public Comment and Notice of Public Hearing for the Draft NPDES Permit. The 45-day comment period does not allow time for permittees to fully discuss the permit amongst each other in order to adequately coordinate comments and responses. This process is not only desired by permittees, but also necessary as many of the permit provisions are intended for permittees to work together on a watershed (or sub-watershed) scale. In order to fully understand how these provisions will work on a watershed scale, it is necessary that permittees (staff and elected officials) be allowed adequate time to fully understand the permit, coordinate and prepare comments.

Furthermore, for this process to be clearly open and transparent, permittee (City) staff should be given sufficient time to vet this permit within our agency staff and with our elected officials and then be given time to discuss and negotiate issues with Regional Board staff prior to the Tentative Draft comments due date.

The LA Permit Group respectfully requests for the comment period to be extended by **180 working days** for permittees to first try to work with Regional Board staff to draft a permit that has a reasonable chance for compliance and then prepare written comments on un-resolved issues. Additionally, we request that a Revised Tentative Permit be released with a 45-day comment period so that permittees have the opportunity to see any changes made to the Permit and have the chance to provide comments prior to the Adoption Hearing.

If you have any questions or request additional information, I may be reached at (626) 932-5577 or hmaloney@ci.monrovia.ca.us.

Sincerely,  
  
Heather M. Maloney, Chair  
LA Permit Group

**Exhibit E:**

**RWL submitted by CASQA re Caltrans permit**

California Stormwater Quality Association<sup>®</sup>

Dedicated to the Advancement of Stormwater Quality Management, Science and Regulation

---

June 26, 2012

Jeanine Townsend, Clerk to the Board  
State Water Resources Control Board

**Subject: State of California Department of Transportation Municipal Separate Storm Sewer System Permit Second Revised Draft Tentative Order**

Dear Ms. Townsend:

The California Stormwater Quality Association appreciates this opportunity to comment on the subject Caltrans Municipal Separate Storm Sewer System (MS4) Permit Second Draft Tentative Order (draft Tentative Order). CASQA typically comments on individual MS4 permits only when there is an issue of potential statewide significance. Accordingly, we are compelled to comment on the Receiving Water Limitations provisions incorporated into the draft Tentative Order.

**The Draft Tentative Order in Provisions A and C will expose the Department to unwarranted and immediate liability.**

CASQA believes the current revision of the receiving water limitations section is contrary to established Board policy and appears to create an inability for Caltrans to comply. Multiple constituents in stormwater runoff on occasion may be higher than receiving water quality standards before it is discharged into the receiving waters, and may create the potential for the runoff to cause or contribute to exceedances in the receiving water itself. Previously, MS4s have presumed that permit language like that expressed in Receiving Water Limitation D.4 in conjunction with Board Policy (WQ 99-05) established an iterative management approach and process as the fundamental, and technically appropriate, basis of compliance. The “iterative process language” now at issue in the draft Tentative Order, however, combined with General Discharge Prohibition A.4, renders the iterative process obsolete as a compliance strategy. Moreover, in the wake of the July 2011 Ninth Circuit Court of Appeal’s decision, if this language is not revised, the precedent may be set for municipal permits that create unlimited liability for government entities across the State.

As you know, on July 13, 2011, the United States Court of Appeals for the Ninth Circuit issued an opinion in *Natural Resources Defense Council, Inc., et al., v. County of Los Angeles, Los Angeles County Flood Control District, et al.* (NRDC v. County of LA). The court’s opinion addressed two key issues for California’s MS4s, one of which is directly applicable here, that being whether a permittee who is in compliance with the iterative process is nevertheless still in violation of a MS4 permit that contains language like that proposed for Caltrans.

## CASQA comments on Caltrans MS4 Permit Second Revised Draft Tentative Order

Like the Caltrans draft Tentative Order, the County of Los Angeles MS4 permit includes Receiving Water Limitations language that is consistent with the language developed by the State Water Board in its Order WQ 99-05. In previous State Water Board orders, the Board indicated that the language specified in Order WQ 99-05 did not require strict compliance with water quality standards. The language in question is often referred to as the “iterative process.”

However, contrary to the State Water Board’s stated intent and the understanding of CASQA, the Ninth Circuit Court of Appeals found that, because the iterative process paragraph did not explicitly state that a party who was implementing the iterative process was not in violation of the permit, a party whose discharge “causes or contributes” to an exceedance of a water quality standard is in violation of the permit, even though that party is implementing the iterative process in good faith.

As a result of the court’s decision, if the draft language is not changed, all discharges to receiving waters must meet water quality standards to avoid being in violation of permit terms. Although an important goal, no one reasonably expects Caltrans or any other municipal permittee to be able to meet this goal now. Indeed, the impossibility of meeting this goal is reflected by the hundreds of TMDLs across the state that specifically recognize that water quality standards cannot currently be met, often for reasons beyond Caltrans or other permittees’ control, and that instead an adaptive program over a span of several years or longer is necessary.

Thus, unless this language is changed, Caltrans may be vulnerable to enforcement actions by the state and third party citizen suits alleging violations of the permit terms in question. Indeed, the liability resulting from a failure to address these provisions may be a risk to Caltrans regardless of the current or future enforcement policy of the State or Regional Water Boards. For example, the City of Stockton was engaged in the iterative process per the terms of its Permit, but was nonetheless challenged by a third-party on the basis of the Receiving Water Limitations language. There is no regulatory benefit to imposing permit provisions that result in the potential of immediate non-compliance for the Permittee.

To avoid undercutting the regulatory benefits of the State Water Board’s program for Caltrans (and other MS4s), the Receiving Water Limitations language must be revised. In an attempt to avoid this undercutting we have attached proposed language for the Receiving Water Limitation provision. CASQA believes that our suggested Receiving Water Limitations language is drafted in a manner to clearly indicate that compliance with the iterative process provides effective compliance with the discharge prohibition (General Discharge Prohibition A.4), and the “shall not cause or contribute” receiving water limitations (Receiving Water Limitations D.2 and D.3). Furthermore the proposed language allows the MS4s to focus and prioritize their resources on critical water quality issues that will lead to water quality improvement, such as those reflected by the TMDLs. We therefore request further consideration of this or other alternative language so as to avoid a situation where, even if Caltrans is in complete compliance with the iterative process provisions, it could be subject to significant liability and lawsuits.

We thank you again for the opportunity to provide our comments and we ask that the Board carefully consider them and our suggested Receiving Water Limitations language for the

CASQA comments on Caltrans MS4 Permit Second Revised Draft Tentative Order

Caltrans permit. If you have any questions, please contact CASQA Executive Director Geoff Brosseau at (650) 365-8620.

Sincerely,

A handwritten signature in black ink that reads "Richard Boon". The signature is written in a cursive style with a large initial "R" and "B".

Attachment – CASQA Proposed Language for Receiving Water Limitation Provision

## California Stormwater Quality Association<sup>®</sup>

*Dedicated to the Advancement of Stormwater Quality Management, Science and Regulation*

---

February 21, 2012

Mr. Charles Hoppin, Chair  
State Water Resources Control Board  
P.O. Box 100  
Sacramento, CA 95812-0100

**Subject: Receiving Water Limitation Provision to Stormwater NPDES Permits**

Dear Mr. Hoppin:

As a follow up to our December 16, 2011 letter to you and a subsequent January 25, 2012 conference call with Vice-Chair Ms. Spivy-Weber and Chief Deputy Director Jonathan Bishop, the California Stormwater Quality Association (CASQA) has developed draft language for the receiving water limitation provision found in stormwater municipal NPDES permits issued in California. This provision, poses significant challenges to our members given the recent 9th Circuit Court of Appeals decision that calls into question the relevance of the iterative process as the basis for addressing the water quality issues presented by wet weather urban runoff. As we have expressed to you and other Board Members on various occasions, CASQA believes that the existing receiving water limitations provisions found in most municipal permits needs to be modified to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but also allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. To that end, we have drafted the attached language in an effort to capture that intent. We ask that the Board give careful consideration to this language, and adopt it as 'model' language for use statewide.

Thank you for your consideration and we look forward to working with you and your staff on this important matter.

Yours Truly,

Richard Boon, Chair  
California Stormwater Quality Association

cc: Frances Spivy-Weber, Vice-Chair – State Water Board  
Tam Doduc, Board Member – State Water Board  
Tom Howard, Executive Director – State Water Board  
Jonathan Bishop, Chief Deputy Director – State Water Board  
Alexis Strauss, Director – Water Division, EPA Region IX

## CASQA Proposal for Receiving Water Limitation Provision

### D. RECEIVING WATER LIMITATIONS

1. Except as provided in Parts D.3, D.4, and D.5 below, discharges from the MS4 for which a Permittee is responsible shall not cause or contribute to an exceedance of any applicable water quality standard.
2. Except as provided in Parts D.3, D.4 and D.5, discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible, shall not cause a condition of nuisance.
3. In instances where discharges from the MS4 for which the permittee is responsible (1) causes or contributes to an exceedance of any applicable water quality standard or causes a condition of nuisance in the receiving water; (2) the receiving water is not subject to an approved TMDL that is in effect for the constituent(s) involved; and (3) the constituent(s) associated with the discharge is otherwise not specifically addressed by a provision of this Order, the Permittee shall comply with the following iterative procedure:
  - a. Submit a report to the State or Regional Water Board (as applicable) that:
    - i. Summarizes and evaluates water quality data associated with the pollutant of concern in the context of applicable water quality objectives including the magnitude and frequency of the exceedances.
    - ii. Includes a work plan to identify the sources of the constituents of concern (including those not associated with the MS4 to help inform Regional or State Water Board efforts to address such sources).
    - iii. Describes the strategy and schedule for implementing best management practices (BMPs) and other controls (including those that are currently being implemented) that will address the Permittee's sources of constituents that are causing or contributing to the exceedances of an applicable water quality standard or causing a condition of nuisance, and are reflective of the severity of the exceedances. The strategy shall demonstrate that the selection of BMPs will address the Permittee's sources of constituents and include a mechanism for tracking BMP implementation. The strategy shall provide for future refinement pending the results of the source identification work plan noted in D.3. ii above.
    - iv. Outlines, if necessary, additional monitoring to evaluate improvement in water quality and, if appropriate, special studies that will be undertaken to support future management decisions.
    - v. Includes a methodology (ies) that will assess the effectiveness of the BMPs to address the exceedances.
    - vi. This report may be submitted in conjunction with the Annual Report unless the State or Regional Water Board directs an earlier submittal.

- b. Submit any modifications to the report required by the State or Regional Water Board within 60 days of notification. The report is deemed approved within 60 days of its submission if no response is received from the State or Regional Water Board.
  - c. Implement the actions specified in the report in accordance with the acceptance or approval, including the implementation schedule and any modifications to this Order.
  - d. As long as the Permittee has complied with the procedure set forth above and is implementing the actions, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the State Water Board or the Regional Water Board to develop additional BMPs.
4. For Receiving Water Limitations associated with waterbody-pollutant combinations addressed in an adopted TMDL that is in effect and that has been incorporated in this Order, the Permittees shall achieve compliance as outlined in Part XX (Total Maximum Daily Load Provisions) of this Order. For Receiving Water Limitations associated with waterbody-pollutant combinations on the CWA 303(d) list, which are not otherwise addressed by Part XX or other applicable pollutant-specific provision of this Order, the Permittees shall achieve compliance as outlined in Part D.3 of this Order.
5. If a Permittee is found to have discharges from its MS4 causing or contributing to an exceedance of an applicable water quality standard or causing a condition of nuisance in the receiving water, the Permittee shall be deemed in compliance with Parts D.1 and D.2 above, unless it fails to implement the requirements provided in Parts D.3 and D.4 or as otherwise covered by a provision of this order specifically addressing the constituent in question, as applicable.

Agency/Reviewer: LA Permit Group

Comment		Doc. Reference		Comments	
No.	Page	Section	Apr-12	Jul-12	
1	General	General	Any TMDL, for which compliance with a waste load allocation (WLA) is exclusively set in the receiving water, shall be amended by a re-opener to also allow compliance at the outfall to allow that flexibility, or other end-of-pipe, that shall be determined by translating the WLA into non-numeric WQBELs, expressed as best management practices (BMPs). While the TMDL re-opener is pending, an affected Permittee shall be in compliance with the receiving water WLA through the implementation of permit requirements	Same comment	
2	17	Findings	Not clear on what "discharges from the MS4 for which they are owners and/or operators" means.	The Tentative Order, states " ... each Permittee shall maintain the necessary legal authority to control the contribution of pollutants to its MS4 and shall include in its storm water management program a comprehensive planning process that includes intergovernmental coordination, where necessary." If the MS4/catch basin is owned by the LACFCD, does this mean that the LACFCD needs to control the contribution of pollutants?	
3	pages 111 - 123 and Attachments K - R	TMDL	<p>Santa Monica Bay Beaches Bacteria TMDL (SMBBB TMDL) is currently being reconsidered. As part of that reconsideration, the summer dry weather targets must be revised to be consistent with the reference beach/anti-degradation approach established for the SMBBB TMDL and with the extensive data collected over that past seven years since original adoption of the SMBBB TMDL. This data clearly shows that natural and non-point sources result in 10% exceedances during dry weather. Data collected at the reference beach since adoption of the TMDL, as tabulated in Table 3 of the staff report of the proposed revisions to the Basin Plan Amendment, demonstrate that natural conditions associated with freshwater outlets from undeveloped watersheds result in exceedances of the single sample bacteria objectives during both summer and winter dry weather on approximately 10% of the days sampled.</p> <p>Thus the previous Source Analysis in the Basin Plan Amendment adopted by Resolution No. 02-004 which stated that "historical monitoring data from the reference beach indicate no exceedances of the single sample targets during summer dry weather and on average only three percent exceedance during winter dry weather" was incorrect and based on a data set not located at the point zero compliance location. Continued allocation of zero summer dry weather exceedances in the proposed Basin Plan Amendment is in direct conflict with the stated intent to utilize the reference beach/anti-degradation approach and ignores the scientifically demonstrated reality of natural causes and non-point sources of indicator bacteria exceedances.</p>	This is a critical issue that was not addressed in the recent reopener. The reference reach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included	
4	pages 111 - 123 and Attachments K - R	TMDL	Continued use of the zero summer dry weather exceedance level will make compliance with the SMBBB TMDL impossible for the Jurisdictional agencies. This is also in conflict with the intent of the Regional board as expressed in finding 21 of Resolution 2002-022 "that it is not the intent of the Regional Board to require treatment or diversion of natural coastal creeks or to require treatment of natural sources of bacteria from undeveloped areas".	This is a critical issue that was not addressed in the recent reopener. The reference reach approach and the overriding policy that permittees are not responsible for pollutants outside their control, including natural sources, needs to be included	
5	pages 111 - 123 and Attachments K - R	TMDL	The SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) was approved by the Regional Board staff and that CSMP should be incorporated into the TMDL monitoring requirements of the next MS4 Permit. The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week, thus it is highly confusing and misleading to refer to "daily monitoring". The CSMP established that compliance monitoring would be conducted on a weekly basis, and although some monitoring sites are being monitored on additional days of the week, none of the sites are monitored seven days per week.	The problem with sites monitored two days a week has not been corrected. Please provide clarification that this issue could be addressed and would supersede the TMDL if submitted in an integrated monitoring plan. This is critical for summer dry weather and 5-day per week sites.	

6	pages 111 - 123 and Attachments K - R	TMDL	This discussion in this section devoted to the SMBBB TMDL seems to create confusion regarding the meaning of the terms "water quality objectives or standards," "receiving water limitations," and "water quality-based effluent limitations". Water quality objectives or water quality standards are those that apply in the receiving water. Water Quality Effluent Based Limits apply to the MS4. So the "allowable exceedance days" for the various conditions of summer dry weather, winter dry weather, and wet weather should be referred to as "water quality-based effluent limitations" since those are the number of days of allowable exceedances of the water quality objectives that are being allowed for the MS4 discharge under this permit. While the first table that appears under this section at B.1 (b) should have the heading "water quality standards" or "water quality objectives" rather than the term "effluent limitations".	In effect the effluent limitations are stricter than the receiving water standards. This is inconsistent with law and creates a situation in which permittees are out of compliance at the effective date of this permit. Please adjust so that limits are consistent with standards and not exceeding standards.
7	pages 111 - 123 and Attachments K - R	TMDL	While it makes sense for the Jurisdictional Groups previously identified in the TMDLs to work jointly to carry out implementation plans to meet the interim reductions, only the responsible agencies with land use or MS4 tributary to a specific shoreline monitoring location can be held responsible for the final implementation targets to be achieved at each individual compliance location. An additional table is needed showing the responsible agencies for each individual shoreline monitoring location.	A table is still needed and should be developed. Perhaps referred to in this section but placed in the Watershed Management Plan and then approved by Executive Officer with the plan.
8	pages 111 - 123 and Attachments K - R	TMDL	The Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4 based on estimates from limited data on existing stormwater discharges which resulted in a waste load allocation for stormwater that is lower than necessary to meet the TMDL targets, in the case of DDT far lower than necessary. EPA stated that "If additional data indicates that existing stormwater loadings differ from the stormwater waste load allocations defined in the TMDL, the Los Angeles Regional Water Quality Control Board should consider reopening the TMDL to better reflect actual loadings." [USEPA Region IX, SMB TMDL for DDTs and PCBs, 3/26/2012]	Same comment
9	pages 111 - 123 and Attachments K - R	TMDL	In order to avoid a situation where the MS4 permittees would be out of compliance with the MS4 Permit if monitoring data indicate that the actual loading is higher than estimated and to allow time to re-open the TMDL if necessary, recommend as an interim compliance objective WQBELs based on the TMDL numeric targets for the sediment fraction in stormwater of 2.3 ug DDT/g of sediment on an organic carbon basis, and 0.7 ug PCB/g sediment on an organic carbon basis.	Same comment
10	pages 111 - 123 and Attachments K - R	TMDL	Although the Santa Monica Bay DDT and PCB TMDL issued by USEPA assigns the waste load allocation as a mass-based waste load allocation to the entire area of the Los Angeles County MS4, they should be translated as WQBELs in a manner such that watershed management areas, subwatersheds and individual permittees have a means to demonstrate attainment of the WQBEL. Recommend that the final WLAs be expressed as an annual mass loading per unit area, e.g., per square mile. This in combination with the preceding recommendation for an interim WQBEL will still serve to protect the Santa Monica Bay beneficial uses for fishing while giving the MS4 Permittees time to collect robust monitoring data and utilize it to evaluate and identify controllable sources of DDT and PCBs.	Please clarify that this situation would be covered under the new provisions for USEPA established TMDLs opens the door for allowing Permittees to address this through their plans.
11	pages 111 - 123 and Attachments K - R	TMDL	The Machado Lake Trash WQBELs listed in the table at B.3 of Attachment N in the Tentative Order appear to have been calculated from preliminary baseline waste load allocations discussed in the July 11, 2007 staff report for the Machado Lake Trash TMDL, rather than from the basin plan amendment. In some cases the point source land area for responsible jurisdictions used in the calculation are incorrect because they were preliminary estimates and subsequent GIS work on the part of responsible agencies has corrected those tributary areas. In other cases some of the jurisdictions may have conducted studies to develop a jurisdiction-specific baseline generation rate. The WQBELs should be expressed as they were in the adopted TMDL WLAs, that is as a percent reduction from baseline and not assign individual baselines to each city but leave that to the individual city's trash reporting and monitoring plan to clarify.	Same comment

12	pages 111 - 123 and Attachments K - R	TMDL	<p>The WLAs in the adopted Machado Lake Trash TMDL were expressed in terms of percent reduction of trash from Baseline WLA with the note that percent reductions from the Baseline WLA will be assumed whenever full capture systems are installed in corresponding percentages of the conveyance discharging to Machado Lake. As discussed in subsequent city-specific comments, there are errors in the tributary areas originally used in the staff report, but in general, tributary areas are available only to about three significant figures when expressed in square miles. Thus the working draft should not be carrying seven significant figures in expressing the WQBELs as annual discharge rates in uncompressed gallons per year. The convention when multiplying two measured values is that the number of significant figures expressed in the product can be no greater than the minimum number of significant figures in the two underlying values. Thus if the tributary area is known to only three or four significant figures, and the estimated trash generation rate is known to four significant figures, the product can only be expressed to three or four significant figures.</p> <p>Thus there should be no values to the right of the decimal place and the whole numbers should be rounded to the correct number of significant figures.</p>	Same comment
13	pages 111 - 123 and Attachments K - R	TMDL	<p>The Machado Lake Nutrient TMDL provides for a reconsideration of the TMDL 7.5 years from the effective date prior to the final compliance deadline. Please include an additional statement as item C.3.c of Attachment N: "By September 11, 2016 Regional Board will reconsider the TMDL to include results of optional special studies and water quality monitoring data completed by the responsible jurisdictions and revise numeric targets, WLAs, LAs and the implementation schedule as needed."</p>	Same comment
14	pages 111 - 123 and Attachments K - R	TMDL	<p>Table C is not provided in the section on TMDLs for Dominguez Channel and Greater LA and Long Beach Harbors Toxic Pollutants. Please clarify and reference that Attachment D Responsible Parties Table RB4 Jan 27, 12 which was provided to the State Board and responsible agencies during the SWRCB review of this TMDL, and is posted on the Regional Board website in the technical documents for this TMDL, is the correct table describing which agencies are responsible for complying with which waste load allocations, load allocations and monitoring requirements in this VERY complex TMDL. Attachment D should be included as a table in this section of the MS4 Permit.</p>	Partially addressed--the table provided in the Tentative Order is not the detailed Attachment D which clarifies which agencies are responsible for which portions of the TMDL--need to include that table.
15	pages 111 - 123 and Attachments K - R	TMDL	<p>The Dominguez Channel and Greater LA and Long Beach Harbor Waters Toxic Pollutants TMDL provides for a reconsideration of the TMDL targets and WLAs. Please include an additional statement as item E.5 of Attachment N: "By March 23, 2018 Regional Board will reconsider targets, WLAs and LAs based on new policies, data or special studies. Regional Board will consider requirements for additional implementation or TMDLs for Los Angeles and San Gabriel Rivers and interim targets and allocations for the end of Phase II."</p>	Same comment
16	pages 111 - 123 and Attachments K - R	TMDL	<p>City of Hermosa Beach is only within one watershed, the Santa Monica Bay Watershed, and so should not be shown in italics as a multi-watershed permittee</p>	Addressed in Table K-3 of the Tentative Order but not in Table K-2 of the Tentative Order.
17	pages 111 - 123 and Attachments K - R	TMDL	<p>Recommend not listing specific water bodies in E.5.b.i.(1).(c) because then it risks becoming obsolete if new TMDLs are established for trash, or if they are reconsidered. Furthermore, it is not clear why Santa Monica Bay was left out of this list since the Marine Debris TMDL allows for compliance via the installation of for full capture devices.</p>	Not addressed, still don't know why Santa Monica Bay Marine Debris was not included in the list at E.5.b.i.(1).(c) but it is listed in E.5.a.ii and Attachment M Section B.
19	pages 111 - 123 and Attachments K - R	TMDL	N/A	Suggest wet weather compliance be partially defined by a design storm.

20	pages 111 - 123 and Attachments K - R	TMDL	N/A	<p>Regional Board staff has incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a "numeric effluent limitation." Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board's clear <del>opposition</del> reluctance to use numeric effluent limitations.</p> <p>In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: <i>we will generally not require "strict compliance" with water quality standards through numeric effluent limitations," and instead "we will continue to follow an iterative approach, which seeks compliance over time" with water quality standards.</i></p> <p>[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]</p> <p>More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:</p> <p><i>Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. <u>This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.</u></i></p> <p>The State Board's decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the <i>Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.</i></p>
21	pages 111 - 123 and Attachments K - R	Table K-8	Please remove, in its entirety, the Santa Ana River TMDLs	Same comment
22	pages 111 - 123 and Attachments K - R	E.1.c	Permittees under the new MS4 permit (those in LA County) need to be able to separate themselves from Orange County cities. Since the 0.941 kg/day is a total mass limit, it needs to be apportioned between the two counties. Also, the MS4 permit needs to contain language allowing permittees to convert group-based limitations to individual permittee based limitations.	Same comment
23	111	E.2	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions.	Same comment
24	111	E.2.a.i	N/A	This provision creates confusion and inconsistency with the language in the rest of the permit. By stating that the permittee <b>shall</b> demonstrate compliance through compliance monitoring points, it appears to preclude determining compliance through other methods as outlined in other portions of the permit. This provision does not reference any of the other compliance provisions in the TMDL section, and could therefore be interpreted on its own as a separate compliance requirement. Additionally, the requirement to use the TMDL established compliance monitoring locations regardless of whether an approved TMDL monitoring plan or Integrated plan has been developed is not consistent with the goal of integrated monitoring outlined in the permit. This provision would be more appropriate as a monitoring and reporting requirement for the TMDL section with modified language such as "Monitoring locations to be used for demonstrating compliance in accordance with Parts VI.E.2.d or VI.E.2.e shall be established at compliance monitoring locations established in each TMDL or at locations identified in an approved TMDL monitoring plan or in accordance with an approved integrated monitoring program per Attachment E Part VI.C.5 (Integrated Watershed Monitoring and Assessment)."

25	112	E.2.b.iv	For "each Permittee is responsible for demonstrating that its discharge did not cause or contribute to an exceedance," how is this going to be possible? There is allowed non-storm water discharges, a commingled system, and the LA County region is practically urbanized (impervious landscape). Additionally, a gas tanker on local freeways often discharges onto freeway drains, which connect to MS4 permittee drains - the point here is a private party as the actual discharger should be held responsible and not the MS4 permittee. Lastly, the Construction General Permit cannot establish numeric limitations without the Regional/State Boards clearly demonstrating how compliance will be achieved - the MS4 permit is overly conditioned in terms of achieving compliance and subjects MS4 permittees to violations/enforcement, and given these circumstances, the Boards need to clearly demonstrate how compliance will be achieved.	Same comment
26	112	E.2.b.v.(2)	N/A	This provision should not require that the permittee demonstrate that the discharge from the MS4 <b>is treated</b> to a level that does not exceed the applicable water quality-based effluent limitation. Permittees may achieve the applicable WQBELs through means other than treatment and they should be able to demonstrate that their discharge does not exceed the applicable water quality-based effluent limitation through monitoring or other means than demonstration of treatment.
28	113	E.2.d.i.4.b.	Is this in effect setting a design storm for the design of structural BMPs to address attainment of TMDLs, or is it simply referring to SUSMP/LID type structural BMPs? If it is in effect setting a design storm, there needs to be some sort of exception for TMDLs in which a separate design storm is defined, e.g., for trash TMDLs where the 1-year, 1-hour storm is used.	This is not clarified, but it is still a problem as not all retrofit projects which might be used to address TMDLs may be able to handle the full 85th percentile 24-hour storm, there should be some provision for doing this through a combination of BMPs, e.g., LID plus retrofit.
29	114	E.2.e	Please add the language from interim limits E.2.d.4 a - c and EPA TMDLs to the Final Water Quality Based Effluent Limitations and/or Receiving Water Limitations to ensure sufficient coordination between all TMDLs and the timelines and milestones that will be implemented in the Watershed Management Program.	Same comment
30	116	E.4.a	This provision states "A-Permittees shall comply immediately ... for which final compliance deadlines have passed pursuant to the TMDL implementation schedule." This provision is unreasonable. First, various brownfields/abandoned toxic sites exists, some of which were permitted to operate by State/Federal agencies - nothing has or will likely be done with these sites that contribute various pollutants to surface and sub-surface areas. Additionally, this permit is going to require a regional monitoring program - this program will yield results on what areas are especially prone to particular pollutants. Until these results are made known, MS4 Permittees will have a hard time knowing where to focus its resources and particularly, the placement of BMPs to capture, treat, and remove pollutants. For these reasons, this provision should be revised to first assess pollutant sources and then focus on compliance with BMP implementation.	Same comment
31	116-123	E.5	Please clarify that cities are not responsible for retrofitting.	Same comment
32	116-123	E.5.a - c	Recommend not listing specific waterbody/trash TMDLs here, but simply leave the reference to Attachments to identify the Trash TMDLs. Otherwise, this may have to be revised in the future. Again, Santa Monica Bay Marine Debris TMDL was not included in this list, it is unclear whether it was an oversight or intentional?	Same comment
33	116-123	E.5.b.ii.2	Define "partial capture devices", define "institutional controls". Permittees need to have clear direction of how to attain the "zero" discharges which will have varying degrees of calculations regardless of which compliance method is followed. Explain the Regional Board's approval process for determining how institution controls will supplement full and partial capture to attain a determination of "zero" discharge.	Same comment
34	116-123	E.5.b.ii.(4)	MFAC and TMRP should be an option available to the Los Angeles River.	Same comment
35	116-123	E.5.c.i.(1)	For reporting compliance based on Full Capture Systems, what is the significance of needing to know "the drainage areas addressed by these installations?" Unfortunately, record keeping in Burbank is limited to the location and size of City-owned catch basins. A drainage study would need to be done to define these drainage areas. As such, we do not believe this requirement serves a purpose in regards to full capture system installations and their intended function.	Same comment
36	Attachment L	D.3 a - c	Please change the Receiving Water Limitations for interim and final limits to the TMDL approved table. There should be no interpretation of the number of exceedance days based on daily for weekly sampling with, especially with no explanation of the ratio or calculations, and no discussion of averaging. Please revert to the original TMDL document.	The table was adjusted, but did not eliminate the interpretation of number of exceedance days that are not expressly completed in the Santa Clara River TMDL. Remove all interpretation of number of exceedance days other than what has been expressed in the original TMDL number of days of exceedances without interpretation or recalculation.

37	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For the Freshwater portion of the Dominguez Channel: There are no provisions for BMP implementation to comply with the interim goals. The wording appears to contradict Section E.2.d.i.4 which allows permittees to submit a Watershed Management Plan or otherwise demonstrate that BMPs being implemented will have a reasonable expectation of achieving the interim goals.	Same comment
38	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For Greater LA Harbor: Similar to the previous comment regarding this section. The Table establishing Interim Effluent Limitations, Daily Maximum (mg/kg sediment), does not provide for natural variations that will occur from time to time in samples collected from the field. Given the current wording in the proposed Receiving Waters Limitations, even one exceedance could potentially place permittees in violation regardless of the permittees level of effort. Reference should be made in this section to Section E.2.d.i.4 which will provide the opportunity for the Permittee to develop BMP-base compliance efforts to meet interim goals.	Same comment
39	Attachment N	TMDLs in the Dominguez Channel and Greater Harbor Waters WMA	For the freshwater portion of the Dominguez Channel: the wording should be clarified. Section 5.a states that "Permittees subject to this TMDL are listed in Attachment K, Table K-4." Then the Table in Section E.2.b Table "Interim Effluent Limitations--- Sediment", lists all permittees except the Fresh water portion of the Dominguez Channel. For clarification purposes, we request adding the phase to the first row: "Dominguez Channel Estuary (below Vermont)"	Same comment
40	Attachment O, Page 3	C	For the LA River metals. Some permittees have opted out of the grouped effort. This section needs to detail how these mass-based daily limitations will be reapportioned.	Same comment
41	Attachment O, Page 7	D.4	Why are "Receiving Water Limitations" being inserted here? None of the other TMDLs seem to follow that format.	Same comment
42	Attachment P	TMDLs in the San Gabriel River WMA	It is the permittees understanding that the lead impairment of Reach 2 of the San Gabriel River has been removed. It should be removed from the MS4 permit.	Same comment

Document Name: **Watershed Management Program Section Draft Tentative Order - July 2012**

Agency/Reviewer: **LA Permit Group**

Comment	Doc. Reference		Comments	
No.	Page	Section	Apr-12	Jul-12
1	General	General	While it may be appropriate to have an overall design storm for the NPDES Permit and TMDL compliance, this element seems to address individual sites. Recommend developing more prominently in the areas of the Permit that deals with compliance that the overall Watershed Management Program should deal with the 85th percentile storm and that beyond that, Permittees are not held responsible for the water quality from the much larger storms. However, requiring individual projects to meet this standard is limiting as there may be smaller projects implemented that individually would not meet 85th percentile, but collectively would work together to meet that standard. Please clearly indicate cities are only responsible for the 85th percentile storm for compliance and that individual projects may treat more of less than number.	Changes were made but it is unclear that the overall program would be collectively only held to the 85th percentile storm if working in multiple areas, and individual sites only if the Watershed Management Program states that individual sites would be responsible.
2	46	Process	Please clarify that Permittees will only be responsible for continuing existing programs and TMDL implementation plans during the interim 18 month period while developing the Watershed Management Program and securing approval of those programs	Same comment
3	46-47	Table 9 and Process	Please allow 24 months for development of the Watershed Management Program to provide sufficient time for calibration and the political process to adopt these programs.	Same comment. However, there could be a phased approach in which a permittee could submit early actions within this timeline, while more time is offered for the resource intensive aspects.
4	46-53	various	The Table (TBD) on page 2 states implementation of the Watershed Program will begin upon submittal of final plan. Page 11, section 4 Watershed Management Program Implementation states each Permittee shall implement the Watershed Management Program upon approval by the Executive Officer. Page 13 section iii says the Permittee shall implement modifications to the storm water management program upon acceptance by the Executive Officer. All three of these elements should be consistent and state upon approval by the Executive Officer. The item on page 13 should be changed to reflect the Watershed Management Program, or clarify that the Watershed Management Program is the storm water management program.	Table 9 and Watershed Management Implementation are still inconsistent. The table says submittal and the Watershed Management Program Implementation states upon approval. Please make these consistent
5	47	Program Development	Please include a paragraph that Permittees are not responsible for pollutant sources outside the Permittees authority or control, such as aerial deposition, natural sources, sources permitted to discharge to the MS4, and upstream contributions.	Same comment
6	48	3.a.ii	Pollutants in category 4 should not be included in this permit term, request elimination of any evaluation of category 4. Request elimination of category 3, as work should focus on the first two categories at this point	Thank you for removing category 4. Category 3 puts a burden on cities during this permit cycle. In the next permit term, when permittees have a better understanding of sources and location of the high priority pollutant additional actions may be warranted. At this time including category 3 adds an investigative burden that is unwarranted given the substantial increase in requirements and monitoring that are already included in this draft tentative order.
7	52	Reasonable Assurance Analysis	Reasonable assurance analysis and the prioritization elements should also include factors for technical and economic feasibility	Same comment
8	112	E.2.b.iii	For the "group of Permittees" having compliance determined as a whole, this should only be the case if the group of Permittees have moved forward with shared responsibilities (MOAs, cost sharing, a Watershed Management Program). It would not be fair to have one entity not be a part of the "group" and be the main cause of exceedances/violations.	In the Tentative Order, permittees must notify the Regional Board 6 months after the Order's effective date on whether it plans to participate in the development of a Watershed Management Program. Given this, a sub-watershed will not know whether all permittees will participate or not. It should also be noted that allowed non-stormwater discharges and other NPDES permit discharges may be the cause of exceedances/violations and not the "group of permittees."

1	37-38	All	Currently the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. It is imperative that the Regional Board works with the State Board on this very important issue	There are several NPDES Permits, including the Caltrans Permit and others, that adjust the Receiving Water Limitation language in response to new interpretations. Currently, the State Board is considering a range of alternatives to create a basis for compliance that provides sufficient rigor in the iterative process to ensure diligent progress in complying with water quality standards but at the same time allows the municipality to operate in good faith with the iterative process without fear of unwarranted third party action. LASP has provided the Regional Board staff with sample language. It is imperative that the Regional Board works with the State Board on this very important issue. It is critical that the LA draft tentative order Receiving Water Limitation language be adjusted to ensure cities working in good faith are not subject to enforcement and third party litigation.

1	13-26	Findings	several related		<p>Please add findings regarding the iterative process.</p> <p>The iterative process is a process of implementing, evaluating, revising, or adding new BMPs to attain water quality standards, including total maximum daily load (TMDL) waste load allocations (WLAs). The State Water Resources Control Board (State Board) has affirmed, in several precedential water quality orders (including WQ 99-05 and 2001-15), the inclusion of the iterative process in MS4 permits. As the State Board noted in WQ 2001-15:</p> <p>This Board has already considered and upheld the requirement that municipal storm water discharges must not cause or contribute to exceedances of water quality objectives in the receiving water. We adopted an iterative procedure for complying with this requirement, wherein municipalities must report instances where they cause or contribute to exceedances, and then must review and improve BMPs so as to protect the receiving waters.</p> <p>The iterative process goes hand-in-hand with the Receiving Water Limitation provision of this order, which is intended to address a water quality standard exceedance. An MS4 permit is a point source permit, which is defined by §40 CFR 122.2 to mean outfall or end-of-pipe. Attainment of a water quality standard in stormwater discharge is achieved in the effluent or discharge from the MS4 through the implementation of BMPs contained in a Stormwater Quality Management Plan (SQMP). If a water quality standard is frequently exceeded as determined by outfall monitoring relative to an ambient condition of the receiving water (during the 5-year term of the Order) the permittee shall be required to propose better-tailored BMPs to address the exceedance. The process includes determining (1) if the exceedances are statistically significant and if so, would require the permittee to (2) identify the source of the exceedance; and (2) propose new or intensified BMPs to be implemented in the next MS4 permit – unless the Executive Officer determines that a more immediate response is required.</p> <p>(continued from previous page) The iterative process does not apply to non-stormwater discharges. Section 402(p)(3)(B)(ii) of the Clean Water Act only prohibits non-stormwater discharges to the MS4 and not from it as is the case with stormwater discharges. This is because Congress set two standards for MS4 discharges: one stormwater and one for non-stormwater. As noted in WQO 2009-008, the Clean Water Act and the federal storm water regulations assign different performance requirements for storm water and non-storm water discharges. These distinctions in the guidance document, the Clean Water Act, and the storm water regulations make it clear that a regulatory approach for storm water - such as the iterative approach we have previously endorsed - is not necessarily appropriate for non-storm water.</p>

2	24 and Attachment F, Pages 146-149	Unfunded Mandates Section of Fact Sheet and Permit	several related	It is incorrect to assert an outcome on the unfunded mandates issue in a permit; this has nothing to do with protecting water quality. The unfunded mandates process has not completed a process and these assertions are opinion. Since the Fact Sheet is part of the permit, remove this section. There are many errors and incorrect assumptions, especially around the level of effort required for this permit when compared to the current permit, and the economic issues that are incorrect.

Comment	Doc. Reference		Comments
No.	Page	Section	Jul-12
1	General	General	It is appropriate to have an exemption for a Permittee from a violation of RWL and or WQBELs caused by a non-stormwater discharge from a potable water supply or distribution system not regulated by an NPDES permit but required by state or federal statute; this should clearly apply to all NPDES permits issued to others within, or flow through, the MS4 permittees jurisdiction. We would request that also included in this category should be emergency releases caused by water line breaks which are not necessary, but are unexpected and have to be dealt with as an emergency. MS4 permittees should be exempt from RWL or WQBEL violations associated with any permitted NPDES discharges that are effectively authorized by LARWQCB under the Clean Water Act.
2	General	General	Since it could take 6 months for an agency to decide if they want to join in the development of a Watershed Management Plan or just modify their current Stormwater Management Program to comply with the new permit MCMs, the implementation of the new MCMs should follow this timeline. In the interim the permittees will be required to continue implementing their current Stormwater Management Program.
3	26	A.	<p>RB staff proposed language requires the permittees to “prohibit non-stormwater discharges <b>through the</b> MS4 to receiving waters” except where authorized by a separate NPDES permit or conditionally. This prohibition is inconsistent with legal authority provisions in the federal regulations since 40 CFR 122.26(d)(1)(ii) which requires legal authority to control discharges <b>to</b> the MS4 but not <b>from</b> the MS4. Additionally, with respect to the definition of an illicit discharge at 40 CFR 122.26(b)(2), an illicit discharge is defined as “a discharge <b>to</b> the MS4 that is not composed entirely of stormwater”. In issuing its final rulemaking for stormwater discharges on Friday, November 16, 1990[1], USEPA states that:</p> <p><i>“Section 405 of the WQA alters the regulatory approach to control pollutants in storm water discharges by adopting a phased and tiered approach. The new provision phases in permit application requirements, permit issuance deadlines and compliance with permit conditions for different categories of storm water discharges. The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA (requiring control of the discharge of pollutants that utilize the Best Available Technology (BAT) and the Best Conventional Pollutant Control Technology (BCT) and where necessary, water quality-based controls), but permits for <b>discharges from</b> municipal separate storm sewer systems must require controls to the maximum extent practicable, and where necessary water quality-based controls, and must include a requirement to effectively prohibit non-stormwater <b>discharges into</b> the storm sewers.”</i></p> <p>This is further illuminated by the section on Effective Prohibition on Non- Stormwater Discharges[2]:</p> <p><i>“Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water discharges <b>into the storm sewers</b>. Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather, an ‘effective prohibition’ would require separate NPDES permits for non-storm water discharges to municipal storm sewers”</i></p> <p>The rulemaking goes on to say that the permit application:</p> <p><i>“requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems.”</i></p> <p>Nowhere in the rulemaking is the subject of prohibiting discharges from the MS4 discussed. Furthermore, USEPA provides model ordinance language on the subject of discharge prohibitions: <a href="http://www.epa.gov/owow/NPS/ordinance/mol5.htm">http://www.epa.gov/owow/NPS/ordinance/mol5.htm</a>. Section VII Discharge Prohibitions of this model ordinance provides discharge prohibition language as follows:</p> <p><i>“No person shall discharge or cause to be discharged into the municipal storm drain system or watercourses any materials, including but not limited to pollutants or waters containing any pollutants that cause or contribute to a violation of applicable water quality standards, other than storm water.”</i></p> <p>Thus we recommend that staff eliminate the “from” language at both Part III.A.1.a. and Part III.A.2.</p>
4	28	A.2.b.vi	The conditional exemption of street/sidewalk water is inconsistent with the requirement in the industrial/commercial MCM section that street washing must be diverted to the sanitary sewer. Sidewalk water should definitely be conditionally exempt, but so also should patios and pool deck washing. If street washing has to be diverted to the sanitary sewer for industrial/commercial facilities, then it should for all facilities and so should parking lot wash water as they are similar in their pollutant loads.
5	33-36, Table 8	Discharge Prohibitions	Enforcing NPDES permits issued for the various NSWDS referenced in this table should be the responsibility of the State/Regional Board, not the MS4 permittee. Therefore, it is inappropriate to include a condition that places a responsibility on the MS4 permittee to ensure requirements of NPDES permits are being implemented or effective in order for the pertaining NSWDC category to be exempt. Proper enforcement of the various NPDES permits mentioned in this table should ensure impacts from these discharges are negligible.

6	39	A.2.a.i	<p>Staff proposal states: "Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites."</p> <p>It appears the intent of this language is to transfer the State's inspection and enforcement responsibilities to municipalities through the MS4 permit. When a separate general NPDES permit is issued by the Regional or State Board it should be the responsibility of that agency collecting such permit fees to control the contribution of pollutants, not MS4 permittees.</p>
7	39	A.2.a.vii	<p>Staff proposal states: "Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Co-permittees."</p> <p>The intention of this statement is unclear and should be explained, and a definition of "shared MS4" should be provided. How would an inter-agency agreement work with an upstream and downstream agency? This is not practical - this agreement should have been done before the interconnection of MS4 systems occurred. An example of this agreement should be provided within the Permit. The permittee will not agree to the responsibility of an exceedance without first having evidence of the source and its known origin (in other words, an IC/ID is a private "culprit" and not the cause of the City).</p>
8	39	A.2.a.xi	<p>Staff proposal states: "Require that structural BMPs are properly operated and maintained."</p> <p>MS4 agencies can control discharges through an illicit discharge program, and conditioning new/redevelopment to ensure mitigation of pollutants. Unless the existing development private property owners/tenants are willing or in the process of retrofitting its property, the installation and O&amp;M of BMPs is not practical and cannot be legally enforceable against an entity that does not own or control the property, such as a municipal entity.</p>
9	39	A.2.a.xii	<p>Staff proposal states: "Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4."</p> <p>It is difficult, if not impossible, to accurately quantify the exact effectiveness of a particular set of BMP's in reducing the discharge of pollutants. Some discharges may be reduced over time given reductions in industrial activity, population in a particular portion of the community feeding into the MS4, or for other reasons not directly related to implementation of structural BMPs. Given that the County of LA is generally urbanized and thus impervious, a lethargic economic climate (meaning development and redevelopment is not occurring in an expeditious manner), and that several pollutants do not have known BMPs effective at removing/reducing the content (i.e., metals, toxics, pesticides), the effectiveness of BMPs should not be required and instead should only be used for research, development, and progress of BMP testing.</p>
10	40	A.2.b	<p>Staff proposal states: "Permittee must submit a statement certified by its chief legal counsel that the Permittee has the legal authority within its jurisdiction to implement... Each permittee shall submit this certification annually..."</p> <p>To sign this statement, chief counsel will have to analyze this 500 page Permit, analyze the municipal code, and prepare a statement as to whether actions can be commenced and completed in the judicial system. An annual certification is redundant and unnecessary in addition to being extraordinarily costly. At most, legal analysis should be done once during the Permit term. Otherwise, please delete this requirement.</p>
11	40	A.3	<p>The staff proposal includes a section on Fiscal Resources. Most MS4's do not have a storm water quality funding source, and even those that do have a funding source are not structured to meet the requirements of the proposed MS4 requirements (for instance, development funds may be collected to construct an extended detention basin, but not for street sweeping, catch basin cleaning, public right-of-way structural BMPs, etc).</p>
12	40	A.3.a	<p>Staff proposal states: "Each Permittee shall exercise its full authority to secure the fiscal resources necessary to meet all requirements of this Order"</p> <p>This sentence has no legally enforceable standard. What exactly does the exercise of "full authority" mean when the exercise of a city's right to tax comes with consequences and no guarantee of success? Municipal entities must adjust for a variety of urgent needs, some federally mandated in a manner that cannot be ignored. So, if we seek the fiscal resources to fund the programs required in the permit and the citizens say "No", then a municipality will have a limited ability to comply with "all requirements of this Order".. Can the language be changed to state: "Each permittee shall make its best efforts given existing financial and budget constraints to secure fiscal resources necessary to meet all requirements of this Order"?</p>
13	40	A.3.c	<p>Staff proposal states: "Each permittee shall conduct a fiscal analysis... to implement the requirements of this Order."</p> <p>Most MS4's do not have adequate funding to meet all requirements of the Tentative MS4 Permit. A Permit requirement to secure funding is overreach. Please delete this section.</p>
14	58	D.4.a.i.(2)	<p>Staff proposal states: "To measurably change the waste disposal and storm water pollution generation behavior of target audiences..."</p> <p>Define the method to be used to measure behavior change. As written, this requirement is vague and open to interpretation.</p>
15	60	D.4.d.i.(2).(b)	<p>Staff proposal states: "... including personal care products and pharmaceuticals)"</p> <p>The stormwater permit should pertain only to stormwater issues. Pharmaceuticals getting into waters of the US are typically a result of waste treatment processes. All references to pharmaceuticals should be removed from this MS4 permit.</p>
16	60	D.4.d.i.(3)	<p>The Regional Board assumes that all of the listed businesses will willingly allow the City to install displays containing the various BMP educational materials in their businesses. If the businesses do allow the installations then the City must monitor the availability of the handouts because the business will not monitor or keep the display full or notify the City when the materials are running out. If the business will not allow the City to display the educational material must we document that denial? Will that denial indicate that the City is not in compliance?</p>
17	63-66	D.5.d-f	<p>These sections pertain to inspecting critical source facilities where it appears the intent is to transfer the State's Industrial General Permit inspection and enforcement responsibilities to municipalities through the MS4 permit. We request eliminating these sections OR revise to exclude all MS4 permittee responsibility for NPDES permitted industrial facilities.</p>

19	67	D.6.a.i.(3)	The stated objective of mimicking the predevelopment water balance is not consistent with the requirement that the entire design storm be managed onsite. Please consider allowing subtracting the predevelopment runoff from the design volume or flow.
20	69	D.6.b.ii.(1).(a)	Please clarify whether this paragraph applies to what is existing on the site or what is being redeveloped.
21	70	D.6.c.i.(2).(b)	Consider removing the "whichever is greater" wording. The two methods are considered equivalent and the 85 <sup>th</sup> percentile was calculated to be the 0.75-inch for downtown Los Angeles. Currently, the 0.75-inch storm criterion has been used throughout the County for uniformity. While requiring the 85 <sup>th</sup> percentile to be used instead appears more technically appropriate, requiring calculating both criteria and using the greater value appears punitive.
22	70	D.6.c.i.(4)	Consider deleting this sentence since it is redundant with item VI.D.6.c.i.1 and green roofs are not feasible not only based on the provisions of this order but also due to regional climate and implementability considerations.
23	70	D.6.c.ii.(2)	Add "lack of opportunities for rainwater use" as one of the technical infeasibility criteria to acknowledge the fact that most of the type of development projects cannot utilize the captured volume of water.
24	72	D.6.c.iii.(1).(b). (ii)	The requirement for raised underdrain placement to achieve nitrogen removal is inconsistent with standard industry designs and is based on limited evidence that this change will improve nitrogen removal. Furthermore, by raising the underdrain, other water quality problems may result such as low dissolved oxygen and bacterial growth due to the septic conditions that will be created.
25	72	D.6.c.iii.(2).(b)	The requirement to provide treatment for the project site runoff when offsite mitigation is provided is punitive and unfair considering that an alternative site needs to be retrofitted to retrain the equivalent volume. Please consider removing the on-site requirement when mitigation occurs in an offsite location.
26	72	D.6.c.iii.(4)	The conditions listed for offsite projects are overly restrictive. Also, considering legal and logistical constraints regarding offsite mitigation, this alternative is not very feasible.
27	75	Table 11	The concept of establishing benchmarks for post construction BMPs was initially developed in the 2009 Ventura MS4 permit. However there is a significant different between the permits. The Ventura County's NPDES MS4 permit requires the project developer to determine the pollutant of concern(s) for the development project and use this pollutant as the basis for selecting a top performing BMP. In the case of the Draft Order, there is no determination of the pollutant of concern for the development project. Instead post construction BMPs must meet all the benchmarks established in Table 11. Unfortunately, no one traditional post construction BMP (non-infiltration BMPs) is capable of meeting all the benchmarks and thus the developer will not be able to select a BMP. We recommend that provision VI.D.6.c.iv.(1)(a) (page 74) be modified so that the selection of post construction BMPs is consistent with the Ventura permit and is based on the development site's pollutant of concern(s) and the corresponding top performing BMP(s) that can meet the Table 11 benchmarks.
28	75	D.6.c.v.(1).(a). (i)	Erosion Potential (Ep) is not a widely used term in our region, and may not be the most appropriate term to be used as an indicator of the potential hydromodification impacts.
29	76	D.6.c.v.(1).(a). (iv)	The requirement for development of a new Interim Hydromodification Control Criteria is unnecessary considering there is already peak storm control requirements in the existing MS4 Permit and that the State Water Board is finalizing the statewide Hydromodification Policy.
30	77	D.6.c.v.(1).(c). (i).1	The requirement to retain on site the 95 <sup>th</sup> percentile storm is excessive and inconsistent with all other storm design parameters that appear in this order. It may also not be an appropriate storm in terms of soil deposits for the soil deprived streams such as Santa Clara Creek. Again, consider referring to the statewide policy for a consistent and technical basis of the hydromodification requirements.
31	80	D.6.d.i.1	The requirement of 180 days for the "Local Ordinance Equivalence" may be difficult to be met due to the typical processing and public review period for changes to local municipal codes. Consider revising this provision to require immediate start of this effort instead.
32	83	D.7.a.iii	MEP should be changed to BAT and BCT for consistency with the State's General Construction Permit (GCASP).
33	83	D.7.d	Consider introducing a minimum threshold for construction sites such as those for grading permits. As proposed, minor repair works or trivial projects will be considered construction projects and will unnecessarily be subject to these provisions.
34	83	Table 12	Some of the listed BMPs will not be applicable for all construction sites. Consider replacing the title of the Table 12 to "Applicable Set of BMPs for Construction Sites"
35	84-91	D.7.e-j	All these provisions refer to construction sites of greater than one acre. These sites are subject to the General Construction Permit provisions and within the authority of the State agencies. Towards ensuring compliance with these regulations, the State is collecting a significant fee that covers inspection and tracking of these facilities. We are disputing the need to establish an unnecessary parallel enforcement scheme for these sites. This is consistent with the RWQCB member(s) voice at one of the workshops.
36	84-91	D.7.g-j	Refer to the State's GCASP and its SWPPP requirements to avoid delicacy.
37	85	D.7.g.ii.(9)	There is no need to introduce a new term/document of Erosion and Sediment Control Plan for construction sites that are already subject to GCASP's SWPPP requirements.
38	87	Table 13	Delete. This table is the same as Table 12.
39	90	Table 17	The suggested inspections could not possibly be accommodated based on current resources because of the concurrent need to visit all sites. However, if the GCASP funding is transferred for locally-based enforcement, an increase number of inspections may be accommodated.
40	90	D.7.j.ii.(2).(a)	Consider deleting this requirement as being unnecessary. The placement of BMPs may not be needed based on the season of construction and the planned phases.
41	94	D.8.d	If there is a specific pollutant to address, retrofitting or any other BMP would best be accomplished through a TMDL, which is for the Permittees to determine rather than a prescribed blanket approach. As written, this is too broad of a requirement with unknown costs that is attempting to solve a problem before there is a problem. Please delete VI.D.8.d.
42	94	D.8.d.i	Staff proposal states: "Each Permittee shall develop an inventory of retrofitting opportunities that meets the requirements of this Part VI.8.D... The goals of the existing development retrofitting inventory are to address the impacts of existing development through regional or sub-regional retrofit projects that reduce the discharges of storm water pollutants into the MS4 and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards."  This process would require land acquisition, a feasibility analysis, no impacts to existing infrastructure, proper soils, and support of various interested stakeholders. Additionally, if a property or area is being developed/redeveloped, retrofitting the site for water quality purposes makes sense, but not for an area where no development/redevelopment is planned. Finally, the LID provisions have already included provisions for off-site mitigation, in which we recommend that regional water quality projects be considered in lieu of local-scale water quality projects that will prove difficult to upkeep, maintain, and replace, let alone have existing sites evaluated as feasible. For these reasons, this requirement should be removed.

43	95	D.8.d.v	Any retrofit activities should be the result of either an illicit discharge investigation or TMDL monitoring follow-up and will need to be addressed on a site-by-site basis. A blanket effort as proposed in a highly urbanized area is simply not feasible at this time.
44	96	D.8.e.ii	Staff proposal states: "Each Permittee shall implement the following measures for...flood management projects"  Flood management projects need to be clearly defined.
45	102	D.8.h.vii.(1)	This requirement appears to be an "end-run" around the lack of catch basin structural BMPs in areas not covered by Trash TMDLs. The requirement has the potential to be extraordinarily economically burdensome. If an area is NOT subjected to a Trash TMDL, then the need for any mitigation devices is baseless. The MS4 permit requirements should not circumvent nor minimize the CWA 303(d) process.
46	103	D.8.h.ix	Staff proposal requires: "Infiltration from Sanitary Sewer to MS4 / Preventive Maintenance...."  The State Water Board has implemented a separate permit for sewer maintenance activities. Additional sewer maintenance requirements are redundant and unnecessary. Please delete this requirement.
47	106-110	D.9	A definition of "outfall" is required for clarity. An "outfall" for purposes of "non-stormwater outfall-based monitoring program" should be defined as "major outfall" pursuant to Clean Water Act 40 CFR 122.26. Please revise each mention of "outfall" to read "major outfall" when discussing "non-stormwater outfall-based monitoring program".
48	107	D.9.b.i	Please revise the proposed language to "Permittee/Permittees shall develop written procedures for conducting investigations to identify the source of <b>suspected</b> illicit discharges, including procedures to eliminate the discharge once source is located." It is not known if a discharge is illicit until the investigation is completed.
49	107	D.9.b.iii.(1)	"Illicit discharges suspected of being sanitary sewage... shall be investigated first." ICID inspectors should be allowed to make the determination of which event should be investigated first. For example, a toxic waste spill or a truck full of gasoline spill should take precedence over a sewage spill. This requirement should be amended to the "most toxic or severe threat to the watershed" shall be investigated first.
50	Attachment A	Definitions	The Definition of: "Development", "New Development" and "Re-development" should be added. The definitions in the existing permit should be used:  <i>"Development" means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i>  <i>"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.</i>  <i>"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.</i>  The last of the three "routine maintenance" activities listed above should exclude projects related to existing streets since typically you are not changing the "purpose" of the street to carry vehicles and should not be altered.
51	Attachment A, Page 1	Definitions	The biofiltration definition limits the systems that allow incidental infiltration. Many municipal ordinances and established engineering practices will not allow even incidental infiltration if the planter boxes are located adjacent to a building structure. Thus, this definition will exclude the most common types of planter boxes which logically have to be placed next to the building to collect roof runoff. For this reason, consider allowing biofiltration to include planter boxes without incidental infiltration since they may be the only applicable BMPs.
52			Some small cities do not have digital maps. In the "General" category of Section 11, please provide a 1 year time schedule for cities to create digital maps OR provide the municipality the ability to develop comprehensive maps of the storm sewer system in any format.
53			Omit the comment, "Each mapped MS4 outfall shall be located using geographical positioning system (GPS) and photographs of the outfall shall be taken to provide baseline information to track operation and maintenance needs over time." This requirement is cost prohibitive and of little value because many City outfalls are underground and could not be accurately located or photographed. Photographs of outfalls in channels have little value since data required is already included on "As-Built" drawings. Geographic coordinates can easily be obtained using Google Earth or existing GIS coordinate systems.  "The contributing drainage area for each outfall should be clearly discernible..." The scope of this requirement would involve thousands of records of drainage studies. The Regional Board should be aware that this requirement would be very labor intensive, time consuming, and very costly.
54			Storm drain maps should show watershed boundaries which by definition provide the location and name of the receiving water body. Please revise (3) to read "The name of all receiving water bodies from those MS4 major outfalls identified in (1).
55			The LA Permit Group proposes "non-stormwater outfall-based monitoring program" to be flow based monitoring. Please revise item (4) of 11.c.i. to read "(4) monitoring flow of unidentified or authorized non-stormwater discharges, and..."
56			"Monitoring of unknown or authorized discharges" "Authorized" discharges are exempted or conditionally exempted for various reasons. Monitoring authorized discharges is monitoring for the sake of monitoring and offers no clear goal or water quality benefit. Please delete this requirement. If the source of a discharge is unknown, then monitoring may be used as an optional tool to identify the culprit.

[1] 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

[2] 55 FR 47990-01 VI.G.2. Effective Prohibition on Non-Stormwater Discharges

Document Name: **Attachment E - Monitoring and Reporting Program Draft Tentative Order - July 2012**

Agency/Reviewer: **LA Permit Group**

Comment	Doc. Reference		Comments
No.	Page	Section	Jul-12
1	Multiple	Multiple	The use of the HUC-12 watershed for limits is a good start but there needs to be some flexibility in its use to insure that the HUC-12 truly reflects the actual watershed boundary.
2	Multiple	Multiple	The rain gages to be used for determining a wet versus dry weather day should be selected by the agencies and approved by the Regional Board. Since monitoring plans will be on a regional basis the use of 50% of County rain gages in a watershed may not be necessary. Plus, predictions do not necessarily use County rain gages.
3	Attachment E, Page 3	II.A.1	Omit as a primary objective to assess the "biological impacts" of discharges from the MS4. The MS4 Permit is to regulate water quality. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to assess biological impacts of discharges and to set water quality regulations to prevent adverse biological impacts. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
4	Attachment E, Page 4	II.E.1	Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) indicates:  <i>The permit requires all <b>effluent</b> and <b>ambient</b> monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.</i>  The only definition of "ambient" monitoring is defined by SWAMP protocol as being 72 hours after a storm event.  Regarding monitoring purposes "b" and "c" assessing trends in pollution concentrations should be: (1) limited to ambient water quality monitoring; and (2) Regional Board's surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.  <i>Recommended Corrective Action:</i> Clarify that RWL monitoring is only in the ambient condition as defined by SWAMP and that ambient monitoring is performed as part of the SWAMP and is not the responsibility of MS4 permittees.
5	Attachment E, Page 4	II.E.1.c	Omit Item c. The MS4 Permit is to regulate water quality. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to "Determine whether the designated beneficial uses are fully supported as ...aquatic toxicity and bio-assessment monitoring." This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
6	Attachment E, Page 4	II.E.2.a	Outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to monitor progress towards achieving TMDL WLAs that are expressed in the receiving water. Instead, Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs, if necessary.  Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.  <i>Recommended Correction:</i> Either utilize MALs, in lieu of numeric WQBELs, to measure progress towards achieving TMDL WLAs expressed in the receiving water or eliminate MALs entirely.
7	Attachment E, Page 4	II.E.3.a	Regarding "a," This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.  <i>Recommended Correction:</i> Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the IC/ID program.
8	Attachment E, Page 4	II.E.3.b	With regard to "b", see previous responses regarding MALs and the limitation of the non-stormwater discharge prohibition to the MS4.  <i>Recommended Correction:</i> Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.
9	Attachment E, Page 4	II.E.3.c	Regarding "c", as mentioned, non-stormwater discharges cannot be applied to receiving water limitations because they are only prohibited to the MS4, not from or through it.  <i>Recommended Correction:</i> Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.

10	Attachment E, Page 4	II.E.4	<p>Omit Item 4. Monitoring of Development/Re-development BMPs is the responsibility of the Developers. Requirements for monitoring Developer BMPs should be part of Section VI.D.6. <i>Planning and Land Development Program</i> and the responsibility of the Developer.</p> <p>The purpose of this requirement is not authorized under federal stormwater regulations as it relates to monitoring. Requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4's pollution contribution relative to exceeding ambient water quality standards. There is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.</p> <p>Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines "effectiveness" -- effective relative to what standard? It is also not clear how such monitoring is to be performed.</p> <p><i>Recommended Correction:</i> Delete this requirement.</p>
11	Attachment E, Page 5	II.E.5	<p>Omit Item 5. The MS4 Permit is to regulate discharges to receiving water. It is the role of the State EPA and Water Quality Control Board, not municipal governments, to conduct Regional Studies for Southern California Monitoring Coalition, bio-assessment and Pyrethroid pesticides. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.</p> <p>Requiring 85 jurisdictions to conduct regional monitoring is duplicative and inefficient and should be conducted by a Regional authority.</p> <p>Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a task performed by the Regional Board's SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County's mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.</p>
12	Attachment E, Pages 5-6	III.F & G	Omit Items F. & G. Specifying Sampling Methods and Analytical Procedures in the permit adds unnecessary liability for Cities for work that is already described in USEPA Protocols and per approved TMDLs. These Items should be combined and state to follow USEPA Protocols or per approved TMDLs.
13	Attachment E, Page 6	III.H.3	There is a typo for Item 3. Item 3. should read "...requirements identified in Part XVIII.A.5. and Part XVIII.A.7 of this MRP."
14	Attachment E, Pages 7-8	IV.C.1	More time is needed to prepare Coordinated Integrated Monitoring Plans due to the number of agencies involved. Since existing monitoring programs will proceed as Coordinated Integrated Monitoring Plans are being prepared, then there is no need for accelerated schedules. Revise Item 1. to provide twelve (12) months for each Watershed Group to submit a Memorandum of Understanding to work with other agencies for a Coordinated Integrated Monitoring Plan. A letter of intent allows a Permittee to drop out of the process at any time and 12 months are required to process a Memorandum of Understanding with County and State agencies.
15	Attachment E, Page 8	IV.C.2	Revise Item 2. to require "Each Permittee not participating in a Coordinated Integrated Monitoring Plan to submit an Integrated Monitoring Plan..."
16	Attachment E, Page 8	IV.C.3	Revise to allow participating Permittees 24 months to submit a Coordinated Integrated Monitoring Plan. It will take a minimum of 12 months to process a Memorandum of Understanding with County and State agencies and that agreement is required before any Permittee will award a contract to a consultant to prepare a Coordinated Integrated Monitoring Plan. It takes 3 months to issue Request for Proposals and award a contract and then 9 months for a consultant to prepare a Coordinated Integrated Monitoring Plan. Since existing monitoring programs will proceed as Coordinated Integrated Monitoring Plans are being prepared, then there is no need for accelerated schedules.

17	Attachment E, Page 8	IV.C.5	Revise to allow 9 months after approval of an IMP or CIMP by the Executive Officer to commence monitoring. It takes 3 months to issue Request for Proposals and award a contract for monitoring. It takes an additional 6 months to obtain permits from the Los Angeles County Flood Control District to access monitoring locations on their systems.
----	-------------------------	--------	--

18	Attachment E, Page 8	IV.C.7	<p>Both the current permit shoreline monitoring program (CI-6948) and the SMBBB TMDL Coordinated Shoreline Monitoring Plan (CSMP) are being incorporated into the new permit. <b>The CI-6948 shoreline monitoring requirements, Section II.D – page T-11, is redundant to the CSMP.</b> All stations monitored in the CI-6948 are also monitored in the CSMP. Furthermore, the SMBBB TMDL specifies that the agencies are to select sampling frequency and the CSMP states that the agencies have selected weekly sampling frequency. However, CI-6948 requires several stations to be monitored up to 5 days per week and with the addition of the CSMP additional stations will be monitored two days per week.</p> <p>Paragraph II.D.b) of the CI-6948 shoreline monitoring section specifies that the sampling frequency at 28th Street (DHS 113), also SMB-5-2, and Herondo storm drain (DHS 115), also SMB-6-1, be increased to 5 times per week. Paragraph II.D.e) states that monitoring sites are to be monitored 5 days per week if the historical water quality is worse than the reference beach. However, no evidence was presented to the responsible agencies that this was the case for the SMB-5-2 or 6-1.</p> <p>An evaluation of historical data was presented by the Regional Board Staff Report for the reconsideration of the SMBBB TMDL dated May 2012. Further evaluation of this data shows that SMB-5-2 and SMB-6-1 should not be subject to the increase frequency for the following reasons:</p> <ol style="list-style-type: none"> <li>1. Of the 67 stations being monitored as part of the CSMP, SMB-5-2 and 6-1 are ranked 57 and 43 respectively in the percent of exceedances during the summer dry weather period.</li> <li>2. 37 stations being monitored only weekly or two days per week had a higher summer-dry weather exceedance percentage than SMB-6-1.</li> <li>3. The Reference Beach monitoring station (SMB-1-1) had a summer dry weather period exceedance percentage of 10.2% versus 6.9% and 3.2% for SMB-5-2 and 6-1, respectively.</li> <li>4. The Reference Beach monitoring station (SMB-1-1) had an average year-round exceedance percentage of 12.1% versus 14.6% and 11.4% for SMB-5-2 and 6-1, respectively. Although exceedance rate for SMB 5-2 is higher than the Reference Beach monitoring station based on year round results, it is lower during the critical summer-dry weather period.</li> <li>5. Of the 8 stations being monitored five days per week SMB-6-1 and 5-2 have the lowest summer dry weather period exceedance percentage (top 6 ranged from 40.9% to 8.5% compared to 6.9% and 3.2% for SMB-5-2 and 6-1).</li> </ol> <p>In addition, the inclusion of both the CI-6948 shoreline monitoring program and CSMP into the permit will result in 5 (SMB-5-1, 5-3, 5-5, 6-5, and 6-6) of the other 9 monitoring stations in SMBBB TMDL Jurisdictional Groups 5 and 6 being monitored 2 days per week which is not the case for any of the other CSMP stations.</p> <p>For all of the above reasons, the shoreline monitoring provisions of CI-6948 should be removed from the new permit monitoring program. However, at a minimum, paragraph D.1.b) should be removed and paragraph D.1.e).(1) should be modified to remove stations S13 (SMB-5-1), S14 (SMB-5-3) S15 (SMB-5-5), S17 (SMB-6-5) and S18 (SMB-6-6).</p> <p>The following is proposed wording modification to Attachment E, Section IV.C.7:</p> <p>“7. Monitoring requirements pursuant to Order No. 01-182, except Section D.1.b) is removed and Section D.1.e).(1) is modified to removed sites S13, S14, S15, S17 and S18 of the Monitoring and Reporting Program - CI-6948, shall remain in effect until the Executive Officer of the Regional Water Board approves a Permittee(s) IMP and/or CIMP plan(s).”</p>
19	Attachment E, Page 14	VI.C.1.b	Monitoring should be performed per approved IMP or CIMP or approved TMDL. The IMP and CIMP should identify rain gauges to use in the appropriate watershed.
20	Attachment E, Page 15	VI.C.1.d	Omit iv. The TMDLs will specify if TSS or SSC monitoring is required, otherwise sediments are needed for beach replenishment and the naturally occurring transport of sediments should not be regulated.
21	Attachment E, Page 15	VI.C.1.d	Omit vi. This imposing of State and Federal responsibilities on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
22	Attachment E, Page 15	VI.D.1.a	Omit the requirement for “One of the monitoring events shall be during the month with the historically lowest instream flows.” This data does not exist and it would be simpler to specify the historically driest month.
23	Attachment E, Page 15	VI.D.1.b	Revise item i. and ii. to simply be on days with no measurable rain. There are sufficient days of no measurable rain in Southern California and any rain event could result in isolated stormwater run off.
24	Attachment E, Page 16	VII.A	Revise the description to include database, “The IMP and/or CIMP plan(s) shall include a map <b>and/or database</b> of the MS4 to include the following information:” GIS maps all come with database(s) that include much of the required information.
25	Attachment E, Page 17	VIII.A.2.e	Include the option to monitor “upstream of the actual outfall or downstream of a political boundary”. Sometimes the best location to do monitoring is at the next manhole downstream from a city boundary.
26	Attachment E, Page 17	VIII.B.1.a	Omit “except aquatic toxicity, which shall be monitored once per year...”. This imposing of State and responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
27	Attachment E, Page 18	VIII.B.1.b	Omit Item ii. and iii. Monitoring should be performed per approved IMP or CIMP or approved TMDL.
28	Attachment E, Page 18	VIII.B.1.c	Omit Item iv. The TMDLs will specify if TSS or SSC monitoring is required, otherwise sediments are needed for beach replenishment and the naturally occurring transport of sediments should not be regulated.
29	Attachment E, Page 18	VIII.B.1.c	Omit vi. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
30	Attachment E, Page 19	IX.A.2	Include “natural flows” or “natural sources” as a potential source of non-storm water flow.
31	Attachment E, Page 22	IX.E.2	Revise last sentence to read, “100% of the outfalls <b>in the inventory</b> within 5 years...”

32	Attachment E, Page 22	IX.F.2	Omit the requirement to report to the Regional Board "within 30 days of determination" because there are too many report submittals that could lead to a Notice of Violation that will have no impact on water quality. Reporting source identifications in the annual report provides central location for submittals.
33	Attachment E, Page 23	IX.G.3 & 4	Outfalls not subject to dry weather TMDLs that have significant dry weather flows should have continuous flow monitoring done for a quarter with water quality sampling done once at the beginning of that time period. If the water quality sampling indicates pollutant concentrations that exceed water quality standards, then the IC/ID investigation procedures should begin. If no water quality standards are exceeded or the IC/ID investigation eliminates the source of pollutants, then that flow has been demonstrated NOT to cause or contribute to pollutant loading and should be stopped. To continue monitoring a site that is known NOT to cause or contribute to pollutant loading is a waste of resources and an un-funded mandate.
34	Attachment E, Page 24	X	This section should be moved to Section VI.D.6.d.iv. for clarity.
35	Attachment E, Page 25	XI	Omit this section. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform Pyrethroid and SCCWRP regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
36	Attachment E, Page 28	XII	Omit this section. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform aquatic toxicity regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
37	Attachment E, Page 38	XIV.I.1 & 2	It is not reasonable to force Permittees to make changes to approved Monitoring and Reporting Programs based on the whim of an "interested" party or "as deemed necessary by EO". This provides unlimited power to interested parties or EO. Recommend these items be revised to include a caveat that there would be no additional costs or as approved by Regional Board, to make those changes open and transparent.
38	Attachment E, Page 39	XIV.M	Omit section M. as it is redundant to section L.
39	Attachment E, Page 44	XVIII.A.5	Omit Items b. & c. Regional monitoring should be done by County, State and Federal agencies that have jurisdiction over pollutants of concern. It is a waste of municipal resources to have 85 Permittees all perform aquatic toxicity regional studies. This imposing of State responsibilities beyond Federal requirements on local municipal governments is an un-funded mandate. Please provide legal justification for this transfer of jurisdiction.
40	Attachment E, Pages 49-52	XIX.B	Only include schedules for IMP and CIMP for USEPA established TMDLs and revise those schedules to be 9 months for IMP and 24 months for CIMP. Having due dates for Monitoring and Reporting plans for IMP and CIMP past the due date established by the TMDL creates confusion.

# CITY OF LA VERNE CITY HALL

3660 "D" Street, La Verne, California 91750-3599

**Subject: Comment letter – Draft NPDES Permit (Draft Order) for MS4 Dischargers within the Los Angeles County Flood Control District**

The City of La Verne appreciates the opportunity to provide comments on the subject draft order for the Los Angeles region. The City incorporates by reference the comment letter submitted by the Los Angeles Permit Group "Comment Letter – Draft NPDES Permit (Draft Order) for MS4 Discharges within the Los Angeles County Flood Control District" to this letter. While the City has been participating collaboratively and regionally and supports those efforts, the City feels it is important to send its own letter noting concerns with the pending 4<sup>th</sup> generation NPDES permit. Comments are organized around the following issues:

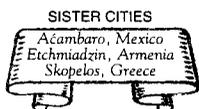

- Time Allowed for Review
- Receiving Water Limitations
- TMDLs
- Monitoring
- MCMs
- Watershed Management Program
- Cost Implications

***TIME ALLOWED FOR REVIEW***

As stated in our letter dated July 12, 2012, the comment deadline of July 23, 2012 is far too short to address all the potential issues and concerns. On several occasions, the Regional Board staff has used the Staff Working Proposal process and workshops as a justification for the expeditious manner in which the draft order was developed. This justification is misplaced for several reasons:

- 1) Each Staff Working Proposal was issued with only a few weeks for stakeholders to provide comments on what may be considered the most significant increase in public effort to address water quality issues in the past 20 years.
- 2) Although the LA Permit Group provided comments on the working proposal, it is unclear to us how the Regional Board staff addressed comments. In some cases changes were made and other cases no changes were made. In both cases no explanation was provided;

Page 1

General Administration 909/596-8726 • Water Customer Service 909/596-8744 • Parks & Community Services 909/596-8700  
Public Works 909/596-8741 • Finance 909/596-8716 • Community Development 909/596-8706 • Building 909/596-8713  
Police Department 909/596-1913 • Fire Department 909/596-5991 • General Fax 909/596-8737

- 3) By rolling out different working proposals at different times it was difficult to understand how the key provisions interacted with each other. It was only after the full draft order was issued did we see the interaction (or lack of interaction) of the provisions;
- 4) Most importantly, stormwater managers have an obligation to adequately inform other municipal departments, legal counsel, city management and elected officials on the fiscal impact of this draft order. The time to properly evaluate the permit or assess its financial, legal, and personnel impacts cannot be accomplished in the 45 day review period.

It is imperative that municipalities be given additional time to review the permit and develop alternatives for the substantial issues found in this draft order. At minimum, this should be accomplished by an additional review of a tentative order before an adoption hearing is held. Additionally, the City has representatives that are planning on attending the League of California Cities Conference on September 5-7, 2012. We request that the adoption hearing be rescheduled after September 6-7, 2012 to allow for elected officials and staff of the permitted agencies to attend the hearing.

**Recommendation:** Provide an additional 180 business days for comments and reissue the Draft Order for 45 days prior to adoption to allow cities appropriate and adequate time for review and preparation.

#### ***RECEIVING WATER LIMITATIONS***

The Receiving Water Limitations (RWL) language in the draft order creates liability that is unnecessary and counterproductive. The City is most concerned with being fined by the Regional Board or sued by a 3rd party even if it is doing everything reasonably within its power to comply with the permit. The City specifically supports recently proposed CASQA language that should be included under the RWL section of the permit allowing a true iterative process to improving stormwater quality.

Under the current RWL working proposal, the City will need to direct their resources to any and all pollutants that may cause or contribute to exceedances of water quality standards. Based on a review of other municipal outfall monitoring results in the State, there will be occasional exceedances of other non-TMDL pollutants (e.g. aluminum, iron, etc.). These exceedances may only occur once every 10 storms, but according to the current RWL proposal, the City must address these exceedances with the same priority as the TMDL pollutants. This is unreasonable and an ineffective use of limited municipal resources.

**Recommendation:** Develop Receiving Water Limitation language consistent with the California Stormwater Quality Association language that was submitted in a comment letter on the Caltrans permit and on the Statewide Phase II Permit which defines action thresholds, an iterative/adaptive management process, and avoids unnecessary liability.

#### ***TOTAL MAXIMUM DAILY LOADS***

The manner in which TMDLs are being entered into the permit does not allow the City of La Verne or other municipalities the appropriate steps or proper science to be in compliance with TMDLs.

#### **Recommendation**

- Provide a provision which requires that a TMDL be reconsidered in light of information that was not available when the TMDL was developed before the final WLAs become effective.

Whenever the reconsideration has been completed, the permit should be reopened to make changes to any wasteload allocation, time schedules, and other pertinent information.

- Translate WLAs into WQBELs, expressed as BMPs
- State that the implementation of the BMPs using an iterative process will place the permittee into compliance with the MS4 Permit.
- Provide for four (4) compliance options for both interim and final WLAs:
  - Implement Actions/BMPs consistent with Watershed Management Program
  - Compliance at the outfall (end of pipe)
  - Compliance in the receiving water (river, creek, ocean)
  - No direct discharges
- Allow for the adaptive management approach to be utilized for TMDL compliance, consistent with the timelines identified in the Watershed Management Programs.

### ***MONITORING***

The proposed monitoring program will significantly increase from current monitoring efforts. Although we understand the need for monitoring to support the permit, there are a number of issues that need to be fully vetted and discussed. These issues include:

- **Receiving water monitoring should be consistent with SWAMP protocols including the requirement that ambient monitoring be conducted two days following a storm event.** Currently the receiving water monitoring is proposed to be conducted during storm events. Such an approach will not support the need to assess the receiving water quality consistent with the SWAMP approach that is used as the basis for 303(d) listing.
- **The focus and scope of non-stormwater monitoring is not commensurate with the environmental issues associated with dry weather flows.** We believe the non-stormwater monitoring should be to help identify illicit discharges and not for assessing the multitude of objectives noted in the MRP, II.E.a – c. Furthermore we would submit that the MS4s should focus its non-stormwater monitoring on discharges “into” the MS4 and not on discharges “through” or from our MS4s that may cause or contribute to exceedances of water quality standards. This is consistent with CWA section 403(p).
- Regarding regional studies (MRP XI.A – B), these studies should be conducted by the Regional or State Board. But if the permit does require special studies, **the permit needs to establish the mechanism/option for permittees to participate in the studies without having to conduct the studies on an individual basis.** Furthermore, the Regional Board should be the agency to lead and coordinate these studies. The MRP appears to read that each and every permittee must conduct the regional studies.
- **Toxicity monitoring should be limited to the receiving water only and not at the outfalls.** It’s important to establish whether if toxicity is an issue in the receiving water before conducting expensive monitoring at the outfalls. Furthermore, recent Department of Pesticide Regulations has severely limited the use of pyrethroid based pesticides, thus calling into question the need for expensive toxicity monitoring, especially at outfalls. Finally, if a study is necessary, the Regional Board should lead the study.
- Insufficient time is allotted to prepare Coordinated Integrated Monitoring Plans (CIMP). Since the monitoring for TMDLs should continue per the TMDL schedules, the Permittees should be allowed sufficient time to prepare the CIMPs. To prepare a CIMP the Permittees will need more than a Letter of Intent to proceed. **We recommend that the draft order be modified to allow 12 months to submit a Memorandum of Agreement to participate in a CIMP and 24 months to submit the complete CIMP.** The time required to award the monitoring contract is

3 months and at least 6 months are needed to obtain Los Angeles County Flood Control Encroachment Permits, thus at least 9 months is needed before commencing monitoring.

### ***MINIMUM CONTROL MEASURES***

In order to further water quality improvements, the permit needs to set clear goals, while allowing flexibility with the programs and BMPs implemented. Furthermore, the municipal stormwater performance standard to reduce pollutants to the maximum extent practicable is not well defined and will depend on a number of factors. This constraint, as well as the USEPA position that the iterative process is the basis for good stormwater management, supports the need to provide flexibility in defining the criteria for customizing MCMs.

### **Timeline**

The City of La Verne requests that the Regional Board provide a draft timeline for implementation and phasing-in of the Minimum Control Measure requirements. The permit should allow a 12 month time schedule to transition from current efforts to the new MCM requirements.

### **Shifting of State Responsibility to the MS4**

The draft order shifts much of the State responsibilities regarding the State's General Permits for Construction and Industrial Activities to cities. This is especially true for the Construction General Permit and Provision VI.D.7. A few examples of where the draft order either shifts the responsibility or actually exceeds the requirements of the CGP are listed below:

- Maintaining a database that overlaps with the States' own SMARTS database. Asking Permittees to collect the same data adds unnecessary time and expense with no benefit to water quality.
- Requiring the quantification of soil loss is redundant with the CGP and adds additional MS4 costs.

Those elements that shift State responsibility should be eliminated and the MCMs should be coordinated with other state and federal requirements, with particular attention to CGP and IGP requirements.

### **New Development MCM**

We have significant concerns with the following parts of the New Development MCM:

- Storm design criteria
- Alternative compliance option offsite mitigation
- Treatment control performance benchmarks
- BMP tracking and inspection
- BMP specificity
- Hydromodification

### ***Storm Design Criteria***

The draft order in Provision D.6.c.i (page 70) requires the developer retain the stormwater quality design volume as calculated by either the 0.75 inch storm or the 85<sup>th</sup> percentile 24 hour storm whichever is greater. We take exception to the requirement to select the largest calculated volume. In all permits to date in California these two design criteria were judged to be equivalent. In fact, the current stormwater permit for Los Angeles County includes four design criteria to choose from for the stormwater volume. The additional effort to assess every project to choose between two equivalent

design criteria makes little sense and adds cost to any project. We recommend that the developer be allowed to choose between the two criteria.

#### *Alternative Compliance Option - Offsite Mitigation*

The draft order goes into great detail discussing an alternative compliance option to full on-site retention of the design storm volume. The alternative option takes the form of an offsite mitigation project. We would recommend that the developer be required to remove only the pollutant loads that would have been removed at the project site by way of the mitigation site and if the mitigation site cannot meet that load reduction then the developer can implement treatment controls at the project site for the remaining differential.

#### *Treatment Control Performance Benchmarks*

The Ventura County's NPDES MS4 permit requires the project developer to determine the pollutant of concern(s) for the development project and use this pollutant as the basis for selecting a top performing BMP. In the case of the Draft Order, there is no determination of the pollutant of concern for the development project. Instead post construction BMPs must meet all the benchmarks. Unfortunately, traditional post construction BMPs are not capable of meeting all the benchmarks and thus the developer will not be able to select a BMP. We recommend that provision VI.D.6.c.iv.(1)(a) (page 74) be modified so that the selection of post construction BMPs is consistent with the Ventura permit and is based on the development site's pollutant of concern(s) and the corresponding top performing BMP(s) that can meet the Table 11 benchmarks.

#### *BMP Tracking and Inspection*

In the draft order provision VI.D.6.d the permittees are being required to track and inspect post construction BMPs including LID measures. The provision does allow that such effort can be addressed by the project developer but even with this consideration, the provision is onerous for city staff as this would still require significant staff time (ex. plan reviews, data entry, letter preparation and enforcement, etc.). This is especially true for LID measures, which if planned and designed correctly, will include a large number of measures (planter boxes, infiltration trenches, swales, etc.) on every site. Furthermore, most of the LID measures will be infiltration type measures, which are difficult to inspect and should be only inspected in wet weather when one can ascertain that the LID measures are operating correctly. This inspection concept, when taken to the extreme will mean that municipalities will be inspecting LID measures all over the community and only during rain events. This is unreasonable and cost prohibitive for the municipality. We recommend that the tracking and inspection of post construction BMPs be limited to only the conventional BMPs (e.g. detention basins, wetlands, etc.); alternatively require the MS4 to spot check a limited number of LID measures to ascertain how well they are operating.

#### *BMP Specificity*

The draft order in Attachment H provides detail specifications for biofiltration and bioretention BMPs. The City believes that such specificity although well intended is counterproductive. Such specificity is equivalent to a wastewater NPDES permit specifying the grain size in the multimedia filtration unit. It is more appropriate to establish the performance standard for the BMP and to allow the MS4 to develop design specifications to meet the standard. We recommend that Attachment H be removed and a provision be established that requires the MS4 to develop the design specifications for bioretention/biofiltration.

### *Hydromodification*

It is premature to change the hydromodification criteria, and specifically the interim criteria. In our current 2001 order Permittees are required to develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study. We believe it is more constructive to keep with the criteria and not revise it for the interim until the final criteria can be developed by the State. A change now and then later on just adds confusion to the development process and creates additional work for a limited or non-existent water quality improvement. The effort under the 2001 permit is sufficient until such time final criteria are developed.

### **PUBLIC AGENCY MCM**

The draft order identifies a number of requirements for public agency MCMs but two are specifically alarming. First is provision VI.D.8.h.vii (page 102) which specifies additional trash BMPs regardless of whether the area is subject to a trash TMDL. We take exception to this approach, as the MCM requires prioritization, cleaning and inspection of catch basins as well as street sweeping and other management control measures to address trash at public events. Even if the Municipality is controlling trash through these control measures, the Municipality must still install trash excluders (see page 102 regarding “additional trash management practices”). This makes little sense and the City would submit that if the initial control measures are successful, then the “additional trash management practices” are unnecessary (as evident by the lack of a TMDL).

The second issue pertains to provision VI.D.8.d (page 94) regarding retrofitting opportunities. Reading this provision in whole would seem to indicate that the MS4 must identify all potential retrofit sites (private or publically owned) and to prioritize the sites. Stormwater regulations (40 CFR 122.26.(d)(2)(iv)(4) requires consideration of retrofitting opportunities, but the consideration is limited to flood management projects (i.e. public right of way) and does not require consideration of private areas. We recommend that for this permit term that the retrofit provision (i.e. inventory, screening, and prioritization) be limited to public right of ways lands only.

### **ID/IC MCM**

The draft order identifies a number of provisions that are fundamental to an Illicit Connection/Illegal Discharge program. These provisions include

- III. Discharge Prohibition,
- VI.A.2 Standard Provisions – Legal Authority,
- VI.D. 9 IC/ID Elimination Program,
- Attachments E, Monitoring and Reporting and
- Attachment G Non-stormwater Action Levels.

We recommend that the permit allow the Watershed Management Programs to guide the customization of the Numeric Action Levels (NAL) based on the highest water quality priorities in each watershed and to establish them at a level that would provide better assurance that illicit discharges can actually be found and not have every outfall become a high priority outfall.

### ***WATERSHED MANAGEMENT PROGRAMS***

The draft order allows the municipalities only one year to develop a comprehensive watershed management program. This is insufficient time to organize the watershed cities and other agencies, develop cooperative agreements, initiate the studies, calibrate and run the models based on relevant data, draft the plans, and obtain necessary approvals from political bodies. It will require at least 24 months to develop a draft plan that is comprehensive, analytically supported, and implementable.

The following comments address the watershed management program:

- The draft order seems to be silent on the critical issue of sources of pollutants outside the authority of MS4 permittees (e. g. aerial deposition, upstream contributions, discharges allowed by another NPDES permit, etc.). We request that permittees be allowed to demonstrate that some sources are outside the permittee's control and not responsible for managing or abating those sources.
- The permit needs to clearly state that watershed management programs and the reasonable assurance analysis can be used for TMDL compliance purposes.
- The permit should clarify that the adaptive management process is equivalent to the iterative process described in the Receiving Water Limitation provision and provide the legal justification for the adaptive management process.
- More careful consideration should be given to the frequency and extent of the reporting and adaptive management assessments. The current draft order results in a significant annual effort and there is no correlation to the value of such an effort. Current reporting appears to overwhelm Regional Board staff resources and has provided limited feedback to cities. Reporting can be streamlined and the jurisdictional and watershed reporting should be combined. Furthermore, the adaptive management process should be applied every two years instead of the every year frequency noted in the draft order.
- It is unclear how the current implementation of the stormwater program and TMDL compliance will be handled during the interim period before development of the watershed management program. For those entities that choose this path, significant efforts in existing programs and implementation plans should be allowed to continue while we evaluate new MCMs as part of the watershed management program.
- Consideration of the technical and financial feasibility of complying with water quality standards should be included in the watershed management program.
- The timing of revising the Watershed Management Programs is conflicting and confusing. There should only be one revision to the Watershed Management Program, and only when the adaptive management/iterative process demonstrates that modification is warranted.
- The adaptive management/iterative approach and timing should be consistent between individual permittees ("jurisdictional watershed management program") and the watershed management program.

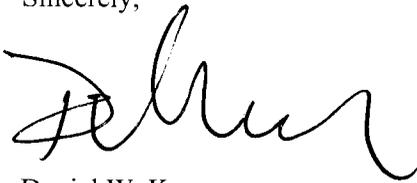

### ***COST/ECONOMIC IMPLICATIONS***

Regarding fiscal resources, the City of La Verne would like the parameters in which municipalities operate recognized. The draft order (page 40) requires municipalities to exercise its authority to secure fiscal resources necessary to meet all of the requirements of the permit. We have reservations as to whether this provision is legal given that it appears to violate the State Constitution, Article XVI, Section 18. That being said, cities have a limited amount of funds that are under local control. Any additional funds needed to raise money for stormwater programs would need to come from increased/new stormwater fees and grants. New fees for stormwater are regulated under the State's Prop 218 regulations, and require a public vote; so, this is an item that is not under direct control of the municipalities – the Permit language should reflect this. Furthermore in addition to clean water, local resources are also directed to a number of health, safety, and quality of life factors. Thus, all these factors need to be developed in balance with each other. We urge you to develop the permit conditions based on a reasonable timeframe in balance with the existing economy and other health, safety, regulatory, and quality of life factors that local agencies are responsible for.

The economic implications of the many proposed permit requirements are of critical importance. It is also worth noting that the cost for complying with both the stormwater regulations and TMDL requirements should be carefully considered. With these types of economic implications, it is critical that this Regional Board and their staff more carefully complete a fiscal analysis of what it will cost cities to be in compliance with the draft order. Finally, many of the requirements included in this permit such as complying with monitoring, TMDLs, RWLs, MCMs, construction/development requirements appear to contain several unfunded mandates. This is also a concern for the City if we are forced to implement these sections of the permit.

In closing, we thank you for the opportunity to comment and the City respectfully requests that the Board provide a second draft Tentative Order with an additional review period to allow permittees to have at least a total of 180 days to discuss and review the full document. It is important to review the entire draft permit to better understand the relationship among the various provisions. We strongly encourage you to make the adjustments requested. Please feel free to contact me at (909) 596-8710 if you have any questions regarding our comments.

Sincerely,

A handwritten signature in black ink, appearing to read 'D. Keesey', written in a cursive style.

Daniel W. Keesey  
Director of Public Works

July 19, 2012

Mr. Ivar Ridgeway  
320 W. 4th Street, Suite 200  
Los Angeles, CA 90013  
(213) 620-2150

**Subject: Tentative MS4 Order Comments**

---

Dear Mr. Ridgeway:

The City of Lawndale (City) is pleased to submit the attached comments for your consideration in re: Order No. R4-2012-XXXX NPDES Permit No. CAS004001.

Please note that the City also supports comments submitted to you from the Los Angeles Stormwater Permit (LASP) group. Additionally, to reiterate the comments offered on p.17, Costs/Economic Implications, the potential impacts upon smaller cities would have deleterious effects upon any hints of recovery. With the current economic situation, most cities are struggling to provide the basic infrastructure services and reduced these services, performed staff reductions and delayed planned improvements in order to still provide these basic services. To introduce a permit in a manner that has not been fully and completely thought out as to the effects and be hastily implemented, would most likely cause "knee-jerk" reactions by most agencies and further draw upon already reduced funding and resources just to be in compliance. We respectfully request that you carefully consider the comments offered and the timing of the permit implementation.

The City's comments are intended to be complimentary and more specific to the issues raised in the LASP group letter. The City's letter also comments on additional issues that may not be addressed in the LASP group letter.

Thank you for the opportunity to submit comments on this very important matter. Should you have any questions, please feel free to contact me.

Sincerely,

  
Glen W.C. Kau, P.E.  
Interim Public Works Director

Encls

City of Lawndale

**COMMENTS**

Regarding the Los Angeles MS4 Tentative Order No. R4-2012-XXXX -  
NPDES PERMIT NO. CAS004001 (issue date unspecified)

---

1. Numeric WQBELS
2. Receiving Water Limitation (RWL)
3. Iterative Process
4. Non-Storm Water Prohibition
5. Receiving Water Monitoring
6. Storm Water Outfall Based Monitoring
7. Non-Storm Water Outfall Based Monitoring
8. New Development/Re-development Effectiveness Monitoring

## 1. Numeric WQBELS

Numeric Water Quality Based Effluent Limitations (WQBELS) applied to dry and wet weather Total Maximum Daily Load (TMDLs) waste load allocations (WLAs) and to stormwater and non-stormwater municipal action levels (MALs) are not authorized under federal stormwater regulations and are not in keeping with State Water Resources Control Board (State Board) water quality orders (WQOs).

The tentative order specifies that: *Each Permittee shall comply with applicable WQBELS as set forth in Part VI.E of this Order, pursuant to applicable compliance schedules.* The tentative order specifies two categories of WQBELS, one for USEPA adopted TMDLs and one for Regional Board/State adopted TMDLs. Regarding USEPA adopted TMDLs, it appears that BMP-WQBELS may be used to meet TMDL WLAs in the receiving water. For Regional Board/State-adopted TMDLs, the tentative order specifies a different compliance method: meeting a “numeric” WQBEL which is derived directly from the TMDL waste load allocation. For example, the wet weather numeric WQBEL for dissolved copper for the Los Angeles River is 17 ug/l.

- a. **Issue: *Regional Board staff is premature in requiring any kind of WQBEL because no exceedance of any TMDL WLA at the outfall has occurred. This is because outfall monitoring is not a requirement of the current MS4 permit or previous MS4 permits.***

The Regional Board’s setting of WQBELS – any WQBEL -- to translate the TMDL WLA for compliance at the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.”*

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELS in the NPDES permit’s fact sheet. According to USEPA’s NPDES Permit Writers’ Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELS. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELS and explain how the state’s anti-degradation policy was applied as part of the*

*process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.*<sup>1</sup>

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis -- a consequence of the fact that no outfall monitoring has been required of the Regional Board either in the current or previous MS4 permits for Los Angeles County. Outfall monitoring is a mandatory requirement under federal regulations at CFR 40 §122.22, §122.2 and §122.26. CFR 40 §122.22(C)(3) requires effluent and ambient monitoring:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

“Effluent monitoring,” according to Clean Water Act §502, is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2, defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

Conclusion: Because Regional Board staff has not required outfall monitoring, it could have not have detected an excursion above a water quality standard (includes TMDL WLAs). Therefore, it could not have conducted a reasonable potential analysis and, as further consequence, cannot require compliance with a WQBEL (numeric or BMP-based) or with any TMDL or MAL until those burdens have been met.

**Recommended Correction: Eliminate all reference to comply with WQBELs until outfall monitoring and a reasonable potential analysis have been performed.**

---

<sup>1</sup>United States Environmental Protection Agency, *NPDES Permit Writers' Manual*, September, 2010, page 6-30.

- b. Issue: Even if Regional Board staff conducted outfall monitoring and detected an excursion above a TMDL WLA and performed the requisite reasonable potential analysis, it cannot require a numeric WQBEL strictly derived from the TMDL WLA.**

USEPA's 2010 guidance memorandum mentions that numeric WQBELs are permissible only if feasible.<sup>2</sup> This conclusion was reinforced by a memorandum from Mr. Kevin Weiss, Water Permits Division, USEPA (Washington D.C.). He explains:

*Some stakeholders are concerned that the 2010 memorandum can be read as advising NPDES permit authorities to impose end-of-pipe limitations on each individual outfall in a municipal separate storm sewer system. In general, EPA does not anticipate that end-of-pipe effluent limitations on each municipal separate storm sewer system outfall will be used frequently. Rather, the memorandum expressly describes "numeric" limitations in broad terms, including "numeric parameters acting as surrogates for pollutants such as stormwater flow volume or percentage or amount of impervious cover." In the context of the 2010 memorandum, the term "numeric effluent limitation" should be viewed as a significantly broader term than just end-of-pipe limitations, and could include limitations expressed as pollutant reduction levels for parameters that are applied system-wide rather than to individual discharge locations, expressed as requirements to meet performance standards for surrogate parameters or for specific pollutant parameters, or could be expressed as in-stream targets for specific pollutant parameters. Under this approach, NPDES authorities have significant flexibility to establish numeric effluent limitations in stormwater permits.*<sup>3</sup>

Reading the 2010 USEPA memorandum, together with Mr. Weiss's memorandum, creates the inescapable conclusion that (1) numeric WQBELs are permissible if "feasible" and (2) numeric WQBELs cannot be construed to only mean strict effluent limitations at the end-of-pipe (outfall) but more realistically must include surrogate parameters and other variants as well. Regional Board staff failed to examine alternative numeric WQBELs, along with BMP WQBELs, as a consequence of not conducting the appropriate analysis.

In any case, the feasibility of numeric WQBELs, whether strictly derived from TMDL WLAs or of the surrogate parameter type, the State Water Resources Control Board has determined that numeric effluent limitations are not feasible. In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require "strict compliance" with water quality standards through numeric effluent*

---

<sup>2</sup>Memorandum from James A. Hanlon, Director, Office of Waste Management, Revisions to the November 22, 2002 Memorandum *Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, November 12, 2010, page

<sup>3</sup>Memorandum from Kevin Weiss, Water Permits Division, USEPA (Washington D.C.), March 17, 2011.

*limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

The State Board’s decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.*

Conclusion: The Regional Board does not have the legal authority to require numeric WQBELs.

**Recommended Correction: Eliminate all references to comply with numeric WQBELs.**

- c. Issue: There cannot be a WQBEL to attain a dry weather TMDL WLA nor a WQBEL that addresses a non-stormwater municipal action level (MAL).**

The foundation for this argument lies in the federal limitation of non-stormwater discharges to the MS4 – not from or through it as the tentative order concludes. Federal stormwater regulations only prohibit discharges to the MS4 and limits outfall monitoring to stormwater discharges. This is explained in greater detail under 4. *Non-stormwater Discharge Prohibitions.*

Conclusion: Regional Board does not have the legal authority to compel compliance with dry weather WQBELs or non-stormwater MALs.

**Recommended Correction: Eliminate all references to comply with numeric WQBELs.**

## 2. Receiving Water Limitation

The tentative order has altered Receiving Water Limitation (RWL) language causing it to be overbroad and inconsistent with RWL in the current MS4 permit, the Ventura MS4 permit, State Board WQO 99-05, the draft Caltrans MS4 permit, and RWL language recommended by CASQA.

- a. **Issue: The proposed RWL language changes the “exceedance” determinant from water quality standards and objectives to receiving water limitations, thereby increasing the stringency of the requirement. The tentative order RWL version reads: *Discharges from the MS4 that cause or contribute to the violation of receiving water limitations are prohibited.***

Compare this with what is in the current MS4 permits for Los Angeles and Ventura Counties:

*Discharges from the MS4 that cause or contribute to a violation of water quality standards are prohibited.*

Whereas standard RWL language limits water quality standards to what is in the basin plan, and includes water quality objectives (relates to waters of the State), the tentative order uses revised language that replaces water quality standards with the following receiving water limitation criteria:

*Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38.*

It is unclear why Regional Board staff has removed water quality standards, which is a USEPA and State Board requirement, and replaced them with the more global receiving water limitation language that include additional compliance criteria (e.g., “or federal regulations including but not limited to 40 CFR § 131.38”). Other “federal regulations” could include CERCLA (Comprehensive Environmental Remediation and Compensation Liability Act).

Enlarging the scope of the RWL from water quality standards to a universe of other regulatory requirements exceeds RWL limitation language established in State Board WQO 99-05, a precedential decision. The order bases compliance on discharge prohibitions and receiving water limitations on the *timely implementation of control measures and other action in the discharges in accordance with the SWMP (stormwater*

*management plan) and other requirements of the permit's limitations.* It goes on to say that if exceedances of water quality standards or water quality objectives, collectively referred to as water quality standards continues, the SWMP shall undergo an iterative process to address the exceedances. It should be noted that this language was mandated by USEPA.

It should be noted that the draft Caltrans MS4 permit is scheduled for adoption in September, as well as CASQA, proposes RWL language that is in keeping with WQO 99-05.

Conclusion: Regional Board does not have the legal authority to re-define RWL language to the extent it is proposing.

**Recommended Correction: Replace RWL contained in the tentative order with the CASQA model or with language contained in the draft Caltrans MS4 permit.**

- b. **Issue: By eliminating water quality standards, the tentative order has created a separate compliance standard for TMDLs and for non-TMDLs.** Standard RWL language in other MS4 permits designates the SWMP<sup>4</sup> as the exclusive determinant for achieving water quality standards in the receiving water. Since TMDLs are enhanced water quality standards, the SWMP (or in this case the SQMP) should enable compliance with TMDLs. Instead, the tentative order specifies compliance through implementation plans – including plans that were discussed in several State/Regional Board adopted TMDLs (e.g., the Los Angeles River Metals TMDL). The absence of water quality standards also creates a separate compliance standard for non-TMDLs. According to Regional Board staff, minimum control measures (MCMs) which make up the SQMP, are intended to meet non-TMDLs pollutants. Unclear is what defines non-TMDL pollutant. If there are no water quality standards referenced in the RWL then what are the non-TMDL pollutants that the MCMs are supported to address?

There is no authority under federal stormwater regulations to comply with any criterion other than water quality standards. The RWL language called-out in WQO 99-05, which was in response to a USEPA directive, makes it clear that water quality standards represent the only compliance criteria, not an expanded definition of receiving water limitations that exclude such criteria.

---

<sup>4</sup>USEPA and federal stormwater regulations use stormwater management program whereas the Los Angeles County MS4 permit uses stormwater quality management plan (SQMP). In effect they are the same. They consist of 6 core programs that must be implemented through MS4 permit.

MS4 permits throughout the State include TMDL WLAs. None of them, however, has created a compliance mechanism that excludes water quality standards as a means of attaining them. Further, the State Board has, through the draft Caltrans MS4 permit and the draft Phase II MS4 permit, articulated its policy on compliance with water quality standards: they are to be met through the implementation of stormwater management programs. Equally noteworthy is that State Board has not created a dual standard for dealing with TMDLs and non-TMDLs. This is an obvious consequence of its adherence to WQO 99-05.

With regard to implementation plans contained in TMDLs, the Regional Board has no legal authority to include them into the MS4 permit. This issue discussed in greater detail later in these comments.

Conclusion: The tentative order must be revised to restore water quality standards in RWL language and, by extension, enable compliance with TMDLs and other water quality standards through the SQMP/MCMs.

**Recommended Correction: Revise the tentative order to eliminate any reference to complying with anything else except water quality standards through the SQMP; and, therewith, eliminate any reference to complying with implementation plans contained in State/Regional Board TMDLs.**

### **3. Iterative Process**

The tentative order does not include the iterative process, a mechanism that is integral to RWL language which serves to achieve compliance with water quality standards.

- a. **Issue: The absence of the iterative process disables a safeguard to protect permittees against unjustifiably strict compliance with water quality standards – or in this case the expanded definition of receiving water limitations -- that is a requisite feature in all MS4 permits issued in California.** The tentative order circumvents the iterative process by creating an alternative referred to as the adaptive/management process which is only available to those permittees that opt for a watershed management program.

Despite the fact RWL language in MS4 permits since the 90's have provided a description of an iterative process (the BMP adjustment mechanism), the term "iterative process" has only recently been specifically mentioned in them. The absence of this term resulted in the 9<sup>th</sup> Circuit Court Appeal's conclusion in *NRDC v. Los Angeles County Flood Control District* that there is no "textual support" in the current MS4 permit for the existence of an iterative process. This

resulted in the court's conclusion that the LACFCD had exceeded water quality standards in the hardened portions of the Los Angeles and San Gabriel Rivers. More recent MS4 permit's issued in the State contain clear references to the iterative process.

Notwithstanding the absence of water quality standards in the tentative order, the iterative process must be included as required by Water Quality Orders 2001-15 and 2009-0008, wherein the State Board made it clear that: we will generally not require "strict compliance" with water quality standards through numeric effluent limitations," and instead "we will continue to follow an iterative approach, which seeks compliance over time" with water quality standards.

Moreover, both the draft Caltrans MS4 permit and the draft Phase II MS4 permit contain references to the iterative process. The draft Caltrans MS4 permit refers to the iterative process in two places: finding 20, Receiving Water Limitations and in the Monitoring Results Report. Finding 20 states:

*The effect of the Department's storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs).<sup>5</sup>*

Under the Monitoring Results Report section, the draft Caltrans MS4 permit reiterates the iterative process within the context of the following: *The MRR shall include a summary of sites requiring corrective actions needed to achieve compliance with this Order, and a review of any iterative procedures (where applicable) at sites needing corrective actions.<sup>6</sup>*

The draft Phase II MS4 references the iterative process in two places, in finding 35 and under its definition of MEP. Finding 35 states:

*This Order modifies the existing General Permit, Order 2003-0005-DWQ by establishing the storm water management program requirements in the permit and defining the minimum acceptable elements of the municipal storm water management program. Permit requirements are known at the time of permit issuance and not left to be determined later through iterative review and approval of Storm Water Management Plans (SWMPs).*

---

<sup>5</sup>See draft Caltrans MS4 permit (Tentative Order No. 2012-XX-DWQ NPDES No. CAS000003), page 10.

<sup>6</sup>Ibid., page 35.

The draft Phase II MS4 permit also acknowledges the iterative process through the definition of maximum extent practicable (which is also included in the draft Caltrans MS4 permit), to the following extent:

*MEP standard requires Permittees apply Best Management Practices (BMPs) that are effective in reducing or eliminating the discharge of pollutants to the waters of the U.S. MEP emphasizes pollutant reduction and source control BMPs to prevent pollutants from entering storm water runoff. MEP may require treatment of the storm water runoff if it contains pollutants. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. BMP development is a dynamic process and may require changes over time as the Permittees gain experience and/or the state of the science and art progresses. To do this, the Permittees must conduct and document evaluation and assessment of each relevant element of its program, and their program as a whole, and revise activities, control measures/BMPs, and measurable goals, as necessary to meet MEP. MEP is the cumulative result of implementing, evaluating, and creating corresponding changes to a variety of technically appropriate and economically feasible BMPs, ensuring that the most appropriate BMPs are implemented in the most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the "iterative approach."<sup>7</sup>*

It should be clearly understood that the State Board is articulating clear policy on the iterative process through these two draft MS4 permits and that they must be followed by Regional Boards as subordinate jurisdictions.

Conclusion: The Regional Board has no authority to alter the iterative process/procedure by making a revised and diluted version of it available only to those MS4 permittees that wish to opt for watershed management program participation. Quite the contrary, the Regional Board is legally compelled to make the iterative process, as described herein, an undeniable requirement in the tentative order.

**Recommended Correction: Regional Board staff should incorporate the iterative process into the tentative order in the findings section and in the RWL section. It should also be referenced again under a revised MEP definition.**

---

<sup>7</sup> See State Water Resources Control Board Water Quality Order No. XXXX-XXXX-DWQ, NPDES General Permit No. CASXXXXXX, page

#### 4. Non-Storm Water Prohibition

The tentative order incorrectly articulates the non-stormwater discharge prohibition to the MS4 to include discharges from and through it.

- a. **Issue: The tentative order mentions prohibiting non-stormwater discharges not only to the MS4 but from and through it as well. Federal regulations did not authorize the non-stormwater discharge prohibition to go beyond “to” the MS4.** This is a serious issue because extending the prohibition from or through the MS4 would subject non-stormwater discharges (including dry weather TMDL WLAs and non-stormwater municipal action levels) to pollutant limitations at the outfall.

The tentative order attempts to justify interpreting federal stormwater regulations to mean that non-stormwater discharges are prohibited not only to the MS4 but from it and through it as well by: (1) incorrectly stating the Clean Water Act §402(p)(B)(ii) of the Clean Water Act requires permittees effectively prohibit non-stormwater discharges into watercourses (means receiving waters) as well as to the MS4; and (2) a misreading of Federal Register Volume 55, No. 222, 47990 (federal register) which contains an error with regard to the non-stormwater discharge prohibition.

§402(p)(B)(ii) does not, as the tentative order’s fact sheet asserts, include watercourses, which according to Regional Board staff, means waters of the State and waters of the United States, both of which lie outside of the MS4. The original text of §402(p)(B)(ii) actually reads as follows: *Permits for discharges from municipal storm sewers “shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers.”*<sup>8</sup> There is no mention of watercourses.

The tentative order’s fact sheet also relies on the afore-cited federal register which states: *402(p)(B)(3) requires that permits for discharges from municipal storm sewers require the municipality to “effectively prohibit” non-storm water discharges from the municipal storm sewer.* The fact sheet is correct about this. The problem is that the federal register is wrong here. It confuses 402(p)(B)(3), which addresses stormwater (not non-stormwater) discharges from the MS4, with 402(p)(B)(2), which once again prohibits non-stormwater discharges to the MS4. It should be noted that in the same paragraph above the defective federal register language, it says that ... *permits are to effectively prohibit non-storm water discharges to the municipal separate storm sewer system.*

---

<sup>8</sup>Municipal storm sewers is a truncated version of municipal separate stormwater system (MS4).

In any case, this issue has been resolved since the federal register was published in November of 1990. All MS4 permits in the United States issued by USEPA prohibit non-stormwater discharges only to the MS4. USEPA guidance, such as the *Illicit Discharge Detection and Elimination: A Guidance Manual* bases investigation and monitoring on non-stormwater discharges being prohibited to the MS4. And, with the exception of Los Angeles Regional Board MS4 permits, MS4 permits issued by other Regional Boards also limit the MS4 discharge prohibition to the MS4. Beyond this, the draft Caltrans MS4 permit and draft Phase II MS4 permits also limit the non-stormwater prohibition to the MS4.

Conclusion: The Regional Board does not have the legal authority to extend the non-stormwater discharge prohibition from or through the MS4.

**Recommended Correction: Revise the non-stormwater discharge prohibition to be limited to the MS4 only and delete all requirements that are based on the prohibition from or through the MS4. This includes the non-stormwater prohibition that is linked to CERCLA.**

## **5. Receiving Water Monitoring (Attachment "E")**

The purpose of receiving water monitoring is to:

- a. *Determine whether the receiving water limitations are being achieved,*
- b. *Assess trends in pollutant concentrations over time, or during specified conditions,*
- c. *Determine whether the designated beneficial uses are fully supported as determined by water chemistry, as well as aquatic toxicity and bioassessment monitoring.*

Receiving water monitoring is to be performed at various in-stream stations.

At issue is "a" because it serves to determine compliance with receiving water limitations. The Regional Board has no legal authority to compel compliance with receiving water limitations through in-stream monitoring. Monitoring requirements relative to MS4 permits are limited to effluent discharges and the ambient condition of the receiving water, as §122.22(C)(3) clearly indicates:

*The permit requires all **effluent** and **ambient** monitoring necessary to show that during the term of the permit the limit on the indicator parameters continues to attain water quality standards.*

According to Clean Water Act §502, effluent monitoring is defined as outfall monitoring:

*The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from **point sources** into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.*

40 CFR §122.2 defines a point source as:

*... the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.*

In short, effluent monitoring in a receiving water because cannot be required because it lies outside the bounds of the outfall.

Regarding monitoring purposes "b" and "c" no argument is raised here provided that it is understood that assessing trends in pollution concentrations would be: (1) limited to ambient water quality monitoring; and (2) permittees shall be not responsible for funding such monitoring. With respect to the latter, the Regional Board's surface water ambient monitoring program (SWAMP) should be charged with this responsibility. MS4 permittees fund SWAMP activities through an annual surcharge levied on annual MS4 permit fees.

**Recommended Corrective Action:** Delete 1(a) and make it clear that 1(b) and (c) relate to ambient monitoring that is not the responsibility of MS4 permittees.

## **6. Stormwater Outfall Based Monitoring**

The purpose of stormwater outfall based monitoring – including TMDL monitoring -- is to:

- a. *Determine the quality of a Permittee's discharge relative to municipal action levels, as described in Attachment G of this Order,*

- b. *Determine whether a Permittee's discharge is in compliance with applicable wet weather WQBELs derived from TMDL WLAs,*
- c. *Determine whether a Permittee's discharge causes or contributes to an exceedance of receiving water limitations.*

Insofar as "a" is concerned, outfall monitoring for stormwater for attainment of municipal action levels (MALs) would be acceptable were it not for their purpose. MALs represent an additional monitoring requirement for non-TMDL pollutants. MALs should really be used to replace TMDL WLAs as alternatives to addressing receiving water quality. As noted in the National Research Council Report to USEPA:

*The NSQD (Pitt et al., 2004) allows users to statistically establish action levels based on regional or national event mean concentrations developed for pollutants of concern. The action level would be set to define unacceptable levels of stormwater quality (e.g., two standard deviations from the median statistic, for simplicity). Municipalities would then routinely monitor runoff quality from major outfalls. **Where an MS4 outfall to surface waters consistently exceeds the action level, municipalities would need to demonstrate that they have been implementing the stormwater program measures to reduce the discharge of pollutants to the maximum extent practicable.** The MS4 permittees can demonstrate the rigor of their efforts by documenting the level of implementation through measures of program effectiveness, failure of which will lead to an inference of noncompliance and potential enforcement by the permitting authority*

Instead of following the above Regional Board staff has chosen to create another monitoring requirement, without regard for cost or benefit to water quality or to permittees. Non-TMDL pollutants should be not be given special monitoring attention until it has been determined that they pose an impairment threat to a beneficial use. Such a determination needs to be done by way of ambient monitoring performed by the Regional Board SWAMP. The resulting data could then be used to develop future TMDLs if necessary.

Furthermore, many of the MAL constituents (both stormwater and non-storm water) listed in Appendix G, are included in several TMDLs such as metals and bacteria. This is, of course, a consequence of the redundancy created by two approaches that are intended to serve the same purpose: protection of water quality.

*Recommended Correction:* Either require substitution of TMDLs with MALs or eliminate MALs entirely.

As for stormwater outfall monitoring purpose "b", such monitoring cannot be used to determine compliance with **wet weather WQBELs based on TMDL WLAs** for the following reasons:

- a) The wet-weather WQBEL is based on a TMDL WLA in the receiving water that is non-ambient. As mentioned, federal regulations only require ambient monitoring in the receiving water, which by definition can never be deemed the same as wet weather monitoring. They are mutually exclusive. Regional Board staff has also incorrectly determined that a WQBEL may be the same as the TMDL WLA, thereby making it a “numeric effluent limitation.” Although numerous arguments may be marshaled against the conclusion, the most compelling of all is the State Water Resources Control Board’s clear opposition to numeric effluent limitations.

In Water Quality Orders 2001-15 and 2009-0008 the State Board made it clear that: *we will generally not require “strict compliance” with water quality standards through numeric effluent limitations,” and instead “we will continue to follow an iterative approach, which seeks compliance over time” with water quality standards.*

[Please note that the iterative approach to attain water quality standards applies to the outfall and the receiving water.]

More recently, the State Board commented in connection with the draft Caltrans MS4 permit that numeric WQBELs are not feasible as explained in the following provision from its most recent Caltrans draft order:

*Storm water discharges from MS4s are highly variable in frequency, intensity, and duration, and it is difficult to characterize the amount of pollutants in the discharges. In accordance with 40 CFR § 122.44(k)(2), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. This Order requires implementation of BMPs to control and abate the discharge of pollutants in storm water to the MEP.*

- b) The State Board’s decision not to require numeric WQBELs in this instance appears to have been influenced by among other considerations, the *Storm Water Panel Recommendations to the California State Water Resources Control Board in re: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.***

Regarding purpose “b” it should also be noted that the Regional Board’s setting of WQBELs to translate the TMDL WLA in the receiving water to the outfall is premature. Regional Board staff apparently has not performed a reasonable potential analysis as required under § 122.44(d)(1)(i), which states:

*Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any [s]tate water quality standard, including [s]tate narrative criteria for water quality.”*

No such reasonable potential analysis has been performed – even though USEPA guidance requires it as part of documenting the calculation of WQBELs in the NPDES permit’s fact sheet. According to USEPA’s NPDES Permit Writers’ Manual:

*Permit writers should document in the NPDES permit fact sheet the process used to develop WQBELs. The permit writer should clearly identify the data and information used to determine the applicable water quality standards and how that information, or any applicable TMDL, was used to derive WQBELs and explain how the state’s anti-degradation policy was applied as part of the process. The information in the fact sheet should provide the NPDES permit applicant and the public a transparent, reproducible, and defensible description of how the permit writer properly derived WQBELs for the NPDES permit.<sup>9</sup>*

The fact sheet accompanying the tentative order contains no reference to a reasonable potential analysis.

Complicating the performance of a reasonable potential analysis is the absence of (1) outfall monitoring data; and (2) ambient water quality standards. Though federal regulations require monitoring at the outfall, the Regional Board has not required it up until now. Even if outfall monitoring data were available to determine whether pollutants concentrations in the discharge exceeded the water quality standard is not possible. This is because, as mentioned earlier, TMDL WLAs are not expressed as ambient standards. A TMDL is an enhanced water quality standard. As noted in the National Research Council’s *Assessing the TMDL Approach to Water Quality Management*, a report commissioned by the United States Congress in 2001:

*... EPA is obligated to implement the Total Maximum Daily Load (TMDL) program, the objective of which is attainment of ambient water quality standards through the control of both point and nonpoint sources of pollution.*

---

<sup>9</sup>United States Environmental Protection Agency, NPDES Permit Writers’ Manual, September, 2010, page 6-30.

**Recommended Correction:** Eliminate this requirement.

c.) Regarding purpose “c”, the determinant for a water quality standard exceedance is in the discharge from the outfall – not in the receiving water. The use of numeric WQBELs -- though incorrectly defined and established in this instance -- represents the compliance standard in discharges from the outfall. Adding a second compliance determinant in the receiving water is unnecessary and is not authorized under federal stormwater regulations because the receiving water lies outside the scope of the MS4.

**Recommended Corrective Action:** Eliminate this requirement.

## **7. Non-Storm Water Outfall Based Monitoring**

The purposes of this type of monitoring are as follows:

- a. *Determine whether a Permittee’s discharge is in compliance with applicable dry weather WQBELs derived from TMDL WLAs.*
- b. *Determine whether a Permittee’s discharge exceeds non-storm water action levels, as described in Attachment G of this Order,*
- c. *Determine whether a Permittee’s discharge contributes to or causes an exceedance of receiving water limitations,*
- d. *Assist a Permittee in identifying illicit discharges as described in Part VI.D.9 of this Order.*

Regarding “a,” This requirement is redundant in view of the aforementioned MALs and in any case is not authorized under federal stormwater regulations. 402(p)(B)(ii) of the Clean Water Act only prohibits discharges to the MS4 (streets, catch basins, storm drains and intra MS4 channels), not through or from it. This applies to all water quality standards, including TMDLs. Nevertheless, compliance with dry weather WQBELs can be achieved through BMPs and other requirements called for under the illicit connection and discharge detection and elimination (ICDDE) program, or requiring impermissible non-stormwater discharges to obtain coverage under a permit issued by the Regional Board.

**Recommended Correction:** Delete this requirement and specify compliance with dry weather WLAs, expressed in ambient terms, through the implementation of the ICDDE program.

Withy regard to “b”, see previous responses regarding MALs and the limitation of non-stormwater discharge prohibit to the MS4.

**Recommended Correction:** Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4; and determine whether MALs or TMDLs are to be used to protect receiving water quality.

Regarding “c”, as mentioned, non-stormwater discharges cannot be applied to receiving water limitations because they are only prohibited to the MS4, not from or through it.

**Recommended Correction:** Delete this requirement because it exceeds the non-stormwater discharge prohibition to the MS4.

Regarding “d”, this requirement is reasonable and in keeping with federal regulations with the exception that the identification of illicit discharges must adhere to the field screening requirements in CFR 40 §122.26. No non-stormwater discharge monitoring shall occur unless flow is first discovered at the outfall. This would trigger the implementation of additional requirements that the tentative order does not include.

#### **8. New Development/Re-development Effectiveness Monitoring**

The purpose of this requirement is a dubious and is not authorized under federal stormwater regulations as it relates to monitoring. To begin with, requiring such monitoring is premature given the absence of outfall monitoring in the current and previous MS4 permits that would characterize an MS4’s pollution contribution relative to exceeding ambient water quality standards. Without the determination of statistically significant exceedances of water quality standards, detected at the outfall, the imposition of runoff infiltration requirements is arbitrary. Further, there is nothing in federal stormwater regulations that require monitoring on private or public property. Monitoring, once again, is limited to effluent discharges at the outfall and to ambient monitoring in the receiving water.

Beyond this, monitoring for BMP effectiveness poses a serious challenge to what determines “effectiveness” -- effective relative to what standard? It is also not clear how such monitoring is to be performed.

**Recommended Correction:** Delete this requirement.

*The MRP of the tentative order proposes regional studies “to further characterize the impact of the MS4 discharges on the beneficial uses of the receiving waters. Regional studies shall include the Southern California Stormwater Monitoring Coalition (SMC) Regional Watershed Monitoring Program (bio-assessment), sediment monitoring for Pyrethroid pesticides, and special studies as specified in approved TMDLs (see Section XIX TMDL Reporting, below).”*

Regional studies also lie outside the scope of the MS4 permit. However, because federal regulations require ambient monitoring in the receiving water, a

task performed by the Regional Board's SWAMP, regional watershed monitoring for aforementioned target pollutants can be satisfied through ambient monitoring. This can be accomplished with little expense on the part of permittees by: (1) using ambient data generated by the Regional Board SWAMP; (2) re-setting the County's mass emissions stations to collect samples 2 to 3 days following a storm event (instead of using a flow-based sampling trigger); and (3) using any data generated from existing coordinated monitoring programs (e.g., Los Angeles River metals TMDL CMP), provided that the data is truly ambient.

Mr. Samuel Unger  
Executive Officer  
Los Angeles Regional Water Quality Control Board  
320 4<sup>th</sup> Street, Suite 210  
Los Angeles, CA 90013

Attention: Renee Purdy, Regional Programs Section Chief  
Ivar Ridgeway, Stormwater Permitting Chief

Dear Mr. Unger:

**TECHNICAL COMMENTS ON TENTATIVE ORDER NO. R4-2012-XXXX AND NPDES PERMIT NO. CAS004001 - WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) DISCHARGES WITHIN THE LOS ANGELES COUNTY FLOOD CONTROL DISTRICT, INCLUDING THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES THEREIN, EXCEPT THE CITY OF LONG BEACH**

The City of Los Angeles (City) Bureau of Sanitation (Bureau) appreciates the opportunity to provide technical comments on the Los Angeles Regional Water Quality Control Board (Regional Board) Tentative Order No. R4-2012-xxxx and NPDES Permit NO. CAS004001 - Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges within the Los Angeles County Flood Control District, Including the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach (Tentative Order). The Bureau appreciates the time your staff has dedicated to meeting with us and the process that has provided the opportunity for substantial engagement and input.

The City of Los Angeles is committed to continuing to implement TMDLs and MS4 Permit provisions and proactive efforts to improve water quality as demonstrated by programs currently being implemented:

- On November 2, 2004, the voters of Los Angeles overwhelmingly passed Proposition O, which authorized the City of Los Angeles to issue a series of general obligation bonds for up to \$500 million for projects to protect public health by cleaning up pollution, including bacteria and trash, in the City's watercourses, beaches and the ocean, in order to meet Federal Clean Water Act requirements. In addition, the measure is funding improvements to protect water quality, provide flood protection, and increase water conservation, habitat protection, and open space. The bonds allow the City to purchase property and/or improve municipal properties for projects that:
  - Protect rivers, lakes, beaches, and the ocean;
  - Conserve and protect drinking water and other waters sources;
  - Reduce flooding and use neighborhood parks to decrease polluted runoff; and

- Capture, clean up, and reuse stormwater.

Through Proposition O, the City of Los Angeles is implementing key water quality projects, such as the rehabilitation of Echo Park Lake and Machado Lake, upgrading and building low flow diversions in the Santa Monica Bay watershed, and utilizing LID principles such as permeable pavement and bioretention cells to retrofit the Los Angeles Zoo parking lot.

- In 2010, the City of Los Angeles developed and implemented Green Street Standard Plans. The Green Street Standard Plans are City approved construction details for Green Street elements that incorporate stormwater best management practices (BMPs) into the pre-approved designs. Use of the Green Street Standard Plans improves water quality and increases water use efficiency by diverting street runoff into planter areas to cleanse stormwater and urban runoff, provide irrigation for landscaping, and recharge groundwater.
- In 2011, the Los Angeles City Council unanimously passed a landmark Low Impact Development Ordinance (LID), effective in May 2012. Developed by the Bureau of Sanitation in collaboration with community members, environmental organizations, business groups and the building industry, the LID ordinance calls for development and redevelopment projects to mitigate runoff in a manner that captures rainwater at its source, while utilizing natural resources including rain barrels, permeable pavement, rainwater storage tanks, infiltration swales or curb bumpouts to contain water.

The Bureau is providing technical comments on the Tentative Order and looks forward to discussing the comments with Regional Board staff. Given the complex nature of the comments, key technical issues are identified below while detailed discussions of the key technical issues are provided in Attachment A. Additional and supporting technical comments are provided in Attachments B and C.

#### **Watershed Management Programs**

- The Watershed Management Programs are a Welcomed, Necessary and Important Shift in the Implementation of Stormwater Programs in the Los Angeles Region
- More Time is Needed for the Development of the Watershed Management Programs
- Several Provisions of the Order must be Modified so as not to Negate the very Intent and Purpose of the Watershed Management Programs to Focus Resources on the Highest Priorities Within Each Watershed
- This Includes Modifications of the Receiving Water Limitations Language to Help the Permittees Focus on Established Watershed Priorities and make this section consistent with TMDL provisions
- An Additional Provision is Needed that Provides for the Development of an Integrated Plan, Consistent with Recent EPA Guidance on the Integration of Wastewater and Stormwater Requirements

#### **TMDLs**

- There are Multiple and Substantive Discrepancies Between the Specific Permit Provisions and State Adopted and EPA Promulgated TMDLs
- Where TMDL WLAs are Based Upon Receiving Waters, Effluent Limitations Should not be Established
- If Water Quality Objectives are met in the Receiving Water, Permittees Should be in Compliance with the Associated TMDL Provisions

#### **Monitoring and Reporting Program**

- The MRP should Allow Permittees to Focus Monitoring Efforts on Watershed Priorities
- Modifications are Needed to the Toxicity Testing Requirements

### **Discharge Prohibitions**

- The Requirement to Prohibit, in lieu of "Effectively Prohibit," Non-Storm Water Discharges is Inconsistent with the Clean Water Act and Associated Federal Regulations

### **Non-Stormwater Action Levels**

- Throughout the Permit, Revisions are Necessary in order to Clarify that Non-Storm water Action Levels are not Effluent Limitations
- The Approach to Establishing and Utilizing Non-Storm Water Action Levels Needs to be Revised

### **Minimum Control Measures**

- Revisions are Needed in the Planning and Land Development Provisions Pertaining to the City's LID Ordinance and the Definition of Biofiltration
- Streamlining of the Facilities under State Purview is Needed

In addition to the key issues above, the impact of the regional funding should be considered. In July of 2013, the results of the countywide Water Quality Initiative Founding will be available. At that time, we suggest to cooperatively evaluate the impact of these results to reprioritize the provisions of this Permit. A possible mechanism is to include a re-opener clause in the permit to occur at that time as described in Attachment C.

Thank you for considering our technical comments on the Tentative Order. The City of Los Angeles is committed to continuing to work with other Permittees, the environmental community, and you and your staff in our shared mission to protect and improve water quality. If there are any questions, please contact me at (213) 485-0587.

Sincerely,

  
SHAHRAM KHARAGHANI, Ph.D., P.E., BCEE

#### List of Attachments:

Attachment A: Detailed Discussion of Key Technical Issues  
Attachment B: Detailed Technical Comment Matrix  
Attachment C: Suggested Provision to Provide for the Development of an Integrated Plan

**ATTACHMENT A**  
**DETAILED DISCUSSION OF KEY TECHNICAL ISSUES**

**WATERSHED MANAGEMENT PROGRAMS**

**1. The Watershed Management Programs are a Welcomed, Necessary and Important Shift in the Implementation of Stormwater Programs in the Los Angeles Region**

The Bureau supports the Watershed Management Program approach in the Tentative Order, with modifications as discussed below. A watershed-based program is the ideal approach for the implementation of stormwater programs in the Los Angeles Region as it allows for the integration of all program elements, focuses efforts on the highest priorities for each watershed through the customization of actions and strategies, and affords agencies the opportunity to comply with requirements. This approach also supports the current efforts undertaken by agencies to obtain grant funding for water quality projects, as many grant criteria are based on coordinated watershed management efforts. Finally, this approach supports implementation of TMDLs, which are developed and implemented at the watershed scale.

**2. More Time is Needed for the Development of the Watershed Management Programs**

The Watershed Management Programs are a welcomed and necessary shift in the management of stormwater. However, the development of the Watershed Management Programs will be a complex process, especially as Permittees will need to engage not just with each other but also with the Regional Board and also likely provide for public participation. In addition, many Permittees may need to receive official approval by their respective councils or boards prior to submitting a plan that commits the Permittees to a substantial investment of public resources. That approval process itself will take many months to complete.

Therefore, as this very important paradigm shift occurs, the Bureau requests that the time period to submit the draft Watershed Management Programs increases from 12 months to 18 months. Such a time period is consistent with the time typically provided by the Regional Board for development of individual TMDL implementation plans.

Given the number of Watershed Management Programs that must be developed by Permittees that are in multiple watersheds, such as the Bureau, the additional time would provide a substantial benefit without substantively delaying the implementation of the final Watershed Management Programs.

During the 18 months that the Watershed Management Programs are under development, the Bureau will continue to implement its stormwater program that already includes many activities consistent with the requirements of the Tentative Order, including implementation of previously approved TMDL implementation plans, implementation and enforcement of the Low Impact Development (LID) ordinance, and green streets standards.

**Request:** *The following revisions are requested:*

- *Revise Part VI.C.2.b as follows:*

*Permittees that elect to develop a Watershed Management Program must notify the Regional Water Board no later than six months after the effective date of this Order. Such notification shall specify if the Permittee(s) are requesting a 12 month or 18 month submittal date for the draft Watershed Management Program, per Part VI.C.2.c.i – iii. Within 60 days of the receipt of the notification, the Regional Board Executive Officer shall notify the Permittee(s) of the required submittal date for the Watershed Management Program.*

- Revise Part VI.C.2.c. as follows:

Permittees that elect to develop a Watershed Management Program shall submit a draft plan to the Regional Water Board Executive Officer ~~no later than 1 year after the effective date of this Order~~ **as follows:**

i. **For Permittees that elect to collaborate on the development of a Watershed Management Program, Permittees shall submit the draft Watershed Management Program no later than 18 months after the effective date of this Order if the following conditions are met in 50% of the land area in the watershed:**

(1) **Commence development of a Low Impact Development (LID) ordinance within 60 days of the effective date of the Order.**

(2) **Commence development of a policy that specifies the use of green street strategies for transportation corridors within 60 days of the effective date of the Order.**

(3) **Demonstrate in the notification of the intent to develop a Watershed Management Program that Part VI.C.2.b.i(1) and (2) have been met in 50% of the watershed area.**

ii. **For Permittees that elect to develop an individual Watershed Management Program, Permittees shall submit the draft Watershed Management Program no later than 18 months after the effective date of this Order if the following conditions are met:**

(1) **Commence development of a Low Impact Development (LID) ordinance within 60 days of the effective date of the Order.**

(2) **Commence development of a policy that specifies the use of green street strategies for transportation corridors within 60 days of the effective date of the Order.**

(3) **Demonstrate in the notification of the intent to develop a Watershed Management Program that Part VI.C.2.b.ii(1) and (2) have been met.**

iii. **For Permittees that elect not to implement the conditions under Part VI.C.2.c.i or Part VI.C.2.c.ii, Permittees shall submit the draft Watershed Management Program no later than 12 months after the effective date of this Order.**

- Revise Table 9 (page 46) as follows:

Part	Provision	Due Date
VI.C.2.b	Notify Regional Water Board of intent to develop Watershed Management Program <b><u>and request submittal date for draft Watershed Management Program</u></b>	6 months after Order effective date
VI.C.2.c <del>b</del>	<b><u>For Permittee(s) that elect not to implement the conditions of Part VI.C.2.c.i or Part VI.C.2.c.ii, submit draft plan to Regional Water Board Executive Officer</u></b>	<b><u>12 months</u></b> <del>1 year</del> after Order effective date
<b><u>VI.C.2.c</u></b>	<b><u>For Permittee(s) that meet requirements of Part VI.C.2.c.i or Part VI.C.2.c.ii, submit draft plan to Regional Water Board Executive Officer</u></b>	<b><u>18 months after Order effective date</u></b>

### **3. Several Provisions of the Order must be Modified so as not to Negate the very Intent and Purpose of the Watershed Management Programs to Focus Resources on the Highest Priorities Within Each Watershed.**

Currently, the Watershed Management Program Provisions (Part VI.C) mostly focus on the integration and sequencing of the minimum control measures and TMDLs as the basis for the Watershed Management Programs. However, there are other key provisions of the Order that must also be integrated into Section VI.C in order not to negate the very intent and purpose of the Watershed Management Programs – focusing resources on the highest priorities within each watershed, including:

- **Part III.A: Non-Stormwater Action Levels.** In the Discharge Prohibition provisions, Part III.A.4.c. requires Permittees to take action when data, for even one sample, exceed the non-stormwater action levels identified in Attachment G. In the Watershed Management Program provisions, Part VI.C.3.b.iv.(2) addresses non-stormwater discharges, but the provision does not specifically limit the requirements to watershed priorities. As many of the constituents for which non-stormwater action levels have been established would not be identified as a priority for the watershed as there is no impairment in the receiving water, per the State's Listing Policy, requiring Permittees to take action for non-priority issues would negate the concept of prioritization and sequencing of actions via the Watershed Management Programs.

For example, in the Los Angeles River watershed, non-stormwater action levels have been established for chloride, sulfate, TDS, and aluminum, yet none of these pollutants are on the 303(d) list for the Los Angeles River. The non-stormwater action levels have been established at or below water quality standards. The practical outcome would be that Permittees would be obligated to address even single sample exceedances from an outfall for any of the pollutants with assigned non-storm water action levels, in direct conflict with the prioritization processes in Part VI.C.3.a, which is the foundational concept of the Watershed Management Programs. Without the ability to prioritize and sequence actions, the Watershed Management Programs are negated.

- **Part V.A: Receiving Water Limitations.** While the Watershed Management Program provisions do provide for the fulfillment of the requirements for Part V.A.3.a and Part V.A.4, it is limited only to watershed priorities. Without a commensurate change in Part V.A., Permittees will still be obligated to develop and implement an Integrated Monitoring and Compliance Report for non-watershed priorities (e.g., pollutants that are not impairing the receiving water). Similar to the non-stormwater action levels, this results in negating the prioritization and sequencing of actions that are fundamental to the Watershed Management Programs.
- **Attachment E: Monitoring and Reporting Program (MRP).** As currently written, there does not appear sufficient flexibility to modify monitoring requirements to support the Watershed Management Programs. This is of particular concern for the outfall monitoring requirements, which, as currently written, will require a significant level of resources without clear benefit to addressing receiving water issues. The MRP should allow for modification of monitoring requirements to focus efforts on watershed priorities identified in the Watershed Management Programs to ensure the effective and efficient use of resources. The WMP will identify specific priorities based on TMDLs and 303(d) Listings, which will allow MS4s to tailor monitoring to address the Primary Objectives and provide data to support management decisions. The current MRP requirements, specifically the outfall monitoring requirements, will divert resources and attention from watershed priorities, which are focused on receiving water issues.
- **Attachment G: Municipal Action Levels (MALs).** Attachment G is the only location in the Order where the concept of MALs are utilized or referenced. Therefore, it is unclear how the MALs fit into the requirements of the Order, especially within the Watershed Management

Programs in Part VI.C. Attachment G notes that where MALs are exceeded, each Permittee shall submit a MAL Action Plan with the Annual Report. The requirement to submit an additional report that requires an assessment of sources and identification of BMPs would be redundant for Permittees that are developing and implementing a Watershed Management Program. In addition, the discussion in Attachment G related to MALs does not provide a nexus to receiving waters. Consistent with the comments provided above for the non-storm water action levels, there should be a nexus between exceedances in the receiving water and exceedances of MALs so as not to negate the prioritization aspect of the Watershed Management Programs. Otherwise, Permittees may be required to address pollutants that do not meet the priority requirements outlined in Part VI.C for the Watershed Management Programs.

*Request: To clearly and fully integrate the other provisions of the Order with the intent of the Watershed Management Programs to focus on watershed priorities, the following changes are requested:*

- ***Watershed Management Programs***

- *Modify Part VI.C.1.b as follows:*

*Participation in a Watershed Management Program is voluntary and allows a Permittee to ~~customize the requirements in Part VI.D (Minimum Control Measures) address the highest watershed priorities, including achieving compliance with the requirements of Part VI.E (Total Maximum Daily Load Provisions) and Attachments L through R~~ by customizing the control measures and the requirements of the provisions specified in Part VI.C.1.b.i-viii. Implementation of an approved Watershed Management Program fulfills the requirements of and constitutes compliance with these provisions. A Permittee shall not be considered in violation of the following provisions of this Order as long as the Permittee is implementing an approved Watershed Management Program:*

- Part III.A (Prohibitions – Non-Storm Water Discharges)*
- Part V.A (Receiving Water Limitations)*
- Part VI.B (Monitoring and Reporting Program Requirements)*
- Part VI.D (Minimum Control Measures)*
- Part VI.E (Total Maximum Daily Loads)*
- Attachment E (Monitoring and Reporting Program)*
- Attachment G (Non-Storm Water Action Levels and Municipal Action Levels)*
- Attachments L through R (TMDL Provisions)*

- ***Non-storm water action levels***

- *Modify the language in Part VI.C.3.b.iv(2) as follows:*

*For pollutants identified as a watershed priority and where Permittees identify non-storm water discharges from the MS4 as causing exceedances in the receiving water ~~as a source of pollutants in the source assessment,~~ the Watershed Control Measures shall include...*

- *Consistent with the language already used in the Tentative Order linking the Watershed Management Programs to the Receiving Water Limitations provisions, add the following language to the end of Part VI.C.3.b.iv(2):*

**Actions taken by Permittees as part of the Watershed Management Program to address non-stormwater discharges fulfill the requirements under Part III.A.4.c and Part III.A.4.d.**

- Modify the language in Part III.A.4.c. as follows:

**For Permittees implementing an approved Watershed Management Program, compliance with this Part III.A.4.c shall be achieved as outlined in Part VI.C.3.b.iv(2). Implementation of an approved Watershed Management Program, including Part VI.C.3.b.iv(2), fulfills the requirements of Part III.A.4.c.**

- Modify the language in Part III.A.4.d. as follows:

**For Permittees implementing an approved Watershed Management Program, compliance with this Part III.A.4.d shall be achieved as outlined in Part VI.C.3.b.iv(2). Implementation of an approved Watershed Management Program, including Part VI.C.3.b.iv(2), fulfills the requirements of Part III.A.4.d.**

- **Receiving Water Limitations**

- Modify Part V.A.4 as follow:

**A Permittee shall not be considered in violation of Part V.A. of this Order** so long as the Permittee has complied with the procedures set forth in Part V.A.3. above and is implementing the revised storm water management program and its components, **and** the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Water Board to modify current BMPs or develop additional BMPs.

- Add the following language to Part VI.C.3.c.iii.(3)(d):

**The milestones and implementation schedule in (a)-(c) fulfill the requirements in Part V.A.3.a to prepare an Integrated Monitoring Compliance Report. A Permittee shall not be considered in violation of Part V.A. of this Order if the Permittee is in compliance with the applicable requirements of Part VI.C.**

- **Monitoring Program**

- Add the following language regarding flexibility, consistent with the language and approach used for the minimum control measures, to Part VI.B:

**“Dischargers shall comply with the MRP and future revisions thereto, in Attachment E, or may in lieu of the requirements in Attachment E, implement a customized monitoring program as set forth in an approved Watershed Management Program per Part VI.C.”**

- Add the following language to Part VI.C.5:

**Permittees in each WMA shall develop an integrated monitoring program ~~and~~ ~~assessment program~~ as set forth in Part IV of the MRP (Attachment E), or in lieu of the requirements in Part IV of the MRP, implement a customized monitoring program as set forth in an approved Watershed Management Program as defined below. Each monitoring program shall ~~to~~ assess progress toward achieving the water quality-based effluent limitations and/or receiving water limitations per the compliance schedules, and progress toward addressing the highest water quality priorities for each WMA. **The****

customized monitoring program shall be submitted as part of the Watershed Management Program and will be subject to approval by the Executive Officer. The customized monitoring program shall be designed to address the Primary Objectives detailed in Attachment E, Part II.A and shall include the following program elements:

- Receiving Water Monitoring
- Stormwater Outfall Monitoring
- Non-Storm Water Outfall Monitoring
- New Development/Re-Development Effectiveness Tracking
- Regional Studies

- **Municipal Action Levels**

- Include the following language at the end of Attachment G:

“Implementation of an approved Watershed Management Program per Part VI.C of the Order fulfills all requirements related to the development and implementation of the MAL Action Plan. A Permittee that is implementing an approved Watershed Management Program per Part VI.C shall not be considered in violation of this Part VIII of Attachment G.”

**4. An Additional Provision is Needed that Provides for the Development of an Integrated Plan, Consistent with Recent EPA Guidance on the Integration of Wastewater and Stormwater Requirements**

In recent years, USEPA has begun to embrace integrated planning approaches to municipal wastewater and stormwater management. USEPA has committed to working with States and communities to implement and utilize integrated planning approaches to municipal wastewater and stormwater management in its October 27, 2011 memorandum “Achieving Water Quality Through Municipal Stormwater and Wastewater Plans”<sup>1</sup> and in its June 5, 2012 memorandum “Integrated Municipal Stormwater and Wastewater Planning Approach Framework.”

Integrated planning will assist municipalities on their critical paths to achieving the human health and water quality objectives of the Clean Water Act (CWA) by identifying efficiencies in implementing the sometimes overlapping and competing requirements that arise from distinct wastewater and stormwater programs, including how best to make capital investments. Integrated planning can also facilitate the use of sustainable and comprehensive solutions, including green infrastructure, that protect human health, improve water quality, manage stormwater as a resource, and support other economic benefits and quality of life attributes that enhance the vitality of communities. The integrated planning approach does not remove obligations to comply with the CWA, but rather recognizes the flexibilities in the CWA for the appropriate sequencing of work.

Per the June 5, 2012 Memorandum, USEPA states “We encourage all Regions to work with their States to identify appropriate opportunities for implementing the Integrated Planning approach.” The Watershed Management Programs that are provided for in Part VI.C of the Tentative Order are very similar in concept to the Integrated Planning Framework developed by USEPA and provide an appropriate opportunity for implementing the Integrated Planning approach. However, there are some key additional considerations, not currently provided for in the Watershed Management Programs, that would result from the development and implementation of an Integrated Plan.

The Bureau recognizes that the Watershed Management Programs alone are a paradigm shift in the management of stormwater. However, as this shift occurs, the Bureau requests that the Order also provide the opportunity for Permittees to take the evolution one step further via the development and

---

<sup>1</sup> The October 27, 2011 and June 5, 2012 memoranda are available at <http://cfpub.epa.gov/npdes/integratedplans.cfm>.

implementation of an Integrated Plan. As the Integrated Planning Framework is relatively new to the States, the Bureau is not proposing any delays in the reissuance of this Order. However, consistent with the approaches identified by USEPA to incorporating the Integrated Plans into NPDES Permits<sup>2</sup>, the Bureau is requesting that a reopener provision is included in Part VI.C of the final Order.

**Request:** *Include an additional provision that would provide for (a) the development of an Integrated Plan, consistent with USEPA's Integrated Planning Framework and (b) a reopener of the Order to incorporate the Integrated Plan(s). The Bureau has provided a proposed provision as well as a Finding to support the additional provision in Attachment C.*

## **TOTAL MAXIMUM DAILY LOAD (TMDLs)**

### **1. There are Multiple and Substantive Discrepancies Between the Specific Permit Provisions and State Adopted and EPA Promulgated TMDLs**

There are multiple and substantive discrepancies between the specific TMDL provisions and the TMDLs adopted by the State and promulgated by EPA. For example, the Los Angeles River Bacteria TMDL Basin Plan Amendment states (page 6):

MS4 dischargers can demonstrate compliance with the final dry weather WLAs by demonstrating that the final WLA are met instream or by demonstrating one of the following conditions at outfalls to the receiving waters:

1. Flow-weighted concentration of E. coli in MS4 discharges during dry weather is less than or equal to 235 MPN/100mL, based on a weighted-average using flow rates from all measured outfalls;
2. Zero discharge during dry weather;
3. Demonstration of compliance as specified in the MS4 NPDES permit which may include the use of BMPs where the permit's administrative record supports that the BMPs are expected to be sufficient to implement the WLA in the TMDL, the use of calculated loading rates such that loading of E. coli to the segment is less than or equal to a calculated loading rates that would not cause or contribute to exceedances based on a loading capacity representative of conditions in the River at the time of compliance or other appropriate method.

The third and final method, which provides both BMP based and load based methods for demonstrating compliance, is not provided in the Order. The Order must be consistent with the WLAs as outlined in the Basin Plan Amendment and this method of compliance must therefore be incorporated into the Order. Additional discrepancies are identified and detailed in Attachment B.

**Request:** *The Bureau requests that the Regional Board review and address issues with specific TMDLs as outlined in Attachment B to this letter.*

### **2. Where TMDL WLAs are Based Upon Receiving Waters, Effluent Limitations Should not be Established**

Assigning effluent limitations where WLAs are based upon receiving waters is inconsistent with the relevant WLAs in various TMDLs and is an inappropriate method of ensuring that MS4 permittees

---

<sup>2</sup> See USEPA's Integrated Municipal Stormwater and Wastewater Planning Approach Framework at pg. 6: "All or part of an integrated plan can be incorporated into an NPDES permit as appropriate. Limitations and considerations for incorporating integrated plans into permits include: ...Reopener provisions in permits consistent with section 122.62(a) may better facilitate adaptive management approaches." The referenced framework is attached to USEPA's June 5, 2012 memorandum (see footnote 1 for a link to the document).

comply with water quality standards. Given that many of the TMDLs and the WLAs contained therein are expressed in terms of the receiving water and do not necessarily translate to effluent limitations, receiving water limitations are more appropriate under most circumstances. For example, the WLAs in the LA River Bacteria TMDL are expressed as allowable exceedance days, not as concentration based effluent limitations. Discharges from the MS4 that are greater than the proposed effluent limits could nonetheless result in receiving water concentrations lower than the numeric target and in conformity with the TMDL and WLAs. (See Comment Matrix for additional examples)

Thus, if the permit revision proceeds in this manner, the Regional Board will have established a system whereby a Permittee could be acting in conformity with a relevant TMDL by ensuring it meets all applicable receiving water limitations, yet still be in violation of an effluent limit established in its permit that was supposedly derived from and designed to achieve consistency with that TMDL. We do not believe such a result is intended, and can be addressed by not establishing effluent limits where the relevant WLAs have been expressed as a receiving water limit.

In addition, the fact that Permittees will be required to request TSOs also raises the issue of mandatory minimum penalties (MMPs). Pursuant to Water Code section 13385(h) and (i), MMPs are required for certain violations of effluent limitations. It is critical that the implementation of these WLAs in the permit be in the form of receiving water limitations, in order to avoid exposing the Permittees to MMPs for violations that cannot be prevented.

**Request:** *Ensure that limitations are consistent with the assumptions and requirements of the TMDLs and where appropriate incorporate receiving water limitations.*

### **3. If Water Quality Objectives are met in the Receiving Water, Permittees Should be in Compliance with the Associated TMDL Provisions**

Provision VI.E.2 presents the compliance determination provisions that provide multiple mechanisms for demonstrating compliance, which is greatly appreciated. However, some clarification regarding the definition and intent of “receiving water limitation” as used in these provisions is requested. As currently written, Parts VI.E.2.d.2 and VI.E.2.e.2c identify one of several conditions that Permittee’s can use to demonstrate compliance as:

*There are no exceedances of the applicable receiving water limitation for the specific pollutant(s) associated with a specific TMDL in the receiving water(s) at, or downstream of, the Permittee’s outfall(s);*

It is unclear if VI.E.2.d.2 and VI.E.2.e.2c (1) limit “receiving water limitations” to those identified in the TMDL provisions, or (2) include applicable water quality objectives per the definition of “receiving water limitations” identified in Attachment A.

As the ultimate end goal of the TMDL is protection of beneficial uses, attainment of water quality objectives/criteria protective of those uses should constitute compliance with the TMDL provisions. Therefore, please either (a) clarify that “receiving water limitations” is synonymous with the definition provided in Attachment A or (b) modify the language as suggested below.

**Request:** If the use of “receiving water limitation” in Parts VI.E.2.d.2 and VI.E.2.e.2c is limited to those identified in the TMDL provisions, modify the language as follows (additions in bold, underlined text):

*There are no exceedances of the applicable receiving water limitation associated with a specific TMDL **or water quality objective for the specific pollutant(s)** in the receiving water(s) at, or downstream of, the Permittee’s outfall(s);*

## **MONITORING AND REPORTING PROGRAM**

### **1. The MRP should Allow Permittees to Focus Monitoring Efforts on Watershed Priorities**

The MRP identifies five Primary Objectives in the Purpose and Scope subsection (Attachment E.II.A pg E-3). The Bureau agrees that these objectives are appropriate and provide a solid foundation upon which to develop a monitoring program to evaluate MS4 impacts on receiving water as well as to inform management decisions that will improve water quality. However, the specific monitoring requirements contained in the remainder of the MRP will not provide the appropriate data to meet the Primary Objectives. The MRP should allow for modification of monitoring requirements to focus efforts on watershed priorities identified in the Watershed Management Programs (WMPs) to ensure the effective and efficient use of resources. The WMP will identify specific priorities based on TMDLs and 303(d) Listings, which will allow MS4s to tailor monitoring to address the Primary Objectives and provide data to support management decisions. The current MRP requirements, specifically the outfall monitoring requirements, will divert resources and attention from watershed priorities, which are focused on receiving water issues. The following provides several examples:

- The Regional Board adopted LA River Bacteria TMDL established a schedule that prioritizes MS4 implementation. As presented in the TMDL Staff Report (page 64), “Through extensive discussions involving a broad spectrum of stakeholders, four primary locations where water contact activities are known or likely to occur were categorized as the highest priority.” The TMDL schedule recognized the need to focus resources where public health risks were likely the greatest. Additionally, the TMDL recommends outfall monitoring on the same prioritized schedule to support implementation actions. As currently written, the dry weather outfall monitoring outlined in the MRP would require Permittees to monitor for bacteria at all outfalls in the LA River and tributaries within five years and take actions in contradiction to the prioritization dictated in the TMDL. The MS4 Permittee developed monitoring program for the LA River watershed should allow for recognition of the TMDL prioritization and the establishment of a consistent monitoring approach.
- The Regional Board adopted LA River Nutrients TMDL included ammonia WLAs for the three Water Reclamation Plants (WRP) in the watershed (City of LA Donald C. Tillman and LA/Glendale WRPs and the City of Burbank WRP) as well as for MS4 Permittees. Since the adoption of the TMDL, all three POTWs have upgraded their plants to remove ammonia and the Regional Board has adopted new ammonia criteria into the Basin Plan. Because of the WRP upgrades, ammonia criteria are consistently met instream as demonstrated by WRP data collected in Reaches 3, 4, and 5 of the LA River and the Burbank Western Channel and MS4 data collected in Reach 1. However, the current requirements in the MRP will require MS4 Permittees to collect outfall data for a constituent that is no longer impairing the LA River. Having MS4s in the LA River monitor for ammonia, as currently required, at all outfalls is not necessary since MS4 discharges are not causing an impairment as there is no impairment. The MS4 Permittee developed monitoring program for the LA River watershed should allow for recognition of the conditions and the receiving water.
- The wet weather outfall monitoring approach requires each individual MS4 Permittee to monitor at least one major outfall per HUC-12 subwatersheds within the Permittee’s jurisdiction. For the LA River watershed alone that would require between 20 and 108 wet weather sampling sites depending on the interpretation of the permit. However, the reality is that the data collected will have little value in providing the information MS4 Permittees need to focus BMPs (both structural and non-structural). The reasons being that 1) management actions must be targeted within a subwatershed (i.e., focus street sweeping on industrial areas), 2) the majority of structural BMPs for wet weather are distributed throughout a subwatershed in areas where they are expected to result in the most effective reduction of loading rather than at the end of an

outfall, and 3) MS4 Permittees have significantly more outfalls than can be monitored (the City of Los Angeles has more than 1,000 in the LA River watershed alone) and must rely on planning tools such as models of various complexity. The proposed individual outfall data will provide an aggregate description of loading, but will not inform Permittees as to the areas (i.e., land uses) that generate the largest loadings and provide direction for focused actions. The MS4 Permittee developed monitoring programs should allow for a modification to the approach to ensure appropriate data are collected to inform management decisions. These data could also be used to evaluate the extent to which MS4 discharges are affecting receiving water quality.

In summary, the Bureau agrees with the MRP Program Objectives, but believes the MRP should allow for modification of monitoring requirements to focus efforts on watershed priorities identified in the WMP. As currently written, there does not appear sufficient flexibility to modify monitoring requirements. This is of particular concern for the outfall monitoring requirements, which, will require a significant level of resources without clear benefit to addressing receiving water issues.

**Request:** Utilize the following revised language in Attachment E to allow for more efficient approaches to conducting monitoring to support developing and implementing effective management actions as well as to assess compliance.

- **Part II.C**

*The Monitoring Program provides flexibility to allow Permittees to develop an integrated monitoring program to address all of the monitoring requirements of this Order and other monitoring obligations or requirements in a cost efficient and effective manner. In lieu of the requirements outlined in Part IV.A, Permittees may elect to submit a customized IMP as part of the Watershed Management Program as outlined in Part VI.C of the Order. The development and implementation of a customized IMP as part of a Watershed Management Program fulfills the requirements of this Monitoring and Reporting Program.*

- **Part II.D**

*The Monitoring Program provides flexibility to allow Permittees to coordinate monitoring efforts on a watershed or subwatershed basis to leverage monitoring resources in an effort to increase cost-efficiency and effectiveness and to closely align monitoring with TMDL monitoring requirements and Watershed Management Programs. In lieu of the requirements outlined in Part IV.B, Permittees may elect to submit a customized CIMP as part of the Watershed Management Program as outlined in Part VI.C of the Order. The development and implementation of a customized CIMP as part of a Watershed Management Program fulfills the requirements of this Monitoring and Reporting Program.*

- **Part IV.A.4**

*Where appropriate (~~e.g., dry weather outfall based screening program~~), the Integrated Monitoring Program may develop and utilize alternative approaches to meet the Primary Objectives (Part II.A) and address the five Monitoring Program elements (Part II.E). Sufficient justification shall be provided in the IMP for the alternative approach(es). ~~The alternative approach(es) must be screening level monitoring strategies to avoid more costly analytical procedures if approved by the Regional Water Board Executive Officer.~~*

- **Part IV.B (add new bullet)**

*Where appropriate, the Coordinated Integrated Monitoring Program may develop and utilize alternative approaches to meet the Primary Objectives (Part II.A) and address the*

**five Monitoring Program elements (Part II.E). Sufficient justification shall be provided in the CIMP for the alternative approach(es). The alternative approach(es) must be approved by the Regional Water Board Executive Officer.**

## **2. Modifications are Needed to the Toxicity Testing Requirements**

The standard EPA whole effluent toxicity (WET) test methods were developed for continuous point source wastewater discharges and do not take into account the unique features pertaining to stormwater and non-stormwater discharges. However, the MRP requirements for toxicity testing at outfalls are essentially the same as the wastewater plants in the region. The applicability of the WET method for use on intermittent MS4 discharges has never been properly validated. Indeed, the existing EPA WET methods (EPA 2002a-c and EPA 1995) were not designed to assess the extremely dynamic and transient nature of urban runoff. Stormwater discharges typically last a (highly variable) number of hours, while most toxicity tests last several days; the tests continue to expose organisms to stormwater for periods far exceeding the duration of actual exposure to stormwater in the real world. The net effect is to overestimate the toxic effects of stormwater.

The MRP requires stormwater Permittees to conduct both dry and wet weather outfall toxicity testing and Permittees are required to conduct accelerated monitoring if a test results in a “fail.” Storm events are episodic in nature and represent acute (not chronic) conditions, making the accelerated monitoring prescribed in the MRP not appropriate for storm event monitoring. The inapplicability of accelerated monitoring for storm events demonstrates the inherent difference between the regulation of stormwater and wastewater.

Additionally, individual outfalls often carry a minute percentage of the total volume in the receiving waters and as such toxicity observed in one outfall sample will likely have no effect on receiving water. The current approach is appropriate for wastewater discharges but not urban runoff and they should be treated differently.

Furthermore, it is inappropriate to place wastewater program elements such as the Toxicity Reduction Evaluation (TRE) in an MS4 permit. The MRP is focused on identifying individual constituents that are causing or contributing to receiving water impairments such that information is available to develop and implement control measures. Requiring Permittees to implement a TRE subverts the process by which they will identify and address water quality issues.

Lastly, the more appropriate approach for urban runoff is to identify whether toxicity exists in the receiving water, identify pollutants that are causing toxicity through toxicity identification evaluations (TIEs), and then incorporate monitoring of pollutants that are causing toxicity into the outfall monitoring.

***Request:*** Remove the outfall toxicity testing and TRE requirements.

## **DISCHARGE PROHIBITIONS**

### **1. The Requirement to Prohibit, in lieu of “Effectively Prohibit,” Non-Storm Water Discharges is Inconsistent with the Clean Water Act and Associated Federal Regulations**

The Tentative Permit proposes to require that “Each Permittee shall, ..., prohibit non-storm water discharges through the MS4 to receiving waters ...” This requirement to prohibit non-storm water discharges is different from the previous permit and is inconsistent with controlling language in the Clean Water Act and associated federal regulations. Specifically, both the Clean Water Act and the previous permit require each permittee to “effectively prohibit non-storm water discharges” – not prohibit. (33 U.S.C.S., §1342(p)(3)(B)(ii); see also Order No. 01-182, as amended.) The difference between the term “effectively prohibit” and “prohibit” may be significant when being interpreted by a court of law in that without the modifying term “effectively,” a court might determine that the City and other Permittees are

legally required to prohibit all such discharges and any such non-storm water discharge that enters the storm drain system is a violation of the permit, regardless of the Permittees ordinance, programs to enforce the ordinance and other control programs. In other words, the requirement on the Permittee would extend beyond adopting and enforcing local ordinances, and other control programs, to keep such discharges from happening but would make the Permittee legally responsible and liable for any such prohibited non-storm water discharge entering the MS4 system. Such a position is untenable for the City, and is inconsistent with CWA legislative history, regulations and associated guidance.

The legislative history of the CWA suggests that congress intended a pragmatic and sensible approach to the “effectively prohibit” language. Section 1342(p) was added to the CWA in 1987.<sup>3</sup> According to Congress, the purpose of the new provisions was to provide “an improved and less burdensome process for control of discharges of stormwater, particularly for municipalities.” (133 Cong. Rec. S733 (daily ed. Jan. 13, 1987).).”

Section 1342(p)(3)(B) can be read as requiring only that the permit contain a provision that “effectively prohibits” non-stormwater discharges to the MS4. In other words, this section could be interpreted as placing a requirement on the *language in the permit or local ordinances* such that there is no misunderstanding by those who use it that illicit discharges into the MS4 are prohibited.

“Subsection [(p)(3)(B)] requires that *permits* for municipal storm sewers *contains* [sic] a *requirement* to effectively prohibit non-storm-water discharges into storm sewers. Under this provision, *all such permits must assure* that such discharges are prohibited. [. . .] They must include a requirement to effectively prohibit non-stormwater discharges into storm sewers and controls to reduce the discharge of pollutants to the maximum extent practicable . . .” (Emphasis added.)

(133 Cong. Rec. H131 (daily ed. Jan. 7, 1987).)

Essentially, this interpretation construes (p)(3)(B)(ii) to require the prohibition and (p)(3)(B)(iii) to provide the mechanism for that prohibition. However, this language does not dictate that a holder of the permit fails to “effectively prohibit” illicit discharges every time such a discharge occurs. Rather, (p)(3)(B)(iii) provides the mechanism and the standard of care to be applied in “prohibiting” illicit discharges.

This interpretation is also consistent with Environmental Protection Agency (EPA) Permit Writing Guidelines (April 2010), which also take a realistic and practical approach in defining the expectations of permit holders. “In many circumstances, sources of intermittent, illicit discharges are very difficult to locate, and these cases may remain unresolved.” This guideline and the interpretation of (p)(3)(B)(ii)-(iii) above, when taken together, substantially narrow the meaning of “effectively prohibit” to apply only to the regulatory (e.g. ordinance drafting) aspect of the permit process. This is vastly different from an interpretation of (ii) as requiring a permit holder to in fact prohibit any and all illicit discharges into the MS4.

Further, the federal regulations provide that each permittee’s application shall consist of:

---

<sup>3</sup> Section 1342(p)(3)(B) provides:

“(B) Municipal discharge. Permits for discharges from municipal storm sewers—

(i) may be issued on a system- or jurisdiction-wide basis;

(ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and

(iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” (33 U.S.C. §1342(p)(3)(B).)

- (i) Adequate legal authority. A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:
- (B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;
- (C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water; (D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;
- (E) Require compliance with conditions in ordinances, permits, contracts or orders; and (F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer. (40 C.F.R. § 122.26(d)(2)(i).)

This is consistent with a reading of (p)(3)(B)(ii) as requiring only that the permit holder establish a clear regulatory scheme by ordinance or otherwise. In other words, the rule requires that the permit holder have adequate legal authority to prohibit through ordinance and control through ordinance illicit discharges to the MS4. The permit holder must also have sufficient legal authority to require compliance with the regulatory scheme and to carry out its inspection, surveillance, and monitoring procedures. The regulation does not seem to require the permit holder to prevent any and all discharges to the MS4. The Federal Register indicates that a permit holder “effectively prohibits” illicit discharges by creating a program to detect and control illicit discharges to the MS4. It specifically discusses implementation of “effective prohibition on non-stormwater discharges,” which requires a detailed SWMP and a listing of constituents they may or may not deem “illicit.” The following excerpts provide an overview of the relevant sections from the Federal Register:

[T]oday’s rule begins to implement the ‘effective prohibition’ by requiring municipal operators of municipal separate storm sewer systems serving a population of 100,000 or more to submit a description of a program to detect and control certain non-storm water discharges to their municipal system.” (55 Fed. Reg. 47,990 (Nov. 16, 1990).)

The phrase “begins to implement,” implies that achieving “effective prohibition” does not occur all at once, but rather, requires implementation of certain steps or processes. This implication is further supported by the excerpts below, which specifically outline the parameters of “effective prohibition.”

Today’s rule has two permit application requirements that are designed to begin implementation of the effective prohibition. The first requirement . . . addresses a screening analysis which is intended to provide sufficient information to develop priorities for a program to detect and remove illicit discharges. The second provision . . . requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems. . . . In light of the language in the statute, permit conditions should do more than plan for controls during the term of the permit. A strong effort to have the necessary police powers and controls based on pollutant data should be undertaken before permits are issued. (Id.)

The extended excerpt above makes three major points. First, “effective prohibition” involves a series of steps and processes included in the SWMP. Second, a permit holder must do more than merely monitor the MS4 for illicit discharges; it must actively seek them out and utilize its police powers to enforce the provisions of the permit. Third, this combination of policies and procedures satisfies the statutory mandate of 1342(p)(3)(B).

In addition, the Federal Register sections discussing the requirements for small MS4s, also support the policies/procedures definition of “effectively prohibit”:

In today’s rule, any NPDES permit issued to an operator of a regulated small MS4 must, at a minimum, require the operator to develop, implement and enforce an illicit discharge detection and elimination program. Inclusion of this measure for regulated small MS4s is consistent with the ‘effective prohibition’ requirement for large and medium MS4s. (NPDES Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges, 64 Fed. Reg. 68,722. (Dec. 8, 1999), emphasis added.)

Finally, the EPA MS4 Permit Improvement Guide (Guide) also supports the interpretation of “effectively prohibit” as requiring the design and implementation of policies and procedures. Though this guide is designed primarily for small MS4s, its objectives apply to large MS4s as well. (EPA, 833-R-10-001, MS4 Permit Improvement Guide (2010).) Chapter Three of the Guide, “Illicit Discharge Detection and Elimination,” provides the requisite guidelines to permit writers in drafting provisions that satisfy the prohibitions against illicit discharges. Chapter three provides that both small and large MS4s:

. . . are required to address illicit discharges into the MS4 system. An illicit discharge is defined as any discharge to a municipal separate storm sewer system that is not composed entirely of stormwater, except allowable discharges pursuant to an NPDES permit (40 CFR 122.26(b)(2)). In addition to requiring [a] permittee to have the legal authority to prohibit non-stormwater discharges from entering storm sewers (CWA Section 402(p)(3)(B)) (see Chapter I), MS4 permits must also require the development of a comprehensive, proactive Illicit Discharge Detection Elimination (IDDE) program.

An effective IDDE program is more than just a program to respond to complaints about illicit discharges or spills. Permittees must proactively seek out illicit discharges, or activities that could result in discharges, such as illegal connections to the storm sewer system, improper disposal of wastes, or dumping of used motor oil or other chemicals.” (Id. at 24.)

In sum, federal regulations and guidance support an interpretation of “effectively prohibit” as requiring a series of polices and procedures designed to detect, control, and remove illicit discharges to an MS4. None of these sources interpret “effectively prohibit” to require complete prevention of all non-stormwater discharges or to impose absolute liability upon a permit holder for all such discharges.

In *City of Abeline v. EPA*; *City of Irving v. EPA*, 324 F.3d 657 (5th Cir. 2003), the Fifth Circuit denied review of two cities’ Tenth Amendment “as applied” challenges to their MS4 stormwater permits and foreclosed their arguments regarding overextended liability for third party discharges. The cities had argued before the Environmental Appeals Board (EAB) that by refusing to authorize all discharges under the permit, EPA had transferred liability to the city, which forced the city to use its police powers to stop such discharges and is contrary to the scheme established by the storm water regulations, which places responsibility for controlling and obtaining legal authorization for storm water discharges on the discharger rather than the municipality. (2001 EPA App. LEXIS 10 (July 16, 2001). The court disagreed: “The Cities’ argument is foreclosed, however, by the conclusion of the [EAB] that, because the Cities’ permits expressly provide that liability for third-party discharges is not transferred to the permittee, the Cities’ are not liable for such discharges so long as they comply with their SWMP’s. (Id. at 18.)

Although the requirement to “effectively prohibit” non-stormwater discharges is not defined, a review of the legislative history, as well as the EPA regulations and decisions from case law, indicate that a permit holder “effectively prohibits” non-stormwater discharges from entering an MS4 by implementing a set of

policies and procedures to monitor, control and remove illicit discharges. The removal of the term “effectively prohibit” in the Tentative Permit, and replacing it with “prohibit” would imply that the Regional Board is looking to make this requirement more stringent than federal law, and would arguably make the City and all other permittees liable for any prohibited discharge into the their portion of the MS4, regardless of their control efforts to prohibit such non-stormwater discharges.

**Request:** *The Bureau requests that Part III.A.1 (and other relevant provisions where “prohibit” is currently used) is modified to require each Permittee to “effectively prohibit” non-storm water discharges – not prohibit non-storm water discharges.*

## **NON-STORM WATER ACTION LEVELS**

### **1. Throughout the Permit, Revisions are Necessary in order to Clarify that Non-Storm water Action Levels are not Effluent Limitations**

Currently, the non-stormwater action levels are used as requirements throughout the Tentative Order. However, the Tentative Order does not provide any context or discussion related to the intended use, basis, or rationale for the non-stormwater action levels outside of the Fact Sheet and that discussion is limited to the section related to monitoring (pgs. F-119 through F-125). As such, there are several modifications and additions that need to be included in the Order.

**Request:** *The Bureau requests the following modifications to the Tentative Order:*

- *Add a definition for non-storm water action level in Attachment A.*
- *Add explanatory text to Attachment G. Similar to the text provided for municipal action levels, a narrative is needed that fully describes the basis, intended use, and rationale for the for the non-stormwater action levels.*
- *Revise Standard Provision 14(f). The Bureau recommends that this subsection be revised to explicitly state that a non-stormwater action level is not an effluent limitation. Accordingly, the last sentence of Part.VI.A.14(f) should be revised as follows: “An effluent limitation, for these purposes, does not include a receiving water limitation, a compliance schedule, a best management practice, a municipal action level, or non-stormwater action level.”*
- *Add clarifying language to the Fact Sheet. On page F-119, the last sentence in the subsection titled “Approach for deriving Action Levels” should be modified as follows: “Action levels in this Order are based upon numeric or narrative water quality objectives and criteria as defined in the Basin Plan, the Water Quality Control Plan for Ocean Waters of California (Ocean Plan), and the CTR; however, Action Levels are not considered to be water quality objectives or criteria, or water quality based effluent limitations. They are screening tools and trigger the need for certain implementation actions if exceeded. Exceedance of an Action Level does not constitute a violation of a water quality objective, criteria or receiving water limitation.”*

### **2. The Approach to Establishing and Utilizing Non-Storm Water Action Levels Needs to be Revised**

Several issues have been identified with the current approach to establishing and utilizing the non-storm water action levels, including:

- **Non-storm water action levels have been established for pollutant-waterbody combinations with effective TMDLs.** Contrary to the statement on Page F-119 of the Fact Sheet that action levels have been established “where a TMDL has not been developed,” there are numerous instances in Attachment G where non-storm water action levels have in fact been established

where an effective TMDL is in place. For example, WQBELs have been established in the Tentative Order to implement TMDLs for the following pollutant-waterbody combinations, yet action levels have also been assigned:

- Los Angeles River Watershed: copper, bacteria, and nitrate nitrogen
- Ballona Creek: bacteria, copper, lead, selenium

It is inappropriate and confusing to establish non-storm water action levels where WQBELs have also been established to implement an effective TMDL. Permittees, including the Bureau, have invested considerable resources in developing implementation plans for these TMDLs. The introduction of non-storm water action levels are therefore inappropriate and unnecessary for those pollutant-waterbody combinations with established TMDLs.

- **The analysis that establishes the non-storm water action levels cannot be verified based upon the information presented in the Fact Sheet.** The Fact Sheet does not provide detailed calculations or information on how each of the non-storm water action levels were developed and provides only one example of such derivation (for nickel in discharges to salt water). As such, the Regional Board's calculations behind each non-storm water action level cannot be verified. Given that these non-storm water action levels may trigger significant actions by Permittees, it is imperative that Permittees can verify that each non-storm water action level is appropriate and validly established.
- **Action Levels Should be Established in Order to Isolate Problematic Outfalls.** As described on Page F-119 of the Fact Sheet, a Reasonable Potential Analysis (RPA) was conducted to calculate non-storm water action levels for CTR priority pollutants following Section 1.4 of the Policy for the Implementation of Toxic Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). However, as noted on Page 3, footnote 1 of the SIP, the SIP does not apply to the regulation of stormwater discharges.

The result is that non-storm water action levels have been established that in certain instances, such as selenium, are below water quality objectives. Given that there is not a nexus between receiving water quality and outfall concentrations, establishing non-storm water action levels lower than water quality objectives may exacerbate the impact to Watershed Management Programs. Permittees would not only be required to address exceedances without any impairment to receiving waters, but Permittees would also be required to address pollutants for which exceedances have not yet occurred from of the MS4 in addition to lacking a connection to impairment in the receiving water.

Similar to the municipal action levels, the non-storm water action levels can be powerful in isolating problematic outfalls. However, by establishing the action level at or below the water quality objective, it is quite feasible that all discharges will likely exceed one of the action levels thus making it particularly difficult to prioritize action/outfalls. As part of the Watershed Management Programs, Permittees can utilize existing data and local knowledge to propose appropriate non-storm water action levels. As part of the Watershed Management Program, the action levels would be subject to Executive Officer approval.

- **Non-Storm Water Action Levels Should Focus on 303(d) Listings.** Page F-118 of the Fact Sheet states:  

“Given the need for additional data on non-storm water discharges from the MS4 where a TMDL has not been developed, USEPA and the State have used action levels as a means to gauge potential impact to water quality and to identify the potential need for additional controls for non-storm water discharges in the future.”

Using the rationale stated in the Fact Sheet, the non-storm water action levels should be established only for pollutant-waterbody combinations on the 303(d) list where TMDLs have not yet been established. This approach would be consistent with the Watershed Management Programs and would provide appropriate additional rigor to the stormwater program without negating the concept of prioritization.

**Request:** *The Bureau requests the following for non-stormwater action levels:*

- *Delete all non-storm water action levels where an effective TMDL is in place*
- *The Regional Board should provide information (calculations and/or data and procedures) such that all action levels in the Tentative Order can be verified*
- *Where non-storm water action levels are warranted, provide for appropriate non-storm water action levels to be developed as part of the Watershed Management Program in order to ensure that problematic outfalls are isolated and addressed*
- *Revise the overall approach to non-storm water action levels such that action levels are only established for pollutant-waterbody combinations on the 303(d) list where TMDLs have not yet been established*

## **MINIMUM CONTROL MEASURES**

### **1. Revisions are Needed in the Planning and Land Development Provisions Pertaining to the City's LID Ordinance and the Definition of Biofiltration**

The City appreciates the addition of the Local Ordinance Equivalence language. The creation of the City's Low Impact Development (LID) Ordinance, which went into effect in May 2012, included extensive stakeholder input including Regional Board staff participation. In many ways, the City's LID ordinance goes beyond the requirements of the proposed land development requirements; including expanding the targeted categories and lowering the projects size thresholds. The City recommends the City's LID Ordinance be deemed equivalent.

Additional and more detailed comments on the Planning and Land Development Provision are provided in Attachment B. The Bureau supports allowing biofiltration as an alternative to infiltration and rainwater harvesting since it provides high pollutant removal efficiencies, is sustainable, and in many cases provides incidental infiltration. Biofiltration as an equivalent to infiltration is also desirable due to the dense nature of urban development in the City. The number of biofiltration design variations allows their use in a multitude of site and design constraints. The City wishes to maintain the maximum amount of flexibility possible when it comes to BMP selection so that creative and innovative opportunities can be explored that will result in cost-effective mechanisms for reducing multiple pollutants of concern. This is particularly important given the number of TMDLs that Permittees must address in the Los Angeles Region.

One major distinction between the proposed biofiltration provisions and the City's LID Ordinance is the proposed narrowed definition of biofiltration. The proposed biofiltration definition excludes planter boxes that prevent incidental infiltration. In our established practice in the City of Los Angeles, when infiltration is not feasible, planter boxes are used to provide high quality treatment as well as significant runoff reduction through evapotranspiration. However, in many of those cases, even incidental infiltration is a major cause of concern due to structural and geotechnical considerations. As a result, the City requires biofiltration systems to be lined in some cases to prevent any infiltration. The City views the use of lined planter boxes as an additional tool for onsite stormwater mitigation and as a reasonable approach for reducing stormwater pollution, while protecting public safety and property.

***Request:*** The Bureau requests that Regional Board staff consider the City's LID Ordinance as an equivalent mechanism for compliance with the Planning and Land Development MCM provisions. The Bureau also requests to revise the definition of biofiltration to include planter boxes including those that do not allow for incidental infiltration.

## **2. Streamlining of the Facilities under State Purview is Needed**

The Tentative Order expands the permittees responsibilities over facilities that are subject to State purview; primarily those covered under the Industrial General Permit (IGP) and Construction General Permit (CGP). With respect to IGP, many of these facilities are also required to be tracked and inspected as part of the proposed Industrial/Commercial Facilities Program. Reducing overlap with inspections conducted by the State and information tracked by SMARTS will allow the City to focus resources on areas that will maximize reduction of pollution loads from these facilities.

With respect to the CGP construction sites, the provisions listed under the Development Construction Program, significantly expand the permittees' oversight and inspection for construction sites with greater than one acre of disturbed soil. The City of Los Angeles building and grading inspectors, visit these sites during construction as well upon completion of the construction prior to issuance of the certificate of Occupancy of the development project. As part of these inspections, the City can propose a mechanism for referral to the State any problematic sites. However more detailed specialized inspection to determined compliance with the State's regulations would be best performed by State inspectors.

***Request:*** The Bureau recommends that industrial facilities covered under the IGP and construction sites covered under the CGP be kept under State Purview. Instead of the added responsibilities for the permittees, the Bureau recommends a streamlined process for the permittees to refer noted problematic sites to the Regional Board.

<b>PART III: DISCHARGE PROHIBITIONS</b>			
1	<b>Tentative Order III.A.1</b> Pg. 42	The Requirement to prohibit, in lieu of “effectively prohibit,” non-stormwater discharges is inconsistent with the Clean Water Act and associated regulations	The Tentative Permit proposes to require that “Each Permittee shall, ..., prohibit non-storm water discharges through the MS4 to receiving waters ....” This requirement to prohibit non-storm water discharges is different from the previous permit and is inconsistent with controlling language in the Clean Water Act and associated federal regulations. Specifically, both the Clean Water Act and the previous permit require each permittee to “effectively prohibit non-storm water discharges” – not prohibit. (33 U.S.C.S., §1342(p)(3)(B)(ii); see also Order No. 01-182, as amended.) We requests that Part III.A.1 (and other relevant provisions where “prohibit” is currently used) is modified to require each Permittee to “effectively prohibit” non-storm water discharges – not prohibit non-storm water discharges. Please refer to the Attachment A for a more detailed discussion of this concern.
2	<b>Tentative Order III.A.4.a.c</b> <b>III.A.4.a.d</b> Pg. 30-31	Revisions are necessary so as not to negate the intent of the Watershed Management Programs	See comments provided in Attachment A.
3	<b>Tentative Order III</b> <b>Table 8</b> Pg. 35	Overtly restrictive requirements for dechlorinated/ debrominated swimming pool/spa discharges” and for “dewatering of decorative fountains”.	The testing required for residential pools, spas, and decorative fountains prior to discharging is cumbersome and much too sophisticated for most property owners to conduct. In addition, in Los Angeles County alone, there are 16,000 public pools and an undetermined number of decorative fountains, which will be subject to this testing prior to discharge. The cost of testing kits or laboratory analysis will pose a huge burden on the homeowners, as well as recreation and parks departments within the City and County. Please consider deleting this condition. We agree with the requirement for volumetrically and velocity controlling these discharges but for a different reason namely that the storm drain system should be able to handle it. Regardless of the rate of discharge, there would not be a significant loss to evaporation or infiltration when discharging into the storm drain system.
4	<b>Tentative Order III</b> <b>Table 8</b> Pg. 36	The allowable spray washing application rate of 0.006 gallons is unrealistic	The allowable spray washing application rate of 0.006 gallons is too low and we are not aware of any product that would meet this application rate. Please remove application rate for high pressure, low volume spray-washing. Even higher application rates may not result in wash water discharges reaching the storm drain system.

<b>PART V: RECEIVING WATER LIMITATIONS</b>			
5	<b>Tentative Order V.A.1</b> Pg. 39	The Receiving Water Limitations Provisions are Inconsistent with the Intent of the Watershed Management Program	See comments provided in Attachment A.
<b>PART VI.A: STANDARD PROVISIONS</b>			
6	<b>Tentative Order, VI.A.2.i</b> Pg. 39	Waterboards should be the lead regulators for industrial and construction sites with a general NPDES permit	The requirement to control discharges associated with industrial and construction activity including those that have coverage under a State NPDES exceeds past practices and conflicts with the provisions of these NPDES permits that give the authority to the State agencies to regulate them. In addition the State is collecting significant application and annual fees from these sites for the purpose of tracking and enforcing these permits. Finally at the May 3 <sup>rd</sup> Board Workshop on the MS4 Permit, Regional Board members specifically instructed the Regional Board staff to write the permit to maintain authority and responsibility for these sites. Subsequently on the July 9 <sup>th</sup> workshop, Regional Board staff viewed positively this overlapping. Since permittees have multiple challenges as part of this permit, the Bureau will like to request that, during the duration of this permit cycle, the Waterboards maintain responsibility for these sites.
7	<b>Tentative Order, VI.A.2.viii</b> Pg. 39	The permittees should not be held responsible for comingled discharges pending establishment of these interagency agreements.	Much of our MS4 system is receiving stormwater discharges from the highways owned by the State of California Department of Transportation (Caltrans). These discharges have typical concentrations above water quality standards and thus they will cause and contribute to the violation of receiving water limitations. The State Water Resources Control Board is currently processing an updated Caltrans Stormwater Permit. The permittees should not be held responsible for comingled discharges pending establishment of these interagency agreements.
8	<b>Tentative Order, Part VI.A.3.a</b> Pg. 40	The requirement to secure the necessary fiscal resources places compliance with this Permit over other municipal priorities	Requiring “each permittee to exercise its full authority to secure the fiscal resources necessary to meet all requirements of this Order” is beyond the scope of the MS4 and the Regional Board’s authority. The logical extension of this statement is that a permittee must place the funding for meeting MS4 requirements above any other requirements a permittee, especially a municipality, must meet. Please revise this statement to acknowledge that municipalities are required to meet competing regulatory, infrastructure, and social goals.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
9	<b>Tentative Order, VI.A.4.a</b> Pg. 40	Include requirement for Watershed Management coordination	Please include a provision for all permittees, even for those not participating in watershed-wide Watershed Management Plans, to coordinate and share information regarding their permit-compliance activities.
10	<b>Tentative Order, VI.A.7.a</b> Pg. 41	Allow Permit changes for error correction	Please include a provision to allow changes to this Order to correct errors made on developing the provisions of this Order or based on newly found evidence or technical research.
11	<b>Tentative Order, VI.A.7.d.ii</b> Pg. 42	Minor modifications provisions	40 CFR Section 122.63 includes additional provisions for allowing minor modifications other than the two listed. Also more frequent monitoring and reporting does not necessarily constitute a minor modification and unexpected expansion of existing monitoring efforts may be a major imposition on municipalities.
12	<b>Tentative Order, VI.A.8</b> Pg. 42	Standard Provision 8 is More Appropriate for Direct Point Source Discharges such as a Publicly Owned Treatment Works (POTWs)	The Tentative Order includes a standard provision that is more appropriate as applied to direct point source discharges such as POTWs rather than stormwater from MS4 systems. Specifically, the Tentative Permit includes a standard provision that states, “Any discharge of waste to any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of this Order.” (Tentative Permit, p. 42.) The Tentative Order broadly discusses permit coverage in Findings D, however, this broad discussion does not clearly articulate the geographic extent of coverage or the points of discharge with respect to discharges into receiving waters. Because it is difficult to identify the actual “points” of discharge from an MS4 system, this standard provision should be deleted.
13	<b>Tentative Order, VI.A.10</b> Pg. 42-43	Standard Provision 10 Inappropriately Prohibits the Discharge of Any Properly Registered Pesticide that Ultimately May be Released to Waters of the United States	The Tentative Order includes a standard provision that would effectively prohibit the discharge of any properly registered pesticide to any waste stream that may ultimately be released to waters of the United States. (Tentative Permit, p. 42-43.) Such a prohibition is inconsistent with applicable law. As proposed, this prohibition implies that any discharge of a pesticide may cause or contribute to a violation of an applicable water quality standard. However, such is not the case. There are many water quality objectives for pesticides that are set at low levels. A water quality objective at a low level is not equal to prohibition on any pesticide. Furthermore, there are many properly registered pesticides, which by legal definition include herbicides, which are not considered to be a threat to aquatic life or other applicable beneficial uses. Moreover, this standard provision overstates applicable law with respect to application of requirements for NPDES permits. For an NPDES permit to be required, there must be “a point source discharge of a pollutant to a water of the United States.” As proposed, this standard provision would apply to “any waste stream that may be released to waters of the United States.” Such a requirement is inconsistent with the CWA. (See 33 U.S.C. § 1342.) Finally, as proposed, this standard provision makes the Bureau potentially liable for discharges outside of its control. As discussed previously, the City can “effectively prohibit” discharges through ordinances and control programs, however, the Bureau cannot itself be held liable for discharges that occur in violation of the prohibitions established by the Bureau in its ordinances.

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
14	Tentative Order, VI.A.14 Pg. 43-44	It is Inappropriate to Include Descriptions with Respect to the Regional Board’s Enforcement Authority	The standard provisions are considered operational provisions of the Tentative Permit, the violation of which are enforceable through the Regional Board’s discretionary authority and through actions brought by third parties through citizen suits. Accordingly, it is inappropriate to include as part of the standard provisions descriptions with respect to the Regional Board’s enforcement authority. To the extent that the Regional Board wants to inform the Permittees and the public about potential enforcement for violation of the permit, such language is more appropriate for inclusion as part of the findings or the fact sheet, not operational provisions of the permit. The Bureau requests that Standard Provision 14 be removed from the operational provisions of the Tentative Order.
<b>PART VI.B: MONITORING AND REPORTING PROGRAM (MRP) REQUIREMENTS</b>			
15	Tentative Order, VI.B Pg. 45	Revise language to provide flexibility in the monitoring programs to support the Watershed Management Programs	As discussed in Comment #79, flexibility is requested for a customized monitoring program to support the Watershed Management Programs. As such, the Bureau requests that the following language regarding flexibility, consistent with the language and approach used for the minimum control measures, is added to Part VI.B:  “Dischargers shall comply with the MRP and future revisions thereto, in Attachment E, <b><u>or may in lieu of the requirements in Attachment E, implement a customized monitoring program as set forth in an approved Watershed Management Program per Part VI.C.</u></b> ”
<b>PART VI.C: WATERSHED MANAGEMENT PROGRAMS (WMPs)</b>			
16	Tentative Order, VI.C.1.b Pg. 45	Clearly Identify the Provisions Addressed via the Watershed Management Program.	See comments provided in Attachment A. The intent is to identify in one provision all of the elements that will be included in the Watershed Management Program, the provisions of the Order that will be fulfilled via the Watershed Management Programs, and that Permittees will be in compliance with these provisions via the implementation of the Watershed Management Programs.
17	Tentative Order, VI.C.1.d Pg. 46	Delete goal related to not causing exceedances of non-storm water action levels	As currently written in the Tentative Order, there is not a nexus between receiving water data (the basis for establishing watershed priorities per Part VI.C) and the non-stormwater action levels. Exceedances of the non-stormwater action levels may occur without any commensurate exceedance or impact in the receiving water. Establishing a goal that is based upon not exceeding non-storm water action levels would therefore negate the very intent of the Watershed Management Programs – focusing on priorities, as defined by receiving water issues. As discussed in Comment #130, non-storm water action levels are more appropriately used to prioritize BMPs within a watershed.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
18	<b>Tentative Order, VI.C.2.b</b> Pg. 47	Additional time is needed to develop the WMPs	See comments provided in Attachment A.
19	<b>Tentative Order, VI.C.3.a.ii</b> Pg. 47-48	Categorization should not presume all waterbodies exceed applicable water quality standards	As currently phrased, all waterbodies would be classified as exceeding applicable water quality standards. Category 3 should be revised as follows (additions in bold, underlined text; deletions in strike out text):  Category 3: <b><u>Waterbody-pollutant combinations</u></b> <del>Pollutants</del> for which <del>there are insufficient data to</del> indicate <b><u>there is not a</u></b> water quality impairment in the receiving water according to the State’s Listing Policy, <del>but which exceed applicable water quality standards.</del>
20	<b>Tentative Order, VI.C.3.b.ii</b> Pg. 49	Redundant with Part VI.C.1.d	The goals listed for control measures are redundant with the goals identified in Part VI.C.1.d. and should be deleted. The implementation of control measures are the mechanism to achieve the goals identified in Part VI.C.1.d and no additional goals are necessary for Part VI.C.3.b.
21	<b>Tentative Order, VI.C.3.b.iv.1</b> Pg. 50	Provide schedule for the implementation of Minimum Control Measures	Except few MCM provisions, most are not provided with an implementation schedule. During the July 9, 2012 workshop, Regional Board staff indicated that for MCMs similar to the existing permit, their implementation should be immediate. For those that are different or new, the process to set them in place should start upon the effective date of the Permit. The Bureau requests that language in the permit be provided for clarification.
22	<b>Tentative Order, VI.C.3.b.iv.(1)(d)</b> Pg. 51	Approved WMPs should replace in whole, not in part, the requirements in Part VI.D.4 – 9	While the WMPs may revise in whole or in part the existing requirements in Part VI.D.4 through Part VI.D.9, once approved, the WMP itself will be the document through which the Permittees will implement the stormwater program. In order to clearly identify the requirements for the Permittees, and provide clarity regarding how compliance with Part VI.D.4 through Part VI.D.9 will be determined, revise this provision as follows:  Such customized actions, <b><u>which may modify in whole or in part the requirements in Part VI.D.4 to Part VI.D.9</u></b> , once approved as part of the Watershed Management Program, shall replace in whole <del>or in part</del> the requirements in Part VI.D.4 to Part VI.D.9 for participating Permittees.
23	<b>Tentative Order, VI.C.3.b.iv.(2)</b> Pg. 51	Provision should explicitly state that it applies to watershed priorities	The provision should explicitly state that it applies to watershed priorities and should be revised as follow:  <b><u>For pollutants identified as a watershed priority and</u></b> where Permittees identify non-storm water discharges from the MS4 <b><u>as causing exceedances in the receiving water</u></b> <del>as a source of pollutants in the source assessment</del> , the Watershed Control Measures shall include...

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
24	<b>Tentative Order, VI.C.3.b.iv(2)</b>	Modify language to ensure non-stormwater discharge provisions do not negate the flexibility intended by the WMPs	<p>It is currently unclear how the non-stormwater action levels integrate with the concept of prioritization for the Watershed Management Programs. As noted in Comment #17, the fundamental purpose of the Watershed Management Programs is to address the highest watershed priorities, which per the Tentative Order, are based upon identified issues in the receiving water (via TMDLs and 303(d) listings). Non-stormwater action levels are not integrated into the Watershed Management Program approach and may negate the concept of prioritization. The non-stormwater action levels do not have a nexus to receiving water conditions and would require Permittees to investigate and address issues on an outfall by outfall basis, even if the pollutant is not causing exceedances in the receiving water and therefore not identified as a watershed priority. The Bureau has provided additional comments on how the non-stormwater action levels should be revised (see Comment #130). In addition, consistent with the language already used in the Tentative Order linking the Watershed Management Programs to the Receiving Water Limitations provisions, add the following language to Part VI.C.3.b.iv(2):</p> <p><b><u>Actions taken by Permittees as part of the Watershed Management Program to address non-stormwater discharges fulfill the requirements under Part III.A.4.c and Part III.A.4.d.</u></b></p>
25	<b>Tentative Order, VI.C.3.b.iv.(4)(a)</b> Pg. 52	Typo	<p>Please revise as follows:</p> <p>“...contained in <del>this</del> Part VI.E and Attachments L through R...”</p>
26	<b>Tentative Order, VI.C.3.c.iii(3)(c)</b> Pg. 53	Achieving Receiving Water Limitations within Permit Term may not be feasible	<p>TMDL schedules that have been adopted by Regional Board most typically exceed 5 years, which acknowledges that implementation of measures to attain water quality standards in receiving waters may exceed a Permit term. Additionally, as noted by EPA in multiple presentations by Deborah Nagle (Director, Water Permits Division, Office of Water) on EPA’s integrated planning framework (similar in concept and approach to the Watershed Management Programs), EPA acknowledges that the schedule to address water quality priorities will exceed a five year permit term (a recorded version of the presentation can be found here: <a href="https://www1.gotomeeting.com/register/497791865">https://www1.gotomeeting.com/register/497791865</a>.)</p> <p>As the requirement to include a schedule that achieves milestones as soon as possible is included in Part VI.C.3.c.iii(3)(b), the Bureau requests that this provision in Part VI.C.3.c.iii(3)(c) is deleted in its entirety.</p>
27	<b>Tentative Order, VI.C.2.a</b> Pg. 46-47, Table 9	Schedule to commence implementation of WMP not consistent with referenced provision	<p>Part VI.C.4 requires implementation of the WMPs upon approval by the Regional Board Executive Officer, while Table 9 states implementation is required upon submittal of the final plan. Given the importance of Executive Officer approval to clearly identify the expectations for implementation of and compliance with the Order, and considering the potential for a petition for the Watershed Management Program to be heard by the Regional Board within 30 days of approval by the Executive Officer, Table 9 should be revised to be consistent with Part VI.C.4 and state “upon approval by the Executive Officer.”</p>

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
28	<b>Tentative Order, VI.C.5</b> Pg. 54	Modify language to provide flexibility, consistent with concept and approach for MCMs	<p>As currently written, there does not appear to be sufficient flexibility to modify monitoring requirements to support the Watershed Management Programs. This is of particular concern for the outfall monitoring requirements, which, as currently written, will require a significant level of resources without clear benefit to addressing receiving water issues. The MRP should allow for modification of monitoring requirements to focus efforts on watershed priorities identified in the Watershed Management Programs to ensure the effective and efficient use of resources. The WMP will identify specific priorities based on TMDLs and 303(d) Listings, which will allow MS4s to tailor monitoring to address the Primary Objectives and provide data to support management decisions. The current MRP requirements, specifically the outfall monitoring requirements, will divert resources and attention from watershed priorities, which are focused on receiving water issues. The Bureau requests that Part VI.C.5 is modified as follows:</p> <ul style="list-style-type: none"> <li>• Permittees in each WMA shall develop an integrated monitoring program <del>and assessment program</del> as set forth in Part IV of the MRP (Attachment E), <u>or in lieu of the requirements in Part IV of the MRP implement a customized monitoring program as set forth in an approved Watershed Management Program per Part VI.C. Each monitoring program shall</u> <del>to</del> assess progress toward achieving the water quality-based effluent limitations and/or receiving water limitations per the compliance schedules, and progress toward addressing the highest water quality priorities for each WMA. <u>The monitoring program shall be designed to address the Primary Objectives detailed in Attachment E, Part II.A and shall include the following program elements:</u> <ul style="list-style-type: none"> <li>○ <u>Receiving Water Monitoring</u></li> <li>○ <u>Stormwater Outfall Monitoring</u></li> <li>○ <u>Non-Storm Water Outfall Monitoring</u></li> <li>○ <u>New Development/Re-Development Effectiveness Tracking</u></li> <li>○ <u>Regional Studies</u></li> </ul> </li> </ul>
29	<b>Tentative Order, VI.C.6.a.i.(4) and VI.C.6.a.i.(7)</b> Pg. 54	Adapting the WMPs to re-evaluate watershed priorities and soliciting public feedback is not feasible on an annual basis	Given the amount of resources necessary to develop the WMPs, modifications during the Permit term should be limited to areas that improve upon the current goals and objectives. Modifications that would significantly change the WMPs, such as re-evaluating the highest watershed priorities and soliciting feedback via a public participation process, are more appropriately done once per Permit term as part of the Report of Waste Discharge, or every five years, whichever is sooner.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
<b>PART VI.D: STORMWATER MANAGEMENT PROGRAM MINIMUM CONTROL MEASURES</b>			
30	<b>Tentative Order, VI.D.2.a.v</b> Pg. 57	Sites under Industrial and commercial General Permits should be under the purview of Waterboards	This provision requires the permittees to conduct additional enforcement action prior to referral to Regional Board. The Bureau recommends that violations of the Industrial and Construction General Permits can be immediate and there should not have to be inspected and sited by the permittees prior to the referral. Again these facilities are under the purview of the State. This Permit can be used as an opportunity to streamline the oversight of these facilities and improve the efficiency of both municipal and State inspection units.
31	<b>Tentative Order, VI.D.4.c.ii</b> Pg. 59	Minor revision	Add " <i>Participate in or</i> organize events targeted to residents and population subgroups to educate and involve the community in stormwater..."
32	<b>Tentative Order, VI.D.4.d.3</b> Pg. 60	Targeted facilities	Please consider removing pharmacies from the list. Improper disposal of drugs are already been in the focus of municipal wastewater and refuse collection programs. Instead consider including paint stores to the list.
33	<b>Tentative Order, VI.D.6.c.i.2</b> Pg. 70	Remove “whichever is greater” wording	Consider removing the “whichever is greater” wording. In calculating the design Stormwater Quality Design Volume (SWQDV), either the 0.75 inch or the 85 <sup>th</sup> percentile can be used. The two methods are considered equivalent and the 85 <sup>th</sup> percentile was calculated to be the 0.75-inch for downtown Los Angeles. Currently the 0.75-inch storm criterion has been used throughout the County for uniformity. While requiring the 85 <sup>th</sup> percentile to be used instead appears more technically appropriate, requiring calculating both criteria and using the greater value appears punitive.
34	<b>Tentative Order, VI.D.6.c.i.4</b> Pg. 70	Green roofs should not be considered for on-site retention	Consider deleting this sentence since it is redundant with item VI.D.6.c.i.1 and green roofs are not feasible. Their infeasibility is due to regional climate and implementability considerations. Clarify as it was explained in the July 9 <sup>th</sup> Workshop that permittees will have the discretion to outright consider green roofs as unfeasible.
35	<b>Tentative Order, VI.D.6.c.ii.2.a</b> Pg. 70	Suggested infiltration infeasibility	Infiltration technical infeasibility should be based on 1) an infiltration rate, $K_{sat} \leq 0.3$ in/hr and connectivity to higher $K_{sat}$ soils is infeasible; and 2) amending in-situ soil is infeasible

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
36	<b>Tentative Order VI.D.6.c.iii</b> Pg. 71	Offsite mitigation will be difficult to implement	Even without the proposed restrictions to offsite mitigation, the Bureau believes that this alternative will be rarely exercised. As part of the City’s low impact Development, an in-lieu fee was considered and not incorporated and we view onsite mitigation as the most practical approach. The State’s Mitigation Fee Act, California Code Section 66000-66008 has additional requirements for collecting mitigation fees for approving development projects. These restrictions create cumbersome, accounting, and legal consideration and the City may not be able to meet. For these reasons we encourage flexibility in implementing on-site BMPs, including allowing planter boxes with impermeable liner and treatment systems without the need of implementing offsite projects.
37	<b>Tentative Order VI.D.6.c.iii</b> Pg. 71	Biofiltration should be considered equivalent to retain on-site.	If the 1.5 x SWQDv requirements is kept that allows for the over-sizing of the biofiltration BMPs, please clarify that the biofiltration BMPs are considered as equivalent as “retain on site” BMPs. Biofiltration BMPs such as planter boxes allow for a significant loss of the stormwater runoff through evaporation and transpiration.
38	<b>Tentative Order VI.D.6.c.iii.1.b.ii</b> Pg. 71	No need to have raised underdrains	The requirement for raised underdrain placement to achieve nitrogen removal is inconsistent with standard industry designs and is based on limited evidence that this change will improve nitrogen removal. Furthermore by raising the underdrain, other water quality problems may result such as low dissolved oxygen and bacterial growth due to the septic conditions that will be created. Also the second sentence should refer to Appendix H not I.
39	<b>Tentative Order VI.D.6.c.iii.2.b</b> Pg. 72	No need to provide on-site treatment when offsite mitigation is used.	The requirement to provide treatment for the project site runoff when offsite mitigation is provided is punitive and unfair considering that an alternative site needs to be retrofitted to retrain the equivalent volume. Please consider removing this on-site requirement when mitigation occurs in an offsite location.
40	<b>Tentative Order, I.D.6.c.iii.4.b</b> Pg. 73	Allow offsite location flexibility	The conditions listed for offsite projects are overly restrictive. Consider expanding the location of the offsite projects to within watershed or within the permittees jurisdiction so there will be better opportunities and flexibility for permittees.
41	<b>Tentative Order, I.D.6.c.iii.4.c</b> Pg. 73	Delete groundwater recharge as a priority	The emphasis of this permit should be focused on water quality. The requirement to place projects to maximize ground water recharge benefit will not necessarily improve water quality.
42	<b>Tentative Order VI.D.6.c.iii.4 d, f, h</b> 73 -74	In-lieu fee is not feasible	These conditions will make it very difficult for the permittees to implement. Our experience when considering an in-lieu fee for untreated runoff was that there would not be enough fees collected to implement a project. In addition the proposed fee was scrutinized and challenged by the building industry and this condition may not be legally defensible. Please remove these conditions is offsite mitigation is kept as an alternative.
43	<b>Tentative Order VI.D.6.c.iv.1</b> Pg. 74	Minor item	New development and redevelopment projects should be referred to as “new projects” as indicated in page 69, item C.i.1.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
44	<b>Tentative Order VI.D.6 Table 11</b> Pg. 75	The proposed effluent benchmarks are not feasible and should be replaced by design parameters	We support the removal of the monitoring requirements for new projects as “they had appeared in the “working Proposal” document. However since there are no monitoring requirements, the permit should not specify benchmark standards but instead design parameters such as an acceptable flow through rate (i.e: 100 in/hr). The effluent concentration benchmarks for treatment BMPs will not be attainable when considering that these values were selected from the median of the best available datasets of the stormwater BMP database site.
45	<b>Tentative Order VI.D.6.c.v.1.a.i</b> Pg. 75	Ep is not widely used	Erosion Potential (Ep) is not a widely used term in our region, and may not be the most appropriate term to be used as an indicator of the potential hydromodification impacts.
46	<b>Tentative Order VI.D.6.c.v.1.a.iv</b> 76	Use the State’s Hydromodification Policy instead	The requirement for development of a new Interim Hydromodification Control Criteria is unnecessary considering there is already peak storm control requirements on the existing MS4 Permit and that the State Water Board is finalizing the Statewide Hydromodification Policy.
47	<b>Tentative Order VI.D.6.c.v.1.c.i.1</b> Pg. 77	Excessive Hydromodification Control design parameters	The requirement to retain on site the 95 <sup>th</sup> percentile storm is excessive and inconsistent with all other storm design parameters that appear in this order. It may also not be an appropriate storm in terms of soil deposits for the soil deprived streams such as Santa Clara Creek. Again consider referring to the statewide policy for a consistent and technical basis of the hydromodification requirements.
48	<b>Tentative Order VI.D.6.d.iv.1</b> Pg. 81	Schedule	The requirement for implementing these provisions within 60 days is reasonable however for reasons of consistence please considers providing a timeline for all other provisions that do not have a schedule or clarify when the newly required provisions for their implementation process should be initiated.
49	<b>Tentative Order VI.D.7.d</b> Pg. 83	There is no threshold for construction projects	Consider introducing a minimum threshold for construction sites such as those for grading permits. As written minor repair works or trivial projects will be considered construction projects and will unnecessarily be subject to these provisions.
50	<b>Tentative Order VI.D.7, Table 12</b> Pg. 83	Not all proposed construction BMPs in Table 12 will be applicable	Some of the listed BMPs will not be applicable for all construction sites. Please consider replacing the title of the Table 12 to “Applicable Set of BMPs for Construction Sites”
51	<b>Tentative Order VI.D.7.e-j</b> Pgs 84-90	General Construction Permit sites are under the purview of the State.	All these provisions refer to the construction sites than are greater than one acre. As such these sites are subject to the General Construction Permit provisions and within the authority of the State agencies. Towards ensuring compliance with these regulations, the State is collecting a significant fee that covers inspection and tracking of these facilities. We are disputing the need to establish an unnecessary parallel enforcement scheme for these sites. Please consider maintaining these sites under State purview.
52	<b>Tentative Order VI.D.7.g-j</b> Pgs 84-90	Please refer to General Construction Permit instead of including many of these provisions.	Much of the proposed language is taken fro the General Construction Permit. However as a way of reducing the length of the text and prevent conflicting requirements please consider referring to the GCP and its SWPPP requirements.

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
53	<b>Tentative Order VI.D.7.g.ii.9</b> Pg. 85	Please use SWPPP terms instead of ESCP	The term Erosion and Sediment Control Plan is introduced. There is no need to introduce a new document for construction sites that are subject to GCP's SWPPP requirements.
54	<b>Tentative Order Table 13</b> Pg. 87	Delete Table 13	Delete Table 13 which is the same as Table 12.
55	<b>Tentative Order Table 17</b> Pg. 90	The City of Los Angeles will not be able to accommodate this inspection requirement.	The suggested inspections could not be possibly accommodated based on current resources because of the concurrent need to visit all sites. The City of Los Angeles has limited inspection staff, and these requirements will introduce significant staffing needs during the rain season. We believe that inspecting GCP sites is the purview of the State.
56	<b>Tentative Order VI.D.7.j.ii.2.a</b> Pg. 90	Delete requirement for inspection prior to construction	Consider deleting this requirement as being unnecessary. The placement of BMPs may not be needed based on the season of construction and the planned construction phases. A better requirement would be to inspect sites at the beginning of the rain season such as the months of September and October.
57	<b>Tentative Order VI.D.8.f.ii</b> Pg. 99	Allow for exposed washing facilities if equipped with rain diversion gages	Consider using the language as appears in the 2001 MS4 Permit. Some older washing facilities are still open and not self-contained, however they are equipped with rain diversion gages that minimizes to a large extent the release of stormwater pollution.
58	<b>Tentative Order VI.D.8.h.ii</b> Pg. 100	Delete the recommended approach on how to dispose liquid material	The process by which the material removed from MS4 should not be allowed to reenter the MS4 is unnecessarily prescriptive. Additional option that the two listed for disposing liquid material exist and permittees should be these options. Consider including only the first sentence of this subsection.
59	<b>Tentative Order VI.D.8.h.vii</b> Pg. 102	Retrofit of catch basins in non-TMDL areas.	It is unreasonable to prescribe the installation of CB curb opening screens on catch basins that are located within a watershed that has not been identified as being impaired for trash. This requirement should be removed since if an impairment is identified it would be address through a TMDL.
60	<b>Tentative Order VI.D.8.i.iv.1</b> Pg. 105	Delete the second sentence of this provision.	The requirement to clean a parking lot, once a month, even if inspection indicates no presence of debris or oil buildup, is unnecessary.
<b>PART VI.E: TOTAL MAXIMUM DAILY LOADS (TMDLs)</b>			

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
61	<p><b>Tentative Order VI.E.2.b.v.2</b>  <b>VI.E.2.d.i.2</b>  <b>VI.E.2.e.i.2</b>                      Pg. 112, 113, 114</p>	<p>Please correct the language as recommended</p>	<p>Since the ultimate end goal of the TMDL is protection of beneficial uses, attainment of water quality objectives/criteria protective of those uses should constitute compliance with the TMDL. However, Section E Parts 2.b.v.2, 2.d.i.2, and 2.e.i.2 limits this concept to applicable receiving water limitations. If water quality objectives/criteria are met in the receiving waters, Permittees should be in compliance with the TMDL regardless if the receiving water limitation is explicitly incorporated into the permit.</p> <p>Additionally, the language places upstream dischargers in jeopardy if downstream dischargers cause or contribute to exceedances. The current language indicates that compliance can be demonstrated if there are no exceedances at, or downstream of, the Permittee’s outfall. For example, if a water quality objective is met in Reach 6 of the LA River but not in Reach 2 (over 20 miles downstream and a change in flow of over 80 cfs), those discharging to Reach 6 could be considered out of compliance.</p> <p>Based on these issues, please revise as follows:                      Section E Part 2.b.v.2 “Demonstrate that the discharge from the Permittee’s MS4 is treated to the level that does not exceed the applicable water quality-based effluent limitation <u>or water quality objective.</u>”</p> <p>Section E Parts 2.d.i.2 and 2.e.i.2 as follows: There are no exceedances of the applicable <del>receiving water limitation</del> <u>water quality objectives</u> for the pollutant(s) associated with the specific TMDL in the receiving water(s) <del>at, or downstream of, the Permittee’s outfall(s).</del></p>
62	<p><b>Tentative Order VI.E.2.d.i.4.b</b>                      Pg. 113</p>	<p>Clarify the intended purpose of design standard</p>	<p>This incorporation of such a design standard seems to imply that during larger storms, water quality standards may not have to be met. Also please clarify if this is a recommendation or the intent is to prohibit the implementation of BMPs that will provide partial treatment of this design storm.</p>
63	<p><b>Tentative Order Note 38</b>                      Pg. 113</p>	<p>Provide a consistent definition of outfall</p>	<p>Suggested text for Note 1:                      A municipal stormdrain outfall (or conduit) shall have a minimum pipe size of 24-inch diameter where a maintenance access or other point of access can be built based on hydraulic engineering design standards at the Permittee’s jurisdictional boundary.</p>
64	<p><b>Tentative Order VI.E.3.d</b>                      Pg. 115</p>	<p>Additional time is needed for Watershed Management Plan</p>	<p>Please note our comment regarding additional time will be needed for a more comprehensive Watershed Management Program Plan in Attachment A.</p>
65	<p><b>Tentative Order VI.E.4.b</b>                      Pg. 116</p>	<p>Establish an iterative/adoptive approach for State Adopted TMDLs</p>	<p>This provision will put the City of Los Angeles in immediate determination of non-compliance and will require us to request a time schedule order within 45 days of the effective day of the permit. The City developed implementation plans for compliance of these TMDLs, however RWQCB staff did not provide any feedback or acknowledge that the proposed actions will be acceptable. We request that the State Adopted TMDLs, where final Compliance Deadlines have passed or are required prior to the development of the Watershed Management Program, be treated similar of the EPA promulgated TMDLs, and be required to submit updated implementation plans as part of the Watershed Management Program Plan.</p>

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
66	<b>Tentative Order VI.E.5.b.i.2.b</b> Pg. 119	The DGR or similar exercise to quantify institutional controls should be done for two consecutive years during the permit 5-year cycle.	The intent of the DGR is to obtain a measure of the effectiveness of institutional controls. Institutional controls are those measures/programs that adjust human behavior, in this case not contributing to stormwater pollution. These are typically long term programs and their results are not immediate. Prescribing an annual DGR is not sensible since representative data collection may not be realized.
67	<b>Tentative Order VI.E.5.c.i</b> Page 122	Inconsistent reporting due dates	This section states that the compliance report is due October 31, 2012; while Attachment E, Section XIX TMDL Reporting, pg. E-56 states that a report is due December 15, 2013. Please revise the dates to be consistent.
<b>ATTACHMENT A: DEFINITIONS</b>			
68	Definitions A-1	Industry-Established Definitions	Allow industry-established definitions for specific BMPs such as Biofiltration, bioretention, bioswale, green roof, infiltration, planter boxes (other flow through treatment BMPs), rainfall harvest & use and thus no need to define them here. However, if it is decided to keep them, we suggest the revisions as shown below.
69	Definitions A-1	Biofiltration	Industry standards considers planter boxes are a form of biofiltration. Recommend incorporating the language from the planter boxes definition into the biofiltration. Depending on the soil conditions, biofiltration may or may not be infiltrated into the ground; regardless runoff will be infiltrated through a soil media.
70	Definitions A-2	Bioretention	Definition should not go into designing the BMP. Recommend removing the 2 <sup>nd</sup> sentence of the definition.
71	Definitions A-4	Green roof	Green roof means a roof that is partially or completely covered with vegetation and a growing medium, planted over a waterproofing membrane. It may also include additional layers such as a root barrier, subdrain, and irrigation system.
72	Definitions A-5	Infiltration	Downward movement of water through soil in-situ soils or amended soils. For consistency, if examples are going to be given, each BMP definition should be given examples. Recommend removing the 2 <sup>nd</sup> line of the current definition. Also provide definition for uncontaminated ground water infiltration that refers to the introduction of groundwater to the MD4 system as defined on page 27 of the Order.

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
73	Definitions A-7	Planter boxes and other high flow treatment BMPs	Planter boxes should not be grouped with the high flow treatment BMPs. In the City of Los Angeles, we have been requiring planter boxes to have a flow-through velocity less than 5 inch/hour rate. Please define “high flow treatment BMPs” and a specific flow through rate. Also please accept planter boxes as one of the biofiltration options even if they do not allow for incidental infiltration. In the city of Los Angeles, planter boxes are one of the most common BMPs. This was reaffirmed with the recently implemented LID requirements that involved participation with Heal the Bay and other environmental advocacy organizations. Removing planter boxes as an option will make the land Development and Planning Requirements unattainable.
74	Definitions A-8	Rainfall harvest and use	Definition should not limit capture only from the roof and it should be open to capture runoff from the entire site if feasible.
75	Definitions A-1 to A-9	Terms to be added	Please add the following definitions; Municipal Action Level (MAL), Non-Storm Water Action Level, Areas of Special Biological Signification (ASBS), and Minimum Control Measure (MCM)
76	Definitions A-1 to A-9	Terms to be deleted	These terms are in the definitions section. They appear to be terms used for wastewater permit requirements and are not used anywhere in this permit language. They are Average Monthly Effluent Limitation (AMEL), Daily Discharge, Dilution Credit, Instantaneous Maximum Effluent Limitation, Instantaneous Minimum Effluent Limitation, Maximum Daily Effluent Limitation (MDEL), Mixing Zone, and Satellite Collection System. Please delete these terms from the Attachment A.
77	Definitions A-10 to A-12	Acronyms and Abbreviations	Please include these acronyms and Abbreviations; EMC and MUN
<b>ATTACHMENT D: STANDARD PROVISIONS</b>			
78	Standard Provisions D-1 To D-11	Repeated sections’ titles	There is Subsection VI.A also named Standard Provisions. Consider renaming this section as “Additional Standard Provisions”

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
<b>ATTACHMENT E: MONITORING AND REPORTING PROGRAM</b>			
79	<b>Attachment E</b>	Flexibility is needed to focus efforts on watershed priorities	The MRP should allow for modification of monitoring requirements to focus efforts on watershed priorities. The WMP will identify specific priorities based on TMDLs and 303(d) Listings, which will allow MS4s to tailor monitoring to address the Primary Objectives and provide data to support management decisions. As currently written, there does not appear sufficient flexibility to modify monitoring requirements. This is of particular concern for the outfall monitoring requirements, which, as currently written, will require a significant level of resources without clear benefit to addressing receiving water issues.
80	<b>Attachment E II.E.2.b</b>	Revision to storm water outfall monitoring goal to apply only to TMDLs with final compliance dates during the Permit Term	Determining compliance with applicable wet weather WQBELs derived from TMDL WLAs is only necessary when the final compliance date is within this Permit term. As the collection of such data is costly, it should only be required if (1) the Permittee elects to assess compliance at the outfall in lieu of the receiving water and (2) if the final TMDL compliance date is within the Permit term. Therefore, the objective should be revised as follows:  “Determine whether a Permittee’s discharge is in compliance with applicable wet weather WQBELs derived from TMDL WLAs <b><u>with final compliance dates within the term of the Order.</u></b> ”
81	<b>Attachment E II.E.3.a</b>	Revision to storm water outfall monitoring goal to apply only to TMDLs with final compliance dates during the Permit Term	As noted in Comment #80 related to wet weather WQBELs, determining compliance with applicable dry weather WQBELs derived from TMDL WLAs is only necessary when the final compliance date is within this Permit term. Therefore, the objective should be revised as follows:  “Determine whether a Permittee’s discharge is in compliance with applicable dry weather WQBELs derived from TMDL WLAs <b><u>with final compliance dates within the term of the Order.</u></b> ”
82	<b>Attachment E, II.E.4., Pg. E-4</b>	Program element language should be consistent	The information that is expected be generated to evaluate the effectiveness of new development/re-development (Attachment E. Part X) is focused on tracking and documenting the each new development/re-development subject to the requirements of Part VI.D.6 of the Order. As such, the monitoring program elements in Attachment E. Part II should be consistent. Please revise Part II.E.4 as follows:  New Development/Re-development effectiveness <del>monitoring</del> <b>tracking</b> . The objective of best management practices (BMP) effectiveness <del>monitoring</del> <b>tracking</b> is to <del>determine</del> <b>track</b> whether the <u>conditions in the building permit issued by the Permittee are implemented to ensure the volume of storm water associated with the design storm is retained on-site as required by Part VI.D.6.c.i of this Order, and as conditioned in the building permit issued by the Permittee.</u>

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
83	Attachment E, III.F.2, Pg. E-5	Grab samples may be appropriate for additional constituents or sampling approaches	<p>The current requirement limiting grab samples for bacteria, oil and grease, cyanides, and volatile organics unnecessarily limits the ability for MS4s to collect grab samples for other constituents that are intended to be collected as grab (i.e., chromium) and instances where grab samples are considered to appropriately characterize conditions (i.e., dry weather). Suggest removing the sentence or alternatively revise as follows:</p> <p>Grab samples shall be taken <del>only</del> for <u>constituents that are required to be collected as such (i.e., pathogen indicator bacteria, oil and grease, cyanides, and volatile organics) and in instances where grab samples are generally expected to be sufficient to characterize conditions (i.e., dry weather).</u></p>
84	Attachment E, III.H, pg. E-6	Reporting requirements are spread throughout the MRP and create confusing requirements	<p>Part III.H is the first of a number of requirements related to reporting. The requirements in the MRP appear duplicative at times and led to some confusion. Please either remove Part III.H as the reporting requirements are laid out in detail in Parts XIV through XVIII or revise Part III.H.1 to simply refer to Parts XIV through XVIII.</p>
85	Attachment E, IV.A Pg. E-6	Flexibility is needed to focus efforts on watershed priorities	<p>The IMPs should allow for modification of monitoring requirements to focus efforts on watershed priorities. The WMP will identify specific priorities based on TMDLs and 303(d) Listings, which will allow MS4s to tailor monitoring to address the Primary Objectives and provide data to support management decisions. As currently written, the IMP requirements appear to only allow flexibility to modify screening approaches for dry weather outfall monitoring. More efficient approaches may be justifiable for other components of the IMP and should be allowed. Please revise Part IV.A.4 as follows:</p> <p>Where appropriate (<del>e.g., dry weather outfall based screening program</del>), the Integrated Monitoring Program may develop and utilize <u>alternative approaches to meet the Primary Objectives (Part II.A) and address the five Monitoring Program elements (Part II.E). Sufficient justification shall be provided in the IMP for the alternative approach(es). The alternative approach(es) must be screening level monitoring strategies to avoid more costly analytical procedures</u> if approved by the Regional Water Board Executive Officer.</p>
86	Attachment E, IV.B Pg. E-7	Flexibility is needed to focus efforts on watershed priorities	<p>The CIMPs should allow for modification of monitoring requirements to focus efforts on watershed priorities. The WMP will identify specific priorities based on TMDLs and 303(d) Listings, which will allow MS4s to tailor monitoring to address the Primary Objectives and provide data to support management decisions. As currently written, the CIMP requirements do not appear to allow flexibility to modify monitoring approaches. More efficient approaches may be justifiable for other components of the CIMP and should be allowed. Please add a new bullet to Part IV.B. as follows:</p> <p>Where appropriate, the Coordinated Integrated Monitoring Program may develop and utilize alternative approaches to meet the Primary Objectives (Part II.A) and address the five Monitoring Program elements (Part II.E). Sufficient justification shall be provided in the CIMP for the alternative approach(es). The alternative approach(es) must be approved by the Regional Water Board Executive Officer.</p>

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
87	<b>Attachment E,</b> IV. A.6 E-7	Reduction in the monitoring efforts should be allowed	Just for clarification, this provision for the IMP to address all TMDL and Non-TMDL monitoring does not prevent a reduction in the frequency, number of locations, or parameters. We anticipate that integrating all monitoring programs will result in a more efficient monitoring effort where the number of sampling events and analyses may be significantly reduced.
88	<b>Attachment E,</b> IV.C.3 Pg. E-7	Additional time is needed to complete CIMPs	Twelve months is not sufficient time to complete a CIMP. Individual watersheds can have upwards of 40 agencies that may participate in a CIMP. Additionally, Regional Studies that may be addressed by CIMPs could include all 80 plus LA County Copermittees. For reference, TMDL requirements for monitoring program submittal, which tend to address one type of constituent, typically exceed 12 months. For more complicated monitoring (such as the LA/Long Beach Harbors) TMDL have 20 months. The primary challenge for submitting coordinated monitoring programs is twofold: 1) working with a large group to come to consensus on a technical approach and 2) developing and signing agreements (cost sharing and memoranda of agreement). To truly allow for a coordinated approach that allows Permittees to develop a robust technical approach and work through the approval process (often through City council approval) at least 18 months are needed. Please revise the requirement for CIMPs to be submitted from 12 months to 18 months.
89	<b>Attachment E,</b> Table E-1 Pg. E-11	Machado Lake Pesticides & PCBs TMDL	The table states that the Monitoring Plan is due on September 20, 2012. However per attachment A to Resolution No. R10-008, “Table 7-38.2. Machado Lake Pesticides and PCBs TMDL, Implementation Schedule”, Page No. 13, Task Number 4 the deadline is 1.5 years from effective date of the TMDL which was March 20, 2012. Thus the Monitoring Plan is due September 20, 2013. Please make this correction.
90	<b>Attachment E,</b> Table E-1 Pg. E-12	Los Angeles River Nitrogen Compounds and Related TMDLs	Table E-1 indicates that the Monitoring plan was due in March 2005. The County of Los Angeles, in cooperation with the City of Los Angeles, submitted the required document in March 2005.
91	<b>Attachment E,</b> VI.C.b.ii Pg. E-14	Trigger for initiating wet weather sampling	Permittees should be allowed to utilize an alternative to the prescribed rainfall triggers for conducting wet weather monitoring. Permittees have been monitoring the LA region watersheds for years and have a good understanding of how each watershed responds to rainfall events under varying circumstances. As such, the Permit should allow Permittees to propose an alternative in the C/IMPs to the prescribed rainfall triggers.
92	<b>Attachment E,</b> VII.A.10 Pg. E-16	MS4 Map and Outfall Database	The City of Los Angeles has a comprehensive database of its stormwater collection system. However there is no dataset with Effective Impervious Area (EIA) overlay for our region. Also we don’t have data on their consistency of having non-stormwater discharges. Furthermore occasionally we observe errors or missing and outdated data. Please understand that these discrepancies would not constitute a violation.
93	<b>Attachment E,</b> VII.A.11 Pg. E-17	Requirement to photograph every outfall	Requiring MS4s to photograph every outfall is extremely burdensome for large cities. This one component of the MRP would require significant resources of those MS4s that are adjacent to waterbodies, or in the case of the City waterbodies in multiple watersheds. Request that the photographs be included in the database “if available.”

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
94	<b>Attachment E,</b> VIII.A, pg. E-17	Flexibility is needed to focus efforts on watershed priorities	The current permit language requires each Permittee to select one site per jurisdiction per HUC-12 watershed. In the LA River watershed alone 108 sites would be required to meet this requirement. This requirement would result in a significant cost to Permittees without a commiserate benefit. The approach results in sites that have comingled discharges from multiple land uses making the data difficult if not impossible for Permittees to use in evaluating where to focus minimum control measures and source control BMPs as well as where to site and build structural controls to treat stormwater. Furthermore, the proposed approach would still require Permittees to extrapolate the data to calculate their total loads to receiving waters and evaluate the potential impact. However, this approach would be fraught with inaccuracies as one would have to try and desegregate land uses to apply the loadings to other outfalls within the Permittee’s jurisdiction. Flexibility should be provided such that an alternative approach could be submitted with the IMP or CIMP. Such an alternative could include the monitoring of representative land use sites. A representative land use approach would provide Permittees the core data needed to evaluate their overall loading to receiving waters as well as utilize a modeling approach to identify problematic areas and develop and implement control strategies through the WMP.
95	<b>Attachment E,</b> VIII.A.1, pg. E-17	Wet weather monitoring at manholes is often unsafe and infeasible	Sampling in manholes results in entering confined space, often in roads such as major arterials, which can be very expensive because of additional safety requirements for the crew and the need to coordinate with police regarding traffic impacts. Please add “where feasible given technical and safety constraints” following the word manhole.
96	<b>Attachment E,</b> VIII.B.1, pg. E-17	Toxicity testing of MS4 discharges is inappropriate	MS4 discharges are not the same as wastewater plant effluent which represents a single continuous discharge of typically consistent quality to receiving waters. Rather, urban runoff is episodic in nature. Furthermore, individual outfalls carry a minute percentage of the total flow in the receiving waters and as such toxicity observed in one outfall sample will likely have no effect on the receiving water. The current approach is appropriate for wastewater discharges but not urban runoff and they should be treated differently. The more appropriate approach for urban runoff is to identify whether toxicity exists in the receiving water, identify pollutants that are causing toxicity through toxicity identification evaluations (TIEs), and then incorporate monitoring of pollutants that are causing toxicity into the outfall monitoring. Please remove toxicity monitoring requirements from the stormwater outfall monitoring program.
97	<b>Attachment E,</b> VIII.B.1.c, pg. E-18	Flow measurement is not needed	Flow is a parameter that can easily and relatively accurately be estimated based on the drainage area, and the precipitation data for each outfall. Requiring flow measuring equipment for outfall measurement will further increase the cost to about \$30,000 per location. Consider deleting the flow measuring requirement.
98	<b>Attachment E,</b> IX.E, pg. E-21	WMP and C/IMPs should set the priorities for source ID	The permit provides flexibility to select the method by which Permittees determine significant non-stormwater discharges. Similar flexibility should be provided in setting priorities for source investigation. Flexibility should be provided such that an alternative approach could be submitted with the IMP or CIMP. It appears this flexibility is provided and we support this approach.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
99	<b>Attachment E</b> , IX.F.3 and G, pg. E-22	Requirement to conduct water quality monitoring of significant non-stormwater discharges	Requiring Permittees to monitor all significant non-stormwater discharges results in a disconnect between receiving water issues and monitoring, is inconsistent with some TMDL implementation schedules, and will result in Permittees being required to take action at drains that are not a priority as identified in the WMP. As an example of inconsistencies with receiving water issues, based on the data collected in Reaches 1, 3, 4, 5 and the Burbank Western Channel (the reaches original listed in the TMDL), the LA River is meeting ammonia TMDL targets. Having MS4s in the LA River monitor for ammonia, as currently required, at all outfalls is not necessary since MS4 discharges are not causing an impairment as there is no impairment. Additionally, the Permit requires actions to be taken based on outfall data, even though there is no corresponding receiving water issue. As an example of inconsistency with a TMDL, the LA River Bacteria TMDL prioritizes outfall monitoring and implementation on a reach by reach basis. The intent was to require Permittees to focus efforts on the priorities as outlined in the TMDL. If outfall monitoring is required everywhere and action must be taken then there is no prioritization as required in the TMDL. Flexibility should be provided such that an alternative approaches could be submitted with the IMP or CIMP. Alternatives could include changes to the constituents monitored based on watershed priorities (i.e., not including constituents for which there is no receiving water impairment even though there is a TMDL or where a TMDL implementation schedule explicitly incorporates priorities). Additionally, alternatives to the monitoring approach could include conducting snap shot sampling events where all discharges over a short time period are sampled rather than spaced out quarterly as currently required.
100	<b>Attachment E</b> , IX.G, pg. E-22	Toxicity testing of MS4 discharges is inappropriate	MS4 discharges are not the same as wastewater plant effluent which represents a single continuous discharge of typically consistent quality to receiving waters. Rather, urban runoff is episodic in nature. Furthermore, individual outfalls carry a minute percentage of the total flow in the receiving waters and as such toxicity observed in one outfall sample will likely have no affect on the receiving water. The current approach is appropriate for wastewater discharges but not urban runoff and they should be treated differently. The more appropriate approach for urban runoff is to identify whether toxicity exists in the receiving water, identify pollutants that are causing toxicity through toxicity identification evaluations (TIEs), and then incorporate monitoring of pollutants that are causing toxicity into the outfall monitoring. Please remove toxicity monitoring requirements from the non-stormwater outfall monitoring program.
101	<b>Attachment E</b> , IX.H.2, pg. E-24	Requirement to collect composite samples during dry weather	Collection of dry weather samples as composite samples rather than grab samples is unnecessary to characterize conditions during dry weather and will significantly increase the cost of sample collection without a commiserate benefit. Current Regional Board approved TMDL CMPs allow for grab samples during dry weather as do LA Region wastewater NPDES permit receiving water monitoring requirements. The requirement to collect flow-weighted composite samples should be removed.
102	<b>Attachment E</b> , X, pg. E-24	Land Development Tracking	This list of effectiveness tracking does not match with the information provided on Section Vi.D.6.d.iv on page 82. Also delete item 11 from the list since this is not a site specific feature and can be easily mapped for our region using rain gage data.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
103	<b>Attachment E, XI.A</b> E-25	Pyrethroid Study	Monitoring for Pyrethroids is a task that requires samples to be sent to special laboratories outside city/EMD that are equipped with instruments to analyze the eight compounds to detection levels as close to 1 ng/g dry weight. Therefore preparing the samples to be analyzed individually and reporting is not feasible in 90 days, and requires more time than analysis of the samples in-house. <i>Request to reporting of the data to be extended to 150 days from sample collection date.</i>
104	<b>Attachment E, XI.B</b> E-28	SMC watershed monitoring program	SMC monitoring program requiring each MS4 to sample 6 sites from different land uses in their watershed and report on a common data base equates to 90 sites. This monitoring is very comprehensive in answering a) what is the conditions of streams in s. California, b) what are the stressors that affect stream condition. Any additional monitoring as prescribed in stormwater outfall based and non-stormwater outfall based monitoring (E-17 to E-20) may be already conducted as part of SMC. Subsequently, additional monitoring based on this permit may be found to be duplicative. If outfall monitoring is conducted as part of SMC program, it would be included as part of IMP or CIMP to regional board.
105	<b>Attachment E, XII</b> Pg. E-28	Toxicity monitoring methods	The toxicity monitoring methods required appear to be based on wastewater treatment plant toxicity testing requirements. The application of a wastewater approach is inappropriate for monitoring related to urban discharges and effects in receiving waters. Additionally, LA MS4 permits are the only MS4 permits we are aware of that require outfall toxicity monitoring and prescribe follow-up requirements that are essentially the same as wastewater plants. This section should be revised so that the approach is appropriate for addressing MS4 issues.
106	<b>Attachment E, XII, pg. E-28</b>	Toxicity testing of MS4 discharges is inappropriate	MS4 discharges are not the same as wastewater plant effluent which represents a single continuous discharge of typically consistent quality to receiving waters. Rather, urban runoff is episodic in nature. Furthermore, individual outfalls carry a minute percentage of the total flow in the receiving waters and as such toxicity observed in one outfall sample will likely have no affect on the receiving water. The current approach is appropriate for wastewater discharges but not urban runoff and they should be treated differently. The more appropriate approach for urban runoff is to identify whether toxicity exists in the receiving water, identify pollutants that are causing toxicity through toxicity identification evaluations (TIEs), and then incorporate monitoring of pollutants that are causing toxicity into the outfall monitoring. Please revise so that the toxicity monitoring requirements are only applicable to receiving water monitoring.
107	<b>Attachment E, XII.F.1.a&amp;b, pg. E-29</b>	Defining receiving water and effluent limits in the MRP	The MRP is not the appropriate place within a NPDES permit to assign receiving water and/or effluent limitations within a permit. Currently Part XII.F.1.a&b essentially sets toxicity effluent limitations. Part XII.F.1.a&b should be removed.

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
108	Attachment E, XII.F, pg. E-29	Conditions during which acute toxicity testing is conducted	Part XII.F does not clearly state under what flow conditions acute toxicity testing should be conducted. Additionally, Part XII.F.2.c states that Permittees may elect to report midpoint results from a chronic test as acute results. However, acute testing should only be conducted during wet weather and chronic testing should only be conducted during dry weather. Conducting a seven day (168 hours) toxicity test to evaluate the effects of storms in the LA region that typically only result in elevated flows for less than 48 hours provides no relevant information on receiving water conditions. Similarly, requiring acute testing during dry weather when conditions are stable provides no relevant information on receiving water conditions. Additionally, acute effects will be observed in chronic tests. Please clarify that acute toxicity testing is to be conducted during wet weather. At a minimum, do not limit the ability of Permittees to use data generated during chronic tests to calculate acute endpoints to top smelt as currently proposed.
109	Attachment E, XII.F.2.c.i, pg. E-30	TIE trigger	The proposed TIE triggers are based on wastewater permitting and are not appropriate for MS4 monitoring. The proposed thresholds should be replaced with a 50% mortality threshold consistent with the approach recommended in guidance published by USEPA for conducting TIEs (USEPA, 1996, Marine Toxicity Identification Evaluation. Phase I Guidance Document EPA/600/R-96/054), which recommends a minimum threshold of 50% mortality because the probability of completing a successful TIE decreases rapidly for samples with less than this level of toxicity. Additionally, experience in conducting TIEs in receiving waters in the region supports using a higher percent mortality trigger to provide a reasonable opportunity for a successful TIE. During TMDL monitoring in the Calleguas Creek Watershed (CCW) in 2003 and 2004, TIEs were initiated on samples exceeding the 50% threshold (the majority of which displayed 100% mortality. In that study, toxicity degraded in approximately 40% of the samples on which TIE procedures were conducted making the results inconclusive (and effectively useless in pinpointing specific toxicants). The Regional Board approved monitoring program for the CCW Toxicity TMDL utilizes a 50% threshold for TIE initiation. If a 50% threshold is an acceptable approach for a toxicity TMDL that focuses on receiving water issues as well as various types of discharges (i.e., MS4, agriculture, and wastewater) it should also be acceptable in a MS4 permit. The City is not opposed to conducting TIEs, rather, TIEs should be initiated where there is a reasonable chance of successfully identifying the pollutant(s) causing toxicity. As such, the proposed TIE trigger should be replaced with a threshold of 50% mortality.
110	Attachment E, XII.G.3, pg. E-30	Conditions during which chronic toxicity testing is conducted	Part XII.G.3 does not clearly state under what flow conditions chronic toxicity testing should be conducted. Chronic testing should only be conducted during dry weather. Conducting a seven day (168 hours) chronic toxicity test to evaluate the effects of storms in the LA region that typically only result in elevated flows for less than 48 hours provides no relevant information on receiving water conditions. Similarly, requiring acute testing during dry weather when conditions are stable provides no relevant information on receiving water conditions. Additionally, acute effects will be observed in chronic tests. Please clarify that chronic toxicity testing is to be conducted during dry weather.

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
111	<b>Attachment E,</b> XII.G.3.a, pg. E-31	Requirement to conduct three species testing	Notwithstanding the previous comments requesting the removal of outfall toxicity testing, the requirement to conduct three species testing at outfalls will result in a significant additional cost (essentially tripling of costs) without a demonstrated benefit. Furthermore, requiring re-screening every 24 months will result in screening every six wet weather and four dry weather events. Re-screening at this frequency is based on wastewater monitoring. Re-screening requirements are not included in the monitoring requirements for the Ventura County Waiver for Irrigated Lands which addresses discharges similar (i.e., episodic and transient) to MS4 discharges. Please remove the requirement for the three species testing and require Permittees to propose an appropriate species. At a minimum, remove the re-screening requirements such that screening is conducted only once within the permit term.
112	<b>Attachment E,</b> XII.G.3.a.viii, pg. E-31	Toxicity testing of MS4 discharges is inappropriate	See above comments regarding the requirement for toxicity monitoring at the outfall. Remove Part XII.G.3.a.viii.
113	<b>Attachment E,</b> XII.F.2.c.i, pg. E-30	TIE trigger	The proposed TIE trigger is based on wastewater permitting and is not appropriate for MS4 monitoring. The proposed threshold of greater than 1.0 TUC should be replaced with a 50% mortality threshold consistent with the approach recommended in guidance published by USEPA for conducting TIEs (USEPA, 1996, Marine Toxicity Identification Evaluation. Phase I Guidance Document EPA/600/R-96/054), which recommends a minimum threshold of 50% mortality because the probability of completing a successful TIE decreases rapidly for samples with less than this level of toxicity. Additionally, experience in conducting TIEs in receiving waters in the region supports using a higher percent mortality trigger to provide a reasonable opportunity for a successful TIE. During TMDL monitoring in the Calleguas Creek Watershed (CCW) in 2003 and 2004, TIEs were initiated on samples exceeding the 50% threshold (the majority of which displayed 100% mortality. In that study, toxicity degraded in approximately 40% of the samples on which TIE procedures were conducted making the results inconclusive (and effectively useless in pinpointing specific toxicants). The Regional Board approved monitoring program for the CCW Toxicity TMDL utilizes a 50% threshold for TIE initiation. If a 50% threshold is an acceptable approach for a toxicity TMDL that focuses on receiving water issues as well as various types of discharges (i.e., MS4, agriculture, and wastewater) it should also be acceptable in a MS4 permit. The City is not opposed to conducting TIEs, rather, TIEs should be initiated where there is a reasonable chance of successfully identifying the pollutant(s) causing toxicity. As such, the proposed TIE trigger should be replaced with a threshold of 50% mortality.
114	<b>Attachment E,</b> XII.G.4., pg. E-31 XII.I, pg. E-32 XII.J, pg. E-32	TRE Requirements	It is inappropriate to place wastewater program elements such as the Toxicity Reduction Evaluation (TRE) in an MS4 permit. The MRP is focused on identifying individual constituents that are causing or contributing to receiving water impairments such that information is available to develop and implement control measures. Requiring Permittees to implement a TRE subverts the process by which they will identify and address water quality issues. Please remove all references to TREs.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
115	<b>Attachment E, XII.G.4</b> Pg. E-31	Additional toxicity testing	It is unclear if this provision is requiring Permittees to conduct accelerated monitoring. If so, it is inappropriate to place wastewater program elements such as accelerated monitoring into an MS4 permit. MS4 discharges are not the same as wastewater plant effluent which represents a continuous discharge of typically consistent quality. Rather, urban runoff is episodic in nature. The current approach is appropriate for wastewater discharges but not urban runoff and they should be treated differently. The more appropriate approach for urban runoff is to identify the cause of toxicity if observed to exceed an appropriate threshold through toxicity identification evaluations (TIEs). It is not to require accelerated monitoring, particularly if toxicity is observed during a wet weather event. Please remove all references to additional/accelerated toxicity testing.
116	<b>Attachment E, XII</b> E-32	TRE Workplan	The MS4 permittees conduct a TIE when sediment toxicity is observed as required by Toxics TMDL (e.g. Ballona Creek Estuary). TRE has been traditionally required for toxicity of effluent of POTWs. All of the BMPs included in the implementation plans discuss the adaptive measures implemented to reduce the toxics. Subsequently TRE will be unnecessary and will be a duplicative effort when TIE is conducted. <i>Recommend to remove all provisions and requirements for TRE in this section.</i>
117	<b>Attachment E, XIV.L&amp;M,</b> pg. E-39	Turnaround time on data	Data should be required for submittal with annual reports. Requiring the submittal of data between 30 and 90 days will not allow Permittees to complete appropriate QA/QC of the data and provide additional information regarding the context of the data. Please remove the short term turnaround requirements and require all data and supporting information be submitted with the annual reports.
118	<b>Attachment E, XV,</b> pg. E-39	Hard copy reporting requirements	As both the City and the Regional Board are working to increase e-submittals of materials please revise the submittal requirements for the annual report to be only via electronic.
119	<b>Attachment E, XVII.A</b> Pg. E-40	Initial watershed summary information	The permit requires the submittal of watershed summary information in the first year. However, Permittees will still be developing the requested information as part of the WMP. Rather than providing the requested information in year one as part of the annual report, it would be more efficient for Permittees that are participating in a WMP to submit the same information as part of the WMP submittal and then every odd year thereafter. Permittees that are not participating in a WMP could still be required to submit the information in year 1.
120	<b>Attachment E, XVIII.A.2.d,</b> Pg. E-43	This natural drainage systems comparison study has limited applicability in the city of Los Angeles.	Part XVIII.A.2.d requires the following “For natural drainage systems, develop a reference watershed flow duration curve and compare it to a flow duration curve for the subwatershed under current conditions.” This requirement is not appropriate for the City of Los Angeles, since only a very small part of the City drains into a natural drainage system and no reference subwatershed may be found since Los Angeles is substantially developed. The City of Los Angeles would accept in participating for a limited comparison study with other municipalities. However we believe this condition will be applicable for permittees that Permittees that have significant areas that drain to natural drainage systems.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
121	<b>Attachment E</b> Table C Machado Pesticides and PCBs TMDL E-54	Monitoring and Reporting Plan and Quality Assurance Project Plan	The TMDL BPA (page 13) states that: 1.5 years after effective date of TMDL, submit a LWQMP, MRP Plan and QAPP for approval by the Ex. Officer to comply with a MOA. If there is already a LWQMP and QAPP in place to implement the Machado Lake Nutrient TMDL, these documents may be amended to address the requirements of this TMDL. This TMDL was effective on March 2012. 1.5 year after this date which is September 2013, is when this plan is due. Therefore we request to correct the date of submission of the plan in permit from Sep. 20, 2012 to September 20, 2013 to be consistent with BPA for this TMDL.
122	<b>Attachment E</b> Table C Machado Pesticides and PCBs TMDL E-54	Begin Phase 1 Monitoring	This activity needs to be performed 30 days from date of Executive Officer approval of MRP and QAPP or October 20, 2013. However during that time Machado Lake will be under construction of a massive Proposition O-funded project, the Machado Lake Ecosystem Rehabilitation Project. This project is estimated to be completed on March 2016. As such monitoring can only start after completion of construction. Please consider revising the dates to reflect the schedule of this project or acknowledge that no monitoring is expected to commence.
123	<b>Attachment E</b> Machado Pesticides and PCBs TMDL – E-54	Phase 1 Monitoring	As described in the comment above, monitoring cannot be performed during this period (October 20, 2013 to October 20, 2015) due to the construction of the lake. Please revise the proposed schedule to reflect the construction phase of the Machado Lake Ecosystem Rehabilitation Project.
124	<b>Attachment E</b> Table C Echo Park Lake Nutrient TMDL E-60	Reporting	Table C requires that the annual reporting start on December 15, 2012 annually thereafter. Please note that no monitoring results will be submitted by December 2012 nor by December 2013, because Echo Park Lake is under construction for the Proposition O-funded Echo Park Lake Rehabilitation Project. The first year of water quality data will be submitted by December 15, 2014.
125	<b>Attachment E</b> Table C Echo Park Lake PCBs and Organochlorine Pesticide TMDL E-60 to E-61	Compliance Monitoring, Fish Tissue Monitoring, Stormwater Monitoring, Reporting	Table C requires that the compliance monitoring start on December 15, 2013 annually thereafter. Please note that Echo Park Lake is under construction for the Proposition O-funded Echo Park Lake Rehabilitation Project through the end of 2013. The first year of water quality data will be submitted by December 15, 2014.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
<b>ATTACHMENT F: FACT SHEET</b>			
126	<b>Attachment F</b> , Pg. F-100	Ballona Creek Toxics TMDL	Per last column of Table F-7, final compliance date is Jan. 11, 2021. The TMDL BPA allows 15 years after effective date of TMDL for final compliance. Attachment F, page F-82, gives an effective date of 1/11/2008 for this TMDL. It appears that adding 15 years to the effective date of 2008, will make 2023 (not 2021) the final compliance date.
<b>ATTACHMENT G: NON-STORMWATER ACTION LEVELS AND MUNICIPAL ACTION LEVELS</b>			
127	<b>Attachment G</b>	Incorrect cross-references	The tables with action levels (ALs) for brackish waters include a footnote noting that the ALs are set as the most stringent between the freshwater and salt water ALs. The footnote references tables for these ALs as H-# and H-# (H-9 and H-11 in the case of the brackish ALs in Table G-10 for the Dominguez Channel, for example). The reference to H-# tables is incorrect and should refer to the corresponding G-# tables (G-9 and G-11 for the Dominguez Channel example).
128	<b>Attachment G</b> I-VII Pg. G-1-13	Non-Storm Water Action Levels cannot be verified based upon the information provided	Since the Tentative Order (TO) does not include detailed derivation of the ALs, it is not possible to verify or comment on the validity of the numbers presented in Attachment G for priority pollutants. However, a situation where an AL may be incorrect has been identified in the case of mercury. The daily maximum AL for discharges to non-ocean waters is either 0.1 µg/L, or 1.0 µg/L in the tables provided for all of the watersheds. No information for this variation is provided.
129	<b>Attachment G</b> I-VII Pg. G-1-13	Non-Storm Water Action Levels cannot be verified based upon the information provided	The Fact Sheet does not provide detailed calculations or information on how each of the non-storm water action levels were developed and provides only one example of such derivation (for nickel in discharges to salt water). As such, the Regional Board's calculations behind each non-storm water action level cannot be verified. Given that these non-storm water action levels may trigger significant actions by Permittees, it is imperative that Permittees can verify that each non-storm water action level is appropriate and validly established.

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
130	<b>Attachment G</b> VIII, pg. G-17-18	Municipal Action Levels are not utilized or referenced in the Order	<p>Attachment G is the only location in the Order where the concept of MALs are utilized or referenced. Therefore, it is unclear how the MALs fit into the requirements of the Order, especially within the Watershed Management Programs in Part VI.C. Attachment G notes that where MALs are exceeded, each Permittee shall submit a MAL Action Plan with the Annual Report. The requirement to submit an additional report that requires an assessment of sources and identification of BMPs would be redundant for Permittees that are developing and implementing a Watershed Management Program. In addition, the discussion in Attachment G related to MALs does not provide a nexus to receiving waters. Consistent with the comments provided for the non-storm water action levels, there should be a nexus between exceedances in the receiving water and exceedances of MALs so as not to negate the prioritization aspect of the Watershed Management Programs. Otherwise, Permittees may be required to address pollutants that do not meet the priority requirements outlined in Part VI.C for the Watershed Management Programs. The following language should be included in Attachment G, Part VIII:</p> <p><b><u>“Implementation of an approved Watershed Management Program per Part VI.C of the Order fulfills all requirements related to the development and implementation of the MAL Action Plan. A Permittee that is implementing an approved Watershed Management Program per Part VI.C shall not be considered in violation of this Part VIII of Attachment G.”</u></b></p>
<b>ATTACHMENT H: BIORETENTION/BIOFILTRATION DESIGN CRITERIA</b>			
131	<b>Attachment H</b> <b>2.b</b> <b>H-1</b>	Placement of the underdrain	This guidance Attachment encourages the placement of the underdrain near the top of the gravel storage layer. However based on our established biofilter design, the underdrain needs to be placed near the bottom to prevent septic conditions. Since biofiltration will be used where infiltration is not allowed or soil is poorly draining, the biofilter will result in standing water if the underdrain is shifted higher and will result in degraded water quality such as high bacteria and low dissolved oxygen levels.
<b>ATTACHMENT I: DEVELOPER TECHNICAL INFORMATION AND GUIDELINES</b>			
132	<b>Attachment I</b> <b>I-1</b>	No context provided	There is no discussion in the Order that refers to this Attachment. Please introduce this attachment and its purpose in the requirements in Part VI.D: Stormwater Management Program Minimum Control Measures.
<b>ATTACHMENT M: TMDL PROVISIONS FOR SANTA MONICA BAY WMA</b>			

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
133	<b>Attachment M</b> A.2 M-1	Santa Monica Bay Bacteria TMDL water quality standards do not apply at the effluent discharge	The Santa Monica Bay Bacteria TMDL water quality standards do not apply at the effluent discharge (storm drains, creeks, or channels) as stated on Part A.2. Instead, the water quality limitations apply at the point zero mixing zone (runoff discharge and wave wash). The Bureau recommends that the language be changed to <i>“Permittees shall comply with the following final water quality-based limitations at the shoreline monitoring stations designated in the Santa Monica Bay Beaches Bacteria TMDL during ...”</i>
134	<b>Attachment M</b> A.2 M-1	Exclude Geometric Mean column	The draft permit states that compliance with the bacteria effluent limitations including Geometric Mean standard for dry weather becomes effective upon the effectiveness of the permit. The TMDL re-opener adopted on June 7, 2012 does not differentiate between dry or wet weather geometric mean. Instead, the geometric mean is calculated using both wet and dry data with compliance deadline of July 15, 2021. Please consider <i>removing from the table, the column with Geometric Mean standards.</i> See page M-6 on this Attachment for the Geometric Mean provision.
135	<b>Attachment M</b> A.3.b M-5	Update of annual allowable exceedances	This part includes the annual allowable exceedance days of single sample objective for three seasons. Per June 7, 2012 Board adopted re-opener, the allowable exceedance during winter dry period (November 1 to March 31) has increased to nine (9) and two(2) for shoreline monitoring stations under daily and weekly sampling frequency respectively. The table should be updated to reflect this change.
136	<b>Attachment M</b> A.3.c M-5	Antidegradation provision is not applicable in this case	This part tabulates a list of shoreline monitoring stations subject to antidegradation provisions. Included in the list are monitoring stations SMB 2-13, and SMB 3-08 within the jurisdictional groups 2 and 3. These locations provide stormwater runoff treatment and diversion and thus the reason for water quality improvement. Also due to unique climate patterns during which this data was collected, it does not ensure that this water quality will remain at these levels. For these reasons these locations should not be subject to antidegradation and should be removed from the table.
137	<b>Attachment M</b> A.3.d M-6	Geometric Mean standards become effective on July 15, 2021	Per the Board adopted re-opener for Santa Monica Bay Bacteria TMDL, there is no differentiation of wet and dry geometric mean standard. The geometric mean is calculated for all data regardless of weather condition with compliance deadline of July 15, 2021. Please consider stating that <i>“permittees shall comply with the following geometric mean receiving water limitation for all shoreline monitoring stations along Santa Monica Bay beaches no later than July 15, 2021.”</i>
138	<b>Attachment M</b> E.1.d,e,f M-12	Provisions to be removed	Both E.1.d & e are not part of the Ballona Creek Trash TMDL and are not included in any other of the Trash TMDLs incorporated into the permit. Also part E.1.f ignores these requirements for compliance. Please consider removing these two requirements.
139	<b>Attachment M</b> E.3.b.i –E.3.b.iv M-13	Inclusion of Geometric Mean standard	Compliance deadline for Geometric Mean standard for Ballona Creek is the same as Santa Monica Bay. See item 134 above. Consider removing from the tables in part i , ii ,iii, and iv, the column with Geometric mean standards.

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
140	<b>Attachment M</b> E.3.c.i M-14	Update of annual allowable exceedances	The Winter Dry annual allowable exceedance days for single sample have increased similarly as that of Santa Monica Bay as approved in the June 7, 2012 re-opener hearing. The table should be updated to reflect this change. See comment No. 135.
141	<b>Attachment M</b> E.3.c.iii,iv,v M-14 to M-15	Geometric Mean standards become effective on July 15, 2021	Compliance deadline with the Geometric Mean standard for bacteria is the same of that for Santa Monica Bay. See comment No. 137, Please revise to state that “ <i>Permittees shall comply with the following geometric mean receiving water limitations for discharges to Ballona Creek Estuary; Ballona Creek Reach 2 the confluence with Ballona Creek Estuary; and Centinela Creek at the confluence with Ballona Creek Estuary no later than July 15, 2021.</i> ”. Similarly, the language for Parts iv, and v should also be modified
142	<b>Attachment M</b> F.1.b M-17	Exclude Geometric Mean column	Compliance deadline for Geometric Mean standard for Marina del Ray is the same as Santa Monica Bay. See item No. 137.
143	<b>Attachment M</b> F.c.i M-17	Update of annual allowable exceedances	The Winter Dry annual allowable exceedance days for single sample have increased similarly as that of Santa Monica Bay as approved on the June 7, 2012 re-opener hearing. The table should be updated to reflect this change. Also see comment No.135.
144	<b>Attachment M</b> F.c.iii M-18	Geometric Mean standards become effective on July 15, 2021	Compliance deadline with the Geometric Mean standard for bacteria is the same of that for Santa Monica Bay. See comment No. 137.
<b>ATTACHMENT O: TMDL PROVISIONS FOR LOS ANGELES RIVER WMA</b>			
145	<b>Attachment O</b> A.3 O-1 to O-3	Newly developed effluent limitations	The Trash Effluent Limitations listed were not previously identified. Also they appear to be inconsistent value from the Los Angeles River Trash TMDL’s final resolutions and the source of the data is not specified. Please provide effluent limitations to be consistent with the TMDL standards or specify source of data.
146	<b>Attachment O</b> C.2.d O-1 to O-3	Wet Weather definition is inconsistent with TMDL documents	Footnote #47 defines wet weather as “ <i>any day when maximum flow is equal or greater than 500 cfs measured in Wardlow gage station</i> ”. This is not consistent with Los Angeles River Bacteria TMDL definition of wet weather which is defined as “a day with rainfall of 0.1 inch or more plus the 3 days following the rain event.” Please see footnote #6, page 10 of Attachment A, Los Angeles River Bacteria TMDL and page 22 of Los Angeles River Bacteria TMDL. Please make this correction

**Attachment B – Detailed Comment Matrix**

Additional Comment #	Document Reference:	Issue	Comments
147	Attachment O D.2 O-6	Effluent limitations are inconsistent with assumptions of the WLAs	<p>The WLAs in the LA River Bacteria TMDL assigned to the MS4 are expressed as allowable exceedance days. The WLAs are not expressed as concentration based effluent limitations. Discharges from the MS4 could be greater than the proposed effluent limits but concentrations in the wave wash could be lower than the numeric target. Furthermore, the TMDL allows for a certain number of exceedances of the single sample maximum, which may also allow for exceedances of the proposed effluent limitations without violating the assumptions of the WLAs. As such, the assignment of effluent limitations as concentration based limitations is not consistent with the requirements or assumptions of the WLAs and should be removed. Only receiving water limitations are appropriate given that both the TMDL target and the WLAs are expressed in the receiving waters. Additionally, this approach unnecessarily places MS4 permittees in a position to receive mandatory minimum penalties for the exceedance of effluent limits that are not consistent with assumptions of the WLAs. If the interest in providing effluent limitations is to allow discharges to differentiate from other comingled discharges, the interest can be addressed in Part E. Special Provisions by revising b.v, d.i, and e.i to include an additional mechanism for demonstrating compliance that states that a Permittee shall be deemed in compliance if there are no exceedances of applicable water quality objectives at the Permittee’s MS4 outfall(s).</p>
148	Attachment O D.3 O-6	Interim, load-based WQBELs	<p>The load-based allocations are grouped, but can be separated by jurisdiction based on drainage area, per the BPA. Footnote 48 should be revised to state that the load-based interim WQBELs can be separated into individual jurisdictions based on proportional drainage area.</p>
149	Attachment O D.5.a.1 O-12	Compliance Determination is inconsistent with the TMDL BPA	<p>The TMDL BPA (page 6) states that:</p> <p>MS4 dischargers can demonstrate compliance with the final dry weather WLAs by demonstrating that the final WLA are met instream or by demonstrating one of the following conditions at outfalls to the receiving waters:</p> <ol style="list-style-type: none"> <li>1. Flow-weighted concentration of <i>E. coli</i> in MS4 discharges during dry weather is less than or equal to 235 MPN/100mL, based on a weighted-average using flow rates from all measured outfalls;</li> <li>2. Zero discharge during dry weather;</li> <li>3. Demonstration of compliance as specified in the MS4 NPDES permit which may include the use of BMPs where the permit’s administrative record supports that the BMPs are expected to be sufficient to implement the WLA in the TMDL, the use of calculated loading rates such that loading of <i>E. coli</i> to the segment is less than or equal to a calculated loading rates that would not cause or contribute to exceedances based on a loading capacity representative of conditions in the River at the time of compliance or other appropriate method.</li> </ol> <p>The third and final method, above, which provides both BMP based and load based methods for demonstrating compliance is not provided in the permit. The permit must be consistent with the WLAs as outlined in the BPA.</p>

## Attachment B – Detailed Comment Matrix

Additional Comment #	Document Reference:	Issue	Comments
150	<b>Attachment O</b> F.3.c O-15	Mass-Based allocations table for nutrients is inconsistent with the TMDL document	Please include the two key missing footnotes shown on Section 6, page 6-18 of the TMDL document: <sup>1</sup> This input includes effluent from storm drain systems during both wet and dry weather. <sup>4</sup> Each wasteload allocation must be met at the point of discharge. A three year average will be used to evaluate compliance. However, if applicable water quality criteria for ammonia, dissolved oxygen and pH, and the chlorophyll <i>a</i> target are met in the lake, then the total phosphorous and total nitrogen allocations are considered attained. In assessing compliance with wasteload allocations, responsible jurisdictions assigned both northern and southern subwatershed allocations may combine allocations.
151	<b>Attachment O</b> F.3.c O-16	Wasteload allocation table for PCBs is inconsistent with the TMDL document	Please include the two key missing footnotes shown on Section 6, page 6-28 of the TMDL document: <sup>1</sup> This input includes effluent from storm drain systems during both wet and dry weather. <sup>3</sup> Each wasteload allocation must be met at the point of discharge.
152	<b>Attachment O</b> F.3.d O-16	Alternative wasteload allocation table for PCBs is inconsistent with the TMDL document	Please include the two key missing footnotes shown on Section 6, page 6-29 of the TMDL document: <sup>1</sup> This input includes effluent from storm drain systems during both wet and dry weather. <sup>3</sup> Each wasteload allocation must be met at the point of discharge.
153	<b>Attachment O</b> F.4.c O-17	Wasteload allocation table for chlordane is inconsistent with the TMDL document	Please include the two key missing footnotes shown on Section 6, page 6-39 of the TMDL document: <sup>1</sup> This input includes effluent from storm drain systems during both wet and dry weather. <sup>3</sup> Each wasteload allocation must be met at the point of discharge.
154	<b>Attachment O</b> F.4.d O-17	Alternative wasteload allocation table for Chlordane is inconsistent with the TMDL document	Please include the two key missing footnotes shown on Section 6, page 6-40 of the TMDL document: <sup>1</sup> This input includes effluent from storm drain systems during both wet and dry weather. <sup>3</sup> Each wasteload allocation must be met at the point of discharge.  Also the TMDL document does not mention a three-year average for Total Chlordane associated with Suspended Sediment and Annual average for Total Chlordane in Water Column. Please make these corrections
155	<b>Attachment O</b> F.5.c O-17	Wasteload allocation table for dieldrin is inconsistent with the TMDL document	Please include the two key missing footnotes shown on Section 6, page 6-49 of the TMDL document: <sup>1</sup> This input includes effluent from storm drain systems during both wet and dry weather. <sup>3</sup> Each wasteload allocation must be met at the point of discharge.
