Ms. Norma Camacho, Director
Ventura County Watershed Protection District
800 South Victoria Ave., L#1600
Ventura, CA 93009-1600

Certified Mail
Return Receipt Requested
Claim No. 7009 0820 0001 6811 7509

**SUBJECT: TOXICITY TEST SPECIES SUBSTITUTION, VENTURA COUNTY
MUNICIPAL SEPARATE STORM SEWER SYSTEM DISCHARGE (MS4)
PERMIT (BOARD ORDER No. 09-0057; NPDES No. CAS004002)**

Dear Ms. Camacho:

On October 14, 2009, the Regional Board staff received a request from the Ventura County Watershed Protection District (County) to substitute topsmelt, *Atherinops affinis*, with the inland silverside, *Menidia beryllina*, due to the unavailability of topsmelt from the supplier. After consultation with US EPA staff, Regional Board staff denied the request. On October 15, 2009, the Regional Board received an e-mail from the County, titled "Notification of toxicity exception - (species unavailable) Ventura County MS4 NPDES Permit Order No. 09-0057 (Monitoring Program)". The County's e-mail communication was submitted pursuant to requirements in subparts D.5 and D.8(b) of the Ventura County MS4 Permit's Monitoring Program (Monitoring Program), which requires an explanation of the circumstance with documentation when toxicity tests cannot be performed to comply with the requirements of this permit, and written authorization from the Regional Board Executive Officer to substitute test species.

In order to evaluate the appropriateness of substituting topsmelt, *Atherinops affinis*, with the inland silverside, *Menidia beryllina*, in toxicity testing at mass emissions stations in the future, the Regional Board requires the County to conduct comparative static renewal toxicity tests on both species as follows. During the next storm event of this permit year (2009-10) and the first storm event of next permit year (2010-11), the County shall conduct toxicity tests on both topsmelt, *Atherinops affinis*, and the inland silverside, *Menidia beryllina*, along with giant kelp, *Macrocystis pyrifera*, and the purple sea urchin, *Strongylocentrotus purpuratus*, pursuant to subpart D.8(a) of the Monitoring Program. The County shall submit the results of the comparative toxicity tests as part of its reporting requirements.

RECEIVED

NOV 5 2009

California Environmental Protection Agency

Ms. Norma Camacho, Director
Ventura County Watershed Protection District

- 2 of 2 -

October 28, 2009

In the event that topsmelt, *Atherinops affinis*, is unavailable for testing during future sampling events conducted under the Monitoring Program, the County shall follow the protocol set forth in subpart D.5 of the Monitoring Program. The County shall notify the Regional Board by phone and e-mail as soon as possible if a test species is unavailable. Notification shall be sent directly to me as well as Tracy Woods, Stormwater Permitting Unit, with a copy to Renee Purdy, Chief, Regional Programs Section. The County shall submit to the Regional Board documentation of species unavailability from both the County's contract lab and the contract lab's supplier at least 48 hours prior to the planned sampling event to provide adequate time for my staff to evaluate any request for species substitution. Any approval or denial of a request for species substitution must be authorized pursuant to subpart D.8(b) of the Monitoring Program.

If you have any questions, please contact me at (213) 576-6605, or Renee Purdy at (213) 576-6783.

Sincerely,

Tracy J. Egoscue,
Executive Officer

cc: Mr. Bruce Fujimoto, Division of Water Quality, State Water Resources Control Board

Mr. Arne Anselm, Ventura County Watershed Protection District

Appendix I. Aquatic Toxicity Testing Lab Results

Kelly Hahs
Ventura County Watershed Protection District
800 South Victoria Ave., L#1610
Ventura, CA 93009

February 5, 2018

Kelly:

I have enclosed our report "Evaluation of the Toxicity of Ventura County Watershed Protection District Stormwater Samples" for the samples that were collected January 8-9, 2018. The results of this testing are summarized below.

Toxicity summary for VCWPD mass emission station stormwater samples.			
Sample Station	Toxicity Present Relative to the Lab Control treatment?		
	<i>Atherinops affinis</i>		Purple Urchin
	Survival	Growth	Fertilization
ME-CC	no	no	
ME-SCR			no ^a
ME-VR2	YES	YES	

a - The fertilization response in the Salt Control treatment was significantly less than in the Lab Water Control, indicating that the use of artificial sea salt may have impaired fertilization. Accordingly, the test data were analyzed comparing the site water treatment to the Salt Control.

Toxicity summary for VCWPD major outfall station stormwater samples.					
Sample Station	Toxicity Present Relative to the Lab Control treatment?				
	<i>Selenastrum capricornutum</i>	<i>Ceriodaphnia dubia</i>		Fathead Minnow	
	Growth	Survival	Reproduction	Survival	Growth
MO-CAM				no	YES
MO-OJA				YES^b	YES^b
MO-MEI				YES^b	YES^b
MO-VEN		no	YES		
MO-OXN				YES^b	YES^b
MO-HUE		no	YES		
MO-THO		no	no/ Yes^a		
MO-MPK	no				
MO-SIM		no	no		
MO-FIL		no	no		
MO-SPA				no	YES

* As per EPA guidance, samples with a significant reduction in survival are not evaluated for growth toxicity.

a - There was an outlier replicate in the Lab Control treatment. Per EPA instructions, the results are presented including and excluding the outlier.

b - Pathogen-related mortality (PRM) was observed in this treatment.

Chronic Toxicity of VCWPD Stormwater to Purple Urchin Fertilization

There was no significant reduction in purple urchin fertilization in the ME-SCR stormwater sample.

It is important to note that the fertilization response in the Salt Control treatment was significantly less than in the Lab Water Control, indicating that the use of artificial sea salt may have impaired fertilization. Accordingly, the test data were analyzed comparing the site water treatment to the Salt Control. For future testing events, a new box of artificial sea salt will be used to adjust the salinity of the site water.

Chronic Toxicity of VCWPD Stormwater to *Atherinops affinis* (Topsmelt)

There was no significant reduction in topsmelt survival or growth in the ME-CC stormwater sample. There was a significant reduction in topsmelt survival and growth in the ME-VR2 stormwater sample.

It is important to note that low dissolved oxygen (D.O.) measurements were observed in the ME-VR2 sample, and aeration of the test could not maintain the D.O. ≥ 4 mg/L, potentially causing the reduction in survival and growth in this treatment rather than a contaminant. As large amounts of solids in the sample may have caused the low D.O. values, we recommend sample filtration (using a sterile 0.45- μ m filter) be considered prior to testing future samples collected from this location, as well as aerating this sample at test initiation.

Chronic Toxicity of VCWPD Stormwater to *Selenastrum capricornutum*

There was no significant reduction in *S. capricornutum* growth in the MO-MPK stormwater sample.

Chronic Toxicity of VCWPD Stormwater to *Ceriodaphnia dubia*

There was no significant reduction in *C. dubia* survival in any of the stormwater samples. There was no significant reduction in *C. dubia* reproduction in the MO-SIM, MO-THO, and MO-FIL stormwater samples when an outlier replicate in the Lab Control treatment was excluded from the analyses; there was a significant reduction in the MO-THO stormwater sample when the Lab Control outlier replicate was included in the analyses. There was a significant reduction in reproduction in the MO-HUE and MO-VEN stormwater samples (both including and excluding the outlier replicate in the Lab Control).

Chronic Toxicity of VCWPD Stormwater to Fathead Minnows

There was no significant reduction in fathead minnow survival in the MO-CAM and MO-SPA stormwater samples; there was a significant reduction in survival in the MO-OJA, MO-MEI, and MO-OXN stormwater samples. There was a significant reduction in fathead minnow growth in all stormwater samples tested.

It is important to note that low dissolved oxygen (D.O.) was observed in the MO-MEI sample, and aeration of the test could not maintain the D.O. ≥ 4 mg/L, potentially causing the reduction in survival and growth in this treatment rather than a contaminant. As large amounts of solids in the sample may have caused the low D.O. values, we recommend sample filtration (using a sterile 0.45- μ m filter) be considered prior to testing future samples collected from this location, as well as aerating this sample at test initiation.

Please also note, pathogen related mortalities (PRM) were observed in the MO-OJA, MO-OXN, and MO-MEI samples. PRM is considered an artifact of the test methodology. PRM is well documented in the EPA guidelines (EPA-821-R-02-013) as caused by microorganisms, and it is acknowledged that PRM interferes with the toxicity evaluation. PRM was not observed in the Lab Control treatment, indicating that the source of pathogens was the ambient water sample. To resolve the observation of PRM in the affected samples, future testing could be performed following the protocol using 20 test replicates noted in the EPA testing manual.

If you have any questions regarding the performance and interpretation of these tests, feel free to contact me or my colleague Stephen Clark at (707) 207-7760.

Sincerely,

Stevi Vasquez
Project Manager

Pacific EcoRisk is accredited in accordance with NELAP (ORELAP ID 4043). Pacific EcoRisk certifies that the test results reported herein conform to the most current NELAP requirements for parameters for which accreditation is required and available. Any exceptions to NELAP requirements are noted, where applicable, in the body of the report. This report shall not be reproduced, except in full, without the written consent of Pacific EcoRisk. This testing was performed under Lab Order 27911.

1. INTRODUCTION

Under contract to Ventura County Watershed Protection District, Pacific EcoRisk (PER) has been contracted to evaluate the toxicity of stormwater samples collected for the Ventura County Watershed Protection District (VCWPD). This evaluation consists of performing the following US EPA short-term chronic toxicity tests:

- echinoderm sperm fertilization test with the purple urchin, *Strongylocentrotus purpuratus*;
- 7-day survival and growth test with the topsmelt, *Atherinops affinis*;
- 96-hour algal growth test with the green alga, *Selenastrum capricornutum*;
- 3-brood survival and reproduction test with the crustacean, *Ceriodaphnia dubia*; and
- 7-day survival and growth test with larval fathead minnows (*Pimephales promelas*).

These toxicity tests were conducted on stormwater samples collected on January 8-9, 2018. This report describes the performance and results of these tests.

2. CHRONIC TOXICITY TEST PROCEDURES

The methods used in conducting the chronic toxicity tests followed the guidance established by the following EPA manuals:

- “Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms” (EPA/600/R-95/136); and
- “Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms, Fourth Edition” (EPA-821-R-02-013).

2.1 Sample Receipt and Handling

On January 8-9, VCWPD staff collected stormwater samples from 14 stations into appropriately-cleaned containers. These samples were transported on ice and under chain-of-custody to the PER laboratory in Fairfield, CA. Upon receipt at the laboratory, aliquots of the water samples were collected for analysis of initial water quality characteristics (Tables 1a and 1b). The samples were then stored at 0-6°C except when being used to prepare test solutions. The chain-of-custody records for the collection and delivery of these samples are presented in Appendix A.

Table 1a. Initial water quality characteristics of the VCWPD mass emission station stormwater samples.						
Date Sample Received	Sample ID	Temp. (°C)	pH	D.O. (mg/L)	Conductivity (µS/cm)	Total Ammonia (mg/L N)

2.2 Echinoderm Fertilization Toxicity Testing with *Strongylocentrotus purpuratus*

The echinoderm sperm cell fertilization test consists of exposing purple sea urchin or sand dollar sperm to the stormwater, after which the effects on successful fertilization of the eggs are determined. The specific procedures used in this testing are described below.

Sperm and eggs were generated from gravid adult purple urchins, *S. purpuratus*. The gravid adult urchins were obtained from a commercial supplier (Alexi Gabriel, San Diego, CA). Upon receipt at the lab, the urchins were held at 12°C. Spawning of the urchins was induced by injection with 0.5 M KCl, followed by vigorous shaking of the animals to stimulate gamete release, as per EPA guidelines. The gametes from each spawning individual were collected and examined microscopically; the gametes exhibiting the best quality (as determined from morphology and trial fertilization) were pooled to provide a composite of high quality sperm and a composite of high quality eggs.

The Lab Water Control medium for this test consisted of 1-μm filtered seawater (collected from the UC Granite Canyon Marine Lab). The stormwater sample was adjusted to the test salinity of approximately 33 ppt using an artificial sea salt (Tropic Marin®). As an additional QA measure, and in order to assess any potential artefactual toxicity that might have been caused by the addition of the sea salt to the sample, a Salt Control consisting of Type 1 lab water (reverse-osmosis, de-ionized water) adjusted to a salinity of 33 ppt using the same artificial sea salt was prepared and tested. Routine water quality characteristics (pH, D.O., and salinity) were measured for each test solution prior to use in this test.

There were four replicates at each test treatment. Each test replicate consisted of a 30-mL glass vial to which five mL of appropriate test solution was added. The test was initiated with the inoculation of an appropriate quantity of sperm into each replicate vial to achieve a final sperm-to-egg ratio of 2000:1. After a 20-min exposure period, approximately 1000 eggs were inoculated into each vial. After an additional 20-min exposure, the test was terminated with all of the test embryos being fixed by the addition of 0.5 mL of 1% glutaraldehyde.

The contents of each preserved test vial were subsequently examined microscopically to determine the percentage of embryos exhibiting successful fertilization. The resulting percentage fertilization data were analyzed to determine any impairment(s) caused by the stormwater; all statistical analyses were performed using the CETIS statistical software.

2.3 Survival and Growth Toxicity Testing with Topsmelt (*Atherinops affinis*)

The chronic toxicity test with topsmelt consists of exposing larval fish to the stormwater samples for seven days, after which effects on survival and growth are evaluated. The specific procedures used in this testing are described below.

The larval topsmelt used in these tests were obtained from a commercial supplier (Aquatic Biosystems, Fort Collins, CO). Upon receipt at the testing lab, the larval fish were maintained in aerated Lab Water Control medium, and were fed brine shrimp nauplii *ad libitum* during the pre-test holding period.

The Lab Water Control medium for these tests consisted of 1- μ m filtered U.C. Granite Canyon Marine Laboratory seawater. The stormwater samples were adjusted to a salinity of approximately 33 ppt via addition of an artificial sea salt (Crystal Seas[®]-bioassay grade). The samples were tested at the 100% concentration only. Routine water quality characteristics (pH, D.O., and salinity) were measured for each test solution prior to use in these tests.

There were five replicates for each test treatment, each replicate consisting of 400 mL of test solution in a 600-mL glass beaker. The tests were initiated by randomly allocating five 15-day old topsmelt into each replicate beaker. The beakers were randomly positioned in a temperature-controlled room at 20°C (with temperature being monitored daily), under a 16L:8D photoperiod. These test fish were fed brine shrimp nauplii twice daily.

Each day of the tests, fresh test solutions were prepared as before. The test replicate beakers were examined, with any dead animals, uneaten food, wastes, and other detritus being removed. The number of live fish in each replicate was determined and then approximately 80% of the test solution in each beaker was carefully poured out and replaced with fresh test solution. “Old” water quality characteristics (pH and D.O.) were measured on the old test water collected from one randomly selected replicate at each treatment. The test beakers were then placed back into the temperature-controlled room.

After seven days exposure, the tests were terminated and the number of live fish in each replicate beaker was recorded. The fish from each replicate were then carefully euthanized in methanol, rinsed in de-ionized water, and transferred to a pre-tared weighing pan. The fish were then dried at 100°C for >24 hrs and re-weighed to determine the total weight of fish in each replicate; the total weight was then divided by the initial number of fish per replicate to determine the “biomass value”. The resulting survival and growth (biomass value) data were analyzed to determine any impairment(s) caused by the stormwater samples; all statistical analyses were performed using the CETIS® statistical software (TidePool Scientific, McKinleyville, CA).

2.4 Algal Growth Toxicity Testing with *Selenastrum capricornutum*

The short-term chronic toxicity algal test consists exposing *Selenastrum capricornutum* to the stormwater for 96 hrs, after which the effects on cell growth are evaluated. The specific procedures used in this testing are described below.

The Lab Water Control medium for this test consisted of Type 1 lab water (reverse-osmosis, de-ionized water). The stormwater sample was tested at the 100% concentration only. The Lab Water Control medium and the stormwater sample were filtered through sterile 0.45 µm filters and then spiked with nutrients, as per EPA guidelines. “New” water quality characteristics (pH, D.O., and conductivity) were measured on the resulting test solutions prior to use in the test.

There were 4 replicates at each test treatment, each replicate consisting of a 250-mL glass Erlenmeyer flask containing 100 mL of test solution; an additional replicate was established at each test treatment for the measurement of test solution water quality characteristics during the test and at test termination. Each flask was inoculated to an initial algal cell density of 10,000 cells/mL from a laboratory culture of *Selenastrum* that is maintained in log growth phase.

These flasks were loosely capped and randomly positioned within a temperature-controlled room at 25°C, under continuous cool-white fluorescent illumination. Each replicate flask was shaken a minimum of three times daily. The temperature and pH were determined daily for the designated “water quality” replicate at each treatment.

After 96 (±2) hrs exposure, the algal cell density in each replicate flask was determined by spectrophotometric analysis. The resulting cell density data were analyzed to determine any growth impairment, or toxicity, caused by the stormwater; all statistical analyses were performed using the CETIS statistical software.

2.5 Survival and Reproduction Toxicity Testing with *Ceriodaphnia dubia*

The short-term chronic *Ceriodaphnia* test consists of exposing individual females to the stormwater samples for the length of time it takes for the Lab Control treatment females to

produce three broods (typically 6-8 days), after which effects on survival and reproduction are evaluated. The specific procedures used in this testing are described below.

The Lab Water Control medium for this test consisted of modified US EPA synthetic moderately hard water, prepared by addition of reagent grade chemicals to Type 1 lab water. The stormwater samples were tested at the 100% concentration only. Each treatment consisted of a 200 mL aliquot of test solution to which the alga *S. capricornutum* and Yeast-Cerophyll®-Trout food (YCT) had been added to provide food for the test organisms. “New” water quality characteristics (pH, D.O., and conductivity) were measured on these food-amended test solutions prior to use in these tests.

There were 10 replicates for each test treatment, each replicate consisting of 15 mL of test solution in a 30-mL plastic cup. The tests were initiated by allocating one neonate (<24 hours old and within 8 hours of age) *C. dubia*, obtained from in-house laboratory cultures, into each replicate cup. The replicate cups were placed in a temperature-controlled room at 25°C, under cool white fluorescent lighting on a 16L:8D photoperiod.

Each day of the test, fresh test solutions were prepared and characterized as before, and a new set of replicate cups was prepared. The original test replicate cups were examined, with surviving original individual organisms being transferred to the corresponding new cup. The contents of each of the remaining old replicate cups was carefully examined and the number of neonate offspring produced by each original organism was determined, after which the “old” water quality characteristics (pH, D.O., and conductivity) were measured for the old test solution from randomly-selected replicate(s) at each treatment.

After it was determined that ≥60% of the *Ceriodaphnia* in the Lab Control treatments had produced their third brood of offspring, the tests were terminated. The resulting survival and reproduction data were analyzed to determine any impairments caused by the stormwater samples. All statistical analyses were performed using the CETIS statistical software.

2.6 Survival and Growth Toxicity Testing with Larval Fathead Minnows

The short-term chronic fathead minnow test consists of exposing larval fish to the stormwater for 7 days, after which effects on survival and growth are evaluated. The specific procedures used in this testing are described below.

The larval fathead minnows used in these tests were obtained from a commercial supplier (Aquatox, Hot Springs, AR). Upon receipt at the lab, the larval fish were maintained in aerated tanks of EPA moderately-hard water at 25°C, and were fed brine shrimp nauplii *ad libitum*.

The Lab Water Control medium for this test consisted of EPA synthetic moderately-hard water. The stormwater samples were tested at the 100% concentration only. “New” water quality

characteristics (pH, D.O., and conductivity) were measured on these test solutions prior to use in the tests.

There were 4 replicates for each test treatment, each replicate consisting of 200 mL of test solution in a 600-mL glass beaker. The test was initiated by randomly allocating 10 larval fathead minnows (<48 hours old) into each replicate. The replicate beakers were placed in a temperature-controlled room at 25°C, under cool-white fluorescent lighting on a 16L:8D photoperiod. The test fish were fed brine shrimp nauplii twice daily.

Each day of the test, fresh test solutions were prepared for each treatment, and water quality characteristics were determined as before. The replicate beakers were examined, with any dead animals, uneaten food, wastes, and other detritus being removed. The number of live fish in each replicate was determined and then approximately 80% of the old test media in each beaker was carefully poured out and replaced with fresh test solution. “Old” water quality characteristics (pH, D.O., and conductivity) were measured on the old test water that had been discarded from one randomly selected replicate at each treatment.

After 7 days exposure, the test was terminated and the number of live fish in each replicate beaker was recorded. The fish from each replicate were then carefully euthanized in methanol, rinsed in de-ionized water, and transferred to a pre-tared weighing pan. These fish were then dried at 100°C for >24 hours and re-weighed to determine the total weight of fish in each replicate. The total weight was then divided by the initial number of fish per replicate to determine the “biomass value.” The resulting survival and biomass data were analyzed to determine any impairment caused by the stormwater samples. All statistical analyses were performed using the CETIS statistical software.

3. RESULTS

3.1 Effects of VCWPD Emission Station Stormwater on Purple Urchin Fertilization

The results of this test are summarized in Table 2. There was no significant reduction in fertilization in the ME-SCR stormwater sample. The test data and summary of statistical analyses for this test are presented in Appendix B.

Table 2. Effects of VCWPD emission station stormwater on purple urchin fertilization.		
Test Initiation Date (Time)	Treatment/Sample ID	Mean % Fertilization
1/10/18 (1107)	Lab Control	99.0
	Salt Control	31.5 ^a
	ME-SCR	72.0

a - The fertilization response in the Salt Control treatment was significantly less than in the Lab Water Control, indicating that the use of artificial sea salt may have impaired fertilization. Accordingly, the test data were analyzed comparing the stormwater sample to the Salt Control.

3.2 Effects of VCWPD Emission Station Stormwater on *Atherinops affinis*

The results for these tests are summarized in Table 3. There was no significant reduction in survival or growth in the ME-CC stormwater sample. There was a significant reduction in both survival and growth in the ME-VR2 stormwater sample. The test data and summary of statistical analyses for these tests are presented in Appendix C.

Table 3. Effects of VCWPD emission station stormwater on <i>Atherinops affinis</i> .			
Test Initiation Date (Time)	Treatment/Sample ID	Mean % Survival	Mean Biomass Value (mg)
1/10/18 (1710)	Lab Control	92.0	1.54
	ME-CC	100	1.88
	ME-VR2	16.0^{*a}	0.27^{*b}

* The response at this test treatment was significantly less than the Lab Control treatment response ($p < 0.05$).

a - Low dissolved oxygen (D.O.) values were observed in this test treatment, and aeration of the test could not maintain the D.O. >4 mg/L, potentially causing the reduced survival and growth in this treatment rather than a contaminant.

b - The EPA manual indicates that "concentrations that had a significant toxic effect on one of the observed responses would not be subsequently tested for an effect on some other response as only applying to dilution series testing." The Surface Water Ambient Monitoring Program (SWAMP) Roundtable has ruled that this does not apply to testing of 100% solution testing, and that hypothesis test results for both the survival and sub-lethal endpoints must be reported for SWAMP compliant programs. We have complied with this requirement by indicating that this treatment is toxic to survival and reproduction.

3.3 Effects of VCWPD Major Outfall Station Stormwater on *Selenastrum capricornutum*

The results for this test are summarized in Table 4. There was no significant reduction in algal growth in the MO-MPK stormwater sample. The test data and summary of statistical analyses for this test are presented in Appendix D

Table 4. Effects of VCWPD major outfall station stormwater on <i>Selenastrum capricornutum</i> .		
Test Initiation Date (Time)	Treatment/Sample ID	Mean Algal Cell Density (cells/mL x 10 ⁶)
1/10/18 (1709)	Lab Control	2.58
	MO-MPK	4.44

3.4 Effects of VCWPD Major Outfall Station Stormwater on *Ceriodaphnia dubia*

The results for this test are summarized in Table 5. There was no significant reduction in *C. dubia* survival in any of the stormwater samples tested. There was no significant reduction in *C. dubia* reproduction in the MO-SIM, MO-THO, and MO-FIL stormwater samples when an outlier replicate in the Lab Control treatment was excluded from the analyses; there was a significant reduction in the MO-THO stormwater sample when the Lab Control outlier replicate was included in the analyses. There was a significant reduction in reproduction in the MO-HUE and MO-VEN stormwater samples (both including and excluding the outlier replicate in the Lab Control). The test data and summary of statistical analyses excluding outliers are presented in Appendix E; the summary of statistical analyses including outliers is presented in Appendix F.

Table 5. Effects of VCWPD major outfall station stormwater on <i>Ceriodaphnia dubia</i> .			
Test Initiation Date (Time)	Treatment/Sample ID	Mean % Survival	Mean Reproduction (# neonates/female)
1/10/18 (1900)	Lab Control	100	34.3/36.0 ^a
	MO-SIM	100	38.1/36.1 ^a
	MO-THO	100	29.2*
	MO-HUE	70	9.3*
	MO-VEN	90	17.0*
	MO-FIL	100	33.2/31.5 ^a

* The response at this test treatment was significantly less than the Lab Control treatment response ($p < 0.05$).

a - Analysis of the data indicated the presence of an outlier in this treatment, and the results reported above are for the analyses of the test data excluding the outlier. As per EPA guidelines, the test data were analyzed both with and without the outlier, and the results of both sets of analyses are reported in the appendices.

3.5 Effects of VCWPD Major Outfall Station Stormwater on Fathead Minnows

The results for this test are summarized in Table 6. There was no significant reduction in fathead minnow survival in the MO-CAM and MO-SPA stormwater samples; there was a significant reduction in survival in the MO-OJA, MO-MEI, and MO-OXN stormwater samples. There was a significant reduction in fathead minnow growth in all stormwater samples tested. The test data and summary of statistical analyses for this test are presented in Appendix G.

Table 6. Effects of VCWPD major outfall station stormwater on fathead minnows.			
Test Initiation Date (Time)	Treatment/Sample ID	Mean % Survival	Mean Biomass Value (mg)
1/10/18 (1854)	Lab Control	100	1.01
	MO-CAM	100	0.87*
	MO-OJA	65.0*	0.32*^{a,c}
	MO-MEI	36.7*	0.13*^{a,b,c}
	MO-OXN	87.5*	0.60*^{a,c}
	MO-SPA	87.5	0.44*

* The response at this test treatment was significantly less than the Lab Control treatment response ($p < 0.05$).

- a - Pathogen related mortalities (PRM) were observed in this treatment. PRM is considered an artifact of the test methodology. PRM is well documented in the EPA guidelines (EPA-821-R-02-013) as caused by microorganisms, and it is acknowledged that PRM interferes with the toxicity evaluation. PRM was not observed in the Lab Control treatment, indicating that the source of pathogens was the stormwater sample.
- b - Low dissolved oxygen (D.O.) values were observed in this test treatment, potentially causing the reduced survival and growth rather than a contaminant. Sample filtration and aeration should be considered prior to conducting future testing on this site water.
- c - The EPA manual indicates that "concentrations that had a significant toxic effect on one of the observed responses would not be subsequently tested for an effect on some other response as only applying to dilution series testing." The Surface Water Ambient Monitoring Program (SWAMP) Roundtable has ruled that this does not apply to testing of 100% solution testing, and that hypothesis test results for both the survival and sub-lethal endpoints must be reported for SWAMP compliant programs. We have complied with this requirement by indicating that this treatment is toxic to survival and reproduction.

4. AQUATIC TOXICITY DATA QUALITY CONTROL

Two QC measures were assessed during the toxicity testing:

- Maintenance of acceptable test conditions; and
- Negative Control testing;

4.1 Maintenance of Acceptable Test Conditions

Due to the timing of the storm and concern for VCWPD staff safety, the samples were collected over two days and transported to PER the following morning. Tests using samples that were collected on January 8 were initiated outside the 36 hr hold time, but within 72 hrs as allowed in the VCWPD MRP. During the routine D.O. check of the *A. affinis* test on Day 1, a low D.O. of <1.0 mg/L was measured in the ME-VR2 sample, resulting in aeration for the remainder of testing. Despite aeration, the sample continued to exhibit low D.O. values (possibly due to the amount of solids present), potentially causing the observed reduction in survival and growth. During the routine D.O. check of the fathead minnow test on Day 0, a low D.O. of 3.1 mg/L and <1.0 mg/L was measured in the MO-OJA and MO-MEI samples, respectively, resulting in aeration for the remainder of testing; the MO-SPA sample was aerated on Day 1 due to a low D.O. of 4.1 mg/L, and the MO-CAM sample was aerated on Day 5 due to a low D.O. of 4.8 mg/L. Despite aeration of the MO-MEI sample, the sample continued to exhibit low D.O. values (possibly due to the amount of solids present), potentially causing the observed reduction in survival and growth.

Pathogen related mortalities (PRM) were observed in the fathead minnow test in sites MO-OJA, MO-OXN, and MO-MEI. PRM is considered an artifact of the test methodology. PRM is well documented in the EPA guidelines (EPA-821-R-02-013) as caused by microorganisms, and it is acknowledged that PRM interferes with the toxicity evaluation. PRM was not observed in the Lab Control treatment, indicating that the source of pathogens was the ambient water sample.

The Salt Control treatment in the purple urchin fertilization test was significantly less than in the Lab Water Control, indicating that the use of artificial sea salt may have impaired fertilization.

Otherwise, all other test conditions (pH, D.O., temperature, etc.) were within acceptable limits. All analyses were performed according to laboratory Standard Operating Procedures.

4.2 Negative Control Testing

The responses at the Lab Control treatments were acceptable.

5. SUMMARY AND CONCLUSIONS

An evaluation of the toxicity of VCWPD stormwater samples was conducted utilizing samples collected on January 8-9, 2018. A summary of test results is provided below.

Chronic Toxicity of VCWPD Stormwater to Purple Urchin Fertilization

There was no significant reduction in purple urchin fertilization in the ME-SCR stormwater sample.

Chronic Toxicity of VCWPD Stormwater to *Atherinops affinis* (Topsmelt)

There was no significant reduction in topsmelt survival or growth in the ME-CC stormwater sample. There was a significant reduction in topsmelt survival and growth in the ME-VR2 stormwater sample.

Chronic Toxicity of VCWPD Stormwater to *Selenastrum capricornutum*

There was no significant reduction in *S. capricornutum* growth in the MO-MPK stormwater sample.

Chronic Toxicity of VCWPD Stormwater to *Ceriodaphnia dubia*

There was no significant reduction in *C. dubia* survival in any of the stormwater samples. There was no significant reduction in *C. dubia* reproduction in the MO-SIM, MO-THO, and MO-FIL stormwater samples when an outlier replicate in the Lab Control treatment was excluded from the analyses; there was a significant reduction in the MO-THO stormwater sample when the Lab Control outlier replicate was included in the analyses. There was a significant reduction in reproduction in the MO-HUE and MO-VEN stormwater samples (both including and excluding the outlier replicate in the Lab Control).

Chronic Toxicity of VCWPD Stormwater to Fathead Minnows

There was no significant reduction in fathead minnow survival in the MO-CAM and MO-SPA stormwater samples; there was a significant reduction in survival in the MO-OJA, MO-MEI, and MO-OXN stormwater samples. There was a significant reduction in fathead minnow growth in all stormwater samples tested.

Appendix K. Formulas for WQO determination

BASIN PLAN and CALIFORNIA TOXICS RULE OBJECTIVES: FORMULAS

AMMONIA (BASIN PLAN)

Basin Plan Ammonia Objective formula selection is based on wet or dry event, COLD/MIGR designation status, early life stages (ELS) status, and salinity.

See the flow charts below to determine which formula to use:

Basin Plan NH3-N Objectives for Wet Weather

Table 3-1: One hour Average Objective for Ammonia-N for Freshwaters (mg N/L)

COLD and/or MIGR:

$$= \frac{0.275}{1 + 10^{7.204 - pH}} + \frac{39.0}{1 + 10^{pH - 7.204}}$$

NOT COLD and/or MIGR:

$$= \frac{0.411}{1 + 10^{7.204 - pH}} + \frac{58.4}{1 + 10^{pH - 7.204}}$$

Saltwater 1-hour objective for Ammonia-N

$$= 0.233 * \left(1 + 10^{\left[\left(9.245 + 0.116 * \frac{19.9273 * S}{1000 - 1.005109 * S}\right) + 0.0324(298 - T) + \frac{(0.0415)P}{T} - pH\right]}\right)$$

Where T= temperature expressed in °K (Note: Kelvin = Celsius + 273)

S = salinity (ppt)

P = pressure (assumed to be 1 atm)

Basin Plan NH3-N Objectives for Dry Weather

BPA 2005 p15-11 "Implementation actions to achieve applicable ammonia objectives must implement downstream objectives."
 NH3-N = NH3 x 0.822 4 day average objective = 2.5 x 30-day average objective

Table 3-2: 30-Day Average Objective for Ammonia-N for Freshwaters Applicable to Waters Subject to the “Early Life Stage Present” Condition (mg N/L)

$$= \left(\frac{0.0577}{1 + 10^{7.688 - pH}} + \frac{2.487}{1 + 10^{pH - 7.688}} \right) * \text{MIN}(2.85, 1.45 * 10^{0.028 * (25 - T)})$$

Where T= temperature expressed in °C.

Highest four-day average within the 30-day period shall not exceed 2.5 times the 30-day average objective as calculated above.

Table 3-3: 30-Day Average Objective for Ammonia-N for Freshwaters Applicable to Waters Subject to the “Early Life Stage Absent” Condition (mg N/L)

$$= \left(\frac{0.0577}{1 + 10^{7.688 - pH}} + \frac{2.487}{1 + 10^{pH - 7.688}} \right) * 1.45 * 10^{0.028 * (25 - \text{MAX}(T, 7))}$$

Where T= temperature expressed in °C.

Highest four-day average within the 30-day period shall not exceed 2.5 times the 30-day average objective as calculated above.

Saltwater 4-day objective for Ammonia-N

$$= 0.035 * (1 + 10^{\left[\left(9.245 + 0.116 * \frac{19.9273 * S}{1000 - 1.005109 * S} \right) + 0.0324(298 - T) + \frac{(0.0415)P}{T} - pH \right]})$$

Where T= temperature expressed in °K (Note: Kelvin = Celsius + 273)

S = salinity (ppt)

P = pressure (assumed to be 1 atm)

PENTACHLOROPHENOL (CTR)

$$CMC = \exp(1.005(pH) - 4.869)$$

$$CCC = \exp(1.005(pH) - 5.134)$$

METALS (CTR)

[cadmium, chromium, copper, lead, nickel, silver, zinc]

$$CMC = WER * (Acute\ Conversion\ Factor) * (\exp\{m_A[1n(hardness)] + b_A\})$$

$$CCC = WER * (Chronic\ Conversion\ Factor) * (\exp\{m_C[1n(hardness)] + b_C\})$$

Note1: CCC formula contains error in CTR (says “Acute” not “Chronic” for Conversion Factor).

Note2: see note to Table 2 of Paragraph (b)(2) in the CTR, “The term conversion factor represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column.”

Note3: Conversion factors (CF) are provided as values in a table for chromium, copper, nickel, silver, and zinc. CF for cadmium and lead are calculated based on hardness, i.e.

$$Cadmium\ Acute\ CF = 1.136672 - [(\ln\{hardness\}) (0.041838)]$$

$$Cadmium\ Chronic\ CF = 1.101672 - [(\ln\{hardness\}) (0.041838)]$$

$$Lead\ Acute\ and\ Chronic\ CF = 1.46203 - [(\ln\{hardness\}) (0.145712)]$$

Note4: Only two WER in Ventura County and no stations discharge within the applicable reaches - Lower Calleguas Creek (Reach 2 which is Portrero Rd south to Mugu Lagoon) has a WER for copper of 3.69 and Mugu Lagoon copper WER is 1.51.

December 15, 2018

EXECUTIVE SUMMARY

Monitoring of sediment for pyrethroids, total organic carbon, and toxicity to *Hyalella azteca* was conducted at two sites in the Calleguas Creek, Ventura River, and Santa Clara River watersheds in 2012, 2015, and 2018, as required by Monitoring Program No. CI 7388, as part of the Ventura County Municipal Separate Storm Sewer System National Pollutant Discharge Elimination System Permit, Order No. R4-2010-0108 (Permit).

The most commonly detected pyrethroids were bifenthrin and permethrin. The hypothetical contribution to toxicity was calculated for these pyrethroids based on their concentration, the amount of total organic carbon present in the sample, and a reference concentration known to cause significant toxicity to *Hyalella azteca* in sediment samples. For most samples, the hypothetical and observed toxicity agreed that the concentrations should not result in significant toxicity. However, in one sample, WOOD 2012, there was significant hypothetical and observed toxicity, indicating that bifenthrin was the likely cause of the observed toxicity. This site is in a predominantly agricultural area. In two samples, SCR Up 2015 and VR Down 2015, significant toxicity was observed but hypothetical toxicity was low, indicating that the cause of the toxicity was a pollutant that was not part of this study. Both of these sites are associated with multiple land uses, including urban and agriculture. A field duplicate was collected at CC Down in 2015, and while the sample and its duplicate did not show significant observed toxicity, the duplicate had high hypothetical toxicity, while the original sample did not. The lack of observed toxicity suggests that the high concentration in the duplicate may have been the result of an error or subsampling difference at the chemistry laboratory. This site is located in an agricultural area with upstream urban influences.

Two non-pyrethroid pesticides (pendimethalin and dichloran) were also frequently detected. The reference documents do not include reference concentrations for calculating hypothetical toxicity, but the lack of observed toxicity at sites with higher concentrations of these pesticides indicate that these are not likely a cause for toxicity.

Bifenthrin and permethrin are both used in significant quantities for regulated applications for structural and agricultural pest control in Ventura County but are also known to have unregulated applications for residential and industrial uses, which are not tracked. Due to the presence of significant toxicity in some of the samples that may or may not be attributable to urban contributions of pyrethroids, the recommendation to mitigate urban contributions of pyrethroids in the three sampled watersheds is to continue to target pesticide use in the Ventura Countywide Stormwater Management Program's (Program) education and outreach campaigns. The agricultural contributions are not under the jurisdiction of the Program and would need to be addressed through other avenues.

No trends are apparent over the Permit term, however the impact of the Thomas Fire (over 281,000 acres burnt in December 2017 and January 2018, including much of the Ventura and Santa Clara River watersheds) and the heavy rains and sediment loads following the fire may have affected the composition of the samples in 2018.

INTRODUCTION

Pyrethroid insecticide monitoring of sediments is required by Monitoring Program No. CI 7388, as part of the Ventura County Municipal Separate Storm Sewer System National Pollutant Discharge Elimination System Permit, Order No. R4-2010-0108 (Permit). The Permit specifies that the Principal Permittee (Ventura County Watershed Protection District (District)) shall perform a Pyrethroid Insecticides Study (Study) to accomplish the following objectives:

- i. Establish baseline data for major watersheds;
- ii. Evaluate whether pyrethroid insecticide concentrations are at or approaching levels known to be toxic to sediment-dwelling aquatic organisms;
- iii. Determine if pyrethroids discovered are from urban sources; and
- iv. Assess any trends over the permit term.

The first round of sediment monitoring for the Study was conducted in April 2012 by the District at two locations in both the Ventura River and Santa Clara River watersheds. Data from the Calleguas Creek Watershed (CCW) Toxicity Total Maximum Daily Load (TMDL) monitoring program was used to meet the requirements for that watershed, as allowed by the Permit. However, the 2012 TMDL data were unavailable in time for the 2012 report, so 2008-2010 data were included in that report and the 2011 and 2012 data were included in the 2015 report. Two sites in the Calleguas Creek Watershed were added to the District monitoring in 2015 to increase comparability and avoid issues with different detection levels, sampling strategies, and reporting cycles between the TMDL and this Study. Therefore, only TMDL data from 2012 is included in these reports. The second and third rounds of the Study were conducted in April 2015 and May 2018, respectively, by the District at two sites each in the Ventura River, Santa Clara River, and Calleguas Creek watersheds.

The samples were analyzed for total organic carbon (TOC) and eight specific pyrethroid pesticides required by the Permit (bifenthrin, cyfluthrin, cypermethrin, deltamethrin (co-elutes with tralomethrin, which is listed in the Permit if the laboratory is capable of analyzing for it), esfenvalerate (co-elutes with the non-required fenvalerate), lambda-cyhalothrin, and permethrin, as well as several pyrethroid and non-pyrethroid pesticides that are not required by the permit but are standard outputs of the analytical method. All sediment samples were tested for toxicity through a 10-day survival bioassay using 7–10-day old *Hyaella azteca*.

Hypothetical toxicity units (TU_H) were calculated to compare the expected relative toxicity of different samples and pyrethroids. TU_H are calculated by normalizing the sediment pyrethroid concentrations to TOC concentration (to account for hydrophobicity) and then dividing by the *Hyaella azteca* 10-day median lethal concentration (LC50¹) for each detected pyrethroid, if available. TU_H cannot be calculated for detected analytes without LC50s in the reference documents (e.g. non-pyrethroids such as pendimethalin and dichloran) or for analytes that may be present at levels below the method detection limit (i.e. non-

¹ LC50 is the lethal concentration required to kill 50% of the population.

detects), so their hypothetical contributions to toxicity are unknown. Pollutants other than those analyzed may also be contributing to toxicity, however this study was focused on pyrethroid pollutants.

In 2012, two pyrethroids were detected in the Study samples: bifenthrin (three sites) and permethrin (one site); and one pyrethroid (bifenthrin) was detected in the TMDL samples (two sites). All TU_H were less than one indicating the samples were non-toxic. This was supported by the lack of toxicity seen in the analysis of the sediment samples, except for the two TMDL sites, which had significant toxicity. Two non-pyrethroid pesticides were also detected in the Study samples: pendimethalin (two sites) and dichloran (one site) but were not tested in the TMDL.

In 2015, two of the eight Permit-required pyrethroid pesticides were detected: bifenthrin (three sites) and permethrin (one site). One non-required pyrethroid (fenpropathrin at one site) and two non-pyrethroid pesticides (dichloran at one site and pendimethalin at three sites) were also detected. All TU_H were less than one except for bifenthrin in the CC Down duplicate, however there was not significant toxicity in the measured sample. Some toxicity was observed in 2015 at SCR Up and VR Down. None of the Permit required pyrethroids were detected at SCR up. Bifenthrin was detected in VR Down, however other sites with higher concentrations exhibited no toxicity, and the calculated hypothetical toxicity for VR Down based on the bifenthrin concentration was not toxic.

In 2018, the third round of the study was conducted and pyrethroids were not detected in any of the Study samples. One non-pyrethroid pesticide (Dichloran) was detected at one site. Significant toxicity was not observed in any of the 2018 samples.

Ventura County has been subjected to increased environmental stresses in recent years. In addition to the ongoing severe drought, the Ventura River and Santa Clara River watersheds were heavily impacted by the Thomas Fire, which started on December 4, 2017 and continued through January 9, 2018, burning over 281,000 acres to become the largest fire recorded in California history at that time. The fire burned most of the open space and forest lands in the Ventura River Watershed and a significant amount of open space in the Santa Clara River Watershed, as well as orchards, homes, and other structures from Fillmore to Santa Barbara. Areas that did not burn (especially within the Ojai Valley) were still subject to heavy ash deposition.

The first storm of the 2017/18 wet season occurred in January 2018 and the heavy rain on the burned area resulted in higher than typical runoff and sediment loads, which took many weeks to settle out. Most of the rain for the 2017/18 wet season fell during March, when a series of large storms moved through the area, again increasing runoff and sediment loads. Samples for the 2018 Study were collected in May.

METHOD

The Permit specifies that monitoring is to be conducted every three years for the duration of the Permit (i.e. 2012, 2015, 2018, etc.), after sediment has settled within the water body and safe access can be assured. In-stream sediment samples for chemical analysis and toxicity testing were collected using stainless steel scoops according to methods developed by the USGS and outlined in *Guidelines for Collecting and Processing Samples of Stream Bed Sediment for Analysis of Trace Elements and Organic Contaminants for the National Water Quality Assessment Program (1994)*. When possible, sediment sampling stations encompassed a section of the reach approximately 100 meters in length upstream from water-column sampling stations, but this varied depending on site conditions. Five to ten wadeable depositional zones (low energy areas where fine-grained particles can accumulate) within the reach were targeted (when possible) to obtain a sample representative of the site.

Two sites, an upstream site and a downstream site, were selected on the main stem in the Ventura River, Santa Clara River, and Calleguas Creek watersheds (Figure 1). The upstream site was located higher in the watershed to reduce the influence of urban sources and the downstream site was located low in the watershed to include urban contributions. It was not possible in all cases to exclude upstream sources of agriculture and/or urban runoff, including some sources outside of Ventura County. For the Ventura River watershed, the upstream site (VR Up) is on the Ventura River above the Casitas Municipal Water District's diversion structure near the north end of Rice Road in Meiners Oaks. The downstream site (VR Down) is on the Ventura River near the Main Street Bridge in Ventura. For the Santa Clara River watershed, the upstream site (SCR Up) is on the Santa Clara River east of Torrey Road near the Los Angeles/Ventura County Line and the downstream site (SCR Down) is on the Santa Clara River near the Victoria Avenue Bridge in Ventura. For the Calleguas Creek watershed, the upstream site (CC Up) is in Las Lajas Canyon above Las Lajas Dam, north of Simi Valley, and the downstream site (CC Down) is on Calleguas Creek at the Camarillo Street (formerly University Drive) Bridge. Factors such as safety, ease of entry, upstream land use, hydrology, and long-term accessibility (including landowner permission) were considered in site selection.

For the first round of the Study (2012), two sites from the Calleguas Creek Watershed (CCW) Toxicity Total Maximum Daily Load (TMDL) monitoring program were used to meet the requirements for that watershed, as allowed by the Permit. The TMDL sites were 03_UNIV (UNIV) – co-located with CC Down, and 04_WOOD (WOOD) – Revolon Slough at Wood Road. To increase comparability between samples, watersheds, and years, and eliminate differences between the Study and the TMDL (e.g. detection levels, sampling strategies, collection methods, reporting cycles, etc.), the TMDL sites were replaced with CC Up and CC Down beginning in 2015.

Figure 1. Pyrethroid Sampling Locations

As described in the Ventura County MS4 Pyrethroid Insecticides Monitoring Quality Assurance Project Plan (QAPP), the top layer (~1 cm) of the most recently deposited sediment was collected with a pre-cleaned stainless-steel scoop as specified in the Permit. The quantity of sediment required for the tests precluded sampling directly into glass jars, so the sediment was deposited in a 24" by 36" 2mm polyethylene bag per site. The bag was closed and the sediment was manually homogenized onsite by squeezing and rotating the bag. Homogenized sediment was placed in two 8 oz wide-mouth glass jars and placed on ice for TOC and pyrethroid analysis. The jars were placed in the freezer at the end of the sampling day for pickup by the chemistry lab courier the following day. The remaining sediment (~ 3 liters) was double-bagged and kept on ice until delivered to the toxicity laboratory.

All sediment samples were analyzed for total organic carbon (TOC) by EPA 9060, pyrethroids by GC/MS NCI-SIM, and toxicity to 7—10-day old *Hyaella azteca*, as described in *Aquatic Toxicity Due to Residential use of Pyrethroid Insecticides*². Water quality field measurements were taken with hand-held probes.

² *Aquatic Toxicity Due to Residential Use of Pyrethroid Insecticides*; Weston, D., Holmes, R., You, J., Lydy, M.J (2005). Environ. Sci. Technol.; (Article); 2005; 39(24); 9780 pp.

The stainless-steel trowels used for the Study were cleaned prior to sample collection with Alconox laboratory detergent and tap water, rinsed with distilled water, and air dried. They were then sealed in Ziploc bags until arrival at the site. An equipment blank was collected by the laboratory from one clean, unused stainless-steel trowel by rinsing it with one liter of laboratory grade de-ionized water and analyzing the rinsate for TOC by SM 5310C and pyrethroids by GC/MS NCI-SIM.

RESULTS

Study Equipment Blanks

The 2018 equipment blank analysis detected a small amount of TOC and a detected not quantifiable (DNQ) amount of the pyrethroids bifenthrin and cypermethrin (Table 1). These amounts are similar to those seen in equipment blank samples in previous years of the Study (Table 2) and are insignificant in relation to expected environmental concentrations so a second equipment blank was not submitted for 2018. Several non-pyrethroid constituents were also analyzed by this method but were not detected.

2018 Study

The 2017/18 water year started out very dry, with the first storm of the season occurring in January 2018, followed by a series of storms in March 2018 that dropped 4 – 8 inches of rain across the county. Sampling was conducted on May 8 and 9, 2018, approximately 6 weeks after the March storms. VR Up (Figure 2), VR Down (Figure 3), SCR Up (Figure 4), and CC Down (Figure 7) were flowing, however SCR Down (Figure 5) was damp with small remnant ponds and CC Up (Figure 6) was dry (although there were some sediment deposits from earlier flows).

Figure 2. VR Up

Figure 3. VR Down

Figure 4. SCR Up

Figure 5. SCR Down

Figure 6. CC Up

Figure 7. CC Down

No pyrethroids were detected in the 2018 sediment samples, including the eight pyrethroids specified by the Permit for analysis (bifenthrin, cyfluthrin, cypermethrin, deltamethrin, esfenvalerate, I-cyhalothrin,

permethrin, and tralomethrin). Dichloran, a non-pyrethroid pesticide, was detected at one site (SCR Down). A field duplicate sample was collected at VR Down and the results agreed with the original sample, with no pyrethroid detections and TOC within allowed limits for relative percent difference.

All samples were subjected to a 10-day survival and growth sediment bioassay using *Hyalella azteca*. The laboratory inadvertently discarded the organisms before collecting the growth data at the end of the initial test period, so the samples were set up and run a second time within hold time for both growth and survival. All samples were non-toxic for both tests, and all samples outperformed the control in measurements of growth.

TOC amounts ranged from 1.43 g/kg in the upstream Calleguas Creek sample (CC Up 2018) to 31.4 g/kg in the downstream Ventura River field duplicate (VR Down 2018 Dup) and this range is similar to previous years, although it varies between sites.

2012-2018 Combined Results

Data from the Calleguas Creek Watershed (CCW) Toxicity Total Maximum Daily Load (TMDL) monitoring program was used to meet the requirements for that watershed in 2012, as allowed by the Permit. However, TMDL site 04_WOOD (WOOD) is not co-located with CC Up, and although TMDL site 03_UNIV (UNIV) is co-located with CC Down, the sample collection methods and protocols for the TMDL are different to this Study. To increase comparability between samples and watersheds, two sites in the Calleguas Creek Watershed were added in 2015 to avoid issues with different detection levels, sampling strategies, and reporting cycles. TMDL data (except for 2012) is not included in this report.

The 2012-2018 laboratory results are grouped by watershed in Table 3, Table 4, and Table 5. Pyrethroids that were detected during the three Study periods (2012, 2015, and 2018) are also grouped by watershed and shown in Figure 8, Figure 9, and Figure 10. Similarly, detected non-pyrethroids for the same period are shown in Figure 11 and Figure 12 (non-pyrethroid pesticides were not detected in any of the Study samples from the Ventura River Watershed, therefore a chart for this data is not included in this report.)

Three pyrethroids were detected during the Study, bifenthrin and permethrin, which were required analytes in the Permit, and fenpropathrin (danitol) which was not required by the Permit but was included in the analytical method. Two non-pyrethroid pesticides, dichloran and pendimethalin, were also detected but were not required by the Permit. These non-pyrethroid analytes were not part of the TMDL analytical method so data is not available for the 2012 TMDL sites.

DISCUSSION OF RESULTS

The 2017/18 water year started out very dry, with the first storm of the season occurring in January 2018, followed by a series of storms in March 2018 that dropped 4 – 8 inches of rain across the county. Sampling was conducted on May 8 and 9, 2018, approximately 6 weeks after the March storms. VR Up, VR Down, SCR Up, and CC Down were flowing, however SCR Down was damp with small remnant ponds and CC Up was dry (although there were some sediment deposits from earlier flows)

Equipment Blank

The source of the detected but not quantified (DNQ) amounts of bifenthrin and cypermethrin in the Study's 2018 equipment blank is unknown, but the amounts are similar to those seen in equipment blank samples in previous years of the study, including 2012 when the trowels were new. The laboratory QC was within limits for the equipment blank batches, i.e. bifenthrin and cypermethrin were not detected above the reporting limit of 0.0020 µg/L in the laboratory method blank, and the laboratory control samples and duplicates were all within acceptance limits. The trowels were washed twice since they were last used, once with Citranox after the 2015 sampling, and once with Alconox prior to the 2018 sampling. The source of the contamination is unknown but potential sources could be from air drying, during rinsate collection and/or during analysis at the laboratory. Alconox appears to have worked as well or better than Citranox for bifenthrin removal, and similarly or better than Citranox for cypermethrin removal. The equipment blank is collected by rinsing the trowel with one liter of laboratory grade deionized water and collecting the rinsate for analysis. One liter is used as it is the volume required for the analytical method and collecting extra for a potential re-analysis may dilute the sample, so a replicate is not feasible. The trowels did not contaminate the environmental samples as pyrethroids were not detected at all 2018 sites.

A detectable amount of TOC was measured in the equipment blank at 0.23 mg/L, which is above the reporting limit of 0.10 mg/L. A small DNQ amount of TOC was seen in the method blank (0.0182 mg/L) but these amounts are significantly less than seen in the environmental samples (≥ 1.43 g/kg, equal to 1430 mg/kg) so is not considered to be enough to significantly impact the sediment results (i.e. TOC measured in the equipment blank was at least four orders of magnitude below the environmental samples).

Toxicity

Toxicity levels vary between pyrethroids. Hypothetical toxicity units (TU_H) can be calculated to compare the expected relative toxicity of different samples and pyrethroids. This is done by normalizing the sediment pyrethroid concentrations to TOC concentration to account for hydrophobicity (Table 6 and Figure 13) and then dividing by the *Hyalella azteca* ten day median lethal concentration ($LC50^3$) for each detected pyrethroid, if available (Table 7). $LC50$ s for the detected analytes bifenthrin and permethrin were obtained from the study referenced in the Permit, "Aquatic Toxicity Due to Residential Use of Pyrethroid Insecticides (2005) by Weston *et al.* The Study did not include an $LC50$ for the pyrethroid fenpropathrin

³ $LC50$ is the lethal concentration required to kill 50% of the population.

or the non-pyrethroids dichloran and pendimethalin. To complete this Pyrethroid Study, an LC50 for fenpropathrin was obtained from the Los Angeles Regional Water Quality Control Boards study, "Occurrence and Toxicity of Three Classes of Insecticides in Water and Sediment in Two Southern California Coastal Watersheds (2011) by Delgado-Moreno et al. The overall hypothetical pyrethroid toxicity of a sample can be calculated by summing all the pyrethroid TU_H for that sample. TU_H greater than one indicates significant hypothetical toxicity. The non-pyrethroids were also normalized to TOC (Table 6 and Figure 13) but TU_H were not calculated since they are not pyrethroids and do not have LC50s in the Permit-referenced study.

Summed Hypothetical TU _H		TU _H	0.022			0.089	0.354	
Significant Observed Toxicity			No	No	No	No	Yes	No

No pyrethroids were detected in the 2018 Study samples, so all TU_H for 2018 are equal to zero and toxicity due to pyrethroids is not expected. This was supported by the lack of toxicity observed in the sediment samples for both survival and growth.

The 2012-2018 results are summarized by watershed in the figures below, showing their measured toxicity (% mortality) as compared to their hypothetical pyrethroid toxicity units. In some cases, e.g. UNIV (2012), SCR Up (2015), and VR Down (2015), significant toxicity was observed but the TU_H were low, in which case a different contaminant is likely the cause of the observed toxicity. At WOOD (2012), pyrethroids may have contributed to or been the cause of the toxicity observed in the sample, since the pyrethroid TU_H is close to 1. For CC Down Dup (2015), the TU_H were high but the observed toxicity was not, which may be due to other factors such as antagonistic effects with other components in the sample or subsample differences (e.g. differences in concentrations of TOC and pyrethroids). Subsample differences seem a likely cause since CC Down (2015) had a similar observed toxicity but a lower TU_H mostly due to higher TOC and lower bifenthrin concentrations.

Except for the CC Down Dup (2015), the TU_H for the Study samples were all less than one (Table 7) and so pyrethroid toxicity is not expected to be an issue for these samples according to this evaluation method. For the CC Down Duplicate, even though the TU_H was greater than one, the measured toxicity units were not above one, which means that significant toxicity was not observed in the *H. azteca* test.

The study referenced in the Permit does not contain an LC50 for dichloran or pendimethalin, however the lack of toxicity in the environmental sample infers a TU_H of less than one for these analytes. The TU_H were not correlated with the observed toxicity, possibly due to the presence of unanalyzed constituents in the samples.

Figure 14. Hypothetical Toxicity Units Vs. Observed Toxicity – By Watershed

Pyrethroid pesticides were more prevalent in the downstream samples for most analytes/watersheds.

POTENTIAL PESTICIDE SOURCES

The application of pesticides for residential, industrial, and commercial use is not tracked, except for structural pest control by certified applicators. Many pesticides have both general use (lower concentrations and/or small areas) and restricted use (higher concentrations and/or large-scale applications) formulations. General use pesticides can be applied by anyone however restricted use pesticides applications require California Department of Pesticide Regulation (CDPR) Certified Pesticide Applicators.

The pounds of pesticides applied annually for agriculture and structural pest control is tracked by the CDPR. The *Annual Pesticide Use Report Indexed by Chemical* (PUR) for Ventura County summarizes the annual reported pesticide use for regulated applications, including agriculture (e.g. food and ornamental), structural pest control, and other purposes (e.g. animal premise, golf course turf, landscape maintenance, public health, regulatory pest control, rights of way, vertebrate control, etc.). These reports typically become available two years after the year referenced, so 2017 and 2018 were unavailable for this Study report. The pounds used for regulated uses of the detected pesticides in this Study are summarized in Table 8.

Data from Pesticide Use Annual Summary Reports at <https://www.cdpr.ca.gov/docs/pur/purmain.htm>, indexed by Chemical and restricted to Ventura County
E.g "Department of Pesticide Regulation 2015 Annual Pesticide Use Report Indexed by Chemical - Ventura County"

There is approximately a two-year delay for the California Department of Pesticide Regulation Annual Pesticide Use Reports (PUR) to become available online. This means that 2011 and 2012 PUR were unavailable for the 2012 Study report, 2014 and 2015 PUR were unavailable for the 2015 Study report, and 2017 and 2018 PUR were unavailable for the 2018 Study Report.

Five pesticides (three pyrethroids and two non-pyrethroids) were detected by the laboratory's pyrethroid analytical method during the Study. Bifenthrin and permethrin are pyrethroid insecticides that have both agricultural and urban and general and restricted use applications. Bifenthrin and permethrin are both used in significant quantities for regulated applications for structural and agricultural pest control in Ventura County but are also known to have unregulated applications for residential and industrial uses, which are not tracked. The pyrethroid insecticide fenpropathrin and the non-pyrethroid fungicide dichloran are agricultural pesticides without urban uses. The non-pyrethroid herbicide pendimethalin is used for agricultural and urban uses. Fenpropathrin, dichloran, and pendimethalin are not used for structural pest control in Ventura County.

Bifenthrin is used as a restricted use pesticide in orchards, nurseries, and buildings (e.g. structural pest control). Some products with lower concentrations are available for unrestricted residential use for indoor and outdoor insect control. Bifenthrin was detected at all Study sites except CC Up and VR Up at least once from 2012-2018. All the sites at which bifenthrin was detected (TMDL sites in 2012, CC Down in 2015, VR Down in 2012 and 2015, SCR Up in 2012, and SCR Down in 2012 and 2015) have both urban and agricultural influences but are in predominantly agricultural areas. In contrast, CC Up doesn't have urban or agricultural influences and VR Up has a small amount of agriculture and low-density housing. WOOD 2012 is a predominantly agricultural site and given its location within the Oxnard Plain, an area notable for its large crops of strawberries, peppers, and leafy green vegetables, the source of the bifenthrin is likely agricultural, however there are upstream discharges from urban areas.

Permethrin is a restricted use pesticide for crop and wide area applications (e.g. nurseries, sod farms) but is also a general use pesticide for residential (e.g. indoor and outdoor spaces, pets) and industrial applications. According to the United States Environmental Protection Agency's "Reregistration Eligibility Decision (RED) for Permethrin (December 2007)", approximately 70% of permethrin is used in non-agricultural settings and approximately 30% is used on food/feed crops in agricultural settings. The RED states that approximately 55% of the non-agricultural applications are made by professionals, 41% by homeowners on residential areas, and 4% on mosquito abatement areas. Permethrin was only detected at VR Up in 2012, which is downstream of a small amount of agriculture and low-density housing, and at ME-CC in 2015, which has both urban and agricultural influences. The TMDL permethrin detection limit of 5 ng/g is above/near the quantities measured in the 2015 CC Down samples, so the higher TMDL detection limit may have obscured the presence of similar concentrations of permethrin in the TMDL samples. The CDPR reports show that the regulated use of permethrin in Ventura County is predominantly for row crops and structural pest control, however according to the Environmental Health Tracking Program (www.cehtp.org/pesticidetool), which uses CDPR data, there were no applications near VR Up, so the source may be from unregistered residential users but the data is inconclusive at this time.

Fenpropathrin is a pyrethroid insecticide that is registered for multiple crops but its restricted use designation makes it unlikely to have an urban source, however it can be used to treat Asian citrus psyllid infestations (as can cyfluthrin, which was not detected), which have become a problem in Ventura County. It was only detected once during the Study, at VR Down in 2015.

Dichloran is a (non-pyrethroid) general use fungicide with no residential uses [DCNA (Dicloran) Reregistration Eligibility Decision (RED) Fact Sheet (EPA 738-F-06-013, July 2006)], therefore the detected dichloran is not from an urban source. Dichloran was only detected at one site, SCR Down, and was detected during all three study years (2015, 2015, and 2018).

Pendimethalin is a (non-pyrethroid) general use selective herbicide used to control broadleaf weeds and grassy seed species in agricultural and non-agricultural settings. Pendimethalin was predominantly detected in the Santa Clara River Watershed at SCR Up and SCR Down in 2012 and 2015, but it was also detected at CC Down in 2015. It is unknown if the detection of this non-pyrethroid is related to an urban source, but its concentrations tended to be higher at the downstream sites, where agriculture is a more direct influence.

The PUR are summarized by calendar year, however samples for this Study were collected in April/May so the previous year's applications are also relevant. Strawberry and celery are among the top 10 crops grown in Ventura County, and are also the major crops on which the five detected pesticides (3 pyrethroids and 2 non-pyrethroids) are applied. Additionally, as seen in Figure 15, the strawberry and celery growing seasons lead into the sampling period. This suggests that the pesticides could have an agricultural source, however it does not exclude an urban source for those pesticides which have urban uses.

Figure 15. Peak Harvest Seasons

(Chart obtained from <http://www.farmbureauvc.com/new/images/typical-peak.jpg>)

PESTICIDE USE TRENDS

According to the CDPR website (<https://www.cdpr.ca.gov/docs/pur/pur16rep/16sum.htm#trends>), "Since 1990, the reported pounds of pesticides applied and acres treated have fluctuated from year to year. These fluctuations can be attributed to a variety of factors, including changes in planted acreage,

crop plantings, pest pressures, and weather conditions. An increase or decrease in use from one year to the next or in the span of a few years may not necessarily indicate a general trend in use, but rather variations related to changes in weather, pricing, supply of raw ingredients, or regulations. Regression analyses on use over the last twenty years do not indicate a significant trend of either increase or decrease in total pesticide use.” These factors, combined with differences in rainfall and runoff intensities and amounts could all contribute to the variations in concentrations seen in the Study.

The 2017 and 2018 PUR data were not released by CDPR in time for inclusion in this report, so the comparison of analytical data to pesticide application amounts to look for trends are limited to the 2011-2016 period. The multiple factors that can affect fluctuations and the lack of PUR data for 2017 and 2018, combine to prevent drawing conclusions from any apparent trends. However, some possible trends from the current available data are visible in Figure 16, Figure 17, Figure 18, Figure 19, and Figure 20, and are described below.

Figure 16. 2011-2016 Bifenthrin Use in Ventura County (CDPR)

Figure 17. 2011-2016 Permethrin Use in Ventura County (CDPR)

Figure 18. 2011-2016 Fenpropathrin (Danitol) Use in Ventura County (CDPR)

Figure 19. 2011-2016 Dichloran Use in Ventura County (CDPR)

Figure 20. 2011-2016 Pendimethalin Use in Ventura County (CDPR)

The 2011-2016 PUR show dichloran and pendimethalin (non-pyrethroids) are used in larger quantities (pounds) for regulated applications (primarily agriculture) in the County than the pyrethroids bifenthrin,

permethrin, and fenpropathrin, however this was not typically reflected in the monitoring data (i.e. quantities and frequencies of detection). These five pesticides are all applied to strawberry or celery as their major crop, and these are among the top ten crops in Ventura County and are mainly grown in the lower regions of each watershed.

According to the 2011-2016 PUR, bifenthrin, fenpropathrin, and pendimethalin use appear to be trending upward since 2011 (although bifenthrin use decreased in 2016). Bifenthrin use (according to CDPR) was highest in 2015, which correlates with the concentrations measured at downstream sites. Bifenthrin structural use increased in the county between 2012 and 2015, and briefly exceeded agricultural use in 2015. Permethrin use appears to be decreasing (largely due to decreased use for structural pest control use) and dichloran use appears to be staying relatively stable over the 2011-2016 period. The 2017 and 2018 data are unavailable to see if the trend continues.

PESTICIDE REDUCTION EFFORTS

Integrated Pest Management Programs

A model integrated pest management (IPM) program was drafted through the Public Agencies Activities Subcommittee and used as a template by the Permittees to develop their own plans by November 2009. This standardized protocol was amended in February 2014 at the amended version is posted on Program's website at: <http://www.vcstormwater.org/index.php/publications/manuals/pesticide-application-protocol>.

The prevention of pesticides from harming non-target organisms is the primary goal of the Permittees IPM program. The intent is to focus on preventing pesticides, fertilizers, and herbicides from entering the storm drain system and discharging to receiving waters. This protocol is applicable to 1) the outdoor use of pesticides, herbicides, and fertilizers; 2) the use of pesticides and fertilizers where the materials may come into contact with precipitation; 3) the use of pesticides, herbicides, and fertilizers where these materials may come into contact with runoff (natural or induced); and 4) the use of pesticides, herbicides, or fertilizers anywhere where they may be directly or indirectly discharged to a storm drainage system.

An effective IPM program includes the following elements:

- Pesticides are used only if monitoring indicates they are needed according to established guidelines.
- Treatment is made with the goal of removing only the target organism.
- Pest controls are selected and applied in a manner that minimizes risks to human health, beneficial, non-target organisms, and the environment.
- The use of pesticides, including organophosphates and pyrethroids do not threaten water quality.
- Partner with other agencies and organizations to encourage the use of IPM.

- Adopt and verifiably implement policies, procedures, and/or ordinances requiring the minimization of pesticide use and encouraging the use of IPM techniques (including beneficial insects) in the Permittees' overall operations and on municipal property.
- Policies, procedures, and ordinances shall include commitments and timelines to reduce the use of pesticides that cause impairment of surface waters by implementing the following procedures:
 - Quantify pesticide use by its staff and hired contractors.
 - Prepare and annually update an inventory of pesticides used by all internal departments, divisions, and other operational units.
 - Demonstrate reductions in pesticide use.

The protocol is applicable to any Permittee staff and contracted services that apply pesticides, fertilizers, or herbicides. Such staff commonly include, park, public works, purchasing, building/grounds maintenance, hazardous materials, and pesticide application staff. It is not applicable to the indoor use of pesticides, herbicides or fertilizers, but is applicable to the consequential outdoor handling, mixing, transport, or disposal of materials related to indoor use. This protocol also does not apply when another NPDES permit and/or abatement orders are in effect at the selected site. Furthermore, this protocol is not intended to replace federal or state requirements or provide complete directions for applying, handling, transporting, mixing, or storing pesticides, fertilizers, or herbicides.

Public Outreach and Education on Pesticide Use

Ventura County's Community for a Clean Watershed (CCW) is the Program's public outreach effort, and it regularly targets pesticide use in its campaigns. CCW has developed creative materials to promote the safe and correct use of outdoor pesticides. The animated "More, Better" television commercial graphically demonstrates how using too much pesticide results in runoff into the storm drains, eventually making it into the Watershed where it adversely affects plants and animals. The radio spot was a humorous adaptation of the television ad, featuring the two animated characters as they defend their house against garden pests and inadvertently poison the watershed. An animated web banner corresponded with both broadcast media while the transit shelters took a more direct approach showing a snail and telling residents "Don't kill an ocean just to keep pests out of your garden."

Spanish Language Pesticide Outreach

Newspaper Advertisement

In 2010, coinciding with the spring planting season, CCW ran a five-week campaign on television and radio, as well as animated web banners and transit shelter posters. A similar campaign was run in spring 2016 for four weeks, utilizing the thirty second radio spot, digital web banner, and six transit shelters showing the snail poster. The radio spot was also run for four weeks on Pandora in January – February 2017.

In February 2016, April 2016, and twice in January 2017, CCW sent out e-blasts targeting 100,000 homeowners in Ventura County each time. The e-blast promoted the Program's rain barrel and compost bin truckload sale and included links to the Program's "Yard Care Watershed Protection Tips" brochure and "Pesticides, Herbicides, & Fertilizer Application Best Practices" BMP sheet.

Retail Partnership Brochures: Nurseries and Gardeners

"Watershed Protection Tips for Gardeners" pamphlets were created in 2010 to encourage residents to follow best practices in their homes and yards when gardening and dealing with pests. These brochures were distributed to targeted retail stores and numerous outreach events across the county to reach the population that is likely involved in the activities. The colorful pamphlet defines the Watershed, explains the storm drain system, how and why polluted water is damaging, and gives both overall and topic-specific tips for how to keep the Watershed clean. The pamphlet covers plant selection, irrigation, fertilizer and pesticide practices, integrated pest management, and proper yard maintenance. The pamphlet was updated in 2016 to include pictures of drought tolerant plants and an updated link to Integrated Pest Management resources.

The Program also created a best management practices fact sheet covering commercial pesticide, herbicide, & fertilizer application and a poster covering best management practices for nurseries. These were distributed during stormwater business inspections. All the materials are also posted on the CCW website www.cleanwatershed.org.

RECOMMENDATIONS

Urban use of pesticides remains one of the priority pollutants for the Program. Through maintaining a strong public outreach effort to educate the public on the use and handling of pesticides coupled with household hazardous waste collections providing proper disposal of unwanted products, the Program expects to reduce the pesticide contamination in stormwater discharge. The results of this study, and the previous studies in 2012 and 2015, do not directly show a link between pyrethroids and significant toxicity in the samples, therefore the instances of measured toxicity could be from other pesticides or other pollutants. The Program is committed to reducing all pollutants in MS4 runoff and through the continued implementation of the Program, these other potential causes of toxicity will be addressed.
