

Hello Holly,

This is Daniel Green. Thanks for putting on the TMDL meeting in Lakeport, for working with the community to solve the cyanobacteria issue, and listening about permaculture design as piece of the solution. I have learned that there is a number of grants through the water board and other organisations to stop erosion from storm water.

One proposed solution I would like to provide is: Using our non profit (currently in filing) to get grants for storm water run off etc., to create local jobs and training to update local best management practices.

My last comments are "Permaculture can help create many local ecologically friendly careers to reduce the TMDL by slowing water and recharging aquifers using swales, buffer ponds, and rain gardens."

Thanks again,
Daniel Green
