Surrogate Compounds

Parameter Name	RT	RT Dev	Response	Solution Conc	%Rec	%Rec Limits		Rpt?
Octacosane	20.16	0.00	7256754	70.28	94	50-140	OK	

Target Compounds

Final Conc. Units: mg/L

Parameter Name	RT	RT Dev	Response	Solution Conc	Final Conc	Q	Rpt?
Gasoline Range Organics (C6-C1			908108**m**		0.50	U	
Diesel Range Organics (C13-C22	13.00		289627**m**	2.94	0.44	U	
Heavy Range Organics (C24-C3	20.00		389205**m**	4.82	0.50	U	

Prep Amount:	30.0 ml	**Dilution:**	1.0
Prep Final Vol:	3 ml	**Unit Factor:**	1

Final Concentration = ((Soln Conc x Prep Final Vol x Dilution) / Prep Amount) x Unit Factor

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

Run Type:	SMPL			**Dilution:**	1.0
Lab ID:	D0601625-008			**Soln Conc. Units:**	mg/L

Surrogate Compounds

Parameter Name	RT	RT Dev	Response	Solution Conc	%Rec	%Rec Limits		Rpt?
Octacosane	20.16	0.00	6970588	67.51	90	50-140	OK	

Target Compounds

Final Conc. Units: mg/L

Parameter Name	RT	RT Dev	Response	Solution Conc	Final Conc	Q	Rpt?
Gasoline Range Organics (C6-C1			446872**m**		0.50	U	
Diesel Range Organics (C13-C22	13.00		325563**m**	3.31	0.44	U	
Heavy Range Organics (C24-C3	20.00		424587**m**	5.25	0.53	J	

Prep Amount:	30.0 ml	**Dilution:**	1.0
Prep Final Vol:	3 ml	**Unit Factor:**	1

Final Concentration = ((Soln Conc x Prep Final Vol x Dilution) / Prep Amount) x Unit Factor

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.
Q - Qualifier signal failed the ratio test.

QC Flag Legend

a - Target compound detected but, quantitated amount
    Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.

QC Flag Legend

a - Target compound detected but, quantitated amount
    Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.

Semivolatile Organic Compounds by EPA Method 8270C

Sample Name: T-51-GW11
Lab Code: D0601593-006

Extraction Method: EPA 3520C
Analysis Method: 8270C

Units: ug/L
Basis: NA

Level: Low

Analyte Name	Result	Q	PQL	MDL	Dilution Factor	Date Extracted	Date Analyzed	Extraction Lot	Note
Pyridine	ND	U	9.6	0.33	1	10/17/06	10/19/06	DWG0600894	

Surrogate Name	%Rec	Control Limits	Date Analyzed	Note
2,4,6-Tribromophenol	90	31-112	10/19/06	Acceptable
2-Fluorobiphenyl	95	47-110	10/19/06	Acceptable

1. INTRODUCTION

GeoSyntec Consultants (GeoSyntec) retained SiREM Laboratory (SiREM) to perform a laboratory treatability study for hexavalent chromium (Cr^{6+}) in groundwater collected from 2701 North Harbor Drive, San Diego, California (the Site). The purpose of the study was to assess zero valent iron (ZVI) and ferrous sulfate ($FeSO_4$) for the remediation of Cr^{6+} in the soil and groundwater at the Site.

Chromium exists in oxidation states ranging from +6 to -2, however, only the +6 and +3 oxidation states are commonly encountered in the environment. Cr^{6+} is of environmental concern due to its toxic and carcinogenic properties and increased subsurface mobility when compared to the relatively less toxic and immobile trivalent chromium (Cr^{3+}) species.

Groundwater used in this study was collected by GeoSyntec personnel from boring T48 at 11 feet below grade surface on 13 April 2006 and was received by SiREM on 18 April 2006. Soil cores collected on 13 April 2006 from locations T47 to T49 between depths of 7 to 11 feet below ground surface were received from GeoSyntec on 19 April 2006. The remainder of this report is divided into two sections. Section 2 presents the experimental approach and methods. Section 3 presents the results of the treatability study.

2. APPROACH AND METHODS

The following sections describe the approach and methods for reactor construction (Section 2.1) and sampling and analysis (Section 2.2). Batch experiments for treatment of the soil and groundwater were conducted separately.

2.1 Microcosm Construction and Sampling

2.1.1 Soil Experiment

Before the experiment commenced, an unamended soil sample and a sample control reactor was prepared and sent out for external laboratory analysis of total and hexavalent chromium so that iron dosings could be accurately calculated. The results are summarized in Table 1.

Table 1: Preliminary Analytical Results, Soil Experiment

Sample	Total chromium	Hexavalent chromium
Soil	250 µg/g	32 µg/g
Soil –saturated with Site groundwater	270 µg/g	70 µg/g

The ferrous sulfate dosing was calculated based on a theoretical molar ratio of 3 moles ferrous iron (Fe^{2+}) being required to treat 1 mole Cr^{6+}.

Reactors were constructed by filling 125 (mL) (nominal volume) wide mouth glass bottles (reactors) with approximately 100 grams soil material leaving a nominal headspace. The soil being tested was first removed from the shipping cores and homogenized under anaerobic conditions in a disposable glove bag filled with a nitrogen atmosphere. The soil was subdivided in batches for preparation of the control or treatment reactors and one of each treatment batch was prepared. Table 2 summarizes the details of batch construction and amendments for the various treatment and control treatments.

The batches of soil were amended with one of three loading rates of either microscale or granular ZVI products (0.1, 1, or 10 %), or ferrous sulfate (0.5, 5, or 10 g/kg) mixed well by hand, and amended with site groundwater to its water holding capacity (evaluated on a qualitative basis [i.e. saturated but no free water]) prior to distribution to replicate bottles to provide enough replicates for sacrificial sampling at each time interval. The intrinsic controls were amended with groundwater only.

Table 2: Summary of Soil Experiment Controls and Treatments.

	Number of Microcosms	Mass bulk soil in batch (g)	Mass of amendment added (g)	Total weight (g)
Controls				
Intrinsic Control	6	750	0	750.00
Iron Amended				
Microscale Iron 0.1%	6	749.25	0.75	750.00
Microscale Iron 1%	6	742.50	7.50	750.00
Microscale Iron 10%	6	675.00	75.00	750.00
Granular 0.1%	6	749.25	0.75	750.00
Granular 1%	6	742.50	7.50	750.00
Granular 10%	6	675.00	75.00	750.00

	Number of Microcosms	Mass bulk soil in batch (g)	Mass of amendment added (g)	Total weight (g)
$FeSO_4$ 0.5 g/kg	6	749.63	0.375	750.00
$FeSO_4$ 5 g/kg	6	746.25	3.75	750.00
$FeSO_4$ 10 g/kg	6	742.50	7.50	750.00
Number of Treatments	10			
Number of Bottles	60			

All treatments were constructed in triplicate for sacrificial sampling at the scheduled 24 and 72 hour sample intervals. The soil reactors were (re)amended with site groundwater to mimic saturation conditions (i.e. the soil was water saturated but there was no free water visible). Upon construction the samples designated for analysis at 24 hours were shipped by courier under chain of custody to Columbia Analytical Services (Rochester, NY) so that extractions could be conducted at the 24 hour time interval. Samples designated for the 72 hour sample interval were shipped 24 hours in advance to the laboratory. Due to uncontrolled shipping and laboratory delays, the samples were not received at the laboratory until Day 6 and were extracted at the 7 day interval.

2.1.2 Groundwater Treatment

Before the groundwater experiment was conducted, a groundwater sample was sent to a local analytical laboratory (Maxxam Analytics) for analysis of total and hexavalent chromium so that iron dosings could be accurately calculated. The total chromium in the groundwater was 510 mg/L and the Cr^{6+} was 612 mg/L.

Based on the results of the soil experiment ferrous sulfate and nano-scale zero valent iron (nZVI) was selected for testing with the Site groundwater. The ferrous sulfate dosing was calculated based on a theoretical molar ratio of 3 moles ferrous iron (Fe^{2+}) being required to treat 1 mole Cr^{6+}. A two times stoichiometric demand was used for addition of ferrous sulfate which corresponded to 18.6 g/L $FeSO_4 \cdot 7\ H_2O$. The commercial nZVI product used (Toda Corporation, Japan) was supplied as a slurry in water with a moisture content of 50%. The nZVI dosing of 1% was selected by Geosyntec, which corresponded to 10 g/L as Fe^o and 20 g/L wet nZVI.

Reactors were constructed by filling 250 mL (nominal volume) glass bottles (reactors) with approximately 30 grams soil material, amended with appropriate iron product and

dosing and finally adding 150 mL Site groundwater leaving a nominal headspace. Table 3 summarizes the details of the various treatment and control reactors.

Table 3: Summary of Groundwater Experiment Controls and Treatments.

Treatment	Number of Reactors	Soil (g)	Groundwater (mL)	Wet nZVI (g/L)	$FeSO_4 \cdot 7H_2O$ (g/L)
ANAC	2	30	150	-	-
nZVI	2	30	150	20 g/L	-
$FeSO_4$	2	30	150	-	18.6

The intrinsic controls were amended with groundwater only.

All treatments were constructed in duplicate for sacrificial sampling at a single sample interval (24 hours). Upon construction the samples were shipping by courier under chain of custody to Columbia Analytical Services (Rochester, NY) so that extractions could be conducted at the 24 hour time interval. Although soil and groundwater were present in the treatment reactors, only the groundwater was extracted for analysis.

2.2 Analysis of Total and Hexavalent Chromium

Samples for screening level analysis of total and hexavalent chromium (by EPA methods 6010 and 7196 respectively) were sent to a local analytical laboratory (Maxxam Analytics, Mississauga, ON) for a rapid turn around so that experiments could proceed. Samples were extracted upon receipt and analysed using atomic adsorption methods.

Samples from the soil and groundwater experiments were submitted to Columbia Analytical Services for total and hexavalent chromium analysis by EPA methods 6010B and 7199 respectively. The sample extraction date is the date used for the sample date as the extraction process stopped the reaction in the samples.

3. RESULTS

Tables 4A and 4B provide data from the soil and groundwater experiments over the duration of the study. All concentrations are presented in units of mg/L. Figures 1

through 6 present trends in the concentrations of chromium in the control and treatment microcosms for the study.

1. INTRODUCTION

GeoSyntec Consultants (GeoSyntec) retained SiREM Laboratory (SiREM) to perform a laboratory biotreatability study for volatile organic compounds (VOCs) in groundwater collected from 2701 North Harbor Drive, San Diego, California (the Site). The purpose of the study was to assess natural attenuation, enhanced bioremediation, and bioaugmentation processes for the remediation of the target VOCs (namely tetrachloroethene [PCE] and its respective degradation products trichloroethene [TCE], c*is*-1,2-dichloroethene [*cis*-DCE], vinyl chloride [VC], and ethene) in the groundwater at the Site.

Natural attenuation processes occur in situ and are mediated by indigenous microbial populations present at the Site. Enhanced anaerobic bioremediation can be achieved by stimulating the indigenous microbial populations through the addition of electron donors. Bioaugmentation is the process by which a microbial population known to promote complete reductive dechlorination is introduced to Site groundwater. KB-1® Dechlorinator (KB-1®) is a natural microbial consortium containing microorganisms (*Dehalococcoides*) known to be responsible for mediating the complete dechlorination of PCE, TCE, *cis*-1,2-DCE, and VC to ethene [1,2]. The culture is non-pathogenic according to biannual testing by an external laboratory (results available upon request).

Groundwater used in this study was collected by GeoSyntec personnel from well B131-MW2 on 15 March 2006 and was received by SiREM on 22 March 2006. Soil cores collected on 14 March 2006 from location B131-MW2D between depths of 6.5 to 18 feet below ground surface were received from GeoSyntec on 22 March 2006. Microcosms were prepared under anaerobic conditions in an effort to simulate in situ Site conditions in the laboratory to the extent practicable. The remainder of this report is divided into two sections. Section 2 presents the experimental approach and methods; Section 3 presents the results of the microcosm study.

2. APPROACH AND METHODS

The following sections describe the approach and methods for microcosm construction and incubation (Section 2.1), and microcosm sampling and analysis (Section 2.2).

2.1 Microcosm Construction and Incubation

A total of 18 microcosms were constructed on 07 April 2006. Site soil and groundwater were placed in a disposable anaerobic glove bag with the materials required to construct the various treatment and control microcosms. The glove bag was purged

with a carbon dioxide/nitrogen (20:80) gas mixture to create an anaerobic environment. The soil was combined and mixed by hand to improve reproducibility between replicates. Microcosms were constructed by filling sterile 250 milliliter (mL) (nominal volume) screw cap Boston round clear glass bottles (Systems Plus, New Hamburg, Ontario) with 30 mL of homogenized soil and 180 mL of Site groundwater. The bottles were capped with Mininert™ closures to allow repetitive sampling of the bottle with minimal VOC loss, and to allow nutrient amendment, as needed, throughout the incubation period. All controls and treatments were constructed in triplicate.

Anaerobic sterile control microcosms were constructed to quantify potential abiotic and experimental VOC losses from the microcosms. The sterile controls were constructed by autoclaving the Site soil once at 121 degrees Celsius (°C) and 15 pounds per square inch (PSI) pressure for 45 to 60 minutes (min). After autoclaving, the control microcosms were returned to the anaerobic chamber, filled with 180 mL of Site groundwater and amended with 2.8 mL of 2.7 per cent (%) mercuric chloride (equal to a final liquid concentration of 0.05 %) and 0.5 mL of 5 % sodium azide (equal to a final liquid concentration of 0.017 %) to inhibit microbial activity. Intrinsic Control microcosms were not amended with electron donors or other amendments in order to replicate non-amended Site conditions.

All microcosms were sampled and incubated in an anaerobic chamber (Coy Laboratory Products, Grass Lake, MI) filled with approximately 80% nitrogen, 10% carbon dioxide, and 10% hydrogen (BOC gases). Hydrogen was present to scavenge low levels of oxygen via a palladium catalyst, and anaerobic conditions were verified by an open bottle of resazurin-containing mineral medium, which turns pink in color if oxygen is present. During quiescent incubation, all microcosms were covered to minimize photodegradation, and placed on their side to minimize VOC losses via the (submerged) Mininert™ closure. Microcosms were incubated for a period of up to 76 days at 22°C (room temperature).

Treatment microcosms were amended with either a soluble electron donor (sodium lactate [LAC]) or a slow release electron donor (emulsified vegetable oil [commercially available, EOS]). The EOS and LAC treatment microcosms were amended with electron donor at approximately 10 times the stoichiometric demand of the VOCs and selected inorganic compounds (i.e., nitrate and sulfate). The LAC microcosms were amended with 1.66 mL of a 60% sodium lactate solution corresponding to a target concentration of 5,520 mg/L. The EOS microcosms were amended with 486 µL of EOS corresponding to a target concentration of 0.27 % EOS as oil (EOS is 59.8 % soy bean oil). The amount of EOS added was based on the anticipated dosing rate in the field.

To assess the ability of bioaugmentation to improve the extent and rate of PCE dechlorination to ethene, one set of each electron donor treatments was bioaugmented with KB-1® culture on 05 May 2006 (day 28). Microcosms were bioaugmented to a target *Dehalococcoides* (DHC) concentration of 10^6 cells per liter (cells/L) in the microcosms. To achieve this cell concentration, a 1 mL aliquot of a culture with a steady state concentration of approximately 10^{11} DHC cells/L (determined by monthly Gene-Trac testing) was serially diluted in 9 mL of anaerobic mineral medium and 1.8 mL of the diluted culture was added to the microcosms to achieve the final DHC concentration. Microcosms were bioaugmented at day 28 to allow for development of reducing conditions required by the KB-1® culture. Reducing conditions in these microcosms were observed after the addition of the electron donor.

Table 1 summarizes the details of microcosm construction and amendments for the various treatment and control microcosms.

2.2 Microcosm Sampling and Analysis

2.2.1 Microcosm Sampling

Aqueous samples were collected from the control and treatment microcosms on a weekly to biweekly (i.e., every two weeks) basis for analysis of VOCs (PCE, TCE, *cis*-1,2-DCE, and VC), dissolved hydrocarbon gases (DHGs) (ethene, ethane, and methane), anions (sulfate, nitrate, nitrite, chloride, phosphate, bromide) and selected electron donors (lactate). Microcosms were sampled using gas-tight 1 mL Hamilton glass syringes. Separate sets of syringes were used for bioaugmented and non-bioaugmented treatments to reduce the potential for transfer of KB-1® microorganisms to non-bioaugmented treatments. Syringes were cleaned with acidified water (pH ~2) and rinsed 10 times with deionized water between samples, to ensure that VOCs and microorganisms were not transferred between different samples or treatments. The analytical methods employed by SiREM are described below.

2.2.2 Analysis of VOCs and Dissolved Hydrocarbon Gases

This section describes the methods used to quantify the chlorinated ethenes and DHGs. The quantitation limits (QL) for the chlorinated ethenes and DHGs were typically 10 to 20 micrograms per liter (µg/L) in the microcosm based on the lowest concentration standards that were included in the linear calibration trend.

Aqueous VOC concentrations in the microcosms were measured using a Hewlett-Packard (Hewlett Packard 5890 series II Plus) gas chromatograph (GC) equipped with an auto sampler (Hewlett Packard 7684) programmed to heat each sample vial to 75°C

for 45 min prior to headspace injection into a GSQ Plot column (0.53 millimeters x 30 meters, J&W) and a flame ionization detector. Sample vials were heated to ensure that all VOCs in the aqueous sample would partition to the headspace. The injector temperature was 200°C, and the detector temperature was 250°C. The oven temperature was programmed as follows: 35°C for 2 min, increase to 100°C at 50 degrees Celsius per minute (°C/min), then increase to 185°C at 25°C/min and hold at 185°C for 5.80 min. The carrier gas was helium at a flow rate of 11 milliliters per minute (mL/min).

After withdrawing a 1.0 mL sample (as described in section 2.2.1), the sample was injected into a 10 mL auto sampler vial containing 5.0 mL of acidified deionized water (pH ~2). The water was acidified to inhibit microbial activity between microcosm sampling and GC analysis. The vial was sealed with an inert Teflon^{TM}-coated septum and aluminum crimp cap for automated injection of 3 mL of headspace onto the GC. One VOC standard was analyzed with each batch of samples to verify the yearly five-point calibration using methanolic stock solutions containing known concentrations of the target analytes. Calibration was performed using external standards that were purchased as standard solutions (Sigma). Known volumes of standard solutions were added to acidified water in auto sampler vials and analyzed as described above for microcosm samples. Data were integrated using Peak Simple Chromatography Data System Software (SRI, Inc.). Concentrations were converted from mg/L to total millimoles per bottle (Figures 1 to 6 and Table 2A) using Henry's Law as shown in Appendix A.

2.2.3 Analysis of Anions and Lactate

This section describes the methods to quantify anions and lactate.

Analysis was performed on a Dionex DX-600 ion chromatograph (IC) equipped with a Dionex AS-40 auto sampler and an AS18 column. The sample loop volume was 25 μL. An isocratic separation was performed using 33 millimolar (mM) sodium hydroxide (reagent grade, Fisher) eluent for 13 minutes. One standard was analysed with each batch of samples to verify the yearly seven-point calibration using external standards of known concentrations. External standards were prepared gravimetrically using chemicals of the highest purity available (Sigma or Bioshop). Data were integrated using Dionex's Peaknet chromatography software. The QLs were as follows: 0.25 mg/L lactate, 0.03 mg/L chloride, 0.28 mg/L nitrite, 0.1 mg/L nitrate, 0.03 mg/L sulfate, 0.57 mg/L phosphate and 0.14 mg/L bromide. The lactate value included most other volatile fatty acids, such as formate, acetate, propionate, pyruvate, and butyrate

(valerate has not been tested), as the analytical method does not resolve these compounds.

After withdrawing a 0.5 mL sample (as described in section 2.2.1), the sample was placed in a 1.5 mL micro-centrifuge tube. Samples were centrifuged for five minutes to settle out solids. The supernatant was removed, diluted 10-fold in deionized water and placed in a Dionex auto sampler vial with a cap that filters the sample during automated injection onto the IC.

3. RESULTS

Tables 2A and 2B provide chlorinated ethene, ethene, and anion data from the control and treatment microcosms over the incubation period for the study. All chlorinated ethene and ethene concentrations are presented in units of mg/L and mmol/bottle to demonstrate mass balances on a molar basis. Figures 1 through 6 present trends in the concentrations of chlorinated ethenes and ethene in the control and treatment microcosms over the incubation period for the study.

TABLES

TABLE 1: SUMMARY OF MICROCOSM CONTROLS AND TREATMENTS SiREM

2701 North Harbor Drive, San Diego, California

Microcosm Name	Electron Donor Treatment	Description
ANSC	Anaerobic Sterile Control	Autoclaved and amended with mercuric chloride and sodium azide.
ANAC	Anaerobic Intrinsic (Active) Control	Unamended.
LAC	Sodium Lactate amended	Initial donor concentration of 5,520 mg/L sodium lactate and re-amended as necessary to maintain a sufficient supply.
EOS	EOS Amended	Initial donor concentration of 0.27 % EOS as oil.
LAC + KB-1®	Sodium Lactate amended	Initial donor concentration of 5,520 mg/L sodium lactate and re-amended as necessary. Bioaugmented with KB-1® culture to a target concentration of 10^6cells/liter on day 28.
EOS + KB-1®	Emulsified Oil Substrate Amended	Initial donor concentration of 0.27 % EOS as oil. Bioaugmented with KB-1® culture to a target concentration of 10^6cells/liter on day 28.

Notes:

EOS - Emulsified Oil Substrate
mg/L - milligrams per liter
LAC - 60% Sodium Lactate

APPENDIX A: Henry's Law Calculation

The following Henry's Law calculation was used to convert aqueous concentrations (Table 2A) to total mmoles of each analyte per microcosm bottle (Figures 1 to 6):

$$\text{Total mmoles} = \frac{C_{liq} \times (V_{liq} + H \times V_{gas})}{\text{Molecular Weight (mg/mmol)}}.$$

Where

C_{liq} = liquid concentration (mg/L)
V_{liq} = liquid volume (0.18 L) per bottle
V_{gas} = headspace volume (0.04 L) per bottle
H = Henry's Law constant (dimensionless)

The Henry's Law constants used are summarized in the table below.

Analyte	Henry's Law Constant [a] (dimensionless)
Trichloroethene	0.48
cis-1,2-dichloroethene	0.31
Vinyl chloride	0.95
Ethene	8.76
Methane	27.2

APPENDIX F

SITE SPECIFIC BACKGROUND EVALUATION

APPENDIX A
SITE-SPECIFIC BACKGROUND EVALUATION

Prepared by S.S. Papadopoulos and Associates, Inc.
12 May 2005

A.1 Methodology

Inorganic constituents such as metals and cyanide occur naturally in the environment. A determination of whether site-related activities have resulted in elevated concentrations of these constituents requires an understanding of the range of background concentrations representative of natural conditions. Existing site data for metals and cyanide in soil and groundwater were evaluated to derive site-specific maximum background concentrations, following guidance provided in the California Department of Toxic Substances Control document *Selecting Inorganic Constituents as Chemicals of Potential Concern at Risk Assessments at Hazardous Waste Sites and Permitted Facilities, Final Policy* (DTSC, 1997). The site-specific maximum background concentrations for soil and groundwater are presented in Table 3-1.

The 2003 site-specific dataset for soil contains between 408 and 431 analytical results for each metal, 161 results for total cyanide, and 159 results for amenable cyanide in soil samples collected across the site. The existing site-specific dataset for groundwater contains between 121 and 127 analytical results for each metal, and 19 results each for total cyanide, and amenable cyanide in groundwater samples collected across the site.

The soil and groundwater datasets include samples from both potentially impacted and non-impacted areas. For each constituent, each dataset may therefore represent either one population, representative of background conditions, or two or more separate populations, one representative of background conditions and the other(s) impacted by facility-related activities. The impacted soil and groundwater sample populations, if present, are characterized by higher concentrations, relative to background, of those constituents. The soil and groundwater datasets were statistically analyzed to determine whether the two or more populations could be identified and distinguished, and to estimate the maximum concentration of each constituent that could be attributed to the background population.

For each constituent in each of the two media, the statistical evaluation included:

1. An initial screening to determine whether the dataset contained sufficient values greater than the detection limit (at least 10% of samples and at least 10 samples for each constituent),

2. Computation and review of summary statistics for concentrations and log-transformed concentrations of each constituent in each media,

3. Construction and review of histograms, box-and-whisker percentile plots, and normal quantile plots of concentrations and log-transformed concentrations of each constituent in each media, to determine whether the dataset more closely follows a normal or log-normal distribution (both analyses are presented for each constituent), to identify whether more than one population is evident and to estimate the maximum concentration associated with the background population, and

4. Comparison of the site-specific maximum background concentrations in soil with published maximum background values for these same metals in California and Western U.S. soils.

A.2 Results

The statistical analyses are presented in Exhibit A. Beryllium, silver, thallium, and total and amenable cyanide were not detected frequently enough in soils to permit a meaningful analysis. In groundwater, there were insufficient detections for antimony, arsenic, beryllium, cadmium, copper, lead, mercury, silver, thallium, and total and amenable cyanide (Table 3-1).

For arsenic, barium, and vanadium in soil, and for barium in groundwater, quantile plots of concentration or log-transformed concentration plot as a single linear trend, indicating a single sample population. For these, the maximum observed value is taken as the maximum site-specific background concentration. For the remaining metals, quantile plots of either concentration or log-transformed concentration indicated a break in slope. The population nearest the origin was taken as the background population, and the maximum background concentration was estimated from the concentration corresponding to the break in slope on the quantile diagram. The interpreted break in slope is indicated by a line on the diagram. The site-specific maximum background concentrations for soil are compared to published maximum background values for California and Western U.S. soils in Table 3-2. All of the site-specific maximum values are less than state or regional maximum background except for antimony, cadmium, and selenium.

1 INTRODUCTION

This Pilot Study Report (Report) has been prepared by Geosyntec Consultants (Geosyntec) on behalf of TDY Industries, Inc. for the Airport/Former Teledyne Ryan Aeronautical site located at 2701 North Harbor Drive in San Diego, California (Site). This Report summarizes the methods and results of the Enhanced In-situ Bioremediation (EISB) Pilot Study that was commenced on 11 September 2007 in the Building 131/242 Area of Concern (AOC). The work was performed in accordance with the Remedial Investigation and Feasibility Study (RI/FS) dated 30 March 2007 and the Remedial Action Plan (RAP) dated 30 May 2007. This Report was prepared by Mr. Chris Lieder and reviewed by Mr. Brian Hitchens, PG, CHG, and Mr. Sam Williams, PG, CHG, of Geosyntec in accordance with the peer review policy of the firm.

1.1 Background

The Building 131/242 AOC consists of by an area of soil, soil gas, and groundwater impacted predominantly with volatile organic compounds (VOCs) located between Buildings 131 and 242 (Figure 1). A bench scale study was performed to evaluate whether EISB is a viable option to reduce concentrations of VOCs in Site groundwater. Bench-scale microcosms evaluated the attenuation of VOCs after the addition of various electron donors and, in some cases, microbial cultures. The bench scale study data indicated that EISB, using an emulsified oil donor, and supplemented with the KB-1 microbial culture, resulted in complete degradation of chlorinated hydrocarbons to ethene. Based on the results of this pilot study it was estimated that Risk Based Concentrations (RBCs), as presented in the RI/FS, could be achieved within treated areas within approximately 2 years.

Based on the promising bench scale results, a pilot study was recommended to evaluate the effectiveness of EISB in a field implementation and to refine field techniques in advance of a full scale implementation. The Building 131/242 AOC was selected as the pilot study area as it contains a relatively discreet area of impacted groundwater with elevated VOC concentrations indicative of potential dense non-aqueous phase liquid (DNAPL).

1.2 Purpose

The purpose of this Report is to present the results of the EISB Pilot Study, evaluate the effectiveness of EISB as a remedial option, and, if appropriate, make recommendations for full scale remediation.

1.3 Report Organization

- Section 2, "*Pre-Pilot Study Injection Test,*" summarizes the implementation and results of the injection test performed prior to the pilot study.
- Section, 3, *"Pilot Study Injection Implementation,"* summarizes the methods used in the implementation of the pilot study injections.
- Section 4, *"Pilot Study Groundwater Monitoring Results,"* summarizes the groundwater monitoring results for the pilot study performed in the Building 131/242 AOC.
- Section 5, "*Summary and Recommendations*," summarizes the results of the pilot study and presents recommendations for future full scale EISB.
- Section 6, "*References*," lists the documents cited in this report

2 PRE-PILOT STUDY INJECTION TEST

Geosyntec performed an injection test in Area of Concern (AOC) Building 131/242 to evaluate design parameters assumptions for implementation of EISB Pilot Study. The design parameters assumptions to be evaluated were:

- An initial 5-foot radius of influence (ROI) could be achieved by injecting 1,310 gallons of 1% emulsified vegetable oil (EVO) solution (volume of EVO per volume of solution);
- An injection rate of fifteen gallons per minute (gpm) could be achieved with an injection pressure of 15 psig.

2.1 Radius of Influence Estimate

As described in the radius of influence test technical memorandum (Attachment A), the injection test indicated that the initially proposed injection volume of 1,310 gallons of EVO solution per point resulted in a radius of influence (ROI) slightly greater than 4 feet. To increase the ROI to 5 feet, it was recommended that 310 gallons of push water (unamended municipal water) be injected after the injection of the EVO solution had been completed.

2.2 Injection Flow Rates and Pressure

Flow rates and pressure were measured during the injection test. The first test was conducted at a pressure of 15 pounds per square inch (psi). A flow rate (11 gallons per minute (gpm)) was recorded. The second injection test was conducted at a flow rate of 20 gpm. The resulting pressure was somewhat less than 30 psi.

3 PILOT TEST IMPLEMENTATION

Emulsified vegetable oil (EVO) and KB-1® microbial culture were injected into the subsurface using temporary injection points during the period from 11 September 2007 to 4 October 2007. Prior to construction of the temporary injection points, a geophysical subcontractor identified and marked all subsurface utilities and obstructions. Also, Underground Services Alert of Southern California (DigAlert) was notified at least 48 hours prior to commencement of sub-surface activities. A blanket boring permit was obtained from the County of San Diego Department of Environmental Health (DEH) for all of the pilot study injection points.

3.1 Injection Point Layout and Design

The injection points were installed by direct-push to an approximate depth of 15 feet below ground surface (bgs) and were screened from 7 to 15 feet bgs. The injection screen was 1½-inch in diameter and was covered with a coarse filter cloth to prevent clogging of the screen with silt. The blank portion, from the top of the screen to ground surface, was 3¼-inches in diameter to provide a more competent surface seal.

The injection points were installed on 12-foot centers in the portion of the AOC containing groundwater with VOC concentrations indicative of the potential presence of dense non-aqueous phase liquid (DNAPL). Areas of the AOC with groundwater impacts above the RBC, but below the concentrations indicative of potential DNAPL were injected on 14-foot centers (Figure 2). Using this injection pattern, 254 injection points were advanced across the AOC. Approximately 1,310 gallons of 1% EVO solution, 0.14 gallons microbial culture, and 310 gallons of unamended municipal water (approximately 1,620 gallons total) were injected into each well across the 8-foot screen interval.

During the injection test, fine silt within the formation was observed to flow into the perforated injection rods. The silt prevented efficient injection into the rods. This was later determined to occur immediately during advancement and could not be effectively mitigated through maintaining a water column in the rods. This issue was resolved in the field by wrapping a coarse filter cloth around the rods prior to advancement at each location.

3.2 Injection Procedures

Because reductively dechlorinating bacteria are adversely affected by oxygen, municipal water, which contains significant dissolved oxygen (DO), is typically not appropriate for direct injection of the microbial culture. Therefore, the following procedure was employed for the injection of the anaerobic microbial culture in conjunction with EVO solution mixed using municipal water.

The procedure that was employed consisted of the following:

1. Inject approximately 50% of the target volume of EVO solution mixed with municipal water;
2. Inject 50 gallons of a pre-prepared anaerobic EVO solution;
3. Inject the microbial culture;
4. Inject 50 more gallons of the anaerobic EVO solution to follow the culture;
5. Inject the remaining EVO solution mixed with municipal water; and
6. Inject 310 gallons of unamended municipal water to push the entire solution to the proposed 5 foot ROI.

By following this procedure, the culture was introduced into the groundwater within a protective ring of anaerobic water. In this manner, the natural microbial community in the subsurface rapidly depleted the dissolved oxygen in the municipal water before the microbial culture could be adversely affected.

The EVO solution was metered into each injection point using an in-line doser (Attachment C). Individual flow totalizers were used to manage the volume of injectant which was introduced at each point. Control valves were used to meter and control the pressure and volume injected into each injection point. After injection at a given point was completed, the injection rods were removed and the injection location was backfilled with grout.

4 PILOT STUDY GROUNDWATER MONITORING RESULTS

A baseline sampling event was performed on 23 August 2007 in advance of the implementation of the pilot study injections. Groundwater samples were collected from monitor wells B131-MW2, -MW6, and -MW5 for volatile organic compounds (VOCs), ethane, ethene, methane, organic acids, chloride, nitrate, nitrite, sulfate, sulfide, and TOC (EISB sampling suite) using low flow purge methodology. B131-MW3 was added to the EISB sampling program during the first quarter 2008 sample event.Post injection sampling using low flow purge methodology was performed at 1, 3, and 6-months (19 November 2007, 22 January 2008, and 21 April 2008, respectively) after final injections. Samples were analyzed for the same parameters as the baseline sampling. At 1-month, Gene Trac samples were collected at monitor wells B131-MW2, -MW5, and -MW6. Gene Trac samples measure the concentration of the active microbial strain *Dehalococcoides ethenogenes* (DHE) in the groundwater. A Gene Trac sample was collected from monitor well B131-MW3 at 3-months.

4.1 Baseline Sample Results

The baseline data supports that biodegradation is occurring naturally in this area (Table 1). Each well sampled during the baseline monitor event on 23 August 2007 contained ethene, which demonstrates complete degradation of chlorinated VOCs is occurring over a wide area in the AOC. The groundwater within the pilot study area was strongly reducing during the baseline event, and contained low levels of TOC to support microbial activity, although high background sulfate levels within the study areas would compete for this limited supply of electron donor.

Distribution of parent and daughter compounds throughout the study area also strongly indicates that natural degradation is occurring within the study area. Elevated concentrations of parent chlorinated VOCs (PCE and TCE) are observed in groundwater samples from monitor well B131-MW2, which appears to be near a potential source area for this AOC. Downgradient monitor wells B131-MW6 and B131-MW5 contain little to no parent compounds but elevated concentrations of daughter products cis-1,2-DCE and vinyl chloride. This is a further indication that natural degradation was occurring prior to biostimulation or bioaugmentation, although the degradation rate was likely limited due to naturally low TOC and high sulfate conditions.

4.2 Potential DNAPL Area Results

Monitor well B131-MW2 is located in the northern section of the area of potential DNAPL (Figure 3) and is located 3.2 feet from the nearest injection point. After the first month, RBCs had been achieved for tetrachloroethene (PCE) and trichloroethene (TCE). Cis-1,2-Dichloroethene (cis-1,2 DCE) was reduced from 3,200 µg/L to 1,900 µg/L, while an interim increase in vinyl chloride (VC) from 340 µg/L to 680 µg/L was observed. Ethene increased substantially from 13.1 µg/L to 1,220 µg/L. This data is indicative of complete chlorinated hydrocarbon degradation to ethene. The groundwater samples collected from B131-MW2 during the 3-month and the 6-month sampling event contained no detectable concentrations of PCE or TCE, with cis-1,2-DCE and VC concentrations reduced to well below RBCs. Ethene concentrations detected in the 3-month and 6-month samples were lower than the concentrations detected in the 1-month sample, as a result of correspondingly lower VOC concentrations (Table 1, Figure 4).

Monitor well B131-MW3 is located in the southern section of the area of potential DNAPL (Figure 3) and is located 5.6 feet from the nearest injection point. This well was added to the performance sampling schedule to evaluate the southern portion of the potential DNAPL zone. This well was not sampled during the baseline sampling event so the site wide data collected in 2005 (Geosyntec, 2005) is used as an approximate baseline. When this well was first sampled 3-months after injection, groundwater samples contained no detectable chlorinated VOCs. The ethene concentration at 3-months was 431 µg/L. The 6-month sampling event showed similar chlorinated VOC and lower ethene (6.57 µg/L) concentrations (Table 1, Figure 5).

4.3 Dissolved Phase Area Results

Monitor well B131-MW6 is located in the center of the AOC (Figure 3), is located 4.5 feet from the nearest injection point, and did not contain baseline concentration indicative of potential DNAPL. Groundwater samples collected from monitor well B131-MW6 show a decrease in cis-1,2-DCE from a baseline concentration of 22,000 µg/L to below the RBC within the first month. VC also decreased from 4,600 µg/L to 2,100 µg/L and ethene concentrations increased from 36.2 µg/L to 1,720 µg/L. The elevated ethene concentration indicates that complete degradation of VOCs is occurring. Chlorinated VOC concentrations continued to decline at the 3-month post injection sample event with a slight rebound observed of cis-1,2-DCE and VC during

the 6-month monitoring event. Increasing ethene concentrations greater than 1,000 µg/L provide continued strong indication of complete degradation (Table 1, Figure 6).

Monitor well B131-MW5 is located in the downgradient section of the AOC (Figure 3), is located 6.5 feet from the nearest injection point, and did not contain baseline concentrations indicative of potential DNAPL. Groundwater samples collected from monitor well B131-MW5 contained no detectable concentrations of PCE or TCE. At the 1-month sampling event, chlorinated VOCs showed a decrease from baseline conditions, with cis-1,2-DCE decreasing from 27,000 µg/L to 7,200 µg/L and VC decreasing from 4,200 µg/L to 3,800 µg/L. Ethene increased from 19.6 µg/L to 774 µg/L demonstrating that complete reductive dechlorination of VOCs was occurring. Groundwater samples collected from monitor well B131-MW5 during the 3-month sampling event showed continued reduction of cis-1,2-DCE and VC. After 6-months, cis-1,2-DCE concentrations in the groundwater sample from B131-MW5 were reduced to below the RBC. The slight increase of VC observed during the 6-month sampling event is typical of the chlorinated VOC degradation pathway and was accompanied by a corresponding increase in ethene (Table 1, Figure 7).

4.4 Evaluation of Microbial Culture and EVO Distribution

Gene Trac samples were collected during the 1-month post injection sampling event from B131-MW2, -MW5, -MW6 and 3-month post injection sampling for B131-MW3. These samples indicate extremely robust DHE populations throughout the injected area (Table 2). Typically, concentrations of DHE of $1x10^7$ cells/L indicate the potential for strong degradation activity. The observed concentrations of $6x10^7$ to $2x10^9$observed in samples collected from throughout the Building 131/242 pilot study area are consistent with the rapid degradation rates observed.

TOC concentrations within the potential DNAPL area remained high throughout post injection sampling events, indicating that sufficient electron donor was injected to effect complete dechlorination within the potential DNAPL area. The residual elevated TOC concentrations will continue to support a robust microbial community within this area. Because of this ongoing microbial degradation, the potential for rebound of VOC concentrations in groundwater is reduced. Measured TOC concentrations within the downgradient, dissolved phase area were significantly lower. Monitor well B131-MW5 is located 6.5 feet from the closet injection point, outside of the immediate ROI of the injectant. Although there is a greater spacing between injection points in the downgradient area, significant VOC reductions have been observed in the initial six

months of observation (Table 1). It is anticipated that measured VOC concentrations will continue to decline in the downgradient monitor wells as the ROI of the surrounding injection points continue to expand through diffusion.

Sulfate is a primary competing electron receptor which is reduced concurrently with VOCs. The sulfate concentrations within the potential DNAPL area were significantly reduced indicating that sulfate concentrations were effectively addressed by the initial injection of electron donor. Small increases in sulfide were also observed in several wells associated with this sulfate reduction. Some residual sulfate is observed in downgradient monitor wells B131-MW5 and B131-MW6, which corresponds with the generally lower TOC observed in these monitor wells. It is anticipated that sulfate concentrations will continue to decline in the downgradient monitor wells as the ROI of surrounding injections expands through diffusion. Nitrate, another potential electron receptor, was not detected during the baseline or subsequent monitoring events.

The high background chloride concentration in groundwater masked any trends in chloride concentration which could be attributed to VOC reduction. Methane was observed to increase for approximately 3-6 months after the injection of electron donor while TOC concentrations were elevated. This indicates the stimulation of highly reductive (methanogenic) microbial conditions, typically observed in biostimulation/ bioaugmentation. These highly reducing conditions were further confirmed by very low oxidation reduction potential (ORP) readings from the monitor wells within the pilot study area. High concentrations of organic acids (lactic acid, acetic acid, and propionic acid), which are formed during the fermentation of the emulsified oil, also correlate well with elevated TOC concentrations in monitor wells B131-MW2 and B131-MW3.

5 SUMMARY AND RECOMMENDATIONS

The Building 131/242 EISB pilot study has demonstrated the suitability of EISB to degrade chlorinated VOCs and achieve RBCs in groundwater. During the pilot study, EISB was able to rapidly degrade VOC concentrations (including those potentially indicative of DNAPL) to RBCs in as quickly as 6-months. RBCs have been met in two of the four monitor wells with significant VOC reductions and elevated ethene concentrations indicative of complete dechlorination in the other two monitor wells. Ongoing monitoring will be conducted to further document the results of the EISB pilot study in the Building 131/242 area.

It is recommended that this remedial alternative be applied to the remediation of remaining AOCs with chlorinated VOCs in excess of RBCs in groundwater. Based upon this study, the one recommended design modification consists of increasing EVO solution volume by 10% in 14-foot spaced wells to 1,450 gallons per point, followed by 310 gallons of push water. This modification will increase the injection ROI and TOC distribution within the AOC.

Subject: **Results of Injection Test**
Airport / Former TRA Site
2701 N. Harbor Drive
San Diego, California

INTRODUCTION

Geosyntec Consultants (Geosyntec) performed an injection test in Area of Concern (AOC) Building 131/242 at the Airport / Former TRA site in San Diego, California (Site). The injection test was performed to evaluate design parameters for implementation of enhanced in-situ bioremediation (EISB). The design parameters assumptions were:

- An initial 5-foot radius of influence (ROI) could be achieved by injecting 1,310 gallons of 1% emulsified vegetable oil (EVO) solution (volume of EVO per volume of solution);
- An injection rate of fifteen gallons per minute (gpm) could be achieved with an injection pressure of 15 psig.

SCOPE

Two injection probes (IP-1 and IP-2) and four piezometers (P1, P2, P3, and P4) were installed using direct push technology (Figure 1). The injection probes were perforated from 7 to 15 feet below ground surface (bgs). The piezometers were also screened over the same interval. The injection probes were spaced fourteen feet apart (Figure 1). Piezometers P1, P2, P3, and P4 were placed in a line, directly between the probes, at distances from IP-1of 2.5, 5.0, 7.5, and 10.0 feet, respectively. This spacing correlates to distances from IP-2 of 4.0, 6.5, 9.0, and 11.5 feet for piezometers P4, P3, P2, and P1, respectively.

Each piezometer was equipped with a data logging pressure transducer capable of recording the groundwater level and specific conductivity throughout the duration of the injection test. The groundwater level data were used to evaluate the lateral hydraulic influence of the injection. The specific conductivity data were used to evaluate the initial ROI of the injectant. Because the oil emulsion solution consisted of 99% municipal water, which contains fewer ions than the groundwater at the Site, a decrease in conductivity was interpreted as indicative of the presence of the injectant.

The piezometers were installed the day before the injection test. Water samples were collected from each piezometer and analyzed for baseline total organic carbon (TOC) concentrations (Attachment 1). Water levels were monitored overnight to evaluate the influence of tidal cycles on water table elevations prior to commencing the injection test. The observed changes in elevation due to tidal influence were less than a one-half inch and thus considered negligible.

Two separate injection tests were performed (Test 1 and Test 2). Baseline conditions were recorded prior to commencing Test 1. For Test 1, the target volume of 1,310 gallons was injected into IP-1 at a constant pressure (Table 1). The injection rate was observed and recorded while the injection pressure was maintained at 15 pounds per square inch (psi). Water level and specific conductivity data were logged by the transducers. After the target volume was injected, the transducers monitored the decay in groundwater levels in the piezometers until levels returned to within approximately 0.5 feet of the baseline water level (Figure 2).

For Test 2, the target volume of 1,310 gallons of EVO solution was injected into IP-2 at a starting flow rate of 15 gpm, which increased to over 19 gpm by the end of the test (Table 1). Injection pressures were observed and recorded throughout the test (Figure 3).

Post-injection groundwater samples were collected from each piezometer and analyzed for TOC concentrations to evaluate initial distribution of the injected EVO solution (Table 2).

RESULTS AND DISCUSSION

Radius of Influence

For both tests, measurable hydraulic influence was observed in the farthest piezometer from the injection well, corresponding to a minimum hydraulic ROI of 11.5 feet. The water level data indicate both the increasing responses during the start of the test and decreasing responses after the end of the test occurred proportionally and nearly simultaneously in all four piezometers (Figures 2 and 3).

For Test 1, a significant change in conductivity was observed in piezometer P1 (Figure 4). The initial conductivity in P-1 was approximately 2,200 microsiemens per centimeter (µS/cm) and the final conductivity was approximately 1,200 µS/cm. This change of approximately 1,000 µS/cm represents approximately a 45% drop in conductivity. For Test 2, a significant change in conductivity was observed in piezometer P4 (Figure 5). The initial conductivity in P-4 was approximately 2,500 µS/cm and the final conductivity was approximately 2,000 µS/cm. This change of approximately 500 µS/cm represents approximately a 20% drop in conductivity. Conductivity did not significantly decrease to below background levels in piezometers located at 5 feet or more from the closest injection point during the period conductivity was recorded. Based on these data, the initial ROI of the EVO solution achieved was between 4 and 5 feet.

The average baseline TOC concentration was 8.7 mg/L. The post-injection TOC concentrations in piezometers P1, P2, P3, and P4 were 300 milligrams per liter (mg/L), 6.8 mg/L, 10 mg/L, and 67 mg/L, respectively. Based on these data, 35-fold concentration increase (above background) was observed at 2.5 feet from IP-1 and an 8-fold increase was observed at 4 feet from IP-2. TOC concentrations were comparable to background levels in piezometers located 5 feet or more from the closest injection point. The post-injection TOC analytical results support the observed conductivity data that the initial ROI of the EVO solution is between 4 and 5 feet.

Pumping Rate and Pressure

For Test 1, the average injection rate that was achieved while the pressure was maintained at approximately 15 psi was approximately 11 gpm. For Test 2, the flow rate started at 15 gpm, and increased to nearly 20 gpm by the end of the test. The increasing flow rate throughout Test 2 did not directly correlate with the injection pressure, which was observed to fluctuate between 20 and 30 psi. However, these data indicate that up to 20 gpm of EVO solution could be injected at pressures less than 30 psi. No breakthrough of EVO solution to ground surface was observed during either test.

CONCLUSIONS AND RECOMMENDATIONS

Although the injection rate of 15 gpm was not achieved at the anticipated injection pressure of 15 psi, flow rates of 15 gpm or higher were demonstrated to be achievable utilizing higher pressures without breakthrough of EVO solution to ground surface. According to the data, an injection pressure of 30 psi may be utilized without surface breakthrough. Associated higher injection rates should not affect performance of the EISB program.

Based on the combined results of conductivity monitoring for Test 1 and Test 2, the initial ROI of the injected solution was between 4 and 5 feet. Although this ROI is expected to increase over time due to dispersion and diffusion associated with adjacent injections and subsidence of induced groundwater level increases, a design modification is recommended to achieve the target ROI of 5 feet. Because the actual ROI achieved was approximately 4.5 feet, 310 additional gallons would be required to achieve the recommended initial ROI of 5 feet. Therefore, it is recommended that injection of the initial 1,310 gallons of EVO solution be followed by injection of 310 gallons of unamended (no EVO) municipal water to achieve the 5-foot ROI. Based on observed TOC results, concentrations of the injected TOC are highest closest to the injection point and decrease with radial distance. After the injection of the 310 gallons of unamended water, a zone of lower but adequate concentration EVO solution will result from the dispersion of the concentrated EVO solution left in close proximity to the injection point after injection of the 1,310 gallons of EVO solution.

Subject: Calscience Work Order No.: 07-07-1934
Client Reference: TDY /SC0445

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 7/27/2007 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Calscience Environmental
Laboratories, Inc.

Glossary of Terms and Qualifiers

Work Order Number: 07-07-1934

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike or Matrix Spike Duplicate compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Glossary of Terms and Qualifiers

Work Order Number: 07-08-1696

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Subject: **Calscience Work Order No.: 07-11-1606**
Client Reference: TDY / SC0445

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 11/20/2007 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Calscience Environmental
Laboratories, Inc.

Glossary of Terms and Qualifiers

Work Order Number: 07-11-1606

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Subject: **Calscience Work Order No.: 08-01-1515**
Client Reference: TDY / SC0307

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 1/22/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Calscience Environmental
Laboratories, Inc.
Stephen Nowak

Glossary of Terms and Qualifiers

Work Order Number: 08-01-1515

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Subject: **Calscience Work Order No.: 08-04-1916**
Client Reference: TDY / SC0445

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 4/22/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Calscience Environmental
Laboratories, Inc.
Stephen Nowak

Glossary of Terms and Qualifiers

Work Order Number: 08-04-1916

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Certificate of Analysis: Gene-Trac-VC, Vinyl Chloride Reductase (*vcrA*) Assay

Customer: Brian Hitchens, Geosyntec Consultants

SiREM Reference: S-1177

Project: TDY

Report Issued: 13-Dec-07

Customer Reference: SCO445

Data Files: DHC-UP-0406/VC-QPCR-0109
VC-QPCR check-gel-0130

Table 1: Test Results

Customer Sample ID	SiREM Sample ID	Sample Collection Date	Sample Matrix	Percent *vcrA* [A]	Vinyl Chloride Reductase (*vcrA*) Gene Copies
B131-MW2	VCR-0732	19-Nov-07	Groundwater	54-99%	3×10^8/liter
B131-MW5	VCR-0733	19-Nov-07	Groundwater	65-100%	1×10^9/liter
B131-MW6	VCR-0734	19-Nov-07	Groundwater	42-84%	2×10^9/liter

Notes:

[A] Percentage of bacteria in the microbial population that harbor the *vcrA* gene. This value is calculated by dividing the measured number of cells haboring the vinyl chloride reductase A (*vcrA*) gene by the total number of bacteria in the sample estimated using the mass of DNA extracted from the sample. Range represents normal variation in enumeration of *vcrA*.

EVO - emulsified vegetable oil (density: 8.18 lb/gal)

ATTACHMENT D

Photographs of Pilot Study

Photo No. 5 Date: 9/24/07

Description: 500 ml of microbial culture being injected at point IP-121. This system allowed for a precise volume of microbial culture to be measured and injected at each point.

Project: TDY Photographer: Dave Skippon

Photo No. 1 Date: 9/12/07

Description: Oil emulsion doser, pressure gauge, and totalizer setup used for the injections in the Building 131/242 area. Field sheets were attached to document injection rates, volumes, and pressures at each injection point.

Project: TDY Photographer: Dave Skippon

Photo No. 2 Date: 9/21/07

Description: Injection rod wrapped in filter material. This material prevented fine sands and silts from clogging the injection rods.

Project: TDY Photographer: Dave Skippon

Photo No. 3 Date: 9/24/07

Description: Municipal water was delivered to the injection points through a manifold system, allowing up to seven injections to occur simultaneously from a single water source.

Project: TDY Photographer: Dave Skippon

Photo No. 4 Date: 9/21/07

Description: Injection of pre-batched anaerobic water. The anaerobic water protects the microbial culture until the balance of the injected water becomes anaerobic. The large storage tank in the background was used to produce batches of anaerobic water for injection, which was transported in the small foreground tank.

Project: TDY Photographer: Dave Skippon

Soil Volume Estimate Assumptions:

Above 4.2 mg/kg - Area 1: 30 inch East SWCS excavations - 25 mg/kg ave -	1- 10x10x5 excavation 2- 10x20x8 excavations 1- 10x30x8 excavation
Estimated volumes Based on confirmation sampling from 30-inch SWCS removal and replacement	
Above 4.2 mg/kg - Building 156 excavation - 6.5 mg/kg ave 6.5 mg/kg ave- Based on actual post-ex results from interim action	1- 10x10x5 excavation
Above 1 mg/kg - Based on five known single point exceedances	5- 10x10x5 excavations
Above 0.3 mg/kg - Based on five known single point exceedances	5- 10x10x5 excavations
Above 0.1 mg/kg -	4- 10x10x5 excavations 2-40x20x8 excavations
Based on 4 single point exceedances and estimated excavations in Building 120 South AOC	
above ND - Based on 26 known single point exceedances	26-10x10x5 excavations
