EXECUTIVE SUMMARY

Introduction

This Remedial Investigation/Feasibility Study (RI/FS) report presents the results of investigation and feasibility studies required by Cleanup and Abatement Order No. R9-2004-0258 (the CAO) issued by the San Diego Regional Water Quality Control Board (RWQCB, 2004). The CAO was revised on May 17, 2005 (RWQCB, 2005a) with subsequent addenda adopted on July 22, 2005 (RWQCB, 2005b) and November 8, 2006 (RWQCB, 2006). The objective of this RI/FS report is to present the results of Site investigations, human health risk assessments, and the evaluation of potential remedial alternatives for each Area of Potential Concern (AOPC) identified in the Site Characterization Report (Geosyntec, 2005). Recommendations for remedial action at each AOPC are also provided.

Remedial Investigation

Additional investigations, including bench-scale studies, were performed for AOPCs Building 158, Building 131/242, Building 120, and the Convair Lagoon vicinity to more accurately evaluate, design, and plan remedial options. These additional investigations further delineated the lateral and vertical extent of impacts in the Building 120, Building 131/242, Building 158, and Convair Lagoon areas.

The nature and extent of impacts has been adequately defined to perform the risk assessment and feasibility study. The results of two bench-scale studies are presented. These studies evaluated the use of Enhanced In-Situ Bioremediation (EISB) for treatment of VOCs in groundwater and the relative effectiveness of zero valent iron (ZVI) versus ferrous sulfate for reduction of hexavalent chromium in groundwater.

Risk Assessment

A summary of the results of the Site-wide human health risk assessment is presented. Risk-based concentrations (RBCs) were developed to identify areas of the Site that may warrant remediation based on reasonable expectations of future land use at the Site. These RBCs were then used to screen the AOPCs using the calculated RBC for each compound, for each exposure scenario. AOPCs where concentrations of constituents in soil, soil gas, or groundwater exceeded any RBC were considered an AOC. Through this process, eight AOCs have been identified:

- Building 131/242;
- Building 156;
- Building 158;
- Building 102;
- Building 120 South;
- Building 130/166 AST/120/121;
- Former Maintenance Yard; and
- Building 180.

Feasibility Study

A feasibility study of potential remedial alternatives was conducted for each AOC and AOPC. This feasibility study (FS) consists of a screening analysis of potential remedies and a more detailed feasibility analysis of remedies considered potentially appropriate. The following technologies were retained for further consideration within the FS.

- No action;
- Monitored natural attenuation (MNA);
- Enhanced In-Situ Bioremediation (EISB);
- In-situ reduction (ISR) using Ferrous Sulfate;
- In-situ soil mixing using Ferrous Sulfate:
- In-situ reduction (ISR) using emulsified vegetable oil (EVO);
- Two-phase extraction (TPE);
- Soil vapor extraction (SVE);
- Chemical Oxidation/Biostimulation
- Targeted excavation;
- Potential NAPL or metals excavation; and
- Whole AOC/AOPC excavation.

Conceptual Remedial Action Plan

Based on the FS, recommended remedial options were developed for each AOC and AOPC. A conceptual remedial action plan (RAP) is presented with the following recommended remedial options:

- AOC Building 131/242 – EISB with targeted excavation;
- AOC Building 156 – Targeted excavations;
- AOC Building 158 – In-situ reduction by EVO with targeted excavation;

- AOC Building 102 – Targeted excavation
- AOC Building 120 South – Targeted excavation;
- AOC Building 130/166 AST/120/121 – EISB with targeted excavations;
- AOC 30-Inch SWCS – targeted excavation
- AOC Former Maintenance Yard – EISB;
- AOC Building 180 – EISB with targeted excavation;
- AOPC Explosives Area – Alternative excavation;
- AOPC Test Cell#4/Area D – To be determined based on soil gas evaluation/LNAPL;
- AOPC Building 142 – No Action;
- AOPC Southeast of Building 146 – No Action;
- AOPC Building 120 West – Alternative excavation;
- AOPC Building 222/228 – Alternative excavation; and
- AOPC South of Building 121 – No Action.

RI/FS Appendix A

The RI/FS Appendix A presents the feasibility study of potential remedial alternatives for the pathways identified as potentially completed within the Risk Assessment Appendix A (Geosyntec, 2010) for off-site groundwater and existing impacted sediment within the SWCS. Recommendations for remedial action are also provided.

The feasibility study evaluates potential options for mitigation of these impacts on the basis of effectiveness, implementability, protection of human health and the environment, and cost.

The conceptual remedial action plan for existing sediment within the 60-inch SWCS is sediment cleanout following site demolition and tributary removal. The recommended remedial action for off-site groundwater impacts in the Convair Lagoon Vicinity will be continued groundwater monitoring to confirm model results showing that Site-related groundwater impacts are unlikely to migrate to Convair Lagoon at concentrations exceeding CTR standards.

1.0 INTRODUCTION

This Remedial Investigation/Feasibility Study (RI/FS) report presents the results of investigation and feasibility studies required by Cleanup and Abatement Order No. R9-2004-0258 (the CAO) issued by the San Diego Regional Water Quality Control Board (RWQCB, 2004) for alleged Discharges of Waste from 2701 North Harbor Drive in San Diego, California (the Site) (Figure 1-1, Figure 1-2). The CAO was revised on May 17, 2005 (RWQCB, 2005a) with subsequent addenda adopted on July 22, 2005 (RWQCB, 2005b) and November 8, 2006 (RWQCB, 2006a) and requires TDY Industries, Inc., TDY Holdings, LLC, and Teledyne Ryan Aeronautical Company (TDY) to: (1) cleanup and abate discharges; (2) perform Site investigation and characterization; (3) perform interim remedial actions; (4) perform a RI/FS; (5) prepare a remedial action plan; and (6) cleanup and abatement completion verification.

This document has been prepared to address the entire Site and supersedes the previously prepared "Western Area Remedial Investigation/Feasibility Study" (Geosyntec, 2006a), which was prepared to assist with a previous conceptual phased approach to redevelop the Site. Although several interim remedial actions have subsequently been performed at the Site, this document evaluates all areas of concern (AOCs) and Areas of Potential Concern (AOPCs) based on Site conditions as described in the Site Characterization report (Geosyntec, 2005) and subsequent data collected during the Remedial Investigation. More recent data has been included where it identifies a new AOC/AOPC, expands the constituents of concern within an existing AOC/AOPC, provides data for the analysis for the effectiveness of remedial options, or significantly adds to the overall understanding of the distribution of Site impacts.

This report has been prepared by Mr. Chris Lieder PG, Ms. Jennifer Schwartz, PE and Mr. Brian Hitchens, PG, C.HG. This report was reviewed by Mr. Sam Williams, PG, C.HG. in accordance with the peer review policy of the firm.

1.1 Remedial Investigation/Feasibility Study Objective

The objective of this RI/FS report is to present the results of Site investigations, human health risk assessments, and the evaluation of potential remedial alternatives for each AOPC, identified in the Site Characterization Report (Geosyntec, 2005), at the Site. Recommendations for remedial action at each AOPC are also provided. This document has been prepared in accordance with Directives D.3.a and D.3.b of the CAO.

The RI/FS Appendix A presents the feasibility study of potential remedial alternatives for the pathways identified as potentially completed within the Risk Assessment

Appendix A (Geosyntec, 2010) for off-site groundwater and existing impacted sediment within the SWCS. Recommendations for remedial action are also provided.

The feasibility study evaluates potential options for mitigation of these impacts on the basis of effectiveness, implementability, protection of human health and the environment, and cost.

The conceptual remedial action plan for existing sediment within the 60-inch SWCS is sediment cleanout following site demolition and tributary removal. The recommended remedial action for off-site groundwater impacts in the Convair Lagoon Vicinity will be continued groundwater monitoring to confirm model results showing that Site-related groundwater impacts are unlikely to migrate to Convair Lagoon at concentrations exceeding CTR standards.

1.2 Report Organization

The remainder of this report consists of the following:

- Section 2, "*Hydrogeologic Conditions*," presents a summary of the general location of the Site, the Site geology, and hydrogeology;
- Section 3, "Evaluation of Background Conditions" summarizes data from the Site Characterization Report regarding background soil and groundwater conditions at the Site and identifies AOPCs based on the observed areas with concentrations exceeding background;
- Section 4 "*Remedial Investigation*," summarizes the Site data collected to complete the feasibility study and presents the results of the bench-scale studies;
- Section 5, "*Risk-Based Concentrations and Area of Potential Concern Evaluation*" summarizes conclusions from the risk assessment, presents calculated RBCs, and screens the AOPCs against these risk-based criteria to identify AOCs;
- Section 6, "*Feasibility Study*," presents the screened potential remedial alternatives for each AOC and AOPC, and detailed evaluations of each;
- Section 7, "*Conceptual Remedial Action Plan*," presents the recommended action for each AOC and AOPC, and a conceptual implementation plan; and

- Section 8, "*References,*" lists the documents cited in this report.

2.0 HYDROGEOLOGIC CONDITIONS

In accordance to directive D.3.a.(2) through (4) of the CAO, this section summarizes the general location and hydrogeologic conditions at the Site. The Site ownership and operating history is presented in several previously submitted documents including an Environmental Assessment prepared by PES Environmental (2001), the Site Characterization Work Plan (SSPA and Geosyntec, 2005), the Site Characterization Report (Geosyntec, 2005), the Western Area RI/FS Work Plan (Geosyntec, 2006a), and the RI/FS Work Plan (Geosyntec, 2006b). That history and information is incorporated by reference.

2.1 Geology

The Site was originally tidelands of the San Diego Harbor. The area was filled with material dredged from San Diego Harbor from 1936 to 1939 during the creation of Lindbergh Field and the U.S. Coast Guard Station. The Site is located approximately 200 feet north of Convair Lagoon and the San Diego Bay. Field investigations indicate the upper 8 to 10 feet of soil at the Site consists of bay fill, primarily composed of mixed silty sand and clay with interbedded shell hash. Below the fill material is fine-grained sands, silts, and interbedded clays characteristic of the pre-existing bay mud. The transition from bay mud to the Bay Point Formation is gradational beginning at approximately 35 feet below ground surface (bgs). Representative hydrogeologic cross-sections of specific areas of the Site (locations shown on Figure 2-1) are depicted in Figures 2-2 through 2-5.

2.2 Local Hydrogeologic Conditions

The Site is located within the coastal plain section of San Diego Drainage Province, approximately 250 feet north of Convair Lagoon and the San Diego Bay. The San Diego Basin Plan (RWQCB, 2006) identifies the Site location as a portion of the Lindbergh Hydrologic Sub Area (8.21) of the San Diego Mesa Hydrologic Area within the Pueblo San Diego Hydrologic Unit. Groundwater in the Lindbergh Hydrologic Sub Area is designated as non-beneficial use and has been exempted from municipal drinking water designation by the RWQCB. Groundwater at the Site occurs at approximately 6 to 8 feet bgs. Groundwater elevations fluctuate diurnally with tidal variations in the San Diego Bay.

The surface water of the San Diego Bay has been designated for many beneficial uses including industrial service supply, navigation, contact and non-contact recreation, fishing, and wildlife habitat. Presently, surface runoff from the Site is directed through

the 54-inch storm drain tributaries, the 60-inch storm drain, 30-inch east storm drain, 18-inch storm drain to San Diego Bay and the 30-inch storm drain to San Diego Bay.

Physical properties of the Site soils were characterized during Site investigation activities. Samples were collected on Site from 3 to 55 feet bgs with effective porosity ranging from 18% and 48%. Based on Site observations, the average effective porosity is estimated to be 25%. Saturated hydraulic conductivity was determined to be in approximately 1×10^{-5} cm/sec, in a core sample of the shallow saturated zone, collected approximately 11 feet bgs by Geosyntec in March 2006.

2.2.1 Groundwater Flow Characterization

Groundwater monitor wells have been installed throughout the Site during the course of numerous investigations (Figure 2-1). Groundwater elevation data were collected across the Site on August 21, 2007 to evaluate groundwater gradient and flow direction. Groundwater elevations were collected by two teams and all elevations were recorded within 3 hours within one tidal cycle. Groundwater generally flows from north to south at a gradient of between 0.0005 and 0.0022 ft/ft. The gradient appears to increase adjacent to storm drains and the Convair Lagoon (Figure 2-6).

On July 27, 2005, variations in groundwater elevations between high and low tide events were evaluated. Measured water levels were observed to fluctuate from 0 to 3.04 feet between high and low tide. Generally wells located closer to the bay and near utility/storm drain corridors experienced the greatest influence from tidal variations. However, only wells on the southeastern portion of the Site (monitor wells BLD120-MW4 and BLD120-MW5) had variations of greater than 1 foot. These wells are located close to Convair Lagoon and the 30-inch east SWCS. All other wells showed less than 0.25 feet tidal fluctuation, with an average fluctuation of 0.06 feet.

One groundwater well (GT-4) indicates that groundwater may be tidally influenced in the immediate vicinity of the 54-inch storm drain. Groundwater elevations in this well are typically 1 foot lower than an adjacent well located 15 feet away. This also indicates that this effect is localized and does not impact groundwater over the vast majority of the Site.

Groundwater velocity onsite is estimated to range between 0.02 and 3.0 ft/year, based on a range of hydraulic conductivity between 1.0×10^{-5} to 3.0×10^{-4} cm/sec (Appendix C, H&A 2004), a gradient ranging between 0.0005 ft/ft and 0.0022 ft/ft, and an estimated effective porosity of 25%.

3.0 EVALUATION OF BACKGROUND CONDITIONS AND IDENTIFICATION OF AREAS OF CONCERN

In accordance with directive D.3.a.(1), this section presents information collected during the Site characterization process on the nature and extent of constituents of concern which have been identified at the Site above background.

Inorganic constituents such as metals and cyanide occur naturally in the environment. A determination of whether Site-related activities have resulted in elevated concentrations of these constituents requires an understanding of the range of background concentrations representative of natural conditions. Existing Site data for metals and cyanide in soil and groundwater were evaluated to derive site-specific maximum background concentrations, following guidance provided in the California Department of Toxic Substances Control document Selecting Inorganic Constituents as Chemicals of Potential Concern at Risk Assessments at Hazardous Waste Sites and Permitted Facilities, Final Policy (DTSC, 1997). The site-specific maximum background concentrations for soil and groundwater are presented in Table 3-1.

Because organic constituents do not typically occur naturally, all detectable concentrations of VOCs, SVOCs, Petroleum Hydrocarbons, and PCBs are assumed to be anthropogenic. As such, these constituents are identified as being in excess of background where detected.

All constituents positively detected in at least one sample at a concentration exceeding background were identified in the Risk Assessment (Geosyntec, 2007) as constituents of potential concern (COPCs). In accordance with directive D.3.a of CAO R9-2004-0258, the distribution of these COPCs is identified in Figures 3-1 and 3-2.

3.1 Definition of Areas of Potential Concern

AOPCs at the Site are specific areas where COPCs have been detected above Site background or appropriate screening criteria, as described in the Site Characterization Report (Geosyntec, 2005) (Figure 1-3). The Building 120 AOPC has been subdivided from its initial description in the Site Characterization Report (SCR) to more accurately describe three individual AOPCs within the Building. The AOPCs from west to east are as follows (Figure 1-3):

- **AOPC Building 131/242** – Soil, groundwater, and soil gas impacted predominantly with volatile organic compounds (VOCs) located between Buildings 131 and 242;

- **AOPC Explosives Area** – An area at the northwest corner of the Site, where a soil sample contained greater than 1.0 mg/kg polychlorinated biphenyls (PCBs).

- **AOPC Building 156** – Isolated zones of groundwater impacted with VOCs, total petroleum hydrocarbons (TPH), soil impacted with VOCs, TPH, metals, and PCBs, and soil gas impacted with VOCs located beneath Building 156;

- **AOPC Test Cell #4/Area D** – An underground storage tank (UST) area formerly containing light non-aqueous phase liquid (LNAPL) impacts (pending closure by RWQCB);

- **AOPC Building 158** – Soil and groundwater impacted with chromium, hexavalent chromium (CrVI), and isolated LNAPL impacts in Building 158, and VOC impacts in soil gas immediately to the southeast of Building 158;

- **AOPC Building 142** – A former UST site with minor VOC impacts in groundwater;

- **AOPC Southeast of Building 146** – An area near the southeast corner of Building 146 where vinyl chloride was detected in groundwater;

- **AOPC Building 102** – A former UST site with TPH and VOC impacts in soil.

- **AOPC Building 120 West** – An area in the west end of Building 120 where a soil sample contained greater than 1.0 mg/kg PCBs.

- **AOPC Building 222/228** – An area northwest of Building 125/126 where chromium, cobalt, lead, mercury, nickel, zinc, and PCBs were detected above background in soil;

- **AOPC Building 130** – Although impacted soils within this area were excavated and disposed offsite under DTSC oversight in accordance with a RCRA closure plan, groundwater PCE and TCE impacts contiguous with AOPC Building 120 were observed and remain in this area;

- **AOPC Building 120 South** – An area in the south-central portion of Building 120 where TPH has been detected in soil, and LNAPL with associated PCBs has been observed in excavations and test pits;

- **AOPC Building 120** – An area beneath and in the vicinity of the former sheet metal fabrication area of Building 120 where PCE, TCE, cis-1,2-DCE, VC, PCBs, and 1,4-dioxane have been detected in soil, soil gas or groundwater;

- **AOPC Building 121** – An area in the eastern portion of Building 121 where elevated VOCs were detected in groundwater and soil gas, contiguous with "Building 120" impacts;

- **AOPC South of Building 121** – An area in the vicinity of catch basin CB-155 where a soil sample contained greater than 1.0 mg/kg PCBs in soil;

- **AOPC Building 166 Above Ground Solvent Tank (AST)** – An area associated with a former AST historically containing chlorinated solvents, which was located a**l**ong the northern border of the Site, between Buildings 130 and 166. Groundwater and soil gas contain detections of VOCs above RBCs and impacts are contiguous with AOPC Building 120;

- **AOPC Former Maintenance Yard** – An area northeast of Building 161 where groundwater and soil gas samples contain elevated PCE concentrations; and

- **AOPC Building 180** – An area in the vicinity of the loading dock on the south side of Building 180. VOCs have been detected in groundwater; TPH, mercury, cobalt, zinc, and lead have been detected at concentrations exceeding background; and PCBs have been detected at concentrations greater than 1.0 mg/kg in shallow soils.

The storm water conveyance system (SWCS) drains the entire Site. The 54-inch storm drain, 30-inch west storm drain, 60-inch storm drain, 30-inch east storm drain, and 30-inch storm drain to San Diego Bay and some of their tributaries were determined to have sediment containing PCBs at concentrations greater than 1.0 mg/kg. The SWCS was cleaned as an interim action during 2006, per the CAO, as described in the storm drain cleanout work plans and report (Geosyntec, 2006c, 2006d, 2006e, 2006e, 2007b). Although this sediment was addressed during the 2006 cleanout event, there remain ongoing concerns related to continuing elevated PCB concentrations within the 60-inch SWCS and potentially within certain laterals thereto. The proposed demolition of the Site will include removal of all on-site storm drains with the exception of the 54-inch and 60-inch SWCS main trunk lines.

Soil, groundwater, and sediment impacts to San Diego Bay via the formation and the storm water conveyance system (SWCS) are addressed in Appendix A to the Risk Assessment. These pathways include:

Groundwater to San Diego Bay Migration Pathways:

- **Impacted groundwater to San Diego Bay through the shallow/deep interval:** This pathway is assessed by using groundwater quality data from shallow and deep monitor wells adjacent to Convair Lagoon, as compared to the California Toxics Rule (CTR). A groundwater model is presented which evaluates the potential for trace PCB impacts observed in Convair Lagoon vicinity monitoring wells to discharge to Convair Lagoon.
- **Impacted groundwater from the Site to the SWCS backfill to San Diego Bay:**
  This pathway is assessed based on soil physical properties and data from wells and borings advanced adjacent to storm drains which penetrate the groundwater table.
- **Impacted groundwater from the Site into seeps in the SWCS to San Diego Bay:**
  This pathway is assessed using groundwater quality data from monitor wells and groundwater grab samples adjacent to the SWCS.

Soil/Sediment to San Diego Bay Migration Pathways:

- **Impacted soil/sediment from the surface of the Site through the SWCS to San Diego Bay:**
  This pathway is assessed based on post-demolition Site condition and BMPs to be employed at the site.
- **Impacted storm drain backfill material through the SWCS to San Diego Bay:**
  This pathway is assessed based on an evaluation of the data collected from the backfill of the 60-inch SWCS.
- **Impacted sediment within the SWCS to San Diego Bay**
  This pathway is assessed using data collected from tributary filter sock samples, sediment movement monitoring, and additional sediment data from the channel and SWCS.

Soil/Sediment to Construction/Maintenance Worker Pathway:

Potential health risks to construction/maintenance workers are evaluated in the Risk Assessment Appendix A using data collected from tributary sock samples, sediment movement monitoring, and additional sediment data from the channel and SWCS. Interim precautions such as the use of gloves and hand washing are recommended to mitigate potential risk through this pathway until the impacted SWCS sediment pathway is addressed.

Based on these pathway analyses, impacted sediment within the SWCS and direct groundwater migration to Convair Lagoon were identified as potentially complete pathways. Remedial alternatives are screened for these pathways in Appendix A.

4.0 REMEDIAL INVESTIGATION

Site characterization activities and results are documented in the Site Assessment Activity Report, the Site Characterization Report, the 54-Inch Storm Drain Sampling Report, and the 2004 Haley & Aldrich (H&A) Baseline Site-Wide Investigation (Geosyntec, 2002, 2005, 2006g; H&A 2004). That information which includes information describing the nature and extent of constituents is incorporated by reference.

Additional investigations, including bench-scale studies, were performed for AOPCs Building 158, Building 131/242, Building 120, and the Convair Lagoon vicinity to more accurately define the extent of constituents and evaluate, design, and plan remedial options. These additional investigations are presented below.

4.1 AOPC Building 158 Investigations

Soil and groundwater samples were collected and analyzed to further delineate the horizontal and vertical extent of TPH, total chromium, and hexavalent chromium (CrVI). A bench-scale study was conducted to evaluate the effectiveness of zero valent iron (ZVI) and ferrous sulfate ($FeSO_4$) to reduce CrVI to trivalent chromium (CrIII).

4.1.1 Delineation of Impacts

Soil and groundwater samples were collected at three locations on April 13, 2006 using a direct push rig (Figure 2-1). Borings T-47, -48, and -49 were advanced to approximately 6 and 11 feet bgs where soil and groundwater samples were collected. The central boring, T-48, was additionally advanced to 35 feet bgs to vertically delineate the extent of impacts. Each sample was analyzed for TPH in soil and TPH, total chromium, and CrVI in groundwater. Boring logs and field sample-collection forms are presented in Appendix B. Laboratory analytical reports are presented in Appendix C. Sample locations and results are shown in cross-section A-A' on Figure 2-2, and summarized in Table 4-1.

During this additional delineation, the highest concentration of TPH in soil was observed in soil sample T-48-6B at 221 mg/kg, collected from the approximate center of Building 158. The highest concentration of TPH in groundwater was observed in sample T-49GW-11 at 1 mg/L. This sample was collected in close proximity to a previous direct push sample collected at location 0158-GW-16 in 2003 in which LNAPL was observed. TPH concentrations observed in the 2006 Building 158 sampling event do not indicate the presence of residual LNAPL.

Elevated concentrations of CrVI in groundwater were detected in the shallow portions of T-49 (280 mg/L) and T-48 (580 mg/L), located in the southern and central portion of Building 158, respectively. The northern hydropunch location contained no detectable CrVI and 0.0034 mg/L of total chromium. A deeper sample was collected at 35 feet bgs to evaluate the vertical extent of chromium and TPH impacts, this sample contained 0.16 mg/L CrVI, a three order of magnitude reduction over approximately 20 feet. These results indicate chromium impacts are limited to shallow groundwater in the southern portion of Building 158 (Figure 2-2).

4.1.2 Bench Study: Reduction of Hexavalent Chromium Using Zero Valent Iron or Ferrous Sulfate

The objective of this study was to evaluate whether CrVI in saturated soil and groundwater could be reduced to CrIII in-situ, using either ZVI or $FeSO_4$. Both ZVI and $FeSO_4$ use the process of electron reduction to change the valent state of the chromium.

4.1.2.1 Sample Collection

Soil and groundwater were collected on April 13, 2006 during characterization activities in Building 158 using direct push techniques. A total of nine-2 foot Shelby tubes of saturated soil were collected from borings T-47, -48, and -49 between 7 and 11 feet bgs. A total of 3 liters of groundwater were collected from boring T-48 at 11 feet bgs using a peristaltic pump under low flow conditions. The samples were submitted to SiREM under chain of custody protocol.

4.1.2.2 Methodology

Two phases of the study were conducted. The first phase was associated with reduction of CrVI in soil. The second phase evaluated the reduction of CrVI in groundwater.

Soil Evaluation

Soil cores were homogenized and divided into 10 bags, one for each treatment option: active control (no amendment added); microscale ZVI at 0.1, 1, and 10% (mass:mass); granular ZVI at 0.1, 1, and 10%; and $FeSO_4$ at 0.05, 0.5, and 1%. Each bag contained a total mass of 750 grams of soil plus treatment (i.e., for 10% microscale ZVI, 75 grams of microscale ZVI was added to 675 grams of soil to make a total of 750 grams). Groundwater was then added to each bag of saturated soil to mimic saturated conditions at the Site.

Microcosms were constructed from each bag by filling six-125 mL (nominal volume) wide mouth glass bottles (reactors) with approximately 125 grams saturated soil material leaving a nominal headspace for gas production. Site groundwater was added evenly to the surface of the reactors and allowed to percolate down creating saturated conditions at the bottom and less saturated conditions in the surface layer (top) of the soil column.

Microcosms remained at room temperature and sampled at 24 and 72 hours. Samples were sent to an external laboratory for chromium analysis. Additional baseline soil analyses such as pH and moisture content were conducted at the beginning and end of the experiment.

Groundwater Evaluation

A second phase of chromium treatability study was performed to evaluate the effectiveness of nanoscale ZVI and $FeSO_4$ to treat hexavalent chromium in groundwater. Microcosms were constructed using 30 grams of the homogenized soil and 150 milliliters of groundwater per 250 milliliters (nominal volume) bottles. An active control, 1% nanoscale ZVI treatment, and 18.6 g/L $FeSO_4$ treatment were prepared in duplicate and analyzed for total chromium and CrVI after 24 hours of the addition of the amendment.

4.1.2.3 Bench Study Results and Discussion

Before any treatment, the homogenized soil with groundwater had a total chromium concentration of 270 mg/kg and CrVI concentration of 70 mg/kg. The active control contained concentrations of total chromium and CrVI up to 289 and 118 mg/kg, respectively. These results are representative of a baseline condition, prior to any treatment. The results of the soil study are presented in Appendix D.

The 10% granular ZVI had the largest reduction of CrVI after 72 hours with an average concentration between triplicates of 18 mg/kg (Appendix D). The 1% $FeSO_4$ treatment had the next largest reduction of CrVI with an average concentration between the triplicates after 72 hours of 22 mg/kg. The 0.5% $FeSO_4$ treatment also had significant reduction. All $FeSO_4$ treatments reduced CrVI concentrations significantly within the first 24 hours, indicating the reaction proceeds rapidly. Microscale ZVI did not show any significant reduction in CrVI concentrations. Total chromium concentrations in soil increased after the addition of microscale, and even more so with granular (Appendix D). This may have occurred due to chromium precipitating out of the

groundwater. Based on these data, $FeSO_4$ and granular ZVI appear to be suitable for the reduction of CrVI to CrIII in soil and groundwater at the Site.

Before treatment, baseline total and CrVI results in groundwater samples were 510 and 612 mg/L respectively. After 24 hours, the control sample showed little change (589 mg/L and 592 mg/L total chromium and CrVI, respectively). The nanoscale ZVI microcosm showed a reduction of total chromium and CrVI concentrations (375 mg/L and 394 mg/L, respectively). The $FeSO_4$ microcosm indicated complete reduction of CrVI after 24 hours with total and CrVI concentrations of 1.2 mg/L and <0.005 mg/L, respectively. Total concentrations are likely reduced in groundwater due to the relative insolubility of CrIII, which would cause the CrVI to precipitate after reduction to CrIII, resulting in a reduction of total dissolved chromium (Appendix D).

4.1.3 Building 158 Pilot Study Results

In October 2007, a pilot study was commenced by injecting $FeSO_4$ solution into the groundwater through 17 direct push points. After injections were completed, groundwater monitoring was performed to evaluate the effectiveness of the $FeSO_4$ injections. A groundwater monitor well in the center of the injection area showed an immediate reduction in total and hexavalent chromium concentrations in groundwater in December 2007. However, concentrations subsequently rebounded to pre-injection concentrations within one year of the injection event (Geosyntec, 2009).

These data indicate that although the $FeSO_4$ solution was effective at reducing the readily available hexavalent chromium, the reagent was likely unable to penetrate into low-permeability lenses. The residual hexavalent chromium trapped in these lenses then re-equilibrated with the surrounding groundwater once the $FeSO_4$ reaction was spent.

Effective in-situ remediation of the remaining CrVI impacts will require these low permeability lenses to be addressed either through remedial actions which improve the ability to directly affect these layers or injections which are able to sustain reducing conditions for an extended time period to adequately promote reduction throughout the low permeability zones.

4.2 AOPC Building 131/242 Investigation

Groundwater samples were collected from newly installed deep monitor wells, and downgradient of Building 131/242 to further delineate the vertical and horizontal extent of VOCs and 1,4-dioxane in groundwater. A bench-scale study was conducted to

evaluate enhanced in-situ bioremediation (EISB) for VOCs near Building 131/242 and Building 120.

4.2.1 Vertical Extent of VOCs and 1,4-Dioxane

Two deep monitor wells were installed on March 14, 2006 adjacent to existing shallow monitor wells B131-MW2 and B131-MW3 to further delineate the vertical extent of VOCs in the area of Building 131/242, (Figure 2-1). Wells B131-MW2D and B131-MW3D were completed to a total depth of 40 feet bgs and are screened from 35 to 40 feet bgs. The boring logs and well construction diagrams are presented in Appendix B. A hydrogeologic cross-section of this area is presented in Figure 2-3.

The wells were sampled for VOCs and semi-volatile organic compounds (SVOCs) by bladder pump and low flow procedures in accordance with the San Diego County Department of Environmental Health (DEH) Site Assessment and Mitigation Manual (DEH, 2004). The bladder pump was set in the approximate middle of the screen at 37.5 feet bgs. The results from this event, as well as the most recent results from the adjacent shallow wells, are shown in Table 4-2. The laboratory analytical reports are presented in Appendix C.

Observed VOC concentrations in the deep monitor wells are significantly lower than those observed in the shallow wells. The significant attenuation of VOCs over the 20-foot vertical span between the shallow and deep paired monitor wells indicates that dense NAPL (DNAPL) is not present at depth.

4.2.2 Horizontal Extent of 1,4-Dioxane

Groundwater samples were collected from three hydropunch locations, T-44, -45, and -46, downgradient of Buildings 131/242 on March, 30 2006, to further evaluate the downgradient extent of 1,4-dioxane in groundwater (Figure 2-1). The sampling results are presented in Table 4-3. Boring logs are presented in Appendix B. The laboratory analytical reports are presented in Appendix C.

Observed concentrations indicate 1,4-dioxane impacts decline from the Building 131/242 area across a narrow zone (Figure 4-1), and are not detectable in the deeper groundwater interval. The extent of 1,4-dioxane has been sufficiently defined to perform the risk assessment and feasibility study.

4.2.3 Bench Study: Treatment of VOCs in Groundwater by Enhanced In-situ Bioremediation

The objective of this study was to evaluate whether EISB is a viable option to reduce concentrations of VOCs in Site groundwater. Bench-scale microcosms evaluated the attenuation of VOCs under ambient conditions with the addition of various electron donors and with the addition of microbial cultures in addition to electron donor.

4.2.3.1 Sample Collection

On March, 14 2006, eleven 1-foot Shelby tubes of soil were collected from 6.5 to 18 feet bgs during the installation of deep monitor well B131-2MWD. On 15 March 2006, 12 liters of groundwater was collected from shallow monitor well B131-MW2, which is screened from 5 to 15 feet bgs. The water was collected in twelve 1-liter HDPE containers using a peristaltic pump under low flow conditions. The samples were submitted to SiREM under chain of custody on March, 21 2006.

4.2.3.2 Methodology

Microcosms were constructed by filling 250 milliliter glass bottles with approximately 150 to 200 mL of groundwater and 60 g of Site soil leaving a small headspace for gas production (e.g., ethene, carbon dioxide, methane). All treatments were constructed in triplicate. The following table summarizes each treatment/control that was prepared for the study:

Microcosm	Description
Anaerobic sterile control (ANSC)	Autoclaved and amended with mercuric chloride and sodium azide
Anaerobic active control (ANAC)	No amendments
Soluble electron donor amended (LAC)	Amended with lactate as electron donor
Slow release electron donor amended (EVO)	Amended with emulsified vegetable oil as electron donor
Soluble electron donor amended and bioaugmented (LAC+KB-1)	Amended with lactate as electron donor and bioaugmented with microbial culture
Slow release electron donor amended and bioaugmented (EOS+KB-1)	Amended with emulsified vegetable oil as electron donor and bioaugmented with microbial culture

One replicate of each treatment was amended with resazurin to monitor redox conditions. Resazurin is clear under anaerobic conditions but turns pink when exposed

to oxygen. Microcosms were sealed with Mininert™ valves to allow repetitive sampling of each microcosm, and to allow addition of electron donors/acceptors to sustain metabolic/biodegradation activities. In order to maintain anaerobic conditions construction of the microcosms were conducted in a disposable anaerobic glove-bag; anaerobic microcosms were stored and sampled in an anaerobic chamber. Geologic materials added to the sterile control microcosms were autoclaved and groundwater used in these microcosms was amended with mercuric chloride and sodium azide to inhibit microbial activity. The intrinsic control microcosms, designed to measure intrinsic biodegradation activity, did not receive electron donor amendments. Treatment microcosms were amended with electron donor (i.e., lactate or emulsified vegetable oil) at approximately 10 times the stoichiometric demand of the chlorinated VOCs (cVOCs) and selected inorganic compounds (i.e., nitrate, sulfate, and oxygen). Bioaugmented treatment microcosms were amended after 28 days with a dehalorespiring microbial consortium KB-1™ (KB-1) to assess the ability of these bacteria to promote or accelerate complete dechlorination.

Biotreatability study microcosms were incubated for a period of 76 days. Aqueous samples were collected from the control and treatment microcosms every two to three weeks for analysis of cVOCs including their expected degradation intermediates (e.g., PCE, TCE, cis-1,2-DCE, and VC) and end products (e.g., ethene, ethane). At selected time points, samples were collected for analysis of added soluble electron donors (i.e., volatile fatty acids [lactate, acetate, and propionate]). Other analyses included the measurement of pH, methane, and anions (i.e., sulfate, nitrate, chloride, and phosphate). Sample intervals for individual treatments were modified (either shorter or longer intervals) during the treatability study based on observed microbial activity, cVOC degradation rates, and depletion of electron donors/acceptors.

4.2.3.3 Bench Study Results and Discussion

The results of the samples collected from the microcosms and analyzed for cVOCs during the biotreatability study are illustrated in Appendix E. The concentrations plotted are the averages of the three replicate sample results from each microcosm group.

As expected, there was no decrease in PCE, TCE, or cis-1,2-DCE concentrations and no increase in VC or ethene concentrations over the incubation period of the Anaerobic sterile control microcosms. The anaerobic active control microcosms also displayed similar results (Appendix E).

A decrease was observed in PCE concentrations for the lactate and emulsified oil amended microcosms (Appendix E). TCE and VC concentrations did not significantly change over the incubation period. The concentration of cis-1,2-DCE increased slightly likely due to microbial activity. Ethene was not detected. The results of the lactate and emulsified oil amended microcosms indicate there is a potential for naturally occurring dechlorinating bacteria to degrade cVOCs with the addition of an electron donor.

The emulsified oil and lactate amended microcosms which were bioaugmented with KB-1, showed decreases in PCE and TCE concentrations followed by an increase and then a decrease in cis-1,2-DCE and VC concentrations (Appendix E). All replicates of the emulsified oil + KB-1 treatment and one from the lactate + KB-1 treatment have achieved complete reduction of cVOCs to ethene. Sulfate has almost been completely reduced in one lactate + KB-1 replicate and all of the emulsified oil + KB-1 replicates. It is these microcosms that showed complete dechlorination of PCE and TCE through cis-1,2-DCE and VC to ethene. It appears that sulfate reduction is an important precursor to complete reductive dechlorination. Sufficient electron donor must be provided to cover the demand of all electron acceptors (of which sulfate is a major component). Overall, the emulsified oil + KB-1 treatment appears to perform at a faster rate than the lactate + KB-1 amendment. However, both treatments effectively reduce VOC concentrations within a faster time frame than with treatments consisting of only electron donor.

4.3 Pilot Study: Treatment of VOCs in Groundwater by Enhanced In-situ Bioremediation

A pilot study was performed in AOC Building 131/242 to evaluate the effectiveness of EISB in treating VOCs in groundwater (Appendix G). Temporary injection points were constructed for injection of the emulsified vegetable oil (EVO) and KB-1® microbial culture into the subsurface at 254 locations from 11 September to 4 October 2007. The injection points were installed by direct-push to an approximate depth of 15 feet bgs and were screened from 7 to 15 feet bgs. The injection screen was 1 ½-inch in diameter. The blank portion, from the top of the screen to ground surface, was larger (3 ¼-inches in diameter) to provide a more competent surface seal.

The injection points were installed on 12-foot centers in the portion of the AOC containing VOC concentrations indicative of the potential presence of dense non-aqueous phase liquid (DNAPL). Areas of the AOC with groundwater impacts above the RBC, but below concentrations indicative of potential DNAPL were injected on 14-foot centers (Appendix G). Approximately 1,310 gallons of 1% emulsified vegetable oil (EVO) solution, 0.14 gallons of microbial culture, and 310 gallons of unamended

municipal water were injected into each well across the 8-foot screen interval, equaling a total of approximately 1,620 gallons of fluid. It is expected that the initial 5-foot radius of influence (ROI) for each injection point will expand to approximately 7 feet over a two year period due to dispersion and migration of the EVO and microbial culture.

4.3.1 Pilot Study Groundwater Monitoring Results

A baseline sampling event was performed in advance of the implementation of the pilot study injections. Groundwater samples were collected from monitor wells B131-MW2, -MW6, and -MW5 for VOCs, ethane, ethene, methane, organic acids, chloride, nitrate, nitrite, sulfate, sulfide, and total organic carbon (TOC) (EISB sampling suite) using low flow purge methodology. Monitor well B131-MW3 was added to the EISB sampling program during the first quarter 2008 sample event.

In the baseline data, the presence of ethene throughout the study area, the absence of parent compounds (PCE, TCE) in the downgradient monitor wells, and the strong presence of daughter products in the downgradient monitor wells (cis-1,2-DCE, vinyl chloride, ethene) all support that natural degradation of chlorinated hydrocarbons was occurring prior to the addition of electron donor or microbial cultures.

4.3.1.1 Potential DNAPL Area Results

Post injection sampling was performed at 1, 3, and 6-months after final injections. Monitor well B131-MW3 was added to the post-injection performance monitoring schedule at the 3-month sample event. Samples were analyzed for the same parameters as the baseline sampling using low flow purge methodology. At 1-month, Gene Trac samples were collected at monitor wells B131-MW2, -MW5, and -MW6. Gene Trac samples measure the concentration of the active microbial strain *Dehalococcoides ethenogenes* (DHC) in the groundwater. A Gene Trac sample was collected from monitor well B131-MW3 at 3-months.

Monitor well B131-MW2 is located in the northern section of the area of potential DNAPL (Figure 2-1, 2-3, Appendix G Figure 3) and is located 3.2 feet from the nearest injection point. After the first month, RBCs had been achieved for tetrachloroethene (PCE) and trichloroethene (TCE). Cis-1,2-Dichloroethene (cis-1,2 DCE) was reduced from 3,200 µg/L to 1,900 µg/L, while an interim increase in vinyl chloride (VC) from 340 µg/L to 680 µg/L was observed. Ethene increased substantially from 13.1 µg/L to 1,220 µg/L. This data is indicative of complete chlorinated hydrocarbon degradation to ethene. The groundwater samples collected from B131-MW2 during the 3-month and

the 6-month sampling event contained no detectable concentrations of PCE or TCE, with cis-1,2-DCE and VC concentrations reduced to well below RBCs. Ethene concentrations detected in the 3-month and 6-month samples were lower than the concentrations detected in the 1-month sample, as a result of correspondingly lower VOC concentrations (Appendix G).

Monitor well B131-MW3 is located in the southern section of the area of potential DNAPL (Figure 2-1, 2-3, Appendix G Figure 3) and is located 5.6 feet from the nearest injection point. This well was added to the performance sampling schedule to evaluate the southern portion of the potential DNAPL zone. This well was not sampled during the baseline sampling event so the Site wide data collected in 2005 (Geosyntec, 2005) is used as an approximate baseline. When this well was first sampled 3-months after injection, groundwater samples contained no detectable chlorinated VOCs. The ethene concentration at 3-months was 431 µg/L. The 6-month sampling event showed similar chlorinated VOC and lower ethene (6.57 µg/L) concentrations.

4.3.1.2 Downgradient Results

Monitor well B131-MW6 is located in the center of the AOC (Figure 2-1, 2-3, Appendix G Figure 3), is located 4.5 feet from the nearest injection point, and did not contain baseline concentrations indicative of potential DNAPL. Groundwater samples collected from monitor well B131-MW6 show a decrease in cis-1,2-DCE from a baseline concentration of 22,000 µg/L to below the RBC within the first month. VC also decreased from 4,600 µg/L to 2,100 µg/L and ethene concentrations increased from 36.2 µg/L to 1,720 µg/L. The elevated ethene concentration indicates that complete degradation of VOCs is occurring. Chlorinated VOC concentrations continued to decline at the 3-month post injection sample event with a slight rebound observed of cis-1,2-DCE and VC during the 6-month monitoring event. Increasing ethene concentrations greater than 1,000 µg/L provide continued strong indication of complete degradation (Appendix G).

4.3.1.3 Summary and Recommendations

The Building 131/242 EISB pilot study has demonstrated the effectiveness of EISB at degrading chlorinated VOCs and achieving RBCs in the near term, and potentially ultimately achieving background concentrations in groundwater. During the pilot study, EISB was able to rapidly degrade VOC concentrations (including those potentially indicative of DNAPL) to RBCs in as quickly as 6-months. RBCs have been met in two of the four monitor wells with significant VOC reductions and elevated ethene concentrations indicative of complete dechlorination in the other two monitor

wells. Ongoing monitoring will be conducted to further document the results of the EISB pilot study in the Building 131/242 AOC.

Baseline data from the Pilot Study area shows that biodegradation is occurring naturally in this area as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates and time to reach background after the Pilot Study, VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation.

4.4 AOPC Building 120 Investigation

Soil and groundwater samples were collected on 12 October 2006 from four hydropunch borings along the north-south axis of the Building 120 AOPC to characterize the vertical extent and nature of VOC impacts (Figure 2-4). Soil samples were collected at the water table and groundwater samples were collected at the water table (10 feet bgs), 28 feet bgs, and the contact with the Bay Point Formation (38 feet bgs). Samples were analyzed for VOCs, SVOCs, and TPH. Groundwater analytical results from the hydropunch samples and monitoring well results from the First Quarter 2007 sampling event are presented in Table 4-4 and soil analytical results are presented in Table 4-5.

Shallow groundwater results indicate concentrations of VOCs roughly equivalent to the 2003 and 2005 Site characterization data collected by H&A and Geosyntec, respectively. Each of the four sampling locations show decreases of several orders of magnitude in VOC concentrations between the shallow and intermediate-depth sampling point (Figure 2-4). In T-50, cis-1,2-DCE drops from a groundwater concentration of 22,000 ug/L at 10 feet bgs to a concentration of 3.1 ug/L at 28 feet bgs. This trend is seen repeatedly for all constituents detected in the shallow groundwater, in all four hydropunch borings advanced for determination of vertical extent. Groundwater concentrations in the vicinity of Building 130 are discussed below. Based on these data, significant groundwater impacts associated with the Building 130/166 AST/120/121 area appear to be confined to within approximately 15 feet of the water table. The downgradient extent of impacts is defined by B120 MW-4 and -5 which show VOC concentrations to trace concentrations (Table 4-4).

4.5 AOPC Building 120 South Interim Actions

The extent of the Building 120 South excavation footprint increased from its original dimension of 34- by 27-feet to approximately 40- by 30-feet, due to RBC exceedances in some of the initial side wall and bottom confirmation samples. To better delineate the potential extent of impacted soil, step out direct push borings were advanced around the excavation. Results from direct push investigation helped to define the potential extent of hydrocarbon impacted soil (Geosyntec, 2009). The presence of LNAPL was also observed on the surface of the groundwater in the bottom of the southwestern quadrant of the excavation. The LNAPL contained a total PCB concentration of approximately 8.2 mg/kg. However, soil samples from the excavation contained a maximum total PCBs concentration of 0.25 mg/kg. Test pits were dug to the west and south of the excavation and also next to a former heavy machinery foundation east of the excavation (Geosyntec, 2009). LNAPL was observed within each of the test pits with PCB concentrations ranging from 1.9 mg/kg to 8.6 mg/kg. Building footings and obstructions prevented further step-out prior to building demolition.

4.6 Convair Lagoon Vicinity

The potential for impacted groundwater to migrate from the Site to Convair Lagoon in both shallow and deeper groundwater intervals was evaluated. Monitor wells MWCL-1, -3, and -5 were installed at 15 feet bgs with screened intervals from 5 to 15 feet bgs. Monitor wells MWCL-2, -4, and -6 were installed at the contact of the Bay Point Formation (approximately 42 feet bgs) and contain 5-foot screen intervals. Monitor well MWCL-7 was installed at 65 feet bgs and is screened from 60 to 65 feet bgs. Monitor well MWCL-8 was installed at 12 feet bgs in the backfill of the 60-inch SWCS and is screened from 7 to 12 feet bgs. The depth of the wells, lithology, and groundwater elevations are presented in cross-section D-D' (Figure 2-5).

Monitor wells MWCL-1, -2, -3, -4, -5 ,and -6 were sampled during the Third Quarter 2006, First Quarter 2007, and Third Quarter 2007 semi-annual groundwater monitoring events (Geosyntec, 2006h). During the First Quarter 2007 sampling event, MWCL-7 and -8 were added to the ongoing Convair Lagoon groundwater semi-annual sampling. The wells were sampled for TPH, SVOCs, and VOCs using low flow sampling methods. Limited impacts of VOCs and TPH were observed in the westernmost well cluster. Step-out hydropunch borings (T-54, and -55) were installed to further evaluate the lateral and vertical extent of these impacts. Groundwater samples collected from the central well pair contained no VOCs or TPH detections above laboratory reporting limits. Groundwater samples collected from the eastern well pair during the Third

Quarter 2006 and First Quarter 2007 contained low-level detections of 1,1-dichoroethane and 1,4-dioxane, while groundwater samples collected from the eastern well pair during the Third Quarter 2007 contained no VOCs or TPH detections above laboratory reporting limits. The well installed in the 60-inch SWCS backfill contained no PCBs, TPH, SVOCs, or VOCs above laboratory reporting limits during the Third Quarter 2007 monitoring event (Table 4-6), when it was added to the semi-annual groundwater monitoring program.

4.7 AOC Building 130

In 2010, groundwater samples collected south of Building 130 during the closure of the RCRA Drum/Drum Tank storage area indicated additional VOC impacts contiguous with the Building 120 groundwater VOC impacts. Groundwater samples were collected from five direct push samples, each of which exceeded the RBC for PCE with concentrations ranging from 378 ug/L to 631 ug/L and for TCE with concentrations ranging from 440 ug/L to 732 ug/L. This area is located approximately 25 feet east of the edge of the adjacent interim EISB treatment area performed along the eastern portion of Building 120 and contains the same COCs, and so it will be evaluated in this report as an extension of the Building 120 AOC.

5.0 RISK-BASED CONCENTRATIONS AND AREA OF POTENTIAL CONCERN EVALUATION

5.1 Summary of Risk Assessment

In accordance with directive D.3.a (5), (6), and (7) of the CAO, this section presents a summary of the Site-wide Risk Assessment (Geosyntec, 2007a). A human health risk assessment was conducted for the entire Site (Geosyntec, 2007a) superseding the previously submitted Western Area Risk Assessment (Geosyntec, 2006f). The Site-wide risk assessment followed guidelines set by the RWQCB, the California Environmental Protection Agency (CalEPA) Department of Toxic Substances and Control (DTSC), the DEH, and CalEPA's Office of Environmental Health Hazard Assessment (OEHHA), and United States EPA (USEPA). Based on the historical and planned uses of the Site, it is presumed that the entire Site will be redeveloped for future commercial/light industrial uses.

The southern boundary of the Site is situated approximately 250 feet from Convair Lagoon (San Diego Bay). Potential impacts to San Diego Bay from groundwater are addressed in Appendix A to the Site Wide Risk Assessment (Geosyntec, 2007). Current data from wells installed in the vicinity of Convair Lagoon indicate that on-Site groundwater impacts do not impact San Diego bay (Section 4.4). Impacted sediment within the 60-inch SWCS and 54-inch SWCS are also addressed in Appendix A to the Site Wide Risk Assessment. No quantitative onsite ecological risk assessment has been prepared as no onsite ecological receptors were identified.

The risk assessment consists of five major components:

- **Data Review and Evaluation:** A review of available data collected from the Site and contiguous areas which defines the nature and extent of environmental impacts identified at the Site and contiguous impacted areas; the identification of chemicals of potential concern (COPCs); and the identification of potential data gaps.

- **Exposure Assessment:** An assessment of the magnitude, frequency, duration, and routes of potential human exposures to Site-related COPCs. The exposure assessment considers both current and likely future uses of the Site and adjacent areas, and is based on complete exposure pathways to actual or probable human receptors. The exposure scenarios are summarized in a Conceptual Site Model (CSM), which includes the sources, affected media, release mechanisms, and exposure pathways for each identified

receptor population. Onsite ecological exposures were not evaluated quantitatively as there are no known onsite ecological receptors.

- **Toxicity Assessment:** A presentation of available information to identify the nature and degree of toxicity and to characterize the dose-response relationship for each COPC.

- **Risk Characterization:** A synthesis of exposure and toxicity information to yield quantitative estimates of potential cancer risks and noncancer hazards to defined receptor populations.

- **Uncertainty Analysis:** Discussion of the uncertainties associated with each of the four previous steps to assist decision-makers in evaluating the risk assessment results in the context of the assumptions and variability in the data used.

5.1.1 Exposure Scenarios

The Risk Assessment addressed potential adverse impacts to human health under four future exposure scenarios: 1) construction workers; 2) trench workers; 3) future industrial/commercial workers; and 4) future landscapers. A quantitative risk assessment was conducted using conservative, site-specific assumptions to estimate potential human health risk. Reasonable maximum exposure (RME) estimates were developed for the identified exposure scenarios. To estimate RMEs, reasonable conservative modeling assumptions and upper-bound default values were used for most exposure parameters (Geosyntec, 2007a).

The Risk Assessment also evaluated potential adverse impacts to human health using the maximum VOC concentrations detected in soil gas and groundwater adjacent to each respective structure under four current exposure scenarios: Potential commercial workers in the North and South Sky Chefs Buildings, a current San Park Attendant located south of the Site, and a current on-Site security guard. Each of these scenarios was evaluated using Default and Site Specific exposure scenarios. The potential cancer risk estimated using Default parameters did exceed the target risk goal. However, based on the site-specific exposure factors which are believed to be consistent with current and future planned Site use and minimal engineering controls, potential cumulative cancer and noncancer hazard estimates from the Targeted Risk Assessment did not exceed target health goals. These engineering controls include modifications to the HVAC system to increase the air exchange rate to 5 exchanges per hour, and placement of the proposed office area in the northwest corner of the North Sky Chefs building.

The potential receptors, exposure medium, and exposure pathways considered complete are discussed below and are summarized in the following table:

Receptor Population	Exposure Medium	Potentially Complete Exposure Pathway
Current Industrial/Commercial Worker	Groundwater (data adjacent to existing structures)	• Indoor Air Vapor Inhalation
	Soil Gas (data adjacent to existing structures)	• Indoor Air Vapor Inhalation
Construction Worker	Shallow Soil	• Incidental Ingestion • Dermal Contact • Outdoor Fugitive Dust Inhalation • Outdoor Air Vapor Inhalation
	Groundwater	• Dermal Contact • Outdoor Air Vapor Inhalation
Trench Worker	Shallow Soil	• Incidental Ingestion • Dermal Contact • Outdoor Fugitive Dust Inhalation • Outdoor Air Vapor Inhalation
	Groundwater	• Dermal Contact • Outdoor Air Vapor Inhalation
Industrial/Commercial Worker	Shallow Soil	• Incidental Ingestion • Dermal Contact • Outdoor Fugitive Dust Inhalation • Outdoor Air Vapor Inhalation
	Groundwater (offsite only)	• Indoor Air Vapor Inhalation
	Soil Gas	• Indoor Air Vapor Inhalation
Landscaper	Shallow Soil	• Incidental Ingestion • Dermal Contact • Outdoor Fugitive Dust Inhalation • Outdoor Air Vapor Inhalation

5.1.2 Compounds of Potential Concern

USEPA guidance (USEPA, 1997) was used to identify the COPCs to be evaluated in the Risk Assessment. The USEPA guidance states that the list of compounds should include all compounds that were:

- Positively detected in at least one sample;
- Detected above levels of the same compounds found in associated blank samples;
- Tentatively identified but may be associated with the Site based upon historical information;
- Transformation products of detected compounds; and
- Detected above naturally occurring levels (background).

For inorganic compounds, a compound was considered a COPC if it was determined to exceed background concentrations. The existing site-specific dataset contains between 408 and 431 analytical results for each metal in soil, and between 121 and 127 analytical results for each metal in groundwater, which were considered in the derivation of site-specific background concentrations for inorganic compounds. The methodology to determine background concentrations followed CalEPA guidance (CalEPA, 1997). This method is used to determine if an ambient population can be discriminated from a Site-impacted population of sample results. In addition, a comparison was made of the site-specific maximum background concentrations in soil with published maximum background concentrations for these same metals in California and western soils. Metals detected at concentrations above their respective site-specific background concentrations were selected as COPCs and were evaluated in the risk assessment. The AOPCs are shown on Figure 1-3.

All organic compounds that were detected positively in at least one sample were included as COPCs.

5.1.3 Site Conceptual Model

A general Site Conceptual Model (SCM) was developed to represent the current understanding of the site-specific occurrence of the COPCs, the means by which they are released and transported in various media, and the exposure pathways and routes by which they might contact human receptors on-site (Geosyntec, 2007a). The SCM was developed based on the anticipated near-term and long-term use of the Site. Potential exposure routes considered both direct and indirect contact with soil and groundwater, including potential migration of vapors from the subsurface. For metals and SVOCs, direct contact routes such as incidental ingestion and dermal contact are the most

relevant. An evaluation of potential exposure routes to off-site receptors is presented in the Risk Assessment Appendix A.

5.2 Remedial Action Objectives

This section describes the remedial action objectives (RAOs) identified for soil, soil gas, and groundwater, and the development of risk-based concentrations (RBCs) for each exposure scenario, by compound and media. RAOs are required by USEPA guidance (1997) as part of the FS process. RAOs are specific goals applied to media that have been identified as posing an unacceptable baseline risk. These media are then considered for remedial action in this FS Report. Most commonly, RAOs are expressed in terms of chemical concentrations and routes of exposure, so that RAOs can be achieved through a combination of reducing chemical concentrations or reducing exposures.

The following RAOs were identified for onsite soils and groundwater:

- Mitigate risk from ingestion, inhalation, and dermal contact with soils to acceptable risk levels;
- Mitigate risk from inhalation of soil gas to acceptable risk levels;
- Mitigate risk from dermal contact with groundwater to acceptable risk levels; and
- Achieve background concentrations for COPCs to the extent technically and economically achievable pursuant to State Water Resources Control Board (SWRCB) resolution 92-49.

These RAOs are applied to develop appropriate target RBCs for the COPCs that were identified in soil and groundwater at the Site. The COPCs were selected in the Risk Assessment (Geosyntec, 2007a) and were included in the derivation of RBCs.

5.2.1 Risk-Based Concentrations

Site-specific RBCs for chemicals that potentially pose unacceptable cancer risk or health hazard to receptors have been calculated based on reasonable expectations of future land use at the Site. These RBCs, have been used to identify areas of the Site that require remediation or other risk mitigation measures because concentrations of COPCs in those areas exceed the site-specific RBCs.

RBCs were calculated using the exposure algorithms, as well as the Johnson and Ettinger (J&E, 1991 and CalEPA, 2005) subsurface vapor intrusion model, employed in the quantitative risk assessment. RBCs were developed for each COPC detected in its respective environmental media. Current risk assessment toxicity values (cancer slope factors and noncancer reference doses) were selected from CalEPA's (2006) online Office of Environmental Health Hazard Assessment (OEHHA) Toxicity Criteria Database, USEPA's (2006) online Integrated Risk Information System (IRIS), or from the Region IX Preliminary Remedial Goals (PRG) table (USEPA, 2004).

RBCs for COPCs in soil, groundwater, and soil gas determined for the four exposure scenarios summarized in Section 5.3.1 are presented in Tables 5-1 through 5-4, and the corresponding locations are shown on Figures 5-1 through 5-3.

5.2.2 RBCs for the Indoor Air Pathway

RBCs for the indoor air pathway are presented in Table 5-3. The RBCs were derived using the DTSC J&E model (J&E, 1991 and CalEPA, 2005) to estimate potential migration of volatile chemicals from soil, soil gas, and groundwater into indoor air. This computer spreadsheet model, which is public domain software that is freely available at the CalEPA internet website, can also be used to estimate maximum target cleanup levels by back calculating subsurface vapor concentrations which would result in indoor air risk exceedances. The model accounts for both the diffusion of chemicals through the subsurface, as well as advection due to pressure differentials between the soil and buildings. It also incorporates two different types of building foundation construction: (1) slab on grade; and (2) structures with basements. The same soil physical parameters and building characteristics that were used in the risk assessment were also used to estimate RBCs for soil, soil gas, and groundwater.

5.2.3 RBCs for the Direct Contact and Outdoor Air Pathway

RBCs for the direct contact (incidental ingestion and dermal contact) and outdoor air inhalation pathways are presented in Tables 5-1 through 5-4. These were derived using exposure algorithms following USEPA and CalEPA risk assessment guidance (USEPA, 1989). These same algorithms were used, with slight modifications as outlined below, to develop RBCs for the different receptors.

Chemical-specific soil RBCs were derived first by calculating cancer risk and noncancer hazard using a unitized soil concentration of 1 mg/kg for each COPC. In other words, cancer risks and noncancer hazards were estimated for an onsite commercial worker assuming exposures to soil concentrations of 1 mg/kg for each

COPC via incidental soil ingestion, dermal soil contact, and outdoor air inhalation of vapors/dust. The unitized risk calculations are presented on Table 5-5 through 5-8. To calculate cancer risk from exposure via incidental ingestion of soil, the following equation was used:

$$CR_{ingestion} \text{ or } HQ_{ingestion} = \frac{C_s \times IngR \times ABS \times EF \times ED \times CF \times \left(CSF_o \text{ or } {}^{1}\!/\!_{RfD_o} \right)}{BW \times AT}$$

Where:

$CR_{ingestion}$	= Chemical-specific cancer risk, incidental ingestion pathway
$HQ_{ingestion}$	= Chemical-specific noncancer hazard quotient
C_s	= Unitized chemical concentration in soil (1.0 mg/kg)
IngR	= Ingestion rate of soil (mg/day)
ABS	= Percent absorption (assumed to be 100 percent)
EF	= Exposure frequency (days/year)
ED	= Exposure duration (years)
CF	= Conversion factor for soil (10^{-6} kg/mg)
CSF_o	= Oral cancer slope factor $(mg/kg \cdot day)^{-1}$
RfD_o	= Oral noncancer reference dose (mg/kg·day)
BW	= Body weight (kg)
AT	= Averaging time (days) cancer effects: 70 years × 365 days = 25,550 days noncancer effects: ED × 365 days

To calculate cancer risk from exposure via dermal contact with soil, the following equation was used:

$$CR_{dermal} \text{ or } HQ_{dermal} = \frac{C_s \times SA \times AF \times EF \times ED \times CF \times DAF \times \left(CSF_o \text{ or } {}^{1}\!/\!_{RfD_o} \right)}{BW \times AT}$$

Where:

CR_{dermal}	= Chemical-specific cancer risk, dermal contact pathway
HQ_{dermal}	= Chemical-specific noncancer hazard quotient
C_s	= Unitized chemical concentration in soil (1.0 mg/kg)
SA	= Skin surface area exposed to soil per day (cm^2/day)
AF	= Soil-skin adherence factor (mg/cm^2)
CF	= Conversion factor (10^{-6} kg/mg)
DAF	= Dermal absorption factor (unitless, chemical specific)

To calculate cancer risk from exposure via inhalation of vapors and fugitive dust from soil, the following equation was used:

$$CR_{inhalation} \text{ or } HQ_{inhalation} = \frac{C_s \times InhR \times ABS \times EF \times ED \times CF \times \left(CSF_i \text{ or } {}^{1}\!/\!_{RfD_i} \right)}{BW \times AT \times (PEF \text{ or } VF)}$$

Where:

$CR_{inhalation}$	= Chemical-specific cancer risk, outdoor inhalation pathway
$HQ_{inhalation}$	= Chemical-specific noncancer hazard quotient
C_s	= Unitized chemical concentration in soil (1.0 mg/kg)
InhR	= Inhalation rate (m^3/day)
ABS	= Percent absorption (assumed to be 100 percent)
CSF_i	= Inhalation cancer slope factor $(mg/kg \cdot day)^{-1}$
RfD_i	= Inhalation noncancer reference dose (mg/kg·day)

The derivation of the chemical-specific volatilization factors (VFs) for the outdoor vapor inhalation pathway and the particulate emission factor (PEF) for the outdoor fugitive dust pathway was presented in the risk assessment (Geosyntec, 2007a).

Subsequently, the cancer risks and noncancer hazards are summed together across exposure routes to yield a cumulative risk per each COPC (e.g., $CR_{ingestion}$ + CR_{dermal} + $CR_{inhalation}$ = Cumulative Cancer Risk). Assuming a chemical-specific target cancer risk of 1×10^{-5} and a target noncancer hazard quotient (HQ) of 1, the risk-based cleanup level (RBC) was estimated by using the following equations:

$$RBC_{carcinogen} = \left(\frac{1}{\text{Cumulative Cancer Risk}} \right) \times \text{Target Risk}$$

$$RBC_{noncarcinogen} = \left(\frac{1}{\text{Cumulative HQ}} \right) \times \text{Target HQ}$$

Soil gas and groundwater RBCs were also derived similarly to what was presented for the soil RBCs above. However, instead of a unitized soil concentration of 1 mg/kg, an initial soil gas or groundwater concentration of 1 µg/L is used in the exposure algorithms to derive their respective soil gas and groundwater RBCs. The RBCs for the construction worker, trench worker, commercial worker, and landscaper are presented

in Tables 4-1 through 4-4, respectively. The summary of RBCs is presented in Table 5-9.

Consistent with prior methodology, because the RBCs were calculated at a chemical-specific risk level of 10^{-5}, after remediation to RBCs the cumulative Site risk would be within the USEPA acceptable risk range of 10^{-6} to 10^{-4}.

5.3 Evaluation of Technical and Economic Feasibility of Cleanup to Background

In accordance with State Water Resources Control Board Resolution 92-49, the technical and economic feasibility of achieving background concentrations was performed. These evaluations are included within the feasibility study for each AOC and AOPC presented in Section 6.4.

An additional evaluation was performed to evaluate the economic feasibility of additional reduction of PCB concentrations to below the RBC of 4.2 mg/kg. Several alternate cleanup goals were evaluated to determine the break-point for economic feasibility of cleaning up to concentrations incrementally lower than the risk based goal:

- The RBC of 4.2 mg/kg;
- 1 mg/kg (site characterization data distribution break point);
- 0.3 mg/kg, the industrial California Human Health Screening Level (CHSSL);
- 0.1 mg/kg (site characterization data distribution break point); and
- Background, set at the laboratory reporting limit of 0.050 mg/kg.

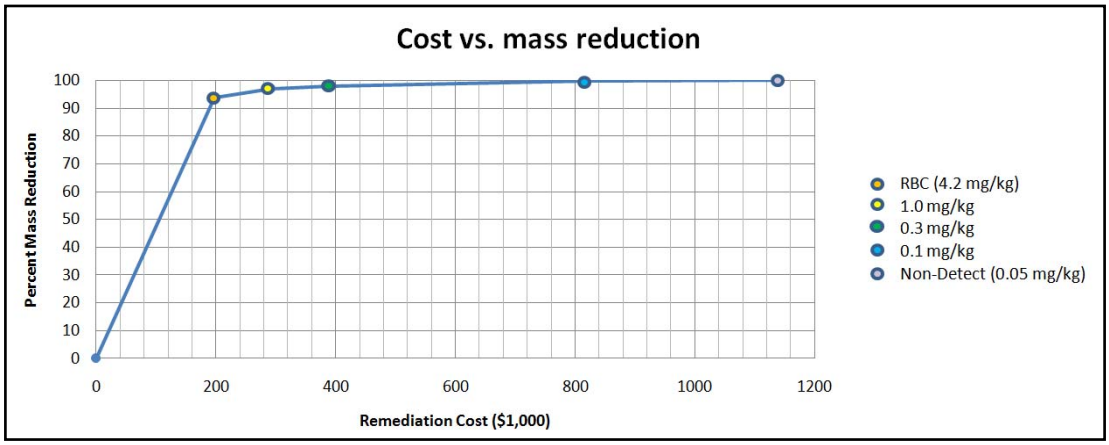
An economic feasibility analysis was performed for remediation to each of these concentrations (Appendix H). The results are summarized in the following table:

Cleanup Goal	Estimated incremental PCBs mass removed (kg)	% of total mass	Estimated Volume of Soil (yd^3)	Cumulative percent mass removed	estimated incremental cost	Cost per incremental % PCB mass removed
4.2 mg/kg	6.468	93.7%	250	93.7%	$ 197,000.00	$2,100
1 mg/kg	0.220	3.2%	100	96.9%	$ 94,500.00	$29,600
0.3 mg/kg	0.055	0.8%	100	97.7%	$ 94,500.00	$118,300
0.1 mg/kg	0.132	1.9%	600	99.6%	$ 430,250.00	$225,000
ND<0.05 mg/kg	0.029	0.4%	520	100.0%	$ 491,400.00	$1,186,200

Estimates of total PCB mass are based on a soil density of 1.44 g/cc (approximately 1,100 kg/yd^3) as reported in recent geotechnical sampling results (Geosyntec, 2010).

This analysis indicates that approximately 93.7% of currently identified PCB mass at the site would be removed using the RBC as the soil cleanup goal.

It is estimated that a goal of 1 mg/kg would cost approximately an additional $94,500 and would increase the total PCB mass removal from approximately 93.7% to 96.9% (3.2% of total site mass removal). A goal of 0.3 mg/kg would remove an additional 0.8% of total estimated site mass would cost approximately an additional $94,500. A goal of 0.1 mg/kg would remove an additional 1.9% of site mass and is estimated to cost approximately an additional $430,250. To achieve background (the final 0.4% of site mass), the additional cost is estimated to be $491,400. The cost vs. mass reduction is graphed below.



The most significant break point in the cost vs. mass reduction curve is at the risk-based goal of 4.2 mg/kg. There is another, much less pronounced, break point in the curve at 1.0 mg/kg. There are no other substantive break points in the curve. Costs per increment of PCB mass removal increase exponentially for the final 3.1% of PCB mass removed from the Site. Additionally, as soil concentrations decrease, larger volumes of soil must be excavated to achieve an equivalent volume of mass removal, i.e. 1 yd^3 of soil with an average concentration of 1 mg/kg accomplishes the same PCB mass removal as 10 yd^3 of soil with an average concentration of 0.1 mg/kg.

The additional non-economic costs for performing large scale excavations also need to be considered, including project related greenhouse gas emissions, increased demand on finite landfill capacity, and increased truck trips and associated risk of traffic accidents. The break point observed at the 1.0 mg/kg concentration represents a point of diminishing returns where increasingly large excavations would be required to realize ever smaller incremental reductions in residual PCB mass. After this point, the relative cost to the people of the state in terms of landfill space, truck trips, fuel consumption,

and potential for construction related accidents is not offset by the relative benefit of additional reduction in residual on-site concentrations. Therefore, 1.0 mg/kg is proposed as the most appropriate PCB remediation goal.

The alternative PCB remedial goal of 1.0 mg/kg in soil is more stringent than the risk based remedial requirements and is evaluated to be protective of potential off-site receptors as described in the Risk Assessment Appendix A (Geosyntec, 2010). The alternative PCB goal also meets the directives of Resolution 92-49 in that it is consistent with maximum benefit to the people of the State, does not unreasonably affect present and anticipated beneficial use of water and does not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

5.4 Post-Remediation Evaluation of Risk

To confirm the effectiveness of the remediation, a post-remediation Risk Assessment will be conducted. The post-remediation Risk Assessment will use post-remediation soil, groundwater, and soil gas sample data from each remediated AOC or AOPC, as well as existing data from nearby unremediated areas, as appropriate. The site-specific exposure parameters as well as toxicity criteria presented in the Site-wide Risk Assessment will be applied during the post-remediation Risk Assessment, with one modification. A PCB oral slope factor of 5 was utilized in the preparation of the Risk Assessment. The post remediation Risk Assessment and all future Risk Assessments will adopt the DTSC recommended PCB slope factor of 2.

During the remediation phase, interim area-specific post-remediation risk evaluations will be performed sequentially for each remediated AOC or AOPC using the 95% UCL concentration for each chemical. The exposure areas for estimating the 95% UCL will be the AOCs or AOPC defined in the RI/FS. However, the AOC or AOPC will be subdivided if the size of the AOC or AOPC exceeds 25,000 square feet (the dimensions of a typical commercial building that may be built on the property). Buildings in use on adjacent parcels (e.g., current private jet facilities north of the runway) provide the basis of this typical dimension. As remedial actions are completed in each area and media, risk evaluations will be performed to evaluate potential post-remediation risk in the targeted media. For soil, these area-specific risk evaluations will be performed after each excavation is completed. During Site demolition, additional areas of potential environmental concern may be identified. These areas will be characterized by additional sampling, as necessary. If remedial actions are required, the area will be included in the area-specific post-remediation interim risk evaluations described above and the post-remediation Site wide Risk Assessment described below.

Groundwater risk evaluations will follow as in-situ remedial actions are being completed. After the risk goals (1×10^{-5} cancer risk and Hazard Index of 1) for soil and groundwater have been met in a given area, and building demolition is complete, a soil gas survey will be performed. Soil gas samples will be collected after steady state conditions have been attained. The time to reach steady state will be estimated using the methods described in Johnson et al., 1999. The resulting data will be used for the vapor intrusion risk evaluation because soil gas data provides a direct measurement of the chemical concentration that may migrate into indoor air.

When remediation is deemed complete, a final post-remediation Site-wide Risk Assessment will be prepared. The final post-remediation Risk Assessment will compile the confirmation sample results from the AOC and AOPC remediation areas and the relevant Site characterization sample results into a comprehensive Site wide post-remediation dataset for soil, groundwater and soil gas. Site wide post-remediation risks for each media and receptor will be calculated using Site wide 95% UCL chemical concentrations. To address cumulative risks across media for the construction worker and trench worker (who may be exposed to soil and groundwater simultaneously), soil and groundwater risks will be summed. All other potential risks will be presented separately for each media.

While Site wide risks may be acceptable, due to the size of the Site and data distribution, there may be localized areas of impacts with chemical concentrations much greater than surrounding areas. To address this concern, a review of the Site data will be conducted. The constituent specific data distributions will be evaluated with regard to the 95% UCL to identify any outliers (results exceeding 3 times the 95% UCL). If these outliers represent a chemical specific risk exceeding 1×10^{-6} or a noncancer hazard index of 0.1, a location specific cumulative risk evaluation will be performed as described below.

If a specific location on the Site is identified with potentially elevated concentrations, this area will be evaluated with an area-specific post-remediation Risk Assessment consistent with the approach applied to the AOCs and AOPCs. An area of 25,000 square feet, placed and centered over the specific location, will be used to calculate area-specific 95% UCL concentrations. If cumulative risks in the area are greater than the target risk goal of 1×10^{-5} or a noncancer hazard index of 1, further action will be conducted. This may consist of collecting additional data or remedial action.

If additional on or off Site remedial measures are required to address potential impacts to Convair Lagoon, an evaluation of the post-remediation risk to human health and the environment in Convair Lagoon will be performed to document the efficacy of the

mitigation measures. This evaluation will be added as an Appendix to the post-remediation Risk Assessment.

5.5 Area of Potential Concern Screening

AOPCs were screened using the calculated RBC for each compound, for each exposure scenario. AOPCs where concentrations of COCs in soil, soil gas, or groundwater exceeded any RBC were then considered an AOC.

AOCs required further evaluation for potential remediation technologies for risk-based cleanup, which is discussed in detail in Section 6. The remaining AOPCs were not evaluated with respect to risk-based cleanup. However, all AOCs and AOPCs were considered for non-risk-based cleanup, where concentrations were observed to exceed background concentrations or where NAPLs were observed or suspected.

Eight AOCs have been identified:

- Building 131/242;
- Building 156;
- Building 158;
- Building 102
- Building 120 South;
- Building 130/166 AST/120/121;
- Former Maintenance Yard; and
- Building 180.

A summary of RBC exceedances are presented on Figures 5-1 through 5-3. The results of the AOPC screening and comparison to RBCs is presented below. Remedial alternatives to address risk-based cleanup and potential remedial actions for non-risk-based cleanup to background concentrations are presented in Section 5.

5.5.1 AOC Building 131/242

PCE, TCE, cis-1,2-DCE, and vinyl chloride exceed RBCs in Building 131/242, as described below.

- PCE, TCE, cis-1,2-DCE, and vinyl chloride exceeded RBCs in shallow groundwater (Figure 5-1);

- PCE in soil exceeded RBCs at one soil sampling locations beneath the northwest corner of Building 131 (Figure 5-2);

- PCE, TCE, cis-1,2-DCE, 1,1-dichloroethane (1,1-DCA), vinyl chloride, and benzene exceeded RBCs for soil gas (Figure 5-3).

5.5.2 AOC Building 156

PCE exceeds RBCs for soil and soil gas within AOC Building 156, and PCBs also exceed RBCs in one soil location, as described below.

- One soil sample exceeds RBCs for PCBs at one location in the southwestern portion of Building 156 (Figure 5-2);

- One soil samples exceed RBCs for PCE. One in the southwestern portion of Building 156 and two in the northeastern portion (Figure 5-2);

- PCE concentrations in soil gas exceed the RBCs for commercial workers (Figure 5-3).

5.5.3 AOC Building 158

Total and hexavalent chromium have been detected in soil and groundwater within the footprint of Building 158. One location in Building 158, (0158-GW-16) has additionally contained elevated VOC concentrations related to a sheen of TPH described as LNAPL. Chromium impacts are isolated to a relatively small area within the footprint of Building 158. Based on current RBCs there is a potential risk to anticipated on-Site receptors due to hexavalent chromium in soil and groundwater and VOCs in shallow soil, as described below.

- Groundwater concentrations exceed the construction and trench worker RBCs for CrVI (Figure 5-1).

- Soil concentrations exceed the construction worker RBCs for CrVI.

- LNAPL consisting primarily of naphthalene was observed at location 0158-GW-16 during previous assessment activities (H&A, 2004). Soil concentrations exceeded the RBCs for n-butylbenzene, ethylbenzene, n-propylbenzene, isopropylbenzene, naphthalene, xylene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and TPH (Figure 5-2). LNAPL was not observed in a

subsequent hydropunch boring/sample advanced in the vicinity of this location at location T-49 (Section 4.1).

- Four samples exceed RBCs for soil gas related to detections of vinyl chloride and benzene immediately to the southeast of Building 158.

5.5.4 AOC Building 102

1,2,4-Trimethylbenzene and naphthalene have been detected in excess of soil RBCs in one confirmation sample collected during the closure of this former UST area. TPH has also been detected above soil RBCs just below the water table. These samples were collected during the removal of a diesel UST. All NAPL observed in soil and shallow groundwater was reportedly removed during UST removal activities in 2003 (H&A, 2004).

5.5.5 AOC Building 120 South

TPH has been detected in excess of soil RBCs at two locations in the south central portion of Building 120. LNAPL containing PCB concentrations in excess of the Soil RBC has also been observed in test pits and excavations.

5.5.6 AOC Building 130/166 AST/120/121

This AOC incorporates Building 130, Building 166 AST, Building 120, and Building 121, which will be handled as a single AOC for remediation purposes. These areas have RBC exceedances in soil, groundwater, and soil gas, as described below.

- Soil samples exceeded RBCs for PCE in one location in the central portion of Building 120 and PCBs in the vicinity of the 30-inch East SWCS.

- Groundwater samples exceeded RBCs for PCE, TCE, and cis-1,2-DCE. PCBs also exceeded groundwater RBCs in one location south of Building 120.

- Soil gas samples exceeded RBCs for PCE, TCE, cis-1,2-DCE, carbon tetrachloride, 1,1,2-trichloroethane, and 1,1-DCA.

5.5.7 AOC Former Maintenance Yard

Groundwater samples in the area contain PCE at concentrations which appear to indicate a source of PCE separate from the Building 120 AOC in this area. Groundwater in this area is co-mingled with impacted groundwater from AOC Building

130/166 AST/120/121. This area has RBC exceedances in groundwater and soil gas, as described below.

- Four groundwater samples exceed the RBC for PCE; and
- Soil gas samples exceed the RBC for PCE and TCE.

5.5.8 AOC Building 180

VOCs have been detected in groundwater in the vicinity of the loading dock immediately south of Building 180. Only one groundwater sample exceeded RBCs and only for vinyl chloride in this area. TPH has also been detected above the soil RBC in one sample at 1foot bgs, and PCBs have been detected above the alternative PCB soil remediation goal in one soil sample at 1 foot bgs.

5.5.9 AOPC Explosives Area

PCBs were detected in one shallow soil at a concentration of 1.5 mg/kg (H&A, 2004) which exceeds the Alternate Soil PCB cleanup goal.

5.5.10 AOPC Test Cell #4/Area D

During 2005, a sheen (approximately 0.1 feet) of NAPL was observed in monitor well 142WNC, near the center of Test Cell #4/Area D. A NAPL sheen was subsequently observed in this area during a groundwater monitoring event in August 2007. The RWQCB is currently the lead agency for this former UST. No constituents exceed RBCs in this area.

5.5.11 AOPC Building 142

A 2,000 gallon gasoline underground storage tank was removed from the southeastern corner of Building 142 in 1990. A no further action determination was granted by the San Diego Department of Environmental Health in October 2000 (PES, 2001). Building 142 was identified as an AOPC in the Western Area RI/FS Work Plan (Geosyntec, 2006a) due to concentrations of PCE (280 µg/L) detected in groundwater south of Building 142. A subsequent groundwater sample collected from monitor well 142WDP, located approximately 25 feet north of this historical hydropunch sample contained no detectable PCE in 2005 (Geosyntec, 2005). Groundwater in the vicinity of Building 142 does not exceed RBCs.

5.5.12 AOPC Southeast of Building 146

One groundwater sample collected in 2003 slightly exceeded RBCs for vinyl chloride in AOC Building 146 for the construction worker, groundwater to outdoor air pathway. More recent sampling at this location in 2005 suggests that groundwater no longer exceeds any RBCs.

5.5.13 AOPC Building 120 West

PCBs were detected in two shallow soil samples at concentrations of less than the RBC, but above the alternative soil PCB cleanup standard. No soil, soil gas, or groundwater samples exceed RBCs (Geosyntec, 2005).

5.5.14 AOPC Building 222/228

Soil samples collected west of former Building 228 contained PCBs, chromium, cobalt, lead, mercury, nickel, and zinc above site-specific background concentrations. No soil, soil gas, or groundwater samples exceed RBCs. However, one soil sample exceeded the alternate soil PCB cleanup goal (Geosyntec, 2005).

5.5.15 AOPC South of Building 121

PCBs were detected in one shallow soil sample at a concentration of less than the RBC, but above the alternative soil PCB cleanup standard (Geosyntec, 2005).

5.5.16 AOPC Storm Water Conveyance System

PCBs were detected in sediments within the 60-inch SWCS in excess of RBCs following cleanout efforts in 2006. Impacts to sediment and from groundwater seeps within the 54-inch and 60-inch SWCS are evaluated in Appendix A of the Site Wide Risk Assessment (Geosyntec, 2007). Interim actions to address PCB impacted sediment and prevent migration to San Diego Bay will be implemented, if needed, until storm drain tributaries are removed during anticipated demolition activities. An evaluation of the feasibility of remedial alternatives, based on the results of the Risk Assessment is presented in Appendix A.

6.0 FEASIBILITY STUDY

In accordance with directive D.3.b of the CAO, a feasibility study of potential remedial alternatives was conducted for each AOC and AOPC. This feasibility study evaluates alternatives, including the cost and effectiveness of each alternative for the remediation of soil, groundwater, and SWCS impacts to risk based cleanup levels, as well as the feasibility of cleanup to background conditions per the directives of RWQCB Order No. 92-49. A recommended remedial alternative is presented for each AOPC based on the findings of the feasibility study in accordance with directive D.3.c of the CAO.

As presented in Section 5, AOPCs that contain concentrations of constituents in exceedance of RBCs are labeled as an AOC. This feasibility study consists of a screening analysis of potential remedies and a more detailed feasibility analysis of remedies considered potentially appropriate.

6.1 Screening Analysis

The screening analysis was conducted to reduce the number of potentially applicable alternatives to those that were determined to be readily implementable, considered potentially cost effective, and able to achieve the following remedial goals.

The primary remedial goals for AOCs are:

- Reduction of constituent concentrations in soil and groundwater to below RBCs for all constituents;
- Reduction of constituent concentrations of PCBs in soil to below the proposed alternate cleanup goal of 1.0 mg/kg; and
- Removal of LNAPL if present.

The secondary remedial goal for AOCs is:

- Elimination of impacts by achieving background concentrations.

The primary remedial goal for the AOPCs is:

- Reduction of constituent concentrations of PCBs in soil to below the proposed alternate cleanup goal of 1.0 mg/kg; and
- Removal of LNAPL if present.

The secondary remedial goal for AOPCs is:

- Elimination of impacts by achieving background concentrations.

The retained alternatives for each AOC/AOPC are presented in Section 6.4.

6.2 Detailed Feasibility Analysis

Each remedial alternative retained from the screening analysis was subjected to a detailed analysis against four criteria. These criteria are presented below.

Effectiveness

Effectiveness was evaluated on: the ability to reduce constituent concentrations below RBCs; the ability to remove LNAPL if present; and secondarily the ability to achieve background concentrations.

Areas that contain constituents at concentrations greater than background, but that do not exceed RBCs were evaluated as AOPCs. In these areas, effectiveness was evaluated simply on the ability to remove LNAPL if present, and secondarily the ability to achieve background concentrations.

Implementability

The implementability evaluation was based on the ability to construct and reliably operate each alternative. Specific factors evaluated were: availability of equipment, material, and technical personnel; ability to meet technology-specific regulations until the remedial action is complete; and operation, maintenance, replacement, and monitoring of the remedial alternative components. Each remedial alternative was rated as readily implementable, moderately implementable, or difficult to implement based on the criteria above.

Overall Protection of Human Health

Remedial alternatives were evaluated with respect to their overall ability to be protective of human health both during implementation, and after remediation was completed. Specific factors considered were protection of the general public and Site workers during the remedial action and the anticipated time frame required to reduce risk or hazard. A longer time frame was considered less protective overall than a shorter time frame.

Because AOPCs do not contain impacts exceeding risk-based cleanup goals, this criterion only applies to AOCs. It should be noted; however, that large excavations targeting non-risk based cleanup standards (background) have inherent potential for increased risk to human health due to traffic and construction accidents. Also, when an excavation is performed to non-risk based standards, the incremental benefit from the reduced soil concentrations at the Site must be weighed against the increased carbon footprint which results from expanded excavation, transport and disposal activities.

Cost

An evaluation of both capital and annual costs was performed. Capital costs include both direct and indirect costs. Annual costs are post-construction costs necessary to ensure the continued effectiveness of a remedial action alternative. The result of the cost evaluation is presented numerically within the AOC or AOPC; these cost estimates are only an approximation based on the currently understood potential system design. Average unit costs which are incorporated into cost tables are provided in Table 6-1. A range of potential volumes or units are presented to illustrate how unit costs are affected by economies of scale, oversight, and mobilization costs which, when distributed across a larger project, result in lower overall unit costs for some remedial options. Costs presented on Table 6-1 provide a generalized unit cost for the scopes of work/volumes indicated. Estimated unit costs included on the AOC/AOPC cost tables may vary from the averages presented in Table 6-1 due to AOC/AOPC specific considerations regarding access/clearance or other unique circumstances.

6.3 Technology Descriptions

Technologies considered for possible application at the Site are presented below. The technologies which were eliminated from consideration are presented first, followed by the retained technologies.

6.3.1 Eliminated Technologies

Remedial action alternatives were screened and eliminated from the proposed options for initial implementation in the Western Area RI/FS Work Plan and RI/FS Work Plan (Geosyntec, 2006a and 2006b). These include:

- Ozone sparging;
- Potassium permanganate and modified Fenton's reagent;
- In-situ reduction (ISR) using ZVI;
- Ex-Situ Electrocoagulation; and

- Ex-Situ Reduction/precipitation.

Ozone sparging was considered for the treatment of VOCs in groundwater. This alternative was eliminated during the screening analysis due to the proximity of the potential amendment areas to the ground surface and to underground utilities. In-situ chemical oxidative technologies, such as potassium permanganate and modified Fenton's reagent, were also considered for the treatment of VOCs in groundwater. However, these technologies would not efficiently reduce the concentrations of the COCs below RBCs.

ISR using ZVI was considered for treating VOCs or CrVI in groundwater. However, based on the bench-scale treatability study using ZVI for treatment of CrVI in groundwater (Section 4.1.2), ZVI does not appear to be effective for the Site conditions. The ZVI may possibly be hindered by the salinity of the groundwater.

Electrocoagulation and reduction/precipitation were considered for ex situ treatment of CrVI in groundwater. However, due to cost and increased exposure to groundwater related to ex-situ treatment, it is recommended that CrVI impacted groundwater be treated in-situ.

6.3.2 Retained Technologies

The following technologies were retained for further analysis:

- No Action;
- Monitored natural attenuation (MNA);
- Enhanced In-Situ Bioremediation (EISB);
- In-situ reduction (ISR) using $FeSO_4$ by injection;
- ISR using $FeSO_4$ by In-situ soil mixing;
- ISR using Emulsified Vegetable Oil (EVO) by injection;
- Two-phase extraction (TPE);
- Soil vapor extraction (SVE);
- Chemical Oxidation/Biostimulation
- Targeted excavation;
- Alternative excavation areas; and
- Whole AOC/AOPC excavation.

These technologies are described below along with a discussion of their effectiveness.

6.3.2.1 No Action

This alternative consists of performing no work now or in the future to attempt to mitigate an existing condition. For No Action to be considered an acceptable alternative, the concentrations of the COCs would have to be below RBCs and below the alternative PCB cleanup criteria for soil of 1.0 mg/kg.

The relative ability of this alternative to achieve RBCs or the alternate soil PCB criteria is low and is considered ineffective. Implementation of No Action may not change present conditions. Based on observed indicators of natural attenuation, it is possible that background concentrations could be achieved over time. However, for persistent constituents such as metals and PCBs, the alternative would not affect existing concentrations. This alternative does not include long-term monitoring. Changes to constituent concentration or potential offsite migration would not be documented.

This alternative may require an extended period of time to reach remedial objectives, based on constituent concentrations and Site conditions.

6.3.2.2 Monitored Natural Attenuation

MNA refers to the monitoring of natural processes working to achieve site-specific objectives. Natural processes include a variety of physical, chemical, or biological processes that, under favorable conditions, act without human intervention to reduce the mass, toxicity, mobility, volume, or concentration of constituents in media of concern. These processes include biodegradation, dispersion, dilution, sorption, volatilization, and chemical or biological stabilization, transformation, or destruction of constituents. To be considered an acceptable alternative, MNA would be expected to achieve remedial objectives comparable to that offered by other more active methods.

The relative ability of this alternative to reduce concentrations to below RBCs in the near-term may be low. This alternative requires a time to monitor naturally occurring changes over time. It is possible that MNA would prove to be moderately effective for certain constituent concentrations under the conditions at the Site. However, this alternative may require an extended period of time to reach remedial objectives for some AOCs.

6.3.2.3 Enhanced In-Situ Bioremediation

EISB is a technology that uses subsurface bacteria to degrade VOCs in groundwater. Chlorinated constituents, such as PCE and TCE can be biodegraded, under proper conditions, by both reductive dechlorination and direct oxidation. EISB uses the

application of nutrients and other elements to ensure optimum conditions in the subsurface for the degradation/dechlorination mechanisms to occur using the indigenous bacteria. EISB involves the addition of specific bacteria (*Dehalococcoides Ethenogenes*) when the indigenous bacteria cannot completely degrade chlorinated ethenes. A wide variety of EISB technologies are currently in use that utilize one or more of these degradation mechanisms.

The relative ability of EISB to reduce constituent concentrations in groundwater to below RBCs is high. It is expected that EISB will reduce VOC groundwater concentrations to the RBCs within 2 to 3 years with an aggressive implementation approach.

Baseline data from the Pilot Study area shows that biodegradation is occurring naturally in this area as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-3-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates and time to reach background after the Pilot Study, VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation.

The relative ability of this alternative to achieve remedial objectives for soil gas is moderately high. Volatilization of constituents in groundwater is the apparent source of impacted soil gas at the Site. VOC concentrations in soil gas are expected to be reduced over time as groundwater is remediated. Soil gas concentrations will be measured at the end of the remedial groundwater action to evaluate risk to human health from soil gas.

6.3.2.4 In-Situ Reduction Using Ferrous Sulfate by Injection

Ferrous Sulfate ($FeSO_4$) is a low oxidation-state chemical species which serves as an electron donor to reduce CrVI to CrIII. $FeSO_4$ can be dissolved into water and injected in-situ, using direct push technologies, to treat soil and groundwater.

The relative ability of $FeSO_4$ injection to achieve RBCs in groundwater is high. It is expected that the addition of $FeSO_4$ will reduce the CrVI concentrations in groundwater to the RBC within weeks. Because of the high starting concentration of total chromium in this area, it is unlikely that total chromium concentrations in groundwater will reach background. Because this technology reduces CrVI to CrIII (a less soluble and less

toxic form of chromium), the mass of total chromium will not change, and background will not be achieved for total chromium in soil.

6.3.2.5 In-Situ Reduction Using Ferrous Sulfate by Soil Mixing

ISR using $FeSO_4$ by soil mixing uses the same chemical principals as ISR through direct injection. However, the soil mixing approach applies the $FeSO_4$ directly to the soil through the drill stem of a bucket-auger. This application method greatly improves overall contact of the $FeSO_4$ through low-permeability soils while mitigating potential rebound due to preferential injection pathways or incomplete contact of the $FeSO_4$ with impacted soils.

The relative ability of soil mixing to achieve RBCs in groundwater is high due to the improved contact and distribution of the $FeSO_4$ in the subsurface. The relative ability to achieve RBCs in vadose zone soil is moderate as it may be difficult to achieve full contact throughout the soil column in the vadose zone.

6.3.2.6 In-Situ Reduction Using Emulsified Vegetable Oil by Injection

Emulsified vegetable oil (EVO) serves as an electron donor for naturally occurring microbial cultures in the subsurface. The availability of electron donor allows these microorganisms to create reductive conditions in the groundwater. These reducing conditions promote the reduction of CrVI to CrIII. EVO can be dissolved into water and injected in-situ, using direct push technologies, to treat soil and groundwater.

The relative ability of EVO injection to achieve RBCs in groundwater is high. Although the reduction process is not as rapid as the direct chemical reduction from FeSO4, electron donor concentrations measured as total organic carbon are expected to remain elevated for up to two years. It is expected that the addition of EVO will reduce the CrVI concentrations in groundwater to the RBC within months. The long-term reducing environment stimulated by the addition of EVO will improve the ability to reduce chromium concentrations within fine grained materials, reducing rebound conditions which can be caused by incomplete contact with short-lived reductants.

Because of the high starting concentration of total chromium in this area, it is unlikely that total chromium concentrations in groundwater will reach background. Because this technology reduces CrVI to CrIII (a less soluble and less toxic form of chromium), the mass of total chromium will not change, and background will not be achieved for total chromium in soil.

6.3.2.7 Two-Phase Extraction

TPE uses a vacuum applied to a groundwater monitor well to remove soil vapor, groundwater, and mobile LNAPL from within the well and surrounding soil. TPE would also improve the potential flow of any mobile LNAPL in the capillary fringe from the surrounding soil into the well for removal, and generate soil vapor flow within the vadose zone and dewatered capillary fringe. TPE also stimulates aerobic degradation of petroleum hydrocarbons by pulling oxygen into the subsurface.

The relative ability of this alternative to achieve LNAPL removal and reduction of soil gas and groundwater impacts is moderate. Implementation of TPE would remove available LNAPL, and could achieve background concentrations for some VOCs in soil and groundwater in the immediate vicinity of the extraction zone. Groundwater and soil concentrations may remain unchanged outside the radius of influence of the extraction zone. However, targeted implementation of TPE can efficiently address source zones and remove mass to support closure of an isolated area.

6.3.2.8 Soil Vapor Extraction

SVE is a proven technology for removing VOCs from the vadose zone. SVE is an option for in-situ treatment of TPH in soil at the Site. A pilot study may be performed to gather information on extracted soil gas from the Site. The quality and concentration of compounds in the extracted soil vapor must be evaluated prior to selection of a vapor treatment technology. SVE also stimulates aerobic degradation of petroleum hydrocarbons by pulling oxygen into the subsurface.

Targeted implementation of SVE can efficiently address source zones and remove mass to support closure of an isolated area. The relative ability of this technology to reduce constituent concentrations to below RBCs is high and to achieve background concentrations is moderate.

6.3.2.9 Chemical Oxidation/Biostimulation

Chemical oxidation followed by biostimulation is an option for in-situ treatment of TPH in saturated soil and shallow groundwater at the Site. RegenOx with ORC Advanced would be injected to promote biodegradation of TPH impacts accumulated at the water table. RegenOx would reduce the initial concentrations and make the remaining TPH more bioavailable. The ORC Advanced would stimulate the aerobic microbial community to further break down the remaining TPH impacts.

Targeted implementation of chemical oxidation with biostimulation can efficiently address source zones and remove mass to support closure of an isolated area. The relative ability of this technology to reduce constituent concentrations to below RBCs is high and to achieve background concentrations is moderate.

6.3.2.10 Targeted Excavation

A targeted excavation consists of the localized removal of soil specifically to remove a hot-spot of impacted soil. Excavated soil would be hauled offsite for disposal.

The relative ability of targeted excavation to reduce risk in soil and achieve background concentrations within the area excavated is high, as the soil exceedance would be directly removed. However, the direct cost and indirect impacts (related to traffic, landfill use, and greenhouse gas emissions) must be evaluated against the relative reduction in potential risk and maximum benefit to the people of the state of California realized from the implementation of the remedial action.

6.3.2.11 Alternative Excavation Areas

Alternative excavation areas are excavations performed to potentially expedite the remediation of VOCs or TPH impacted soil or groundwater or to provide further reductions in soil concentrations to below RBC values. During the Site characterization activities, two AOPCs were determined to potentially contain residual DNAPL and two were determined to potentially contain residual LNAPL, based on observed groundwater concentrations of VOCs and TPH. To supplement natural attenuation or EISB of VOCs and more quickly attain RBCs, those areas with potential NAPL, if present, could be excavated (Figure 6-2)

While only individual points across the Site exceed RBCs for metals in soil (readily addressed by targeted excavation), there are some larger areas over which metals exceed background. Because metals in soil will not naturally attenuate, some areas would require more significant excavation to achieve background levels.

Four areas of the Site contain PCB concentrations less than the RBC, but greater than the proposed alternative PCB cleanup goal. These areas have also been designated as potential alternative excavation areas. An evaluation of the technical and economic feasibility of cleanup of PCBs to background was performed on a site-wide basis based on the incremental cost for performing additional excavation activities vs. the incremental mass removed by that action (Section 5.3). The unit costs underlying the calculated site-wide incremental costs per mass removed are essentially the same regardless of the size of the excavation, so the incremental costs per mass removed are

similar in an AOPC specific evaluation. For example, in the former explosives area AOPC, which has approximately 20 yards of soil exceeding a 1 mg/kg alternative cleanup standard and an additional 60 yards of soil exceeding background (<0.05 mg/kg), a remedy removing the first 20 yards of soil would result in an overall removal of approximately 44 grams of PCBs. This is an estimated reduction of 0.6% of site PCB mass and would cost approximately $19,000 (approximately $31,600 per percent mass removed). The remaining 60 yards would result in an overall removal of approximately 3 grams. This is an estimated reduction of 0.05% of Site PCB mass and cost approximately $57,000 (approximately $1,140,000 per percent mass removed).

Cleanup Goal	Estimated incremental PCBs mass removed (kg)	% of total Site mass	Estimated Volume of Soil (yd^3)	estimated incremental cost	Cost per incremental % PCB mass removed
1 mg/kg	0.044	0.6%	20	$ 19,000	$31,600
ND<0.05 mg/kg	0.003	0.05%	60	$ 57,000	$1,140,000

These incremental costs are comparable to the site-wide incremental costs presented in Section 5.3.

These moderately sized excavations could achieve background concentrations or alternate cleanup goals for some constituents and remove NAPL, if present. Therefore this option is highly effective. However, the direct cost and indirect impacts of additional excavations (related to traffic, landfill use, and greenhouse gas emissions) must be evaluated in relation to the relative benefit of further reduction in on-site constituent concentrations below RBCs to determine if the additional excavation is consistent with the goal of achieving the maximum benefit to the people of the state of California.

6.3.2.12 Whole-AOC/AOPC Excavation

Whole AOC/AOPC excavation would consist of the removal and offsite disposal of all soil exceeding background (Figure 6-3). Excavation occurring below the groundwater table would require dewatering. For the purposes of the feasibility study, it is assumed that the permeability of the saturated soil at the Site is low enough that dewatering of the excavation can be effectively accomplished using trash pumps. Excavated soil would be staged for offsite disposal using roll-off bins.

The relative ability of excavation with dewatering to achieve background concentrations within the area excavated is high, as the soil exceedances would be

removed. The groundwater directly underlying and within the vicinity of the excavation, would also be removed from the Site. There is an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

6.4 Remedial Alternatives by AOC/AOPC

Each retained technology is described below for each AOC/AOPC. The remedial alternatives retained from the screening analysis were subjected to the detailed analysis criteria. The effectiveness of each technology is discussed in Section 6.3.2. This section compares AOC/AOPC specific criteria of implementability, overall protection of human health, and cost of each alternative.

The technologies which are identified as technically feasible for each AOC are subsequently evaluated on a basis of economic feasibility as described in State Water Resources Control Board Resolution 92-49, in which the incremental benefit of attaining further reductions in the concentration of constituents are compared with the incremental cost of achieving those reductions. Evaluated costs and benefits include, current and planned future land use and social or economic impacts to the surrounding community. Based on this combined technical and economic evaluation, a recommended remedial action is presented.

6.4.1 AOC Building 131/242

AOC Building 131/242 contains exceedances of RBCs for VOCs in soil, soil gas, and groundwater. The primary remedial goal for this AOC is reduction of human health risk to acceptable levels, defined as achieving the site-specific RBCs presented in Tables 5-1 through 5-4. The secondary remedial goal is achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action;
2. MNA for VOCs in groundwater;
3. EISB for VOCs in groundwater and targeted excavation for hot-spot VOCs in soil;

4. Alternative excavation of the area indicative of potential DNAPL in groundwater to approximately 10 feet bgs and targeted excavation for hot-spot VOCs in soil followed by EISB; and

5. Whole-AOC excavation of soil that exceeds background concentrations, to approximately 10 feet bgs, with dewatering.

The results of the detailed analysis of alternatives for this AOC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-2.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable with regard to the criteria as defined in Section 6.2.

Overall Protection of Human Health

The overall ability of No Action to be protective of human health is limited, because the concentrations of constituents that exceed RBCs will not be evaluated by the implementation of No Action. Based on observed indicators of natural attenuation, it is possible that background concentrations would be achieved over time. However, without a monitoring program, future Site conditions would be unknown.

Cost

No costs would be expected by implementation of this alternative.

Alternative 2 – Monitored Natural Attenuation

Implementability

MNA is readily implementable at the Site since a monitoring program, required infrastructure, and equipment already exists. Additional monitor wells could be readily installed if needed.

Overall Protection of Human Health

The overall ability of MNA to be protective of human health at this AOC is low. Little to no near-term reduction of risk would be provided by this alternative. Measures to

reduce worker exposures would be required for trenching and construction work during Site redevelopment and engineering controls would be required after Site redevelopment. The long-term exposure is reduced over time but the time frame to achieve this reduction is long.

Cost

The cost to implement MNA would be low with respect to both capital costs and O&M costs. The approximate cost of implementing MNA is $403,000. Capital costs would primarily be associated with installation of monitor wells. O&M costs would primarily be associated with sample collection and analysis, data trending, and reporting. The estimated cost assumes that this area would be monitored for 30 years due to the high concentrations of VOCs in this AOC.

Alternative 3 – Enhanced In-Situ Bioremediation and Targeted Excavation

Implementability

This alternative is highly implementable. EISB has been successfully used for the remediation of DNAPL source zones at similar sites across the country (ITRC, 2007). Based on the results of the bench-scale and pilot scale studies, addition of electron donor and microbial culture can achieve rapid dechlorination rates. Direct push technology was used during the Pilot Study to inject a grid of dechlorinating electron donor and microbial culture. The approximate area of electron donor and microbial culture injection is shown in Figure 6-1. Monitoring data is provided in Appendix G. Approximately one month was required to inject the electron donor and microbial culture at 254 points, using direct push rods as temporary injection points.

One targeted excavation would be performed surrounding a soil sample with PCE concentrations in soil that exceed RBCs. The extent of targeted excavation would cover approximately a 20 foot by 20 foot area around the one elevated soil concentration in the northeast corner of Building 131 (Figure 6-2). Soil would be excavated to the groundwater surface, approximately 7 feet bgs. The volume of soil removed would not generate technical or administrative challenges.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Exposure to RBC exceedances in soil would be immediately eliminated. Under this alternative, there would be no immediate elimination of groundwater RBC exceedances although

RBCs in groundwater could be achieved in the near term (likely within approximately 2 years).

Baseline data collected prior to the Pilot Study indicates that biodegradation is occurring naturally in this area as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates and time to reach background after the Pilot Study, VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation.

Cost

The relative cost for this alternative is medium with respect to other alternatives for this AOC. This alternative would cost approximately $1,622,000 associated with the cost of excavation and disposal of soil, electron donor, biological media, and labor and equipment involved in injection of EISB products. The volume of soil to be excavated and disposed of is low, and therefore the excavation cost is relatively low.

Alternative 4 – Alternative Potential DNAPL Area Excavation with EISB and Targeted Excavation

Implementability

The relative implementability of this alternative is moderate. The excavation area is approximately 17,100 square feet, based on the area of concentrations of VOCs indicative of DNAPL in groundwater, as delineated in the Site Characterization Report (Geosyntec, 2005; Figure 6-2). The depth of soil excavated would be approximately 10 feet. Approximately 6,500 cubic yards of soil and 410,000 gallons of groundwater would need to be disposed of properly. The volume of soil removed may generate technical or administrative challenges, and may result in the generation of nuisance vapors in the adjacent public parking area. Some shoring may be required along the western wall of Building 131 due to the proximity of the excavation to the foundation. Building 242 would need to be removed to make this action feasible. It is anticipated that this building will be removed during Site demolition activities beginning in July 2010.

EISB would be coupled with the excavation to eliminate groundwater RBC exceedances not addressed during the excavation. Direct push technology could be used to inject a grid of dechlorinating electron donor and microbial culture (Figure 6-1).

Monitor wells would also be installed in addition to existing monitor wells to monitor the surrounding area. Approximately one month would be required to inject the electron donor and microbial culture.

One additional targeted excavation would be required in the northwest corner of Building 131, due to an RBC exceedance for PCB in soil at one location. The targeted would cover a 20 foot by 20 foot area, excavated to 7 feet bgs or until groundwater is encountered.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Short-term exposure to soil exceedances would be immediately eliminated. There would be no immediate elimination of groundwater RBC exceedances although RBCs in groundwater should be achieved in the near term (likely within approximately 2 years). Baseline data collected prior to the Pilot Study indicates that biodegradation is occurring naturally in this area as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates and time to reach background after the Pilot Study, VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation.

The residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the increased risk associated with any large construction excavation action resulting from the operation of heavy machinery and increased road traffic. There is also a risk of public exposure to nuisance vapors with an excavation activity adjacent to the existing public parking area. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

This alternative would cost approximately $4,918,000. This is due to the cost of electron donor, biological media, labor and equipment involved in excavation and injection of EISB products, and disposal of 6,500 cubic yards of excavated soil and 410,000 gallons of groundwater as hazardous waste.

Alternative 5 – Whole-AOC Excavation and Dewatering

Implementability

This alternative is relatively difficult to implement. Excavation to approximately 10 feet bgs across the entire delineated AOC (approximately 48,100 square feet) represents a major excavation action (Figure 6-3). Approximately 17,900 cubic yards of soil and 1,160,000 gallons of groundwater would be removed. Sufficient volumes of suitable clean fill could be difficult to locate. Truck traffic through the Site and over public roads near the Airport would likely generate public concerns over traffic congestion. Air emissions from truck traffic and volatilizing compounds during the work would likely generate concerns from the public and regulatory agencies.

Shoring or appropriate sloping of the excavation walls is required to ensure a safe working environment, and avoid sloughing, and thus excessive soil removal. This alternative cannot be performed with the current buildings in place, which are expected to be removed during Site demolition activities beginning in July 2010. However, whole-AOC excavation and dewatering would be more implementable, but still difficult after demolition activities are completed.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Exposure to soil and groundwater exceedances would be essentially eliminated. However, this technology cannot be implemented in advance of demolition. The residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the incidental increased risk associated with any large construction excavation action resulting from the operation of heavy machinery and increased road traffic.

Environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

This alternative represents the highest cost at approximately $10,703,000. The primary cost elements are associated with excavation and offsite disposal of approximately 17,900 cubic yards of soil and 1,160,000 gallons of water.

Recommended Remedial Option

While all of the evaluated alternatives are considered technically feasible, Alternative 1, "No Action" is not sufficiently protective of human health given current soil and ground water concentrations in this AOC.

Alternative 2 "Monitored Natural Attenuation" is also not considered to be sufficiently protective of human health given the long time frame anticipated to reach risk based concentrations or background.

Alternative 3 "EISB with Targeted Excavation" would achieve risk based concentrations. Based on the pilot study performed within this AOC to evaluate the EISB alternative, it is estimated that RBCs can be met across the AOC within approximately 2 years. Baseline data collected prior to the Pilot Study indicates that biodegradation is occurring naturally in this area as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. While there is not currently sufficient data to evaluate natural degradation rates and time to reach background after the Pilot Study, VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation. The small scale of the proposed excavation would not pose significant construction risk or cause significant environmental impact.

Alternative 4 "Alternative Potential DNAPL area Excavation with EISB and Targeted Excavation" would remediate the source area rapidly through direct excavation. However, since EISB remedial timeframes for the potential DNAPL area and the balance of the AOC are substantially similar (as observed during the Building 131/242 EISB Pilot Study (Appendix G)), there would be no difference in remediation timeframe between this alternative and the EISB with Targeted Excavation alternative. Similarly, there would be no difference in anticipated final constituent concentrations between this alternative and the EISB with Targeted Excavation alternative. There is an incremental risk associated with the operation of heavy machinery and increased road

traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. Although the footprint of the proposed remedial area is equivalent for Alternatives 3 and 4, Alternative 4 is estimated to cost approximately $3,300,000 more than Alternative 3.

Because there is no difference in the timeframe, proposed cleanup area, or anticipated final constituent concentrations in the AOC to offset the increased cost, physical risk, and environmental impacts of a large excavation activity, this alternative is not economically feasible vs. Alternative 3.

Alternative 5 "Whole AOC Excavation" would not be technically feasible until demolition has been completed. According to the schedule provided by the Port, demolition in this area will be completed no sooner than August, 2010. Because of this constraint, although the alternative would immediately reduce constituent concentrations to background through direct excavation, the overall timeframe for the remedial process is no better than that of Alternatives 3 and 4 which could be implemented in advance of demolition.

Baseline data collected prior to the Pilot Study indicates that biodegradation is occurring naturally in this area as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs are likely to be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates and time to reach background after the Pilot Study, VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation. There is an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Alternative 5 is estimated to cost approximately $5,800,000 more than Alternative 4 and $9,000,000 more than Alternative 3.

Based on this assessment, this Alternative is not economically feasible. The incremental benefit of further reducing constituent concentrations vs. Alternative 3, would not be offset by the increased cost, physical risk, and environmental impacts of a large excavation activity.

The recommended remedial alternative for this AOC Building 131/242 is Alternative 3 "EISB with targeted excavation". The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

VOC concentrations in soil gas are expected to decline as sources are removed in nearby soil and groundwater. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts from the Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

It is anticipated that the proposed remedial action (EISB with targeted excavation) will reduce the remaining VOC mass in place, to below RBCs likely within approximately 2 years and to background conditions over time. Groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. The excavation would remove the RBC exceedance in soil. Due to extremely low hydraulic gradient, groundwater velocities in the Building 131/242 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors, along with the natural degradation processes observed prior to the EISB pilot study, cause the footprint of impacted groundwater to be very stable to declining and unlikely to migrate to Convair Lagoon.

Based on historical Site data, lateral migration of impacted groundwater appears to be in equilibrium with natural attenuation of the constituents, which results in a stable or decreasing area of impact over time. Based on current Site data, natural attenuation is also expected to further reduce the concentrations of residual VOCs in areas which are currently below RBC levels and not directly addressed by Alternative 3. As a result, it is unlikely that impacted groundwater will migrate to Convair Lagoon over time.

The primary remedial goal (i.e., achieving RBCs) proposed for the recommended remedial option for this AOC is consistent with maximum benefit to the people of the State in that further reduction of the anticipated residual constituent concentration

would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. This combination of technologies has been proven to be effective in reducing short- and long-term risk or hazard. It is also implementable, protective of human health, and cost effective.

6.4.2 AOC Building 156

This AOC is impacted with PCBs and PCE in soil at concentrations that exceed RBCs. In addition, PCE in soil gas exceeds RBCs. The primary remedial goal for this AOC is reduction of human health risk to acceptable levels, defined as achieving the site-specific RBCs presented in Tables 5-1 through 5-4. The secondary remedial goal is achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action;
2. Targeted excavations for PCBs and PCE exceeding RBCs in soil;
3. Alternative excavation of metals exceeding background concentrations in soil; and
4. Whole-AOC excavation of soil that exceeds background concentrations, to approximately 10 feet bgs, with dewatering.

The results of the detailed analysis of alternatives for this AOC are presented below, along with a brief description of each alternative. The results are summarized for comparison in Table 6-3.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable with regard to the criteria as defined in Section 6.2.

Overall Protection of Human Health

The overall ability of No Action to be protective of human health is limited, because the concentrations of compounds that exceed RBCs will not be mitigated by performing No Action.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Targeted Excavations

Implementability

Targeted excavations are readily implementable for the AOC Building 156. Two targeted excavations would be required (Figure 6-2). The extent of each targeted excavation would cover approximately a 10 foot by 10 foot area around one PCB RBC exceedance as well as one PCE RBC exceedance. The depth of soil would be excavated to approximately 5 feet bgs. The volume of soil removed would not generate technical or administrative challenges.

Overall Protection of Human Health

The overall ability of targeted excavations to be protective of human health at this AOC is high. RBC exceedances in soil would be eliminated. The PCE RBC exceedances in soil gas would reduce as the constituents remaining in groundwater and soil naturally degrade.

Cost

The relative cost to implement targeted excavations would be low due to capital costs and no O&M costs would be incurred. The cost is approximately $35,000 for removal and disposal of excavated soil as hazardous waste and associated excavation backfill costs.

Alternative 3 – Alternative Metals Excavation

Implementability

Alternative excavation of metals in soil to background concentrations is moderately implementable at the Site. The extent of the proposed excavation would cover approximately an area of 24,100 square feet (Figure 6-2). Soil would be excavated to a

depth of approximately 5 feet bgs. The volume of soil removed would be approximately 4,500 cubic yards. The alternative excavation areas are located beneath Building 156. Due to the nature of the construction of this building, this alternative could not be implemented with the building remaining in place. However, metals excavation and dewatering would be readily implementable after demolition activities in this area have been completed.

Overall Protection of Human Health

The overall ability of alternative excavation to be protective of human health at this AOC is high. RBC exceedances in soil would be eliminated and residual metals concentrations would be reduced to background. The PCE RBC exceedances in soil gas would also be eliminated during the soil removal activity. However, there is an increased risk associated with any large construction excavation action resulting from operation of heavy machinery and increased road traffic. The residual concentrations additionally addressed by this Alternative vs. Alternative 2 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

The relative cost to implement an excavation of metals to background would be high due to capital costs and no O&M costs would be incurred. The cost is approximately $2,300,000 for removal and disposal as hazardous waste of 4,500 cubic yards of soil.

Alternative 4 – Whole-AOC Excavation and Dewatering

Implementability

Excavation of metals and VOCs in soil to background concentrations is relatively difficult to implement. Excavation to approximately 10 feet bgs across the entire delineated AOC (approximately 70,000 square feet) (Figure 6-3) represents a major excavation action. Approximately 26,000 cubic yards of soil and 1,680,000 gallons of groundwater would be removed. Sufficient volumes of suitable clean fill could be

difficult to locate. Truck traffic through the Site and over public roads near the Airport would likely generate public concerns over traffic congestion. Air emissions from truck traffic and volatilizing compounds during the work would be difficult to control and would likely generate concerns from the public and regulatory agencies.

Shoring or appropriate sloping of the excavation walls would be required to ensure a safe working environment, and avoid sloughing, and thus excessive soil removal. This alternative is not feasible with the current buildings in place. However, whole-AOC excavation and dewatering would be more implementable, yet still difficult, after demolition activities are completed.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Short- and long-term exposure to soil and groundwater exceedances would essentially be eliminated. However, there is an increased risk associated with large construction excavation actions, resulting from the operation of heavy machinery and increased road traffic. The residual concentrations additionally addressed by this Alternative vs. Alternative 2 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

This alternative has a high cost of approximately $14,324,000. The primary cost elements are associated with excavation and offsite disposal of approximately 26,000 cubic yards of soil and removal of approximately 1,680,000 gallons of water.

Recommended Remedial Option

While all of the evaluated alternatives are considered technically feasible, Alternative 1, "No Action" is not sufficiently protective of human health given current soil concentrations in this AOC.

Alternative 2 "Targeted Excavation" would achieve risk based concentrations immediately upon removal of the impacted soil. This Alternative would be readily implementable in advance of demolition activities. The small scale of the proposed excavations would not pose significant construction risk or environmental impact.

Alternative 3 "Alternative Metals Excavation" would remediate the area with metals above background rapidly through direct excavation, but this alternative could not be implemented in advance of demolition. Alternative 2 would result in more rapid achievement of RBC goals because it could be implemented in advance of demolition, reducing potential exposure of demolition workers to soil impacts. According to the schedule provided by the Port, demolition in this area will be completed no sooner than August 2010. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Because all RBC exceedances are addressed immediately by Alternative 2, the benefit which would be achieved by attaining background concentrations for metals is relatively small, and is offset by the near term achievement of RBC goals in advance of Site demolition. There is an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. Alternative 3 is estimated to cost approximately $2,300,000 more than Alternative 2.

Based on this assessment, this alternative is not economically feasible. The incremental benefit of further reducing constituent concentrations vs. Alternative 2 would not be offset by the increased near-term exposure of construction workers, increased cost, physical risk, and environmental impacts of a large excavation activity.

Alternative 4 "Whole AOC Excavation" would remediate the area with metals and VOCs above background rapidly through direct excavation, but this alternative could not be implemented in advance of demolition. According to the schedule provided by the Port, demolition in this area will be completed no sooner than August 2010. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Because all RBC exceedances are addressed immediately by Alternative 2, the benefit which would be achieved by attaining background concentrations for metals and VOCs is relatively small, and is offset by the near term achievement of RBC goals in advance of Site demolition afforded by Alternative 2. There is an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental

impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. Alternative 4 is estimated to cost approximately $14,300,000 more than Alternative 2 and $10,000,000 more than Alternative 3. Based on this assessment, this Alternative is not economically feasible

The recommended remedial alternative for AOC Building 156 is Alternative 2 "Targeted Excavation". The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). The residual VOC concentrations below site-specific RBCs not addressed by Alternative 2 are likely to be reduced to background over time through natural degradation. Achievement of the RBCs developed within this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

VOC concentrations in soil gas are expected to decline as sources are removed in nearby soil. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

It is anticipated that the proposed remedial action (targeted excavation) will immediately eliminate the VOC and PCB mass in soils exceeding RBCs, further reducing potential future impacts to Convair Lagoon. The residual soils impacted with metals above background but below RBCs are located primarily in shallow soil, above the groundwater table. Due to extremely low hydraulic gradient, groundwater velocities in the Building 156 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon.

Based on historical Site data, lateral migration of impacted groundwater appears to be in equilibrium with natural attenuation of the constituents, which results in a stable or decreasing area of impact over time. Natural attenuation is also expected to further reduce the concentrations of residual VOCs in areas which are currently below RBC levels and not directly addressed by Alternative 2. Groundwater monitoring data

collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background.

The primary remedial goal (i.e., achieving RBCs) proposed for the recommended remedial option for this AOC is consistent with maximum benefit to the people of the State in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. This technology is effective in reducing short- and long-term risk or hazard. It is also highly implementable, protective of human health, and cost effective.

6.4.3 AOC Building 158

This AOC has soil and groundwater that exceeds CrVI RBCs (trench/construction worker). In addition, a localized area of soil historically contained fuel-related VOCs where LNAPL has been observed. Southeast of Building 158, VOCs exceed RBCs in soil gas. The primary remedial goal for this AOC is reduction of human health risk to acceptable levels, defined as achieving the site-specific RBCs presented in Tables 5-1 through 5-4. The secondary remedial goal is achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action;

2. Targeted excavation of CrVI RBC exceedances and potential LNAPL in soil, and ISR by injection of FeSO4 for CrVI in groundwater;

3. Targeted excavation of CrVI RBC exceedances and potential LNAPL in soil, and ISR by injection of EVO for CrVI in groundwater;

4. Targeted excavation of potential LNAPL in soil, ISR by in-situ soil mixing of $FeSO_4$ for CrVI in shallow soil, and ISR by injection of EVO for CrVI in groundwater; and

5. Targeted excavation of potential LNAPL in soil, ISR by in-situ soil mixing of $FeSO_4$ for CrVI in shallow soil and groundwater; and

6. Whole-AOC excavation of soil that exceeds background concentrations, to approximately 10 feet bgs, with dewatering.

The results of the detailed analysis of alternatives for this AOC are presented below, along with a brief description of each alternative. The results are summarized for comparison in Table 6-4.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable as the criteria are defined in Section 6.2.

Overall Protection of Human Health

The overall ability of No Action to be protective of human health is limited, because the concentrations of compounds that exceed risk or hazard will not be mitigated by performing No Action.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Targeted Excavation and ISR by Ferrous Sulfate

Implementability

The relative implementability of this alternative is high. $FeSO_4$ in solution would be injected by direct push technology into the area indicated on Figure 6-1. Direct push equipment is readily available and this technology is easily implemented to the shallow depths required at this AOC.

The extent of the targeted excavation would cover approximately a 40 foot by 80 foot area around the CrVI exceedance and potential LNAPL location (Figure 6-2). The average depth of the soil excavation is estimated to be 4 feet below ground surface. The volume of soil removed would not generate technical or administrative challenges.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is moderate. There would be rapid reduction in near-term exposure to groundwater exceedances and exposure to soil exceedances would be eliminated. Because reduction in the groundwater would be limited to the area directly affected by the injections, there is the potential for rebound if the injectate is not uniformly dispersed in the subsurface. Long-term exposure would be reduced to acceptable levels as it is expected that risk and hazard will be reduced using this alternative.

Cost

This alternative has a medium cost relative to the other alternatives at approximately $426,000. This cost is primarily due to the cost of the excavation. Because of this, the cost of implementation could increase significantly if the volume of excavated material increases. Targeted O&M costs would primarily be associated with sample collection and analysis, data trending, and reporting.

Alternative 3 – Targeted Excavation and ISR by Emulsified Vegetable Oil

Implementability

The relative implementability of this alternative is high. EVO in solution would be injected by direct push technology into the area indicated on Figure 6-1. Direct push equipment is readily available and this technology is easily implemented to the shallow depths required at this AOC.

The extent of the targeted excavation would cover approximately a 40 foot by 80 foot area around the CrVI exceedance and potential LNAPL location (Figure 6-2). The average depth of the soil excavation is estimated to be 4 feet below ground surface. The volume of soil removed would not generate technical or administrative challenges.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. There would be relatively rapid reduction in exposure to groundwater exceedances and exposure to soil exceedances would be eliminated. Because the EVO will persist in the subsurface for several years, promoting an extended period of anaerobic conditions, the effects of the injection are more likely to address CrVI impacts within fine-grained materials which may not be immediately contacted by the direct injection event. Long-

term exposure would be reduced to acceptable levels as it is expected that risk and hazard will be reduced using this alternative.

Cost

This alternative has a medium cost relative to the other alternatives at approximately $447,000. This cost is primarily due to the cost of the excavation. Because of this, the cost of implementation could increase significantly if the volume of excavated material increases. O&M costs would primarily be associated with sample collection and analysis, data trending, and reporting.

Alternative 4 –Targeted Excavation and In-Situ Mixing of Ferrous Sulfate with Direct Push Injection of EVO

Implementability

The relative implementability of this alternative is moderate. EVO in solution would be injected by direct push technology into the area indicated on Figure 6-1. Direct push equipment is readily available and this technology is easily implemented to the shallow depths required at this AOC.

The extent of the targeted excavation would cover approximately a 10 by 10 foot area around the potential LNAPL location (Figure 6-2). Soil would be excavated to the groundwater surface, approximately 8 feet bgs. The volume of soil removed would not generate technical or administrative challenges.

Shallow soil CrVI impacts would be addressed through in-situ soil mixing with an $FeSO_4$ solution. A large diameter auger would be used to mix the vadose zone soil while simultaneously injecting a $FeSO_4$ solution throughout the area of impacted vadose zone material to promote efficient contact of the $FeSO_4$ with the CrVI within the vadose zone.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is moderate. There would be relatively rapid reduction in exposure to groundwater exceedances and exposure to soil exceedances would likely be eliminated. Although the mixing technology promotes the distribution of the $FeSO_4$ throughout the treatment area any material not directly contacted will not be reduced to CrIII, which may result in the need for additional remedial action. Total Cr concentrations will remain above background, but below RBC concentrations. Because the EVO will persist in the

subsurface for several years, promoting an extended period of anaerobic conditions, the effects of the injection are more likely to address CrVI impacts within fine-grained materials which may not be immediately contacted by the direct injection event. Long-term exposure would be reduced to acceptable levels as it is expected that risk and hazard will be reduced using this alternative.

Cost

This alternative has a medium cost relative to the other alternatives at approximately $419,000. This cost is primarily due to the cost of the in-situ soil mixing. The costs for treatment of incremental volumes of soil by soil mixing are significantly less than excavation costs. Because of this, the cost of implementation of a soil mixing alternative would be less affected due to incremental increases in the volume of material to be treated, as compared with an equivalent excavation alternative. O&M costs would primarily be associated with sample collection and analysis, data trending, and reporting.

Alternative 5 –Targeted Excavation and In-Situ Mixing of Ferrous Sulfate

Implementability

The relative implementability of this alternative is moderate. The extent of the targeted excavation would cover approximately a 10 by 10 foot area around the potential LNAPL location (Figure 6-2). Soil would be excavated to the groundwater surface, approximately 8 feet bgs. The volume of soil removed would not generate technical or administrative challenges.

Shallow soil and groundwater CrVI impacts would be addressed through in-situ soil mixing with a $FeSO_4$ solution. A large diameter auger would be used to mix through both the vadose and saturated zone soil while simultaneously injecting a $FeSO_4$ solution throughout the area of impacted material to promote efficient contact of the $FeSO_4$ with the CrVI.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is moderate. The exposure to soil and groundwater exceedances would likely be eliminated. Although the mixing technology promotes the distribution of the $FeSO_4$ throughout the treatment area any material not directly contacted will not be reduced to CrIII. Total Cr concentrations will remain above background, but below RBC concentrations. Because the $FeSO_4$ will not persist in the subsurface, rebound may occur from impacts within

fine-grained materials which are not directly contacted by soil mixing, which may result in the need for additional remedial action. Long-term exposure would be reduced to acceptable levels as it is expected that risk and hazard will be reduced using this alternative.

Cost

This alternative has a medium cost relative to the other alternatives at approximately $400,000. This cost is primarily due to the cost of the in-situ soil mixing. The costs for treatment of incremental volumes of soil by soil mixing are significantly less than excavation costs. Because of this, the cost of implementation of a soil mixing alternative would be less affected due to incremental increases in the volume of material to be treated, as compared with an equivalent excavation alternative. O&M costs would primarily be associated with sample collection and analysis, data trending, and reporting.

Alternative 6 – Whole-AOC Excavation and Dewatering

Implementability

The relative implementability of this alternative is difficult. Excavation to approximately 10 feet bgs across the entire delineated AOC (Figure 6-3) would be more difficult to implement than targeted excavation at the hot-spot. An area of approximately 5,350 square feet would need to be excavated. Shoring or appropriate sloping of the excavation walls is required to ensure a safe working environment, avoid sloughing, protect the foundation of the neighboring Building 140, and reduce excessive soil removal. However, it is not possible to perform the whole-AOC excavation with Building 158 still in place. This remedy would be more implementable, yet still difficult, after demolition is completed.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Exposure to soil and groundwater RBC exceedances would essentially be eliminated. The residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include

the incidental risk associated with any large construction excavation action resulting from operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

This alternative has the highest cost at approximately $1,229,000. The primary cost elements are associated with excavation and offsite disposal of approximately 2,000 cubic yards of soil and 130,000 gallons of water.

Recommended Remedial Option

While all of the evaluated alternatives are considered technically feasible, Alternative 1, "No Action" is not sufficiently protective of human health given current soil and ground water concentrations in this AOC.

Alternative 2 "Targeted Excavation and ISR with Ferrous Sulfate" would potentially achieve RBCs immediately in soil through direct excavation and in groundwater within weeks of performing the remedial action. Because this alternative reduces elevated concentrations of CrVI through reduction to CrIII, the total chromium concentration in the system will remain above background concentrations, but will no longer result in significant potential risk from soil or groundwater. Because immediate and direct contact is required between the CrVI and $FeSO_4$ solution, the development of preferential pathways and non-uniform distribution of the solution in the subsurface may result in untreated areas leading to rebound, requiring multiple rounds of injection to reach goals. The scale of the proposed excavation would not pose significant construction risk or environmental impact.

Alternative 3 "Targeted Excavation and ISR with Emulsified Vegetable Oil" would potentially achieve RBCs immediately in soil through direct excavation and in groundwater within months of performing the remedial action. Because this alternative reduces elevated concentrations of CrVI through reduction to CrIII, the total chromium concentration in the system will remain above background concentrations, but will no longer result in significant potential risk from soil or groundwater. Because EVO is long-lived and can promote ongoing reductive conditions in the subsurface for several years, it is likely to reduce CrVI to CrIII throughout the injection area, including zones with low permeability which may not be initially affected by the injection event. Additional injections are not anticipated to be required. The scale of the proposed

excavation would not pose significant construction risk or environmental impact. However, if the area of soil requiring excavation increases, the cost of implementation could increase significantly. The cost for this alternative is approximately $20,000 more than Alternative 2.

Alternative 4 "Targeted Excavation, In-Situ Mixing of $FeSO_4$, and Direct Push Injection of EVO" would potentially achieve RBCs in soil and groundwater within months of performing the remedial action. Because this alternative reduces elevated concentrations of CrVI through reduction to CrIII, the total chromium concentration in the system will remain above background concentrations, but will no longer result in significant potential risk from soil or groundwater. Although soil mixing would promote the uniform distribution and direct application of FeSO4 throughout the vadose zone, CrVI impacts with insufficient direct contact with the FeSO4 solution would not be reduced to CrIII in the vadose zone, potentially requiring further remedial action. Because EVO is long-lived and can promote ongoing reductive conditions in the subsurface for several years, it is likely to reduce CrVI to CrIII throughout the injection area, including zones with low permeability which may not be initially affected by the injection event. Additional injections are not anticipated to be required. The small scale of the proposed excavation would not pose significant construction risk or environmental impact. The cost for this alternative is approximately $7,000 less expensive than Alternative 2 and $28,000 less than Alternative 3. However, it relies on chemical reduction of CrVI in shallow soil as opposed to direct removal. Incremental cost for changes in soil treatment volumes would be less for this approach than Alternatives 2 and 3.

Alternative 5 "Targeted Excavation and In-Situ Mixing of FeSO4" would potentially achieve RBCs in soil and groundwater within weeks of performing the remedial action. Because this alternative reduces elevated concentrations of CrVI through reduction to CrIII, the total chromium concentration in the system will remain above background concentrations, but will no longer result in significant potential risk from soil or groundwater. Although soil mixing would promote the uniform distribution and direct application of FeSO4 throughout the impacted zone, CrVI impacts with insufficient direct contact with the FeSO4 solution would not be reduced to CrIII. Rebound may be observed due to incomplete contact with fine grain materials, potentially requiring further remedial action. The small scale of the proposed excavation would not pose significant construction risk or environmental impact. The cost for this alternative is approximately $25,000 less expensive than Alternative 2, $50,000 less than Alternative 3 and approximately $20,000 less than Alternative 4. It also relies on chemical reduction of CrVI in shallow soil as opposed to direct removal; however soil mixing

throughout the impacted area significantly reduces the potential for rebound to occur. Incremental cost for changes in soil treatment volumes would be less for this approach than Alternatives 2 and 3.

Alternative 6 "Whole AOC Excavation" would not be technically feasible until demolition has been completed. According to the schedule provided by the Port, demolition in this area will be completed no sooner than August 2010. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Because all RBC exceedances are addressed immediately by Alternative 2, the incremental benefit which would be achieved by attaining background concentrations is relatively small, and is offset by the near term achievement of RBC goals in advance of Site demolition Afforded by Alternatives 2-5. There is an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. The cost for this alternative is approximately $650,000-$750,000 more than Alternatives 2-5. Based on this assessment, this alternative is not economically feasible.

The recommended remedial alternative for AOC Building 158 is Alternative 3 "Targeted Excavation and ISR with EVO". Although this alternative is moderately more expensive than Alternatives 2, 4, and 5, the added benefits to direct removal of the chromium impacted vadose zone soils and reduced possibility of for additional remedial action outweigh these costs based on the existing volume estimates. However, if the post-demolition investigation of the extent of CrVI impacts significantly increases the estimated volume of impacted soils, Alternative 4 may be deemed to be the more feasible alternative. The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). Achievement of the RBCs developed within this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

VOC concentrations in soil gas are expected to decline as sources are removed in nearby soil. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not

currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to extremely low hydraulic gradient, groundwater velocities in the Building 158 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon. Based on historical Site data, lateral migration of impacted groundwater is in equilibrium with natural attenuation of the constituents, which results in a stable or decreasing area of impact over time. Further, the proposed remedial action (Excavation and ISR with EVO) will rapidly reduce available CrVI to CrIII which has much lower solubility and toxicity. The CrIII will precipitate due to its reduced solubility, further reducing the potential for future migration of impacts to Convair Lagoon.

The primary remedial goal (i.e., achieving RBCs) proposed for the recommended remedial option for this AOC is consistent with maximum benefit to the people of the State in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

The excavation or in-situ reduction alternatives would remove the RBC exceedance in vadose zone soil. Although background conditions will not be achieved for chromium in this AOC, the residual concentrations of CrIII proposed is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. This technology is effective in reducing short- and long-term risk or hazard. It is also implementable, protective of human health, and cost effective.

6.4.4 AOC Building 102

This AOC has soil that exceeds RBCs for 1,2,4-trimethylbenzene, naphthalene, and TPH. The primary remedial goal for this AOC is reduction of human health risk to acceptable levels, defined as achieving the site-specific RBCs presented in Tables 5-1 through 5-4. The secondary remedial goal is achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No action;

2. Targeted excavation of soil RBC exceedances for VOCs in vadose soil, with chemical oxidation/biostimulation to remediate soil TPH exceedance in saturated soil.

3. Targeted excavation of soil RBC exceedances for VOCs and targeted excavation and dewatering for RBC exceedances for TPH.

4. Whole-AOC excavation of soil that exceeds background concentrations, to approximately 10 feet bgs, with dewatering.

The results of the detailed analysis of alternatives for this AOC are presented below, along with a brief description of each alternative. The results are summarized for comparison in Table 6-5.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable as the criteria are defined in Section 6.2.

Overall Protection of Human Health

The overall ability of No Action to be protective of human health is limited, because the concentrations of compounds that exceed risk or hazard will not be mitigated by performing No Action.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Targeted Excavation with Chemical Oxidation/Biostimulation

Implementability

The relative implementability of this alternative is high. A targeted excavation is readily implementable for the AOC Building 102. One targeted excavation would be required (Figure 6-2). The extent of the targeted excavation would cover approximately

a 10 foot by 10 foot area around one soil RBC exceedance for 1,2,4-trimethylbenzene and naphthalene. The depth of soil would be excavated to approximately 7 feet bgs. The volume of soil removed would not generate technical or administrative challenges.

Chemical oxidation/biostimulation of the small area with residual TPH impacts at the water table is readily implementable. RegenOx© with ORC Advanced© would be injected by direct push technology into the area indicated on Figure 6-1. Direct push equipment is readily available and this technology is easily implemented in the shallow depth required at this AOC.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health at this AOC is moderate. RBC exceedances in shallow soil would be eliminated by excavation; potential RBC exceedances below the water table could be addressed by the chemical oxidation and biostimulation. However heavy-range hydrocarbons may not be fully remediated by this approach.

Cost

The relative cost to implement targeted excavations with chemical oxidation/biostimulation would be low with respect to capital costs and no O&M costs would be incurred. The cost is approximately $67,000 for removal and disposal of excavated soil as hazardous waste, injection of RegenOx©/ORC© and monitoring costs.

Alternative 3 – Targeted Excavations and Dewatering

Implementability

The relative implementability of this alternative is high. A targeted excavation is readily implementable for the AOC Building 102. Two targeted excavation would be required (Figure 6-2). The extent of the targeted excavation would cover approximately a 10 foot by 10 foot area around one soil RBC exceedance for 1,2,4-trimethylbenzene and naphthalene and a similar sized excavation around one RBC exceedance for TPH at the water table. Soil would be excavated to approximately the water table in the VOC excavation and approximately 1-2 feet below the water table in the vicinity of the TPH impacts followed by dewatering to remove mobile LNAPL to the extent practicable. The volume of soil removed would not generate technical or administrative challenges, however the TPH excavation is located partially beneath Building 102 and is not feasible until after the building has been removed during Site demolition.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health at this AOC is high. RBC exceedances in shallow soil would be eliminated by excavation and mobile LNAPL would be recovered to the greatest extent practicable;

Cost

The relative cost to implement targeted excavations with dewatering would be low with respect to capital costs and no O&M costs would be incurred. The cost is approximately $75,000 for removal and disposal of excavated soil and water.

Alternative 4 – Whole-AOC Excavation and Dewatering

Implementability

The relative implementability of this excavation to 10 feet bgs across this AOC would be difficult. The area to be excavated is approximately 7,000 square feet (Figure 6-3). A volume of approximately 2,600 cubic yards of soil and 168,000 gallons of water would be excavated. This excavation is not feasible if the buildings are in place. However, whole-AOC excavation and dewatering would be more implementable after demolition activities in this area are completed.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Exposure to soil and groundwater impacts would essentially be eliminated. The residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the incidental risk associated with any large construction excavation action resulting from operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

This alternative has a relatively high cost at approximately $1,578,000. The primary cost elements are associated with excavation offsite disposal of approximately 2,600 cubic yards of soil and 168,000 gallons of groundwater.

Recommended Remedial Option

While all of the evaluated alternatives are considered technically feasible, Alternative 1, "No Action" is not sufficiently protective of human health given current soil and ground water concentrations in this AOC.

Alternative 2 "Targeted Excavation with Chemical Oxidation/Biostimulation" could achieve risk based concentrations within weeks of performing the remedial action, however the chemical oxidation/biostimulation may not be effective on heavier-range hydrocarbons. The small scale of the proposed excavation would not pose significant construction risk or environmental impact.

Alternative 3 "Targeted Excavations with Dewatering" could achieve risk based concentrations immediately in the VOC area. However, the TPH area would not be feasible to excavate until demolition of Building 102 has been completed. The small scale of the proposed excavations would not pose significant construction risk or environmental impact. This alternative is approximately $7,000 more than Alternative 2.

Alternative 4 "Whole AOC Excavation and Dewatering" would not be technically feasible until demolition has been completed. Because of this constraint, although the alternative would immediately reduce constituent concentrations to background through direct excavation, the overall timeframe for the remedial process is longer than that of Alternative 2 which could be implemented in advance of demolition. According to the schedule information provided by the Port, demolition in this area will be completed no sooner than August 2010. Because all RBC exceedances in shallow soil are addressed by Alternatives 2 or 3, the incremental benefit which would be achieved by attaining background concentrations is relatively small. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. There is an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. Alternative 4 is estimated to cost

approximately $1,500,000 more than Alternative 2 or 3. Based on this assessment, this alternative is not economically feasible.

The recommended remedial alternative for AOC Building 102 is Alternative 3 "Targeted Excavation with Dewatering". The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

VOCs in soil gas are expected to decline in concentration as sources are removed in nearby soil and groundwater. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. This data will be used in the post remediation risk assessment to confirm remedial actions are complete.

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

It is anticipated that the proposed remedial action (targeted excavation with dewatering) will achieve RBCs through direct physical removal. Due to extremely low hydraulic gradient, groundwater velocities in the Building 102 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon. Based on historical Site data, lateral migration of impacted groundwater is in equilibrium with natural attenuation of the constituents, which results in a stable or decreasing area of impact over time. This will mitigate future potential for impacted groundwater to migrate to Convair Lagoon.

The primary remedial goal (i.e., achieving RBCs) proposed for the recommended remedial option for this AOC is consistent with maximum benefit to the people of the State, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. This combination of technologies has been proven to be effective in reducing short- and long-term risk or hazard. It is also moderately implementable, protective of human health, and cost effective.

6.4.5 AOC Building 120 South

Two samples from an area in the south-central portion of Building 120 exceed RBCs for TPH in soil. Interim action excavations in this area revealed the presence of LNAPL containing PCB concentrations of approximately 8.2 mg/kg. The primary remedial goal for this AOC is removal of LNAPL and reduction of human health risk to acceptable levels, defined as achieving the site-specific RBCs presented in Tables 5-1 through 5-4. The secondary remedial goal is achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action;
2. SVE for TPH concentration exceeding RBCs in soil; and
3. Targeted excavation of soil that exceeds RBCs and removal of LNAPL, to approximately 8 feet bgs.
4. Whole AOC excavation and dewatering

The results of the detailed analysis of alternatives for this AOC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-6.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable with regard to the criteria as defined in Section 6.2.

Overall Protection of Human Health

The overall ability of No Action to be protective of human health is limited, since the concentrations of compounds that exceed RBCs will not be evaluated by the implementation of No Action. Based on observed indicators of natural attenuation, it is

possible that background concentrations would be achieved over time. However, without a monitoring program, future Site conditions would be unknown.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Soil Vapor Extraction

Implementability

SVE is moderately implementable. SVE would use a blower to generate a vacuum to pull soil vapors out of the shallow soil and pass the vapors through a treatment media. A soil vapor extraction well could easily be installed. All equipment required could be readily placed onsite. The SVE system would operate for at least six months and possibly up to two years because of the heavy-end hydrocarbons in this AOC. PCB concentrations would be unlikely to be reduced to meet RBCs through this method.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is low. Soil vapor would be removed from within an extraction well and surrounding soil, however PCB impacts would not be addressed.

Cost

The relative cost to implement SVE at the Site is relatively high due to both capital and O&M costs. To lease an SVE system for six months and the associated monitoring, labor, and laboratory analytical costs would be approximately $230,000.

Alternative 3 – Targeted Excavation with LNAPL removal

Implementability

This alternative is moderately implementable. The size of the excavation is large, covering an area of approximately 2,000 square feet, to a depth of approximately 8 feet bgs (Figure 6-2). Approximately 600 cubic yards of soil and 10,000 gallons of water would need to be removed and disposed.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Soil RBC exceedances and LNAPL would be eliminated.

Cost

This alternative has a high cost at approximately $480,000. The primary cost elements are associated with excavation and offsite disposal of approximately 600 cubic yards of soil and 10,000 gallons of water.

Alternative 4 – Whole-AOC Excavation and Dewatering

Implementability

The relative implementability of this excavation to 10 feet bgs across this AOC would be difficult. The area to be excavated is approximately 14,000 square feet (Figure 6-3). A volume of approximately 5,200 cubic yards of soil and 300,000 gallons of water would be excavated. Shoring or appropriate sloping of the excavation walls is required to ensure a safe working environment, avoid sloughing, and thus excessive soil removal. This alternative is not feasible with the current buildings in place. However, whole-AOC excavation and dewatering would be implementable after demolition activities in this area have been completed.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Exposure to soil and groundwater RBC exceedances would essentially be eliminated. The residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the incidental risk associated with any large construction excavation action resulting from operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

This alternative has a relatively high cost at approximately $3,100,000. The primary cost elements are associated with excavation offsite disposal of approximately 5,200 cubic yards of soil and 300,000 gallons of groundwater.

Recommended Remedial Option

While all of the evaluated alternatives are considered technically feasible, Alternative 1, "No Action" is not sufficiently protective of human health given current soil and ground water concentrations in this AOC.

Alternative 2 "Soil Vapor Extraction" would be unlikely to achieve risk based concentrations. This remedial alternative is more expensive and requires a longer timeframe for remediation than Alternative 3, which would excavate material from a similar area.

Alternative 3 "Targeted Excavation with LNAPL Removal" could achieve risk based concentrations within weeks of performing the remedial action, however the excavation could not be completed until after building demolition, which will be completed no sooner than August 2010. The moderate scale of the proposed excavation would not pose significant construction risk or environmental impact.

Alternative 4 "Whole AOC Excavation and Dewatering" would not be technically feasible until demolition has been completed.

According to the schedule provided by the Port, demolition in this area will be completed no sooner than August 2010. Because all RBC exceedances in shallow soil are addressed immediately by Alternative 3, the incremental benefit which would be achieved by attaining background concentrations is relatively small, and is offset by the near term achievement of RBC goals in advance of Site demolition. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. There is an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. Alternative 4 is estimated to cost approximately $2,660,000 more than Alternative 3. Based on this assessment, this alternative is not economically feasible.

The recommended remedial alternative for this AOC is Alternative 3 "Targeted Excavation with LNAPL Removal". The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

The proposed remedial action (targeted excavation) will remove TPH and PCB impacts in excess of RBCs. Due to extremely low hydraulic gradient, groundwater velocities in the Building 120 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon. Based on historical Site data, lateral migration of impacted groundwater is in equilibrium with natural attenuation of the constituents, which results in a stable or decreasing area of impact over time.

The primary remedial goal (i.e., achieving RBCs) proposed for the recommended remedial option for this AOC is consistent with maximum benefit to the people of the State, does not unreasonably affect present and anticipated beneficial use of water and does not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

6.4.6 AOC Building 130/166 AST/120/121

This AOC contains groundwater that exceeds RBCs for VOCs a localized exceedance for PCBs in soil and groundwater, soil gas that exceeds RBCs for VOCs, and a

localized area of soil contains PCE exceeding RBCs. The primary remedial goal for this AOC is reduction of human health risk to acceptable levels, defined as achieving the site-specific RBCs presented in Tables 5-1 through 5-4. The secondary remedial goal is achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action;
2. MNA for VOCs in groundwater;
3. EISB for VOCs in groundwater and targeted excavations for VOCs and PCBs exceeding the Alternative PCB standard. in soil;
4. Alternative excavation of potential DNAPL in groundwater and excavation of PCBs exceeding the Alternative PCB standard in soil, followed by EISB; and
5. Whole-AOC excavation of soil that exceeds background concentrations, to approximately 10 feet bgs, with dewatering.

The results of the detailed analysis of alternatives for this AOC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-7.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable with regard to the criteria as defined in Section 6.2.

Overall Protection of Human Health

The overall ability of No Action to be protective of human health is limited, since the concentrations of compounds that exceed RBCs will not be evaluated by the implementation of No Action. Based on observed indicators of natural attenuation, it is possible that RBCs could be reduced and background concentrations would be achieved over time. However, without a monitoring program, future Site conditions would be unknown.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Monitored Natural Attenuation

Implementability

MNA is readily implementable at the Site since a monitoring program, required infrastructure, and equipment already exists. Additional monitor wells could be readily installed if needed.

Overall Protection of Human Health

The overall ability of MNA to be protective of human health at this AOC is low. There is little to no near-term reduction of risk offered by this alternative. Measures to reduce worker exposures would be required for trenching and construction work during Site redevelopment and engineering controls would be required after Site redevelopment. The long-term exposure should be reduced over time but the time frame to achieve this reduction is long.

Cost

The approximate cost to implement MNA would be moderate at approximately $403,000, with respect to both capital costs and O&M costs of the other proposed alternatives. Capital costs would primarily be associated with installation of monitor wells. O&M costs would primarily be associated with sample collection and analysis, data trending, and reporting. It was assumed that this AOC would be monitored for 30 years.

Alternative 3 – EISB and Targeted Excavations

Implementability

This alternative is moderately implementable. Based on the results of the bench-scale and pilot scale studies, addition of electron donor and microbial culture would expedite dechlorination rates. Direct push technology would be used to inject a grid of electron donor and dechlorinating microbial culture. The approximate area requiring electron donor and microbial culture is shown on Figure 6-1. Monitor wells would also be installed in addition to existing monitor wells to monitor the degradation process in the

AOC. Approximately two months would be required to inject the electron donor and microbial culture through temporary direct push borings.

The extent of the targeted excavation for VOCs would cover approximately a 10 foot by 10 foot area around the detected RBC exceedance adjacent to the former maintenance pit in Building 120 and several targeted excavations to remove residual PCB impacted soil in the vicinity of the 30-inch East SWCS (Figure 6-2). Soil would be excavated to the groundwater surface, approximately 7 feet bgs.

The extent of the excavations for the PCB excavations would be based on soil sampling. For the purposes of this feasibility study it is estimated that four excavations of PCB RBC exceedances will be required with an average size of 10 feet by 25 feet. Excavations will be extended to 1-2 feet below the water table to allow for removal of associated groundwater where necessary. The volume of soil removed would not generate technical or administrative challenges.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Short-term exposure to soil exceedances would be immediately eliminated. There would potentially be immediate elimination of groundwater PCB RBC exceedances and VOC RBCs in groundwater could be achieved in the near term (likely within approximately 2 years following soil remediation activities). Baseline data collected prior to the Pilot Study indicates that biodegradation is occurring naturally in this area as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-year timeframe. VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation. Groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background.

The RBC exceedance for PCBs in groundwater is likely the result of residual PCBs in soil which were not completely removed during the removal and replacement of the 30-inch East SWCS. Once the soil PCB RBC exceedances have been removed, the related groundwater impacts are also expected to meet RBCs. PCBs have very low water solubility and will adsorb to organic carbon in the environment. Remaining PCB groundwater impacts are unlikely to migrate due to the low groundwater flow rates and this strong tendency to adsorb onto available organic carbon in the subsurface. It is anticipated that PCBs will meet RBCs following the soil remediation activities.

Cost

The relative magnitude of cost for this alternative is medium with respect to other alternatives for this AOC. This alternative would cost approximately $2,750,000. This is due to the cost of electron donor, biological media, labor and equipment involved in injection of EISB products, and for excavation and disposal of VOC and PCB impacted soil.

Alternative 4 – Alternative Potential DNAPL/PCB Area Excavation with EISB

Implementability

The relative implementability of this alternative is difficult. The alternative excavation area is approximately 59,200 square feet, based on the potential DNAPL area delineated from elevated groundwater concentrations in the Site Characterization Report (Geosyntec, 2005; Figure 6-2) and the estimated PCB excavation areas. The depth of soil excavated would be approximately 10 feet. Approximately 19,760 cubic yards of soil and 1,250,000 gallons of groundwater would need to be disposed of, most likely as hazardous waste. The volume of soil removed may generate technical or administrative challenges. This excavation is not feasible if the buildings are in place.

EISB would be coupled with the excavation to mitigate remaining groundwater RBC exceedances. Direct push technology could be used to inject a grid of dechlorinating electron donor and microbial culture (Figure 6-1). Monitor wells would also be installed in addition to existing monitor wells to monitor the surrounding area. Approximately two months would be required to inject the electron donor and dechlorinating microbial culture.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Short-term exposure to soil exceedances would be immediately eliminated. There would be no immediate elimination of groundwater RBC exceedances although RBCs in groundwater could be achieved in the near term (likely within approximately 2 years). Baseline data collected prior to the Pilot Study indicates that biodegradation is occurring naturally in this area as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates, groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to

reach background. VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation.

The residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the increased risk associated with any large construction excavation action resulting from the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

The RBC exceedance for PCBs in groundwater is likely the result of residual PCBs in soil which were not completely removed during the removal and replacement of the 30-inch East SWCS. Once the soil PCB RBC exceedances have been removed, the related groundwater impacts are also expected to meet RBCs. PCBs have very low water solubility and will adsorb to organic carbon in the environment. Remaining PCB groundwater impacts are unlikely to migrate due to the low groundwater flow rates and this strong tendency to adsorb onto available organic carbon in the subsurface. It is anticipated that PCBs will meet RBCs following the soil remediation activities.

Cost

This alternative has a relatively high cost of approximately $14,300,000. This is due to the cost of disposal of excavated soil and groundwater, most likely as hazardous waste, electron donor and biological media, and labor and equipment involved in excavation and injection of EISB products.

Alternative 5 – Whole-AOC Excavation and Dewatering

Implementability

This alternative is relatively difficult to implement. Excavation to approximately 10 feet bgs across the entire delineated AOC (approximately 167,100 square feet) represents a major excavation action (Figure 6-3). Approximately 62,000 cubic yards of soil and 4,000,000 gallons of groundwater would be removed. Sufficient volumes of

suitable clean fill could be difficult to locate. Truck traffic through the Site and over public roads near the Airport would likely generate public concerns over traffic congestion. Air emissions from truck traffic and volatilizing compounds during the work would likely generate concerns from the public and regulatory agencies. This excavation is not feasible if the buildings are in place. However, whole-AOC excavation and dewatering would be more implementable, yet still difficult, after demolition activities are completed.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is moderate. Exposure to soil and groundwater exceedances would essentially be eliminated. However, this technology cannot be implemented in advance of demolition. The residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the incidental increased risk associated with any large construction excavation action resulting from the operation of heavy machinery and increased road traffic. Environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

This alternative represents the highest cost at approximately $37,300,000. The primary cost elements are associated with excavation and offsite disposal of approximately 62,000 cubic yards of soil and 4,000,000 gallons of water.

Recommended Remedial Option

While all of the evaluated alternatives are considered technically feasible, Alternative 1, "No Action" is not sufficiently protective of human health given current soil and ground water concentrations in this AOC.

Alternative 2 "Monitored Natural Attenuation" is also not considered to be sufficiently protective of human health given the long time frame anticipated to reach risk based concentrations or background.

Alternative 3 "EISB with Targeted Excavations" would achieve risk based concentrations. Based on the EISB pilot study performed within the Building 131/242 AOC, it is estimated that RBCs can likely be met across this AOC within approximately 2 years. Baseline data from the Pilot Study area shows that biodegradation is occurring naturally at the Site as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. Although only low concentrations of VC are observed in groundwater over the majority of AOC 166AST/120/121, this is most likely due to the native microbial community, which will be augmented with the microbial culture during the EISB implementation. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs will likely be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates, groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation. The residual concentrations below site-specific RBCs not directly addressed by Alternative 3 are also likely to be reduced to background over time through natural degradation. The small scale of the proposed excavations would not pose significant construction risk or cause significant environmental impact.

Although Alternative 3 would cost approximately $2,350,000 more than Alternative 2, the increased cost is offset by the large improvement in remedial effectiveness and time frame.

Alternative 4 "Potential DNAPL area and Targeted Excavations with EISB" would remediate the source area rapidly through direct excavation. According to the schedule provided by the Port, demolition in this area will be completed no sooner than August 2010. Because of this constraint, although Alternative 4 would immediately reduce constituent concentrations within the DNAPL area to background, the overall timeframe for the remedial process is likely to be longer than that of Alternative 3 which could be implemented in advance of demolition.

This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Alternative 4 represents an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. Alternative 4 is estimated to cost approximately $11,550,000 more than Alternative 3 and $13,900,000 more than Alternative 2.

Because there is a potentially longer implementation schedule and no difference in the proposed cleanup area or anticipated final constituent concentrations in the AOC to offset the increased cost, physical risk, and environmental impacts of a large excavation activity, this alternative is not economically feasible vs. Alternative 3.

Alternative 5 "Whole AOC Excavation" would not be technically feasible until demolition has been completed. According to the schedule provided by the Port, demolition in this area will be completed no sooner than August 2010. Because of this constraint, although Alternative 5 would immediately reduce constituent concentrations to background through direct excavation, the overall timeframe for the remedial process is no better than that of Alternative 3 which could be implemented in advance of demolition.

This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Alternative 5 represents an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. Alternative 5 is estimated to cost approximately $23,000,000 more than Alternative 4, $34,500,000 more than Alternative 3, and $36,900,000 more than Alternative 2.

Because there is no difference in the proposed cleanup area or anticipated final constituent concentrations in the AOC to offset the increased cost, physical risk, and environmental impacts of a large excavation activity, this alternative is not economically feasible vs. Alternative 3.

The recommended remedial alternative for this AOC is Alternative 3 "EISB with targeted excavations". The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

VOC concentrations in soil gas are expected to decline as sources are removed in nearby soil and groundwater. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to the extremely low hydraulic gradient, groundwater velocities in the Building 120 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors, along with the natural degradation processes observed during the EISB pilot study, cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon. Based on historical Site data, lateral migration of impacted groundwater is in equilibrium with natural attenuation of the constituents, which results in a stable or decreasing area of impact over time.

It is anticipated that the proposed remedial action (EISB with targeted excavation) will reduce the remaining VOC mass in place, to below RBCs likely within approximately 2 years and to background conditions over time. Groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. The excavations would remove the RBC exceedances in soil. The residual concentrations of constituents below site-specific RBCs not directly addressed by Alternative 3 are also likely to be reduced to background over time through natural degradation. This will mitigate future potential for impacted groundwater to migrate to Convair Lagoon.

The primary remedial goal (i.e., achieving RBCs) proposed for the recommended remedial option for this AOC is consistent with maximum benefit to the people of the State, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. This combination of technologies has been proven to be effective in reducing short- and long-term risk or hazard. It is also implementable, protective of human health, and cost effective.

6.4.7 AOC Former Maintenance Yard

This AOC has groundwater with concentrations that exceed RBCs for VOCs and soil gas concentrations that exceed RBCs for VOCs. The primary remedial goal for this AOC is reduction of human health risk to acceptable levels, defined as achieving the site-specific RBCs presented in Tables 5-1 through 5-4. The secondary remedial goal is achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action;
2. MNA for VOCs in groundwater;
3. EISB for VOCs in groundwater;
4. Alternative excavation of metals exceeding background concentrations in soil with EISB for VOCs in groundwater; and
5. Whole-AOC excavation of soil that exceeds background concentrations, to approximately 10 feet bgs, with dewatering.

The results of the detailed analysis of alternatives for this AOC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-8.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable with regard to the criteria as defined in Section 6.2.

Overall Protection of Human Health

The overall ability of No Action to be protective of human health is limited, since the concentrations of compounds that exceed RBCs will not be evaluated by the implementation of No Action. Based on observed indicators of natural attenuation, it is possible that background concentrations would be achieved over time. However, without a monitoring program, future Site conditions would be unknown.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Monitored Natural Attenuation

Implementability

MNA is readily implementable at the Site since a monitoring program, required infrastructure, and equipment already exists. Additional monitor wells could be readily installed if needed.

Overall Protection of Human Health

The overall ability of MNA to be protective of human health at this AOC is low. There is little to no near-term reduction of risk offered by this alternative. Measures to reduce worker exposures would be required for trenching and construction work during Site redevelopment and engineering controls would be required after Site redevelopment. Exposure to RBC exceedances is reduced over time but the time frame to achieve this reduction is long.

Cost

The cost to implement MNA would be low with respect to both capital costs and O&M costs. The approximate cost of implementing MNA is $122,000. Capital costs would primarily be associated with installation of monitoring wells. O&M costs would primarily be associated with sample collection and analysis, data trending, and reporting. It was assumed that this area would be monitored for 10 years due to the moderate sized VOC plume which would most likely take a moderate amount of time to naturally attenuate to below RBCs.

Alternative 3 – Enhanced In-Situ Bioremediation

Implementability

This alternative is moderately implementable. Based on the results of the bench-scale study, addition of electron donor and microbial culture would be required to achieve rapid dechlorination rates. Direct push technology could be used to inject a grid of electron donor and dechlorinating microbial culture (Figure 6-1). Monitor wells would also be installed in addition to existing monitor wells to monitor the surrounding area.

Less than one month would most likely be required to inject the electron donor and microbial culture through temporary direct push borings.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. However, there would be no immediate reduction in exposure to groundwater RBC exceedances. Under this alternative, RBCs in groundwater could be achieved in the near term (likely within approximately 2 years).

Baseline data from the Pilot Study area shows that biodegradation is occurring naturally at the Site as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. Although no VC is observed in the AOC Former Maintenance Yard, this is most likely due to the native microbial community, which will be augmented with the KB-1 culture during the EISB implementation. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates, groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation.

Cost

The relative magnitude of cost for this alternative is medium with respect to other alternatives for this AOC. This alternative would cost approximately $198,000. This is due to the cost of electron donor, biological media, and labor and equipment involved in injection of EISB products.

Alternative 4 – Alternative Metals Excavation with EISB

Implementability

The relative implementability of this alternative is moderate. The excavation area is approximately 13,300 square feet. The depth of soil excavated would be approximately 5 feet. Approximately 3,500 cubic yards of soil would need to be disposed of most likely as hazardous waste.

EISB would be implemented to address groundwater RBC exceedances, while excavation would be performed to address metals impacts above background in soils.

Direct push technology could be used to inject a grid of dechlorinating electron donor and microbial culture. Monitor wells would also be installed in addition to existing monitor wells to monitor the surrounding area. Less than one month would be required to inject the electron donor and biological media.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Soil does not exceed RBCs; however, background would be achieved for metals within the AOC immediately. There would be no immediate elimination of groundwater RBC exceedances although RBCs in groundwater should be achieved in the near term (likely within approximately 2 years) It is expected as groundwater concentrations decrease, soil gas concentrations will decrease as well and be within RBCs in approximately 2 years.

Baseline data from the Pilot Study area shows that biodegradation is occurring naturally at the Site as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. Although no VC is observed in groundwater samples collected from the AOC Former Maintenance Yard, this is most likely due to the native microbial community, which will be augmented with the KB-1 culture during the EISB implementation. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates, groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation.

The residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include an increased risk associated with any large construction excavation action resulting from the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large

excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

The relative magnitude of cost for this alternative is high with respect to other alternatives for this AOC. This alternative would cost approximately $1,940,000. This is due to the cost of disposal of excavated soil and groundwater, most likely as hazardous waste, electron donor and biological media, and labor and equipment involved in excavation and injection of EISB products.

Alternative 5 – Whole-AOC Excavation and Dewatering

Implementability

This alternative is relatively difficult to implement. Excavation to approximately 10 feet bgs across the entire delineated AOC (approximately 167,100 square feet) represents a major excavation action (Figure 6-3). Approximately 18,700 cubic yards of soil and 1,210,000 gallons of groundwater would be removed. Sufficient volumes of suitable clean fill could be difficult to locate. Truck traffic through the Site and over public roads near the Airport would likely generate public concerns over traffic congestion. Air emissions from truck traffic and volatilizing compounds during the work would likely generate concerns from the public and regulatory agencies.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Exposure to soil and groundwater impacts would essentially be eliminated. However, the residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the incidental risk associated with any large construction excavation action resulting from operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

This alternative represents the highest cost at approximately $11,200,000. The primary cost elements are associated with excavation and offsite disposal of approximately 18,700 cubic yards of soil and 1,210,000 gallons of water.

Recommended Remedial Option

While all of the evaluated alternatives are considered technically feasible, Alternative 1, "No Action" is not sufficiently protective of human health given current soil and ground water concentrations in this AOC.

Alternative 2 "Monitored Natural Attenuation" is also not considered to be sufficiently protective of human health given the long time frame anticipated to reach risk based concentrations or background.

Alternative 3 "Enhanced In-Situ Bioremediation" would achieve risk based concentrations. Based on the pilot study performed within the Building 131/242 AOC to evaluate the EISB alternative, it is estimated that RBCs can be met across this AOC within approximately 2 years. Baseline data from the Pilot Study area shows that biodegradation is occurring naturally at the Site, as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene.

VOCs in soil gas are expected to decline in concentration as sources are removed in nearby soil and ground water. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. This data will be used in the post remediation risk assessment to confirm remedial actions are complete.

Baseline data from the Pilot Study area shows that biodegradation is occurring naturally at the Site as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. Although no VC is observed in groundwater samples collected from the AOC Former Maintenance Yard, this is most likely due to the native microbial community, which will be augmented with the KB-1 culture during the EISB implementation. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates, groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or

bioaugmentation. The small scale of the proposed excavation would not pose significant construction risk or cause significant environmental impact.

Although Alternative 3 would cost approximately $76,000 more than Alternative 2, the increased cost is offset by the large improvement in remedial time frame.

Alternative 4 "Alternative Metals Excavation with EISB" would remediate the area with metals exceeding background in the vadose zone rapidly through direct excavation. Although several metals exceed background concentrations, they do not pose a significant risk to current or anticipated future receptors. This alternative would cost approximately $1,740,000 more than Alternative 3 and $1,810,000 more than Alternative 2.

This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Given the small potential for migration and the lack of RBC exceedances of the metals impacts addressed by Alternative 4, the incremental benefit of achieving background concentrations for metals is not offset the increased cost, physical risk, and environmental impacts of a large excavation activity, this alternative is not economically feasible vs. Alternative 3.

Alternative 5 "Whole AOC Excavation" would not be technically feasible until demolition has been completed. According to the schedule provided by the Port, demolition in this area will be completed no sooner than August 2010. Because of this constraint, although Alternative 5 would immediately reduce constituent concentrations to background through direct excavation, the overall timeframe for the remedial process is no better than that of Alternative 3 which could be implemented in advance of demolition.

This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Alternative 5 represents an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. This alternative would cost approximately $9,260,000 more than Alternative 4 and $11,000,000 more than Alternative 3

Because there is not a significant risk posed to anticipated Site receptors from VOC and metals concentrations below the RBCs, the incremental benefit of immediately achieving background concentrations for VOCs and metals does not offset the increased cost, physical risk, and environmental impacts of a large excavation activity. This alternative is not economically feasible vs. Alternative 3 or 4.

The recommended remedial alternative for this AOC is Alternative 3 "Enhanced in Situ Bioremediation". The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). The residual VOC concentrations below site-specific RBCs not addressed by Alternative 3 are likely to be reduced to background over time through natural degradation. Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

VOCs in soil gas are expected to decline in concentration as sources are removed in nearby soil and ground water. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. This data will be used in the post remediation risk assessment to confirm remedial actions are complete.

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to extremely low hydraulic gradient across this AOC, groundwater velocities in the AOC Former Maintenance Yard are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors, along with the natural degradation processes observed during the EISB pilot study, cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon. Based on historical Site data, lateral migration of impacted groundwater is in equilibrium with natural attenuation and degradation of the constituents, which results in a stable or decreasing area of impact over time. It is anticipated that the proposed remedial action (EISB) will reduce the remaining VOC mass in place, to below RBCs within approximately 2 years and to background conditions over time. Groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. Natural attenuation is expected to further reduce the concentrations of residual VOCs in areas which are currently below RBC levels and not

directly addressed by Alternative 3. This will mitigate future potential for impacted groundwater to migrate to Convair Lagoon. Residual metals concentrations above background are localized in extent, located above the water table, and unlikely to be significantly mobile.

The primary remedial goal (i.e., achieving RBCs) proposed for the recommended remedial option for this AOC is consistent with maximum benefit to the people of the State, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. This combination of technologies has been proven to be effective in reducing short- and long-term risk or hazard. It is also moderately implementable, protective of human health, and cost effective.

6.4.8 AOC Building 180

This AOC contains groundwater impacted with VOCs. Soil TPH concentrations slightly exceed RBCs at one location. There is no indication that NAPL is present at this AOC. The primary remedial goal for this AOC is reduction of human health risk to acceptable levels, defined as achieving the site-specific RBCs presented in Tables 5-1 through 5-4. The secondary remedial goal is achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action;
2. Monitored Natural Attenuation;
3. Enhanced In-Situ Bioremediation with Targeted Excavation;
4. Whole-AOC excavation of soil that exceeds background concentrations, to approximately 10 feet bgs, with dewatering.

The results of the detailed analysis of alternatives for this AOC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-9.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable as the criteria are defined in Section 6.2.

Overall Protection of Human Health

The overall ability of No Action to be protective of human health is limited, since the concentrations of compounds that exceed RBCs will not be evaluated by the implementation of No Action. Based on observed indicators of natural attenuation, it is possible that background concentrations would be achieved over time. However, without a monitoring program, future Site conditions would be unknown.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Monitored Natural Attenuation

Implementability

MNA is readily implementable at the Site since a monitoring program, required infrastructure, and equipment already exists. Additional monitor wells could be readily installed if needed.

Overall Protection of Human Health

The overall ability of MNA to be protective of human health at this AOC is moderate. The groundwater RBC exceedance in this area is limited to one sample location and the sampled concentration was very close to the RBC when last sampled in 2005. It is possible that additional sampling will show that the RBC has been achieved. The potential TPH RBC exceedance is located at 1 foot bgs and only slightly exceeds RBCs.

Cost

The cost to implement MNA would be low with respect to both capital costs and O&M costs. The approximate cost of implementing MNA is $44,000. Capital costs would primarily be associated with installation of a monitoring well. O&M costs would primarily be associated with sample collection and analysis, data trending, and reporting. It was assumed that this area would be monitored for 3 years due to the small sized VOC plume which would most likely take a short amount of time to naturally attenuate to below RBCs.

Alternative 3 – EISB with Targeted Excavation

Implementability

This alternative is moderately implementable. Based on the results of the bench-scale study, addition of electron donor and microbial culture would be required to achieve rapid dechlorination rates. Direct push technology could be used to inject a grid of electron donor and dechlorinating microbial culture (Figure 6-1). A monitor well would also be installed to monitor the impacted area. Less than one month would be required to inject the electron donor and microbial culture through temporary direct push borings.

One targeted excavation would be required (Figure 6-2). The extent of the targeted excavation would cover approximately a 10 foot by 10 foot area to approximately 5 feet bgs around one soil RBC exceedance for TPH. The excavation would then be extended laterally to an estimated 20 foot by 20 foot area to approximately 2 feet bgs to address a horizon of shallow TPH and PCB impacts at approximately 1 foot BGS. The volume of soil removed would not generate technical or administrative challenges.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Under this alternative, RBCs in groundwater could be achieved in the near term (likely within approximately 2 years).

Baseline data from the Pilot Study area shows that biodegradation is occurring naturally in this area as evidenced by reducing conditions, and the presence of cis-1,2-DCE, VC, and ethene. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs are likely to be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates, groundwater monitoring data collected from the Pilot Study during the next two

years will aid in the evaluation of natural degradation rates and time to reach background. VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation.

Cost

The relative magnitude of cost for this alternative is medium with respect to other alternatives for this AOC. This alternative would cost approximately $145,000. This is due to the cost of electron donor, biological media, labor and equipment involved in injection of EISB products, and labor associated with the subsequent monitoring program.

Alternative 4 – Whole-AOPC Excavation and Dewatering

Implementability

The relative implementability of this alternative is difficult. Excavation to approximately 10 feet bgs across the entire delineated AOPC would be difficult to implement. The area to be excavated is approximately 7,000 square feet (Figure 6-3). A volume of approximately 2,600 cubic yards of soil and 168,000 gallons of water would be excavated. This excavation is not feasible if the buildings are in place.

Overall Protection of Human Health

There is limited risk associated with this AOC. Implementation of this alternative does not significantly threaten human health. However, the residual concentrations additionally addressed by this Alternative vs. Alternative 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the incidental risk associated with any large construction excavation action resulting from operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs.

Cost

This alternative has a relatively high cost at approximately $1,580,000. The primary cost elements are associated with excavation offsite disposal of approximately 2,600 cubic yards of soil and 168,000 gallons of groundwater.

Recommended Remedial Option

While all of the evaluated alternatives are considered technically feasible, Alternative 1, "No Action" is not sufficiently protective of human health given current soil and ground water concentrations in this AOC.

Alternative 2 "Monitored Natural Attenuation" is protective of human health because the VOC exceedances observed in this AOC are relatively close to the RBC and may achieve remedial goals by MNA over a relatively short time frame. Monitoring would allow for this process to be tracked and worker exposure to be monitored.

Alternative 3 "EISB with Targeted Excavation" would achieve risk based concentrations. Based on the pilot study performed within this AOC to evaluate the EISB alternative, it is estimated that RBCs are likely to be met across the AOC within approximately 2 years. Baseline data from the Pilot Study area show that biodegradation is occurring naturally at the Site as evidenced by reducing conditions and the presence of cis-1,2-DCE, VC, and ethene. The EISB Pilot Study was able to significantly enhance the natural degradation rates so that the RBCs should be achieved over an approximate 2-year timeframe. While there is not currently sufficient data to evaluate natural degradation rates, groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. VOCs are expected to continue to be reduced beyond the RBC goal, ultimately reaching background conditions without further biostimulation or bioaugmentation. The small scale of the proposed excavation would not pose significant construction risk or cause significant environmental impact.

Alternative 4 "Whole AOC Excavation" would not be technically feasible until demolition has been completed. According to schedule information provided by the Port, demolition in this area will be completed no sooner than August, 2010. Because all RBC exceedances are addressed immediately by Alternative 2, the incremental benefit which would be achieved by attaining background concentrations is relatively small, and is offset by the near term achievement of RBC goals in advance of Site demolition.

This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. There is an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. Alternative 4 is estimated to cost approximately $1,430,000 more than Alternative 3.

Based on this assessment, this alternative is not economically feasible. The incremental benefit of further reducing constituent concentrations vs. Alternative 3 would not be offset by the increased near-term exposure of construction workers, increased cost, physical risk, and environmental impacts of a large excavation activity.

The recommended remedial alternative for this AOC is Alternative 3 "EISB with targeted excavation". The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). The residual concentrations below site-specific RBCs not addressed by Alternative 3 are likely to be reduced to background over time through natural degradation. Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

VOCs in soil gas are expected to decline in concentration as sources are removed in nearby soil and ground water. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. This data will be used in the post remediation risk assessment to confirm remedial actions are complete.

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to extremely low groundwater flow gradient across this AOC, groundwater velocities in the Building 180 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors, along with the natural degradation processes observed during the EISB pilot study, cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon. Based on historical Site data, lateral migration of impacted

groundwater is in equilibrium with natural attenuation and degradation of the constituents, which results in a stable or decreasing area of impact over time. It is anticipated that the proposed remedial action (EISB with targeted excavation) will reduce the remaining VOC mass in place, to below RBCs within approximately 2 years and to background conditions over time. The excavation would remove the RBC exceedance in soil. Based on existing Site data, natural attenuation is expected to further reduce the concentrations of residual VOCs in areas which are currently below RBC levels and not directly addressed by Alternative 3. These areas will also likely reach background through natural degradation over time. Groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. As a result, it is very unlikely that impacted groundwater will migrate to Convair Lagoon.

The primary remedial goal (i.e., achieving RBCs) proposed for the recommended remedial option for this AOC is consistent with maximum benefit to the people of the State, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. This combination of technologies has been proven to be effective in reducing short- and long-term risk or hazard. It is also moderately implementable, protective of human health, and cost effective.

6.4.9 AOPC Explosives Area

This AOPC contains soil impacted with PCBs at a concentration of 1.5 mg/kg. There is no risk or hazard associated with this location as this value does not exceed the lowest RBC for PCBs of 4.2 mg/kg; however, this soil exceeds the proposed PCB target cleanup goal of 1.0 mg/kg presented in Section 5.3. Concentrations of COPCs in soil and groundwater within this AOPC are considered acceptably protective of human-health, and risk-based cleanup is not required at this AOPC. There is no indication that NAPL is present at this AOPC. The secondary remedial goal for this AOPC is elimination of impacts by achieving background concentrations.

The alternatives retained for detailed analysis are as follows:

1. No Action; and

2. Alternative excavation to approximately 5 feet bgs.

The results of the detailed analysis of alternatives for this AOPC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-10.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable as the criteria are defined in Section 6.2.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. This alternative is protective of human health.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Alternative Excavation

Implementability

The relative implementability of this alternative is moderate. Excavation to approximately 5 feet bgs across the entire delineated AOPC would be more difficult to implement than No Action. The area to be excavated is approximately 100 square feet. A volume of approximately 20 cubic yards would be excavated.

Overall Protection of Human Health

There is no calculated risk associated with this AOPC. Implementation of this alternative does not significantly threaten human health. Given the small volume of the proposed excavation the incidental risk and impacts associated with excavation and disposal are low.

Cost

This alternative has a high cost of approximately $27,000. The primary cost elements are associated with excavation and offsite disposal of approximately 20 cubic yards of soil.

Recommended Remedial Option

Alternative 1 – No Action would be an acceptable alternative for this AOPC. There is no significant risk associated with impacts within this AOPC. However, the PCB impacts in shallow soil exceed the alternative PCB remedial goal of 1.0 mg/kg.

Alternative 2 "Alternative Excavation" would achieve the alternative PCB cleanup goal for PCBs in the AOC. Although this would not result in significantly lower risk to receptors at the Site, given the small volume of PCB impacted soil in this area, the costs wouldn't be substantial. This Alternative costs approximately $27,000 more than Alternative 1.

The recommended remedial alternative for this AOPC is Alternative 2 - Alternative Excavation. There is no significant risk associated with this AOPC; however, this Alternative will meet the Alternative PCB soil cleanup goal of 1.0 mg/kg. Based on this, the residual concentrations proposed to remain at this AOPC are consistent with maximum benefit to the people of the State, do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. There is no identified short- or long-term risk or hazard associated with this AOPC. It is also highly implementable, protective of human health, and cost effective.

6.4.10 AOPC Test Cell #4/Area D

This AOPC was observed in 2005 to contain a sheen of LNAPL in monitor well 142WNC. A sheen of LNAPL was observed in subsequent monitoring during the third quarter of 2007. TDY is currently working with the RWQCB to obtain closure for the Area D/Test Cell #4 area. Based on the available data, concentrations of COPCs in soil and groundwater within this AOPC appear to be protective of human-health.

The DEH had previously requested a vapor risk assessment be performed in Area D using historical soil analytical data (GTI, 1992; 1995). Recent studies indicate that soils data are the least preferable media to use when evaluating vapor risk due to residual VOCs. Based on these data, a soil gas survey will be performed in Area D to evaluate potential health risks due to vapor intrusion. In the event remediation is warranted, the primary remedial goal for this AOPC will be the removal of LNAPL. The secondary remedial goal for this AOPC will be reduction of human health risk to acceptable levels and the elimination of impacts by achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action;
2. Two Phase Extraction for LNAPL and VOCs in soil and groundwater;
3. Targeted Excavation for LNAPL and VOCs in soil and groundwater; and
4. Whole-AOPC excavation of soil that exceeds background concentrations, to approximately 10 feet bgs, with dewatering.

The results of the detailed analysis of alternatives for this AOPC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-11.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable as the criteria are defined in Section 6.2.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. This alternative is protective of human health.

Cost

The relative cost to implement No Action at the Site is low with respect to both capital and O&M costs. No additional costs would be expected by implementation of this alternative.

Alternative 2 – Two Phase Extraction

Implementability

The relative implementability of this alternative is high. TPE would use a liquid-ring pump to generate a vacuum, which would be applied to well TC4WNC by lowering a suction pipe into the well (approximate location shown on Figure 2-1). The suction would be applied for approximately 8 hours. Soil vapor, groundwater, and available mobile LNAPL would be removed from within the well and surrounding saturated soil. In addition, shallow groundwater from the surrounding saturated soil would be drawn into the well for removal. It is expected that the applied vacuum would generate between 15 and 30 standard cubic feet per minute (scfm) of vapor flow and 3 to 5 gallons per minute of liquid.

Overall Protection of Human Health

There is no estimated risk associated with this AOPC. If future soil gas surveys indicate potential risk to human health, this alternative would efficiently mitigate risk in this area.

Cost

The relative cost to implement TPE at the Site is moderate with respect to both capital and O&M costs. To perform a TPE the cost would be approximately $27,000.

Alternative 3 – Targeted Excavation and Dewatering

Implementability

The relative implementability of this alternative is high. Excavation to approximately 10 feet bgs in the area of historically observed LNAPL (approximately 150 square feet) (Figure 6-2) represents a moderate excavation action. Approximately 50 cubic yards of soil and 5,000 gallons of water would need to be disposed.

Overall Protection of Human Health

There is no calculated risk associated with constituents detected within this AOPC. However, there is a risk associated with any large construction excavation action resulting from operation of heavy machinery and increased road traffic.

Cost

This alternative has a moderate cost at approximately $56,000. The primary cost elements are associated with excavation and offsite disposal of approximately 50 cubic yards of soil and 5,000 gallons of water.

Alternative 4 – Whole-AOPC Excavation and Dewatering

Implementability

The relative implementability of this alternative is moderate. Excavation to approximately 10 feet bgs across the entire delineated AOPC (approximately 12,510 square feet) (Figure 6-3) represents a moderate excavation action. Approximately 4,700 cubic yards of soil and 300,000 gallons of water would need to be disposed.

Overall Protection of Human Health

There is no calculated risk associated with constituents detected within this AOPC. The residual concentrations additionally addressed by this Alternative vs. Alternatives 2 or 3 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the risk associated with any large construction excavation action resulting from operation of heavy machinery and increased road traffic.

Cost

This alternative has the highest cost at approximately $2,800,000. The primary cost elements are associated with excavation and offsite disposal of approximately 4,700 cubic yards of soil and 300,000 gallons of water.

Recommended Remedial Option

Alternative 1 “No Action” is both technically feasible and protective of human health if no soil gas concentrations are identified in excess of the RBC and no LNAPL impacts are determined to be present.

Alternative 2 “Two-Phase Extraction” would achieve RBCs and remove mobile LNAPL if impacts are detected in Area D. This alternative is cost effective and could be easily scaled to the observed area of impacts.

Alternative 3 “Targeted Excavation” could achieve risk based concentrations within weeks of performing the remedial action. The small scale of the proposed excavation would not pose significant construction risk or environmental impact. Although Alternative 3 is slightly more costly than Alternative 2, the additional cost of a small excavation of approximately 150 square feet is offset by the improved ability to rapidly and completely remove the source area. Over a larger area, however, two phase extraction is significantly more cost effective and the benefits of direct excavation do not outweigh the cost. This Alternative costs approximately $29,000 more than Alternative 1.

Alternative 4 “Whole AOPC Excavation” would not be technically feasible until demolition has been completed. According to the schedule provided by the Port, demolition in this area will be completed no sooner than August 2010. Because there are no RBC exceedances in this AOPC, the incremental benefit which would be achieved by attaining background concentrations is relatively small. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. There is an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered. Alternative 4 is estimated to cost approximately $2,750,000 more than Alternatives 2 or 3.

Based on this assessment, this alternative is not economically feasible. The incremental benefit of further reducing constituent concentrations vs. Alternatives 2 or 3 would not be offset by the increased cost, physical risk, and environmental impacts of a large excavation activity.

The wells within the Area D AOPC will be gauged for the presence of LNAPL during routine semiannual sampling events. If no LNAPL is observed, a soil gas survey will be performed. If soil gas concentrations are below RBCs, No Action will be the selected Alternative. If LNAPL is observed over a limited area, Alternative 3 “Targeted Excavation” will be implemented. Alternative 2 “Two Phase Extraction” will be implemented if impacts are detected over an extensive area. VOCs in soil gas are expected to decline in concentration as sources are removed in nearby soil and ground water. Post-remediation soil gas survey data will be collected after soil gas conditions

have reached equilibrium. These soil gas results will be used in the post remediation risk assessment to confirm remedial actions are complete.

The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). The residual concentrations are below site-specific RBCs. Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) and is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to the extremely low hydraulic gradient, groundwater velocities in the Area D/Test Cell 4 AOC estimated to be less than 0.5 feet per year. These factors make migration of observed impacts unlikely. Based on this, the residual concentrations proposed to remain at this AOC are consistent with maximum benefit to the people of the State, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, the proposed alternatives are protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. There is no identified short- or long-term risk or hazard associated with this AOPC. They are moderately implementable, protective of human health, and cost effective.

6.4.11 AOPC Building 142

This AOPC contains groundwater impacted with PCE with concentrations up to 280 µg/L, which is below the lowest RBC calculated for PCE of 320 µg/L (commercial worker exposure scenario). A no-further-action determination was granted by the San Diego DEH in October 2000 based on current land use (PES, 2001). Concentrations of COPCs in soil and groundwater within the AOPC are considered acceptably protective

of human-health, and risk-based cleanup is not required at this AOPC. There is no indication that NAPL is present at this AOPC. The secondary remedial goal for this AOPC is elimination of impacts by achieving background concentrations.

The alternatives retained for detailed analysis are as follows:

1. No Action; and

2. Whole-AOPC excavation and dewatering to approximately 10 feet bgs.

The results of the detailed analysis of alternatives for this AOPC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-12.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable as the criteria are defined in Section 6.2.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. This alternative is fully protective of human health.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Whole-AOPC Excavation and Dewatering

Implementability

This alternative would be relatively difficult to implement. Excavation to approximately 10 feet bgs across the entire delineated AOPC would be more difficult to implement than No Action or MNA. The approximate total area to be covered is 6,500 square feet (Figure 6-3).

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. The residual concentrations additionally addressed by this Alternative vs. Alternative 1 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered.

Cost

This alternative has the highest cost at approximately $1,470,000. The primary cost elements are associated with excavation and offsite disposal of approximately 2,500 cubic yards of soil and 156,000 gallons of water.

Recommended Remedial Option

Alternative 1 "No Action" would be an acceptable alternative for this AOPC. There is no significant risk associated with impacts within this AOPC. The background VOC exceedance is localized in extent. Due to the extremely low hydraulic gradient, groundwater velocities in the Building 142 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors, along with the natural degradation processes observed during the EISB pilot study, cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon, with the potential to reach background concentrations over time.

Alternative 2 "Whole-AOPC Excavation and Dewatering" would achieve background concentrations for VOCs in the AOPC; however, this would not result in significantly lower risk to receptors at the Site. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Environmental impacts from fossil fuel consumption, carbon emissions, and landfill burden related to excavation activities must be considered when evaluating the relative benefit of remedial actions to address

concentrations below RBCs. This Alternative costs approximately $1,500,000 more than Alternative 1. Based on this assessment, this alternative is not economically feasible.

Given the small potential for migration of the VOC impacts from this area, the incremental benefit of achieving background concentrations for VOCs in the short term would not be offset by the increased cost, physical risk, and environmental impacts of an excavation activity.

The recommended remedial alternative for this AOPC is Alternative 1 "No Action". There is no significant risk associated with this AOPC. The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). The residual concentrations are below site-specific RBCs. Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to the extremely low hydraulic gradient, groundwater velocities in the Building 142 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors, along with the natural degradation processes observed during the EISB pilot study, cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon. Based on historical Site data, lateral migration of impacted groundwater is in equilibrium with natural attenuation and degradation of the constituents, which results in a stable or decreasing area of impact over time. It is anticipated that the remaining VOC mass will naturally attenuate to background conditions over time. Groundwater monitoring data collected from the Pilot Study during the next two years will aid in the evaluation of natural degradation rates and time to reach background. This will mitigate future potential for impacted groundwater to migrate to Convair Lagoon. Based on this, the residual concentrations proposed to remain at this AOC are consistent with maximum benefit to the people of the State, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect

present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. There is no identified short- or long-term risk or hazard associated with this AOPC. It is also highly implementable, protective of human health, and cost effective.

6.4.12 AOPC Southeast of Building 146

Data collected in 2003 indicate that groundwater at this AOPC could potentially be impacted with VC that exceeds RBCs. However, confirmation sampling conducted in 2005 indicates that concentrations have declined well below groundwater RBCs. No soil or soil gas detections exceed RBCs in this area. Therefore, there is no significant risk at this AOPC. There is no indication that NAPL is present at this AOPC. The secondary remedial goal for this AOPC is elimination of impacts by achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action; and

2. Whole-AOC excavation of soil that exceeds background concentrations, to approximately 10 feet bgs, with dewatering.

The results of the detailed analysis of alternatives for this AOC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-13.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable with regard to the criteria as defined in Section 6.2.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. This alternative is fully protective of human health

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Whole AOPC Excavation and Dewatering

Implementability

This alternative is relatively moderate to implement. Excavation to approximately 10 feet bgs across the entire delineated AOPC (approximately 100 square feet) (Figure 6-3) represents a minor excavation action. Approximately 37 cubic yards of soil and 2,400 gallons of groundwater would be removed. The volume of soil removed would not generate technical or administrative challenges.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. The residual concentrations additionally addressed by this Alternative vs. Alternative 1 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include an incremental risk associated with the operation of heavy machinery and increased road traffic. Further, environmental impacts from carbon emissions and landfill burden related to large excavation activities must also be considered.

Cost

This alternative has a moderate cost of approximately $40,000. The primary cost elements are associated with excavation and offsite disposal of approximately 37 cubic yards of soil and 2,400 gallons of water.

Recommended Remedial Option

Alternative 1 “No Action” would be an acceptable alternative for this AOPC. There is no significant risk associated with impacts within this AOPC. The background VOC exceedance is localized in extent. Due to the extremely low hydraulic gradient, groundwater velocities in the Building 142 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These

factors, along with the natural degradation processes observed during the EISB pilot study, cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon, with the potential to reach background concentrations over time.

Alternative 2 "Whole AOPC Excavation and Dewatering" would achieve background concentrations for VOCs in the AOPC; however, this would not result in significantly lower risk to receptors at the Site. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Environmental impacts from fossil fuel consumption, carbon emissions, and landfill burden related to excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs. This Alternative costs approximately $40,000 more than Alternative 1. Based on this assessment, this alternative is not economically feasible.

The recommended remedial alternative for this AOPC is Alternative 1 "No Action". There is no significant risk associated with this AOPC. The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). The residual concentrations are below site-specific RBCs. Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to the extremely low hydraulic gradient, groundwater velocities in the Building 146 area are estimated to be less than 0.5 feet per year, with most constituent transport occurring through dispersion and diffusion. These factors, along with the natural degradation processes observed during the EISB pilot study, cause the footprint of impacted groundwater to be very stable and unlikely to migrate to Convair Lagoon. Based on historical Site data, lateral migration of impacted groundwater is in equilibrium with natural attenuation and degradation of the constituents, which results in a stable or decreasing area of impact over time. It is anticipated that the remaining VOC mass will naturally attenuate to background conditions over time. Groundwater monitoring data collected from the Pilot Study during the next two years will aid in the

evaluation of natural degradation rates and time to reach background. This will mitigate future potential for impacted groundwater to migrate to Convair Lagoon. Based on this, the residual concentrations proposed to remain at this AOC are consistent with maximum benefit to the people of the State, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. There is no identified short- or long-term risk or hazard associated with this AOPC. It is also highly implementable, protective of human health, and cost effective.

6.4.13 AOPC Building 120 West

PCBs were detected in one shallow soil sample at a concentration greater than the alternative PCB soil cleanup goal of 1 mg/kg. No sample exceeded soil RBCs. Concentrations of COPCs in soil and groundwater within this AOPC are considered protective of human-health, and risk-based cleanup is not required at this AOPC. There is no indication that NAPL is present at this AOPC. The secondary remedial goal for this AOPC is elimination of impacts by achieving background concentrations.

The alternatives retained for detailed analysis are as follows:

1. No Action;

2. Alternative Excavation of PCB impacts exceeding the alternative PCB cleanup goal; and

3. Whole-AOPC excavation to approximately 5 feet bgs.

The results of the detailed analysis of alternatives for this AOPC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-14.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable as the criteria are defined in Section 5.2.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. This alternative is protective of human health.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Alternative Excavation

Implementability

This alternative is highly implementable. The size of the excavation is moderate covering an area of approximately 100 square feet to a depth of approximately 5 feet bgs. Approximately 20 cubic yards of soil would be removed.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. Although there is an incidental risk associated with any construction excavation action resulting from operation of heavy machinery and increased road traffic, given the small volume of the proposed excavation the incidental risk and impacts associated with excavation and disposal are low.

Cost

This alternative has a relatively low cost of approximately $27,000. The primary cost elements are associated with excavation and offsite disposal of approximately 20 cubic yards of soil.

Alternative 3 – Whole-AOPC Excavation

Implementability

The relative implementability of this alternative is moderate. Excavation to

approximately 5 feet bgs across the entire delineated AOPC would be more difficult to implement than No Action. The area to be excavated is approximately 700 square feet (Figure 6-3). A volume of approximately 130 cubic yards would be excavated.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. The residual concentrations additionally addressed by this Alternative vs. Alternative 2 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the incidental risk associated with any construction excavation action resulting from operation of heavy machinery and increased road traffic.

Cost

This alternative has a relatively high cost at approximately $102,000. The primary cost elements are associated with excavation and offsite disposal of approximately 130 cubic yards of soil.

Recommended Remedial Option

Alternative 1 “No Action” would be an acceptable alternative for this AOPC. There is no significant risk associated with impacts within this AOPC. However, one soil same exceeded the alternative PCB cleanup goal of 1 mg/kg. The PCB impacts are localized in extent, do not exceed RBCs, and are located above the water table. Because of the extremely low solubility of PCBs and low groundwater flow velocity in this area (less than 0.5 feet a year), these impacts are unlikely to be significantly mobile.

Alternative 2 “Alternative Excavation” would achieve the alternative PCB cleanup goal for PCBs in the AOC. Although this would not result in significantly lower risk to receptors at the Site, given the small volume of PCB impacted soil in this area, the costs wouldn’t be substantial. This Alternative costs approximately $27,000 more than Alternative 1.

Alternative 3 “Whole AOPC Excavation” would achieve background concentrations across the AOPC; however, this would not result in significantly lower risk to receptors at the Site. This Alternative is inconsistent with maximum benefit to the people of the

State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Environmental impacts from fossil fuel consumption, carbon emissions, and landfill burden related to excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs. This Alternative costs approximately $110,000 more than Alternative 2.

Based on this assessment, this alternative is not economically feasible. Given the small potential for migration of the COC impacts from this area and the relatively low concentrations of metals across the AOPC as compared with background, the incremental benefit of achieving background concentrations for these constituents would not be offset by the increased cost, physical risk, and environmental impacts of an excavation activity.

The recommended remedial alternative for this AOPC is Alternative 2 "Targeted Excavation". There is no significant risk associated with this AOPC. However, this Alternative will meet the Alternative PCB soil cleanup goal of 1.0 mg/kg. Based on this, the residual concentrations proposed to remain at this AOPC are consistent with maximum benefit to the people of the State, do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to the extremely low hydraulic gradient, groundwater velocities in the Building 120 West AOPC are estimated to be less than 0.5 feet per year. These factors, in addition to the extremely low solubility of PCBs make migration of observed impacts unlikely. Based on this, the residual concentrations proposed to remain at this AOC are consistent with maximum benefit to the people of the State, do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

6.4.14 AOPC Building 222/228

This AOPC is impacted with TPH and metals in soil exceeding site-specific background concentrations including chromium, cobalt, lead, mercury, nickel, and zinc (Figure 1-3). Soil samples collected west of former Building 228 also contained PCBs above the alternative PCB cleanup goal of 1.0 mg/kg. There is no indication that NAPL is present at this AOPC. The secondary remedial goal for this AOPC is elimination of impacts by achieving background concentrations.

The alternatives retained for detailed analysis are:

1. No Action;
2. Alternative excavation of PCB impacts exceeding the alternative PCB cleanup goal; and
3. Whole-AOPC excavation of soil that exceeds background concentrations, to approximately 5 feet bgs.

The results of the detailed analysis of alternatives for this AOPC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-15.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable with regard to the criteria as defined Section 6.2.

Overall Protection of Human Health

The overall ability of No Action to be protective of human health is moderate. No constituent exceeds RBCs in this area.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Alternative Excavation

Implementability

This alternative is highly implementable. The size of the excavation is moderate covering an area of approximately 100 square feet to a depth of approximately 5 feet bgs. Approximately 20 cubic yards of soil would be removed.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. Although there is an incidental risk associated with any construction excavation action resulting from operation of heavy machinery and increased road traffic, given the small volume of the proposed excavation the incidental risk and impacts associated with excavation and disposal are low.

Cost

This alternative has a relatively low cost of approximately $27,000. The primary cost elements are associated with excavation and offsite disposal of approximately 20 cubic yards of soil.

Alternative 3 – Whole-AOPC Excavation

Implementability

This alternative is relatively difficult to implement. The size of the excavation is moderate covering an area of approximately 12,000 square feet to a depth of approximately 5 feet bgs. Approximately 2,300 cubic yards of soil would be removed. However, the excavation cannot be performed with the buildings in place.

Overall Protection of Human Health

The overall ability of this alternative to be protective of human health is high. Soil concentrations would achieve background. The residual concentrations additionally addressed by this Alternative vs. Alternative 2 are not anticipated to unreasonably affect present and anticipated beneficial use of water or result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and

Regional Water Boards. Also, this Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental cost associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. These costs include the increased risk associated with any large construction excavation action resulting from operation of heavy machinery and increased road traffic.

Cost

This alternative has a high cost at approximately $1,185,000. The primary cost elements are associated with excavation and offsite disposal of approximately 2,300 cubic yards of soil.

Recommended Remedial Option

Alternative 1 "No Action" would be an acceptable alternative for this AOPC. There is no significant risk associated with impacts within this AOPC. The PCB and metals impacts are localized in extent, do not exceed RBCs, and are located above the water table. However, the PCB impacts in shallow soil exceed the alternative PCB remedial goal of 1.0 mg/kg. Because of the extremely low solubility of PCBs and low groundwater flow velocity in this area (less than 0.5 feet a year), these impacts are unlikely to be significantly mobile.

Alternative 2 "Alternative Excavation" would achieve the alternative PCB cleanup goal for PCBs in the AOC. Although this would not result in significantly lower risk to receptors at the Site, given the small volume of PCB impacted soil in this area, the costs wouldn't be substantial. This Alternative costs approximately $27,000 more than Alternative 1.

Alternative 3 "Whole AOPC Excavation" would achieve background concentrations across the AOPC; however, this would not result in significantly lower risk to receptors at the Site. This Alternative is inconsistent with maximum benefit to the people of the State due to the social and environmental costs associated with the implementation of the remediation as related to the relatively incremental improvement in the final Site condition. Environmental impacts from fossil fuel consumption, carbon emissions, and landfill burden related to excavation activities must be considered when evaluating the relative benefit of remedial actions to address concentrations below RBCs. This Alternative costs approximately $1,160,000 more than Alternative 2.

Based on this assessment, this alternative is not economically feasible. Given the small potential for migration of the COC impacts from this area and the relatively low

concentrations of metals across the AOPC as compared with background, the incremental benefit of achieving background concentrations for these constituents would not be offset by the increased cost, physical risk, and environmental impacts of an excavation activity.

The recommended remedial alternative for this AOPC is Alternative 2 "Alternative Excavation". There is no significant risk associated with this AOPC, however this Alternative will meet the Alternative PCB soil cleanup goal of 1.0 mg/kg. Based on this, the residual concentrations proposed to remain at this AOPC are consistent with maximum benefit to the people of the State, do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to the extremely low hydraulic gradient, groundwater velocities in the Building 222/228 Area are estimated to be less than 0.5 feet per year. The soil impacts above background concentrations are located primarily in shallow soil, above the groundwater table. Due to this, migration of the observed impacts is unlikely. Based on this, the residual concentrations proposed to remain at this AOC are consistent with maximum benefit to the people of the State, do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with major removal actions. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

6.4.15 AOPC South of Building 121

AOPC South of Building 121 (Figure 1-3) is located in the San Park area adjacent to the Site entrance from North Harbor Drive. PCBs were detected in soil in excess of the alternative PCB cleanup goal of 1 mg/kg. No sample results from this area exceed soil RBCs. Concentrations of COPCs in soil and groundwater within this AOPC are considered acceptably protective of human-health, and risk-based cleanup is not required at this AOPC. There is no indication that NAPL is present at this AOPC. The secondary remedial goal for this AOPC is elimination of impacts by achieving background concentrations.

The alternatives retained for detailed analysis are as follows:

1. No Action; and

2. Alternative excavation to approximately 5 feet bgs.

The results of the detailed analysis of alternatives for this AOPC are presented below, along with a brief description of the alternative. The results are summarized for comparison in Table 6-16.

Alternative 1 – No Action

Implementability

The No Action alternative is readily implementable as the criteria are defined in Section 6.2.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. This alternative is protective of human health.

Cost

No additional costs would be expected by implementation of this alternative.

Alternative 2 – Alternative Excavation

Implementability

The relative implementability of this alternative is difficult. Excavation to approximately 5 feet bgs across the entire delineated AOPC would be more difficult to implement than No Action. The area to be excavated is approximately 100 square feet (Figure 6-3). A volume of approximately 20 cubic yards would be excavated. However, this excavation is located in area with many sensitive subsurface utilities for the primary fiber optic communication lines for Lindbergh Field. To excavate in this area, a method such as air knifing would need to be used. However, even with this alternative excavation method there is significant risk that critical infrastructure could be damaged.

Overall Protection of Human Health

There is no estimated unacceptable risk associated with this AOPC. Although there is an incidental risk associated with any construction excavation action resulting from operation of heavy machinery and increased road traffic, given the small volume of the proposed excavation the incidental risk to human health associated with excavation and disposal are low.

Cost

This alternative has a relatively high cost at approximately $87,000 due to the modified excavation methods required for excavation in the vicinity of sensitive utilities.

Recommended Remedial Option

Alternative 1 "No Action" would be an acceptable alternative for this AOPC. There is no significant risk associated with impacts within this AOPC. The PCB impact is localized in extent, does not exceed RBCs, and is located above the water table. However, the PCB impacts in shallow soil exceed the alternative PCB remedial goal of 1.0 mg/kg.

Alternative 2 "Alternative Excavation" would achieve the alternative PCB cleanup goal for PCBs in the AOC. This would not result in significantly lower risk to receptors at the Site. Due to the sensitive infrastructure in the area, the excavation cost is significantly increased, and consequently the cost per percent mass removal for this excavation is significantly higher than the average cost of an excavation to 1 mg/kg for other parts of the Site.

The maximum concentration observed at this AOC was 1.9 mg/kg at a depth of 3 feet bgs. If a 20 cubic yard excavation is conservatively estimated to remove 22 grams of PCBs (0.32% of total site mass), the cost per percent mass removed would be over $270,000. Based on the cost analysis presented in Section 5.3, the mass removal efficiency of this excavation would be well above the economically feasible inflection point observed for the typical 1 mg/kg alternative cleanup goal.

Given this reduced remedial efficiency and the high risk of damaging critical infrastructure utilities located within the, the increase in risk to infrastructure, and cost of the excavation activity would not be offset by the incremental benefit of achieving additional reduction in concentrations for PCBs. This Alternative costs approximately $87,000 more than Alternative 1. Based on this assessment, this alternative is not economically feasible. The recommended remedial alternative for this AOPC is Alternative 1 “No Action”. There is no significant risk associated with this AOPC. The Site is located in an area designated as non-beneficial use groundwater by the Basin Plan (RWQCB, 2006). The residual concentrations are below site-specific RBCs. Achievement of the RBCs developed in this document is protective of anticipated current and future receptors on-Site, as described in the Risk Assessment (Geosyntec, 2007).

A detailed evaluation of the potential impacts to Convair Lagoon relative to California Toxics Rule (CTR) is presented in Appendix A of the Site-Wide Risk Assessment (Geosyntec, 2007). This evaluation concludes that groundwater impacts on Site are not currently impacting Convair Lagoon in excess of these standards via either direct discharge through the subsurface or potential migration through potential preferential SWCS pathways.

Due to the extremely low hydraulic gradient, groundwater velocities in the South of Building 121 AOPC are estimated to be less than 0.5 feet per year. These factors, in addition to the extremely low solubility of PCBs make migration of observed impacts unlikely. Based on this, the residual concentrations proposed to remain at this AOC are consistent with maximum benefit to the people of the State, in that further reduction of the anticipated residual constituent concentration would provide marginal benefit, while incurring potentially significant social and environmental costs associated with the alternative removal action. The proposed risk based remedial goals do not unreasonably affect present and anticipated beneficial use of water and do not result in water quality less than those prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Based on these evaluations, this alternative is protective for the current and future use of the Site, which is restricted to commercial/industrial use for tidelands properties. There is no identified short- or long-term risk or hazard associated with this AOPC. It is also highly implementable, protective of human health, and cost effective.

7.0 CONCEPTUAL REMEDIAL ACTION PLAN

The conceptual remedial action plan (RAP) for each AOC and AOPC is presented below. The conceptual RAP is based on the results of the feasibility study presented in Section 6. Descriptions of the conceptual design of the recommended alternatives are provided herein and are summarized in Table 7-1. These conceptual designs form the basis of the cost-comparisons within this report, but do not represent final engineered design recommendations.

7.1 Pilot Study / Fast Track Remedial Actions

To more fully evaluate the effectiveness of the selected remedial alternative, a pilot study is proposed for the EISB remedy in the 131/242 AOC. It is further recommended that the excavations able to be conducted in advance of building demolition proceed on a fast track in advance of the full scale implementation of the EISB remedy. These pilot study/fast track actions are described below.

7.1.1 AOC Building 131/242

The recommended alternative for this AOC is targeted excavation for VOCs exceeding RBCs in soil and EISB for VOCs in groundwater (Figure 7-1). This remedial alternative is cost effective and addresses RBC exceedances in both soil and groundwater. VOCs in soil gas are expected to decline in concentration as sources are removed in nearby soil and groundwater. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

The expected implementation of the targeted excavation with EISB alternative would consist of the following major steps:

Targeted Excavation

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil from the 20 foot by 20 foot targeted area around the soil RBC exceedance location (Figure 7-1) to approximately 7 feet bgs, or until groundwater is encountered. Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;
- Collect confirmation samples from the floor and side walls of the excavation; and

Grade, compact, confirm compaction, and demobilize all equipment and spoils.

Enhanced In-Situ Bioremediation

- Select proposed injection locations based on accessibility and technical merit;
- Acquire direct push permit and well construction permit;
- Install a series of temporary injection probes to be connected by manifolds to inject the required amount of electron donor and microbial culture in each well. The number of injection wells required will be based on a calculated ROI of 5 feet (Figure 7-1);
- Install monitor wells using a hollow stem auger drill rig;
- Monitor groundwater quality twice per year; and
- Determine if additional electron donor application is required.

7.1.2 AOC Building 156

The recommended alternative for this AOC is targeted excavations for PCBs and PCE in soil. This is a readily implementable remedial alternative that will addresses RBC exceedances in the soil. VOCs in soil gas are expected to decline in concentration as sources are removed in nearby soil and groundwater. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

Targeted Excavations

The expected implementation of the targeted excavations alternative would consist of the following major steps:

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil in two 10 foot by 10 foot areas around each RBC exceedance location (Figure 7-1) to approximately 5 feet bgs;
- Place spoils in roll-off bins for waste profiling, offsite transport and disposal;

- Collect confirmation samples from the floor and side walls of the excavation; and

- Grade, compact, confirm compaction, and demobilize all equipment and spoils.

7.1.3 AOC Building 102 Targeted Excavation Implementation

The recommended alternative for this AOC is targeted excavation for VOCs and TPH exceeding RBCs in soil and groundwater (Figure 7-1). The excavation for VOCs is recommended as fast-track source removal. This remedial alternative is cost effective and addresses RBC exceedances in both soil and groundwater.

The implementation of the targeted excavations would consist of the following major steps:

Targeted Excavation

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;

- Remove the soil from the 10 foot by 10 foot area around the VOC RBC exceedance location (Figure 7-1) to approximately 7 feet bgs, or until groundwater is encountered. Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;

- If LNAPL is observed, excavate to 1 foot below the water table, remove LNAPL from the excavation to the greatest extent practicable by dewatering with a vacuum truck;

- Collect confirmation samples from the floor and side walls of the excavation; and

- Grade, compact, confirm compaction, and demobilize all equipment and spoils.

7.1.4 AOC Building 120 South

The recommended remedial action for this AOC is excavation of the area exceeding RBCs for TPH in soil.

Targeted Excavation

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil from the approximate 920 square foot area around the potential LNAPL location (Figure 7-1) to approximately 5 feet bgs. Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;
- Collect confirmation samples from the floor and side walls of the excavation; and
- Grade, compact, confirm compaction, and demobilize all equipment and spoils.

7.1.5 AOC Building 130/166 AST/120/121 Targeted Excavation

The recommended alternative for this AOC is targeted excavations for VOCs and PCBs exceeding RBCs in soil and EISB for VOCs in groundwater (Figure 7-1). This remedial alternative is cost effective and addresses RBC exceedances in both soil and groundwater. The expected implementation of the targeted excavations for PCBs and EISB for VOCs in groundwater for this AOC is described in Section 7.2. The implementation of the targeted excavation for VOCs would consist of the following major steps:

Targeted Excavation

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil from the 10 foot by 10 foot pothole area around the RBC exceedance location (Figure 7-1) to approximately 7 feet bgs, or until groundwater is encountered;
- Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;
- Collect confirmation samples from the floor and side walls of the excavation; and
- Grade, compact, confirm compaction, and demobilize all equipment and spoils.

7.1.6 AOC Building 180 Targeted Excavation

The recommended alternative for this AOC is targeted excavation for TPH exceeding RBCs in soil and EISB for VOCs in groundwater (Figure 7-1). This remedial alternative is cost effective and addresses RBC exceedances in both soil and groundwater. The expected implementation of the EISB for VOCs in groundwater for this AOC is described in Section 7.4. The implementation of the targeted excavation alternative would consist of the following major steps:

Targeted Excavation

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil from the 10 foot by 10 foot targeted area around the RBC exceedance location (Figure 7-1) to approximately 5 feet bgs, or until groundwater is encountered;
- Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;
- Collect confirmation samples from the floor and side walls of the excavation; and
- Grade, compact, confirm compaction, and demobilize all equipment and spoils.

7.2 Full Scale Remedial Actions

Following the implementation of the Building 131/242 Pilot study and pending available access to perform the following remedial actions following Site demolition, the following remedial actions are proposed.

7.2.1 AOC Building 130/166 AST/120/121 EISB Implementation

The recommended alternative for this AOC is targeted excavations for VOCs and PCBs exceeding RBCs in soil and EISB for VOCs in groundwater (Figure 7-1). The VOC excavation is recommended as a fast track source removal with full scale EISB implementation following the pilot study in the 131/242 area, and the remaining PCB targeted excavations following removal of the 30-inch east SWCS during Site demolition. This remedial alternative is cost effective and addresses RBC exceedances in both soil and groundwater. VOCs in soil gas are expected to decline in concentration

as sources are removed in nearby soil and groundwater. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

The expected implementation of the targeted excavation for VOCs in this AOC is described in Section 7.1.6. The expected implementation of the EISB and remaining targeted excavations would consist of the following major steps:

Enhanced In-Situ Bioremediation

- Select proposed injection locations based on accessibility and technical merit;
- Acquire direct push permit and well construction permit;
- Install a series of temporary injection probes to be connected by a manifold to inject the required amount of electron donor and microbial culture in each well. The number of injection wells required will be based on an assumed ROI of 5 feet (Figure 7-1);
- Install monitor wells using a hollow stem auger drill rig;
- Monitor groundwater quality twice per year;
- Determine if additional electron donor application is required.

Targeted Excavations

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil from the areas around the RBC or alternative PCB cleanup goal exceedance locations (Figure 7-1);
- Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;
- Collect confirmation samples from the floor and side walls of the excavation; and

- Grade, compact, confirm compaction, and demobilize all equipment and spoils.

7.2.2 AOC Building 158

The recommended alternative for this AOC is targeted excavation for potential LNAPL and CrVI in soil, and ISR by injection of EVO for CrVI in groundwater. However, if the post-demolition investigation of the extent of CrVI impacts significantly increases the estimated volume of impacted soils, then the recommended alternative may become targeted excavation for potential LNAPL in soil, in-situ mixing of $FeSO_4$ for CrVI in soil, and ISR by injection of EVO for CrVI in groundwater. The targeted excavations will remove soil with potential LNAPL and CrVI and are a cost-effective way of addressing the RBC exceedances associated with Building 158 when coupled with ISR of the residual CrVI in groundwater. VOCs in nearby soil gas are expected to decline in concentration as sources are removed in nearby soil and groundwater. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

The expected implementation of this alternative would consist of the following major steps:

Targeted Excavation Alternative

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil from the 10 foot by 10 foot area around the potential LNAPL location (Figure 7-1) to approximately 7 feet bgs, or until groundwater is encountered. Remove the 40 by 80 foot area around the CrVI soil exceedances to approximately 4 feet BGS. Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;
- Collect confirmation samples from the floor and side walls of the excavation; and
- Grade, compact, confirm compaction, and demobilize all equipment and spoils.

In-Situ Mixing Alternative

- Mobilize a drill rig and mixing auger;

- Mix $FeSO_4$ solution directly into vadose zone treatment area;
- Collect confirmation samples from within treatment zone; and
- Stabilize, grade, and demobilize all equipment.

In-Situ Reduction

- Select proposed injection locations based on accessibility and technical merit;
- Acquire direct push permit and well construction permit;
- Mobilize the direct-push rig and support vehicles and personnel to the Site;
- Initiate injection of the EVO solution across the delineated AOC;
- After two months collect confirmation groundwater samples for CrVI analysis by direct push technique; and
- Inject additional EVO based on results of confirmation sampling, if required.

7.2.3 AOC Former Maintenance Yard

The recommended alternative for this AOC is EISB for VOCs in groundwater (Figure 7-1). This remedial alternative is cost effective and addresses RBC exceedances in groundwater. VOCs in soil gas are expected to decline in concentration as sources are removed in nearby soil and groundwater. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

The expected implementation of the EISB alternative would consist of the following major steps:

Enhanced In-Situ Bioremediation

- Select proposed injection locations based on accessibility and technical merit;
- Acquire direct push permit and well construction permit;

- Install a series of temporary injection probes to be connected by manifolds to inject the required amount of electron donor and microbial culture in each well. The number of injection wells required will be based on an assumed ROI of 5 feet (Figure 7-1);

- Install monitor wells using a hollow stem auger drill rig;

- Monitor groundwater quality twice per year; and

- Determine if additional electron donor application is required.

7.2.4 AOC Building 180

The recommended alternative for this AOC is EISB with targeted excavation. This remedial alternative is cost effective and addresses RBC exceedances in soil and groundwater. The excavation is recommended as a fast track source removal with full scale EISB implementation following the pilot study in the 131/242 area. VOCs concentrations in soil gas are expected to decline as sources are removed in nearby groundwater. A post-remediation soil gas survey will be conducted to collect post-remedial soil gas concentration data. These data will be used in the post remediation risk assessment to confirm remedial actions are complete.

The expected implementation of the targeted excavation for this AOC is described in Section 7.1.7. The expected implementation of the EISB alternative would consist of the following major steps:

Enhanced In-Situ Bioremediation

- Select proposed injection locations based on accessibility and technical merit;

- Acquire direct push permit and well construction permit;

- Install a series of temporary injection probes to be connected by a manifold to inject the required amount of electron donor and microbial culture in each well. The number of injection wells required will be based on a ROI of 5 feet (Figure 7-1);

- Install monitor wells using a hollow stem auger drill rig;

- Monitor groundwater quality twice per year; and

- Determine if additional electron donor application is required.

7.2.5 AOPC Explosives Area

The recommended alternative for this AOC is alternative excavation for PCBs exceeding the alternative PCB cleanup goal in soil (Figure 7-1). The implementation of the Alternative excavation would consist of the following major steps:

Alternative Excavation

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil from the 10 foot by 10 foot area around the PCB alternate cleanup goal exceedance location (Figure 7-1) to approximately 5 feet bgs. Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;
- Collect confirmation samples from the floor and side walls of the excavation; and
- Backfill, grade, compact, confirm compaction, and demobilize all equipment and spoils.

7.2.6 AOPC Test Cell #4/Area D

The recommended alternative for this AOPC will be determined after completion of a soil gas survey and vapor risk assessment. Wells within the AOPC will continue to be monitored for LNAPL sheen.

7.2.7 AOPC Building 142

The recommended alternative for this AOPC is No Action. No soil, groundwater, or soil gas samples exceed RBCs. The cost and risk associated with additional actions would not be offset by the incremental benefit of achieving background.

7.2.8 AOPC Southeast of Building 146

The recommended alternative for this AOPC is No Action. No soil, groundwater, or soil gas samples exceed RBCs. The cost and risk associated with additional actions would not be offset by the incremental benefit of achieving background.

7.2.9 AOPC Building 120 West

The recommended alternative for this AOC is alternative excavation for PCBs exceeding the alternative PCB cleanup goal in soil (Figure 7-1). The implementation of the alternative excavation would consist of the following major steps:

Alternative Excavation

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil from the 10 foot by 10 foot area around the PCB alternate cleanup goal exceedance location (Figure 7-1) to approximately 5 feet bgs. Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;
- Collect confirmation samples from the floor and side walls of the excavation; and
- Backfill, grade, compact, confirm compaction, and demobilize all equipment and spoils.

7.2.10 AOPC Building 222/228

The recommended alternative for this AOC is alternative excavation for PCBs exceeding the alternative PCB cleanup goal in soil (Figure 7-1). The implementation of the alternative excavation would consist of the following major steps:

Alternative Excavation

- Mobilize a backhoe, loader, and roll-off bins to a pre-selected staging area;
- Remove the soil from the 10 foot by 10 foot area around the PCB alternate cleanup goal exceedance location (Figure 7-1) to approximately 5 feet bgs. Place spoils in roll-off bins for waste profiling, offsite transport, and disposal;
- Collect confirmation samples from the floor and side walls of the excavation; and
- Backfill, grade, compact, confirm compaction, and demobilize all equipment and spoils.

7.2.11 AOPC South of Building 121

The recommended alternative for this AOPC is No Action. No soil, groundwater, or soil gas samples exceed RBCs. One sample exceeded the alternative soil PCB cleanup goal. However, the substantial increased cost and risk associated with additional actions (due to the sensitive infrastructure in the area) would not be offset by the incremental benefit of achieving background.

Notes:
ND< - Analyte not detected above associated method detection limit (MDL)
- Not analyzed
Bold - Analyted detected
J - Analyte was detected at a concentration below the reporting limit and above the MDL; reported value is estimated

Notes:
ND< - Analyte not detected above associated method detection limit (MDL)
- Not analyzed
Bold - Analyted detected
J - Analyte was detected at a concentration below the reporting limit and above the MDL; reported value is estimated

Notes and equations:
" -- " not applicable or not available; TR = target risk; THI = target noncancer hazard

RBC based on cancer effects:

$$RBC_{soil} = \frac{TR = 1\times10^{-5}}{(CR_{ingestion} + CR_{dermal} + CR_{inhalation})}$$

$$RBC_{gw\text{-}dermal} = \frac{TR = 1\times10^{-5}}{(CR_{dermal})}$$

$$RBC_{gw\text{-}outdoorinh} = \frac{TR = 1\times10^{-5}}{(CR_{inhalation})}$$

RBC based on noncancer effects:

$$RBC_{soil} = \frac{THI = 1}{(HQ_{ingestion} + HQ_{dermal} + HQ_{inhalation})}$$

$$RBC_{gw\text{-}dermal} = \frac{THI = 1}{(HQ_{dermal})}$$

$$RBC_{gw\text{-}outdoorinh} = \frac{THI = 1}{(HQ_{inhalation})}$$

Notes and equations:
" -- " not applicable or not available; TR = target risk; THI = target noncancer hazard

RBC based on cancer effects:

$$RBC_{soil} = \frac{TR = 1\times10^{-5}}{(CR_{ingestion} + CR_{dermal} + CR_{inhalation})}$$

$$RBC_{sg\text{-}indoor\ inh} = \frac{TR = 1\times10^{-5}}{(CR_{inhalation})}$$

$$RBC_{gw\text{-}indoor\ inh} = \frac{TR = 1\times10^{-5}}{(CR_{inhalation})}$$

RBC based on noncancer effects:

$$RBC_{soil} = \frac{THI = 1}{(HQ_{ingestion} + HQ_{dermal} + HQ_{inhalation})}$$

$$RBC_{sg\text{-}indoor\ inh} = \frac{THI = 1}{(HQ_{inhalation})}$$

$$RBC_{gw\text{-}indoor\ inh} = \frac{THI = 1}{(HQ_{inhalation})}$$

Notes and equations:

" -- " not applicable or not available; TR = target risk; THI = target noncancer hazard

RBC based on cancer effects:

$$RBC_{soil} = \frac{TR = 1 \times 10^{-5}}{\left(CR_{ingestion} + CR_{dermal} + CR_{inhalation}\right)}$$

RBC based on noncancer effects:

$$RBC_{soil} = \frac{THI = 1}{\left(HQ_{ingestion} + HQ_{dermal} + HQ_{inhalation}\right)}$$

Notes:
" -- " not applicable
[a] Soil pathways include: incidental soil ingestion, dermal contact, and outdoor inhalation of particulates/vapors
[b] Groundwater pathways include dermal contact, and outdoor inhalation of vapors
[c] Soil gas pathway includes indoor inhalation of vapors

Table 6-1

Unit Price Breakdown of Average Costs Incorporated into Feasibility Study Tables

Alternative	Volume Range	Unit Cost	Assumptions
EISB	500 points	$4,500/point	mob/demob, Inject 1,300 gallons 1% EVO solution, + 0.5 L KB-1, labor, oversight, injection, equipment, permitting, IDW
	300 points	$4,900/point	
	5 points	$11,600/point	
ISR Injection	10 points	$4,600/point	mob/demob, Inject 1,300 gallons FeSO4 solution, labor, oversight, injection, equipment, permitting, IDW disposal, concrete coring,
Regenox/ORC Injections	3 injections	$10,700/injection	3 points per injection, mob demob, sampling, oversight, labor.
In-Situ Soil Mixing	675 cy	$280/cy	mob/demob, soil amendment, labor, oversight
	450 cy	$1,030/cy	mob/demob, soil amendment, labor, oversight
Monitor Well Installation	2 wells	$7,500/well	Mob/demob, concrete cutting, permitting, labor, oversight, IDW disposal, development
Short-Term Quarterly Monitoring	6 wells	$12,250/event	Monitoring and reporting, labor, analytical, IDW disposal, equipment
Long-Term Semiannual monitoring (30-year)	7 wells	$6,300/event	Monitoring and reporting, labor, analytical, IDW disposal, equipment. 6% NPV discount
Excavation	18,000 cy	$100/yd	Mob/Demob, Concrete Cutting, Excavation, Backfill, profiling, oversight
	4,500 cy	$120/yd	Mob/Demob, Concrete Cutting, Excavation, Backfill, profiling, oversight
	200 cy	$370/yd	Mob/Demob, Concrete Cutting, Excavation, Backfill, profiling, oversight
	37 cy	$510/yd	Mob/Demob, Concrete Cutting, Excavation, Backfill, profiling, oversight
Transportation/Disposal	18,000 cy	$400/bcy	RCRA haz, transportation to Beatty, NV, oversight, $165/ton
	4,500 cy	$400/bcy	RCRA haz, transportation to Beatty, NV, oversight, $165/ton
	200 cy	$410/bcy	RCRA haz, transportation to Beatty, NV, oversight, 169/ton
	37 cy	$430/bcy	RCRA haz, transportation to Beatty, NV, oversight $177/ton
Groundwater Disposal	1,200,000 gal	$1.50/gal	pump, transport, dispose, oversight, analysis
	150,000 gal	$1.50/gal	pump, transport, dispose, oversight, analysis

cy - cubic yard

bcy - banked cubic yard

gal - gallon

Average unit costs incorporated into cost tables are provided over a range of volumes to illustrate how unit costs are affected by economies of scale, reduced mobilization costs, and oversight costs which are distributed across a larger project as the scope of an alternative implementation is increased. Actual unit costs indicated on the cost tables may vary slightly from the averages presented above due to AOC/AOPC specific considerations regarding access/clearance, or other unique circumstances, however the bulk of the unit price consideration may be evaluated based on this table.

Table 6-2
Summary of Detailed Feasibility Analysis for AOC Building 131/242
2701 North Harbor Drive, San Diego, California

Geosyntec consultants

Technology	Criteria				
	Effectiveness	**Implementability**	**Overall Protection of Human Health**	**Cost Description**	**Cost (Net Present Value)**
No Action	• LIMITED ◦ Minimal reduction in exposure	• READILY ◦ No material or equipment required	• LIMITED ◦ Minimal reduction in exposure	◦ No additional costs by implementation	Total: **$0**
MNA	• LIMITED ◦ VOC products present in groundwater indicate natural degradation process is in early stage ◦ Exposure is expected to be reduced over time	• READILY ◦ Limited material or equipment required ◦ Easily monitored and maintained until action is complete	• LIMITED ◦ No short-term reduction in exposure and long time frame to achieve risk and background	◦ Install 2 monitor wells ◦ Monitor 7 wells semiannually for 30 years	Total: **$403,000** $23,000 $380,000
EISB and Targeted Excavation	• HIGH ◦ Soil exposure is eliminated ◦ Groundwater risk or hazard is expected to be reduced within a reasonable time frame ◦ Exposure to soil gas is expected to be reduced over time in conjunction with groundwater reduction	• MODERATE ◦ Addition of electron donor and biological media will be time consuming ◦ Easily monitored and maintained until action is complete	• HIGH ◦ Soil exposure eliminated in short time frame ◦ Groundwater exposure eliminated over moderate period of time	◦ Excavate and backfill 104 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ EISB injection ◦ Monitor well installation ◦ Quarterly groundwater monitoring, analysis, and reporting for 3 years	Total: **$1,622,000** $25,000 $43,000 $1,392,000 $15,000 $147,000
Alternative Potential DNAPL Excavation with EISB and Targeted Excavation	• MODERATE ◦ Soil exposure is eliminated ◦ Exposure to groundwater within excavation area is eliminated; groundwater concentrations reduced outside excavation area ◦ VOC products present in groundwater indicate natural degradation process is in early stage	• MODERATE ◦ Material and equipment readily available ◦ Moderate sized excavation with only Building 242 in the way ◦ Easily monitored and maintained until action is complete	• HIGH ◦ Soil exposure eliminated in short time frame ◦ Groundwater exposure eliminated over longer period of time ◦ Some risk associated with excavation	◦ Excavate and backfill 6,500 cubic yards of soil ◦ Transport and dispose of soil ◦ Pump, transport, and dispose of 410,000 gallons of water ◦ EISB injection ◦ Monitor well installation ◦ Groundwater monitoring and analysis for 3 years	Total: **$4,918,000** $646,000 $2,538,000 $607,000 $920,000 $15,000 $147,000
Whole-AOC Excavation	• HIGH ◦ Soil exposure is eliminated ◦ Exposure to groundwater within excavation area is eliminated; groundwater concentrations reduced outside excavation area ◦ Soil gas exposure is eliminated	• DIFFICULT ◦ Traffic congestion would disrupt public transportation around airport ◦ Fugitive volitilization of VOCs difficult to control ◦ Difficult to implement with buildings in place	• HIGH ◦ Soil exposure eliminated ◦ Groundwater exposure eliminated within the excavation area ◦ Increased risk of incidental accident in large scale excavation	◦ Excavate and backfill 17,900 cubic yards of soil ◦ Transport and dispose of soil ◦ Pump, transport, and dispose of 1,160,000 gallons of water	Total: **$10,703,000** $1,764,000 $7,196,000 $1,743,000

Notes:
AOC - Area of concern
DNAPL - Dense non-aqueous phase liquid
EISB - Enhanced in-situ bioremediation
MNA - Monitored natural attenuation
VOC - Volatile organic compound
Net Present Value calculated assuming 6% interest Rate

Table 6-3
Summary of Detailed Feasibility Analysis for AOC Building 156

Technology	Criteria				
	Effectiveness	**Implementability**	**Overall Protection of Human Health**	**Cost Description**	**Cost (Net Present Value)**
No Action	• LIMITED ◦ Minimal reduction in exposure	• READILY ◦ No material or equipment required	• LIMITED ◦ Minimal reduction in exposure	◦ No additional costs by implementation	Total: **$0**
Targeted Excavations	• HIGH ◦ Soil exposure is eliminated ◦ Exposure to soil gas is expected to be reduced over time as source concentrations decrease	• READILY ◦ Material and equipment readily available ◦ Small sized excavation	• HIGH ◦ Soil exposure eliminated	◦ Excavate and backfill 37 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste	Total: **$35,000** $19,000 $16,000
Alternative Metals Excavation	• HIGH ◦ Soil exposure is eliminated ◦ Exposure to soil gas is expected to be reduced over time in conjunction with groundwater reduction	• MODERATE ◦ Material and equipment readily available ◦ Moderate sized excavation however may be difficult with Building 156 remaining	• HIGH ◦ Soil exposure eliminated in short time frame ◦ Some risk associated with excavation	◦ Excavate and backfill 4,500 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste	Total: **$2,300,000** $540,000 $1,760,000
Whole-AOC Excavation	• HIGH ◦ Soil exposure is eliminated ◦ Soil gas exposure is eliminated	• DIFFICULT ◦ Traffic congestion would disrupt public transportation around airport ◦ Difficult to implement with buildings in place	• HIGH ◦ Soil exposure eliminated ◦ Groundwater concentrations eliminated within the excavation area ◦ Increased risk of incidental accident in large scale excavation	◦ Excavate and backfill 26,000 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ Pump, transport, and dispose of 1,680,000 gallons of groundwater as hazardous waste	Total: **$14,324,000** $2,356,000 $9,635,000 $2,333,000

Notes:
AOC - Area of concern
DNAPL - Dense non-aqueous phase liquid
Net Present Value calculated assuming 6% interest Rate

Draft Table 6-4
Summary of Detailed Feasibility Analysis for AOC Building 158
2701 North Harbor Drive, San Diego, California

Geosyntec consultants

Technology	Criteria				
	Effectiveness	**Implementability**	**Overall Protection of Human Health**	**Cost Description**	**Cost (Net Present Value)**
No Action	• LIMITED ◦ Minimal reduction in exposure	• READILY ◦ No material or equipment required	• LIMITED ◦ Minimal reduction in exposure	◦ No additional costs by implementation	Total: **$0**
Targeted Excavation and ISR by $FeSO_4$	• HIGH ◦ Potential LNAPL source removed ◦ Exposure due to groundwater expected to be reduced within a reasonable time frame	• MODERATE ◦ Material and equipment readily available ◦ Easily achieved with regard to technology specific requirements ◦ Easily monitored and maintained until action is complete	• HIGH ◦ Groundwater exposure eliminated in reasonable time frame	◦Excavate and backfill 475 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ $FeSO_4$ injection ◦ Monitor well installation ◦ Groundwater monitoring and analysis for 3 years	Total: **$426,000** $48,000 $175,000 $46,000 $21,000 $136,000
Targeted Excavation and ISR by EVO	• HIGH ◦ Potential LNAPL source removed ◦ Exposure due to groundwater expected to be reduced within a reasonable time frame	• MODERATE ◦ Material and equipment readily available ◦ Easily achieved with regard to technology specific requirements ◦ Easily monitored and maintained until action is complete	• HIGH ◦ Groundwater exposure eliminated in reasonable time frame	◦Excavate and backfill 475 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ EVO injection ◦ Monitor well installation ◦ Groundwater monitoring and analysis for 3 years	Total: **$447,000** $48,000 $175,000 $67,000 $21,000 $136,000
Targeted Excavation, ISR by In-Situ Soil Mixing of FeSO4 and Injection of EVO	• HIGH ◦ Potential LNAPL source removed ◦ Exposure due to groundwater expected to be reduced within a reasonable time frame	• MODERATE ◦ Material and equipment readily available ◦ Easily achieved with regard to technology specific requirements ◦ Easily monitored and maintained until action is complete	• HIGH ◦ Groundwater exposure eliminated in reasonable time frame	◦Excavate and backfill 26 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ In-Situ Soil Mixing (450 cubic yards of soil) ◦ Confirmation Sampling ◦ EVO injection ◦ Monitor well installation ◦ Groundwater monitoring and analysis for 3 years	Total: **$419,000** $19,000 $11,000 $154,000 $11,000 $67,000 $21,000 $136,000
Targeted Excavation, In-Situ Soil Mixing of $FeSO_4$	• HIGH ◦ Potential LNAPL source removed ◦ Exposure due to groundwater expected to be reduced within a reasonable time frame	• MODERATE ◦ Material and equipment readily available ◦ Easily achieved with regard to technology specific requirements ◦ Easily monitored and maintained until action is complete	• HIGH ◦ Groundwater exposure eliminated in reasonable time frame	◦Excavate and backfill 26 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ In-Situ Soil Mixing (675 cubic yards of soil) ◦ Confirmation Sampling ◦ Monitor well installation ◦ Groundwater monitoring and analysis for 3 years	Total: **$400,000** $19,000 $11,000 $191,000 $22,000 $21,000 $136,000
Whole-AOC Excavation	• HIGH ◦ Soil exposure is eliminated ◦ Exposure to groundwater within excavation area is eliminated	• DIFFICULT ◦ Excavation area moderate size ◦ Difficult to implement with buildings in place	• HIGH ◦ Soil exposure eliminated ◦ Groundwater exposure eliminated within the excavation area ◦ Increased risk of incidental accident in large scale excavation	◦ Excavate and backfill 2,000 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ Pump, transport, and dispose of 130,000 gallons of groundwater as hazardous waste	Total: **$1,229,000** $228,000 $803,000 $198,000

Notes:
AOC - Area of concern
$FeSO_4$ - Ferrous sulfate

RBC - Risk based concentration
ISR - In-Situ Reduction
EVO- Emulsified Vegetable Oil

Table 6-5

No Action	• LIMITED ◦ Minimal reduction in exposure	• READILY ◦ No material or equipment required	• LIMITED ◦ Minimal reduction in exposure	◦ No additional costs by implementation	Total: **$0**
MNA	• LIMITED ◦ Exposure is expected to be reduced over time ◦ VOC products present in groundwater indicate natural degradation process is in early stage	• READILY ◦ Limited material or equipment required ◦ Easily monitored and maintained until action is complete	• LIMITED ◦ Long time frame to reduce exposure and achieve background concentrations	◦ Install 2 monitor wells ◦ Monitor 2 wells semiannually for 10 years	Total: **$122,000** $23,000 $99,000
EISB	• HIGH ◦ Groundwater concentrations are expected to be below RBCs within a reasonable time frame ◦ Exposure to soil gas is expected to be reduced over time in conjunction with groundwater reduction	• MODERATE ◦ Addition of electron donor and biological media will be time consuming ◦ Easily monitored and maintained until action is complete	• HIGH ◦ Groundwater exposure eliminated over moderate period of time	◦ EISB injection ◦ Monitor well installation ◦ Quarterly groundwater monitoring and analysis for 3 years	Total: **$198,000** $130,000 $15,000 $53,000
EISB and Alternative Metals Excavation	• HIGH ◦ Soil exposure is eliminated ◦ Groundwater concentrations are expected to be below RBCs within a reasonable time frame ◦ Exposure to soil gas is expected to be reduced over time in conjunction with groundwater reduction	• MODERATE ◦ Moderate sized excavation area ◦ Easily monitored and maintained until action is complete	• HIGH ◦ Soil exposure eliminated in short time frame ◦ Groundwater exposure eliminated over moderate period of time ◦ Some risk associated with excavation	◦ Excavate and backfill 3,500 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ EISB injection ◦ Monitor well installation ◦ Groundwater monitoring and analysis for 3 years	Total: **$1,936,000** $378,000 $1,360,000 $130,000 $15,000 $53,000
Whole-AOC Excavation	• HIGH ◦ Soil exposure is eliminated ◦ Exposure to groundwater within excavation area is eliminated; groundwater concentrations reduced outside excavation area ◦ Soil gas exposure is eliminated	• DIFFICULT ◦ Traffic congestion would disrupt public transportation around airport ◦ Fugitive volitilization of VOCs difficult to control	• HIGH ◦ Soil exposure eliminated ◦ Groundwater and soil gas exposure eliminated within the excavation area ◦ Increased risk of incidental accident in large scale excavation	◦ Excavate and backfill 18,700 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ Pump, transport, and dispose of 1,210,000 gallons of water as hazardous waste	Total: **$11,197,000** $1,845,000 $7,528,000 $2,094,000

Notes:
AOC - Area of concern
EISB - Enhanced in-situ bioremediation
MNA - Monitored natural attenuation
RBC - Risk based concentration
VOC - Volatile organic compound

Table 6-9
Summary of Detailed Feasibility Analysis for AOC Building 180
2701 North Harbor Drive, San Diego, California

Geosyntec consultants

Technology	Criteria				
	Effectiveness	**Implementability**	**Overall Protection of Human Health**	**Cost Description**	**Cost (Net Present Value)**
No Action	• HIGH ◦ No known risk at AOPC	• READILY ◦ No material or equipment required	• LIMITED ◦ Minimal reduction in exposure	◦ No additional costs by implementation	Total: **$0**
MNA	• LIMITED ◦ Exposure is expected to be reduced over time ◦ VOC products present in groundwater indicate natural degradation process is in early stage	• READILY ◦ Limited material or equipment required ◦ Easily monitored and maintained until action is complete	• LIMITED ◦ Long time frame to reduce exposure and achieve background concentrations	◦ Install 1 monitor well ◦ Monitor 2 wells semiannually for 3 years	Total: **$44,000** $18,000 $26,000
EISB w/ Targeted Excavation	• HIGH ◦ Soil exposure is eliminated ◦ Groundwater concentrations are expected to be below RBCs within a reasonable time frame ◦ Exposure to soil gas is expected to be reduced over time in conjunction with groundwater reduction	• MODERATE ◦ Small sized excavation ◦ Addition of electron donor and biological media will be time consuming ◦ Easily monitored and maintained until action is complete	• HIGH ◦ Soil exposure eliminated in short time frame ◦ Groundwater exposure eliminated over moderate period of time	◦ Excavate and backfill 19 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ EISB Injection ◦ Monitor well installation ◦ Quarterly groundwater monitoring, analysis, and reporting for 3 years	Total: **$145,000** $19,000 $11,000 $58,000 $10,000 $47,000
Whole-AOC Excavation	• HIGH ◦ Soil exposure is eliminated ◦ Exposure to groundwater within excavation area is eliminated; groundwater concentrations reduced outside excavation area ◦ Soil gas exposure is eliminated	• DIFFICULT ◦ Moderate sized excavation ◦ Difficult to implement with buildings in place	• HIGH ◦ Soil exposure eliminated ◦ Groundwater and soil gas exposure eliminated within the excavation area ◦ Increased risk of incidental accident in large scale excavation	◦ Excavate and backfill 2,600 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ Pump, transport, and dispose of 168,000 gallons of water as hazardous waste	Total: **$1,578,000** $270,000 $1,050,000 $258,000

Notes:
AOC - Area of potential concern
EISB - Enhanced in-situ bioremediation

Table 6-10
Summary of Detailed Feasibility Analysis for AOPC Explosives Area
2701 North Harbor Drive, San Diego, California

Geosyntec consultants

Technology	Criteria				
	Effectiveness	**Implementability**	**Overall Protection of Human Health**	**Cost Description**	**Cost (Net Present Value)**
No Action	• HIGH ◦ No known risk at AOPC	• READILY ◦ No material or equipment required	• HIGH ◦ No known risk at AOPC	◦ No additional costs by implementation	Total: **$0**
Alternative Excavation	• HIGH ◦ Background exceedances in soil are eliminated ◦ Background exceedances in groundwater within excavation area are eliminated	• MODERATE ◦ Small excavation area ◦ Easily achieved with regard to technology specific requirements	• HIGH ◦ No known risk at AOPC ◦ Soil exceedances reduced to background ◦ Groundwater concentrations reduced within the excavation area	◦ Excavate and Backfill 20 cubic yards of soil ◦ Transport and Dispose of soil as hazardous waste	Total: **$27,000** $19,000 $8,000

Notes:
AOPC - Area of potential concern

Table 6-11
Summary of Detailed Feasibility Analysis for AOPC Test Cell #4/Area D
2701 North Harbor Drive, San Diego, California

Geosyntec consultants

Technology	Criteria				
	Effectiveness	**Implementability**	**Overall Protection of Human Health**	**Cost Description**	**Cost (Net Present Value)**
No Action	• HIGH ◦ No known risk at AOPC	• READILY ◦ No material or equipment required	• HIGH ◦ No known risk at AOPC	◦ No additional costs by implementation	Total: **$0**
Two-Phase Extraction	• HIGH ◦ There is no calculated risk associated with this area ◦ Could achieve background concentrations in immediate vicinity of extraction	• READILY ◦ Material and equipment avialable ◦ Easily monitored and maintained until action is complete	• HIGH ◦ No known risk at AOPC ◦ Soil concentrations reduced ◦ Reduction in groundwater and soil gas concentrations	◦ Rental of two phase extraction equipment ◦ Collection and disposal of water ◦ Analytical testing and labor for operation, monitoring, and maintenance	Total: **$27,000** $6,000 $7,000 $14,000
Targeted Excavation	• HIGH ◦ Soil exposure is eliminated ◦ LNAPL is eliminated ◦ Exposure to soil gas is expected to be reduced over time as source concentrations decrease	• READILY ◦ Material and equipment readily available ◦ Small sized excavation	• HIGH ◦ LNAPL is eliminated	◦ Excavate and backfill 50 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ Pump, Transport, and dispose of 5,000 gallons of water as hazardous waste	Total: **$55,500** $26,000 $21,500 $8,000
Whole-AOPC Excavation	• HIGH ◦ Background exceedances in soil are eliminated ◦ Background exceedances in groundwater within excavation area are eliminated ◦ Groundwater concentrations reduced outside excavation area	• MODERATE ◦ Moderate sized excavation area	• HIGH ◦ No known risk at AOPC ◦ Soil exceedances reduced to background ◦ Groundwater concentrations reduced within the excavation area	◦ Excavate and backfill 4,700 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste ◦ Pump, transport, and dispose of 300,000 gallons of water as hazardous waste	Total: **$2,801,000** $470,000 $1,874,000 $457,000

Notes:
AOPC - Area of potential concern

Summary of Detailed Feasibility Analysis for AOPC Building 222/228
2701 North Harbor Drive, San Diego, California

Geosyntec consultants

Technology	Criteria				
	Effectiveness	**Implementability**	**Overall Protection of Human Health**	**Cost Description**	**Cost (Net Present Value)**
No Action	• HIGH ◦ No known risk at AOPC	• READILY ◦ No material or equipment required	• HIGH ◦ No known risk at AOPC	◦ No additional costs by implementation	Total: **$0**
Alternative Excavation	• HIGH ◦ Background exceedances in soil are eliminated ◦ Background exceedances in groundwater within excavation area are eliminated	• MODERATE ◦ Small excavation area ◦ Easily achieved with regard to technology specific requirements	• HIGH ◦ No known risk at AOPC ◦ Soil exceedances reduced to background ◦ Groundwater concentrations reduced within the excavation area	◦ Excavate and Backfill 20 cubic yards of soil ◦ Transport and Dispose of soil as hazardous waste	Total: **$27,000** $19,000 $8,000
Whole-AOPC Excavation	• HIGH ◦ No known risk at AOPC ◦ Background exceedances in soil are eliminated ◦ Background exceedances in groundwater within excavation area are eliminated	• DIFFICULT ◦ Difficult to implement with buildings in place	• HIGH ◦ No known risk at AOPC ◦ Soil exceedances reduced to background	◦ Excavate and backfill 2,300 cubic yards of soil ◦ Transport and dispose of soil as hazardous waste	Total: **$1,185,000** $284,000 $901,000

Notes:
AOPC - Area of potential concern

Table 6-16
Summary of Detailed Feasibility Analysis for AOPC South of Building 121
2701 North Harbor Drive, San Diego, California

Geosyntec consultants

Technology	Criteria				
	Effectiveness	**Implementability**	**Overall Protection of Human Health**	**Cost Description**	**Cost (Net Present Value)**
No Action	• HIGH ◦ No known risk at AOPC	• READILY ◦ No material or equipment required	• HIGH ◦ No known risk at AOPC	◦ No additional costs by implementation	Total: **$0**
Whole-AOPC Excavation	• HIGH ◦ No known risk or hazard at AOPC ◦ Background concentrations achieved	• MODERATE ◦ Small sized excavation area ◦ Highly sensitive utilities in area make excavation very risky	• HIGH ◦ No known risk or hazard at AOPC	◦ Approximately 20 cubic yards of soil to be removed; however most likely need to use method such as air knife for removal ◦ Possible soil disposal as hazardous waste	Total: **$87,000** $80,000 $7,000

Notes:
AOPC - Area of potential concern

Table 7-1
Conceptual Remedial Action Plan
2701 North Harbor Drive, San Diego, California

Geosyntec consultants

AOC/AOPC	Recommended Remedial Action
Building 131/242 - VOCs/SVOCs	• EISB for VOCs in groundwater • Targeted excavation for PCE in soil
Building 156 - VOCs/PCBs	• Targeted excavations for PCBs and VOCs in soil
Building 158 - Metals/VOCs	• Targeted excavation for potential LNAPL in soil • Targeted excavation or ISR-soil mixing with $FeSO_4$for CrVI in soil • ISR with EVO for CrVI in groundwater
Building 102 - VOCs/TPH	• Targeted excavation for VOCs in soil • Chemox/Biostimulation for TPH in saturated soil
Building 120 South - TPH	• Targeted excavation
Building 130/166 AST/120/121 - VOCs/SVOCs/Metals/PCBs	• EISB for VOCs in groundwater • Targeted Excavations for VOCs and PCBs in soil
Former Maintenance Yard - VOCs/Metals	• EISB for VOCs in groundwater • Targeted excavation for metals in soil
Building 180 - VOCs/TPH	• EISB for VOCs in groundwater • Targeted Excavation for TPH in soil
Explosives Area - PCBs	• Alternative excavation for PCBs in soil
Test Cell #4/Area D - TPH/VOCs	• To be determined based on soil gas evaluation/LNAPL
Building 142 - TPH/VOCs	• No action
Southeast of Building 146 - VOCs	• No action
Building 120 West - PCBs	• Alternative excavation for PCBs in soil
Building 222/228 - Metals/PCBs	• Alternative excavation for PCBs in soil
South of Building 121 - PCBs	• No action

Notes:
AOC - Area of concern
AOPC - Area of potential concern
CrVI - Hexavalent chromium
EISB - Enhanced in-situ bioremediation
$FeSO_4$ - Ferrous sulfate
ISR - In-situ reduction
MNA - Monitored natural attenuation
PCB - Polychlorinated biphenyls
PCE - Tetrachloroethene
SVOC - Semi-volatile organic compound
TPE - Two phase extraction
TPH - Total petroleum hydrocarbons

Table 2: Feasibility Analysis for AOC Convair Lagoon Vicinity Groundwater

1.0 INTRODUCTION

This feasibility study of the Convair Lagoon vicinity groundwater and the 60-inch storm water conveyance system (60-inch SWCS) remedial alternatives has been prepared by Geosyntec Consultants, Inc. (Geosyntec) on behalf of TDY Industries, Inc. for the Airport/Former TRA site located at 2701 North Harbor Drive in San Diego, California (the Site). This Feasibility Study serves as Appendix A to the RI/FS for the Site, required by Cleanup and Abatement Order No. R9-2004-0258 (the CAO) issued by the San Diego Regional Water Quality Control Board (RWQCB, 2004).

This report has been prepared by Mr. Chris Lieder, PG, Ms. Jennifer Schwartz, PE, and Mr. Jim Cox. This report was reviewed by Mr. Brian Hitchens, PG, CHG and Mr. Sam Williams, PG, CHG in accordance with the peer review policy of the firm.

1.1 Background

In accordance with Directive D.3.b of the CAO, a feasibility study of potential remedial alternatives was conducted for each on-site Area of Concern (AOC) and Area of Potential Concern (AOPC). The CAO additionally requires the evaluation of potential offsite impacts to Convair Lagoon. In Appendix A to the Risk Assessment (Geosyntec, 2010), potential soil, sediment, and groundwater pathways were evaluated for the potential to impact Convair Lagoon. Site constituent concentrations were compared to applicable California Toxics Rule (CTR) standards.

The following pathways were evaluated in the Risk Assessment Appendix A (Geosyntec, 2010):

Groundwater/Seep:

- Migration of impacted groundwater in the shallow/deep interval from the Site to Convair Lagoon (discharge to surface water and/or pore water);
- Migration of impacted groundwater from the Site to the SWCS backfill material followed by discharge into Convair Lagoon; and
- Migration of impacted groundwater from the Site to the SWCS (i.e. seeps) followed by discharge into Convair Lagoon.

Soil/Sediment

- Migration of impacted soil/sediment from the surface of the Site to the SWCS followed by discharge into San Diego Bay;
- Migration of impacted storm drain backfill material to the SWCS followed by discharge into San Diego Bay; and
- Migration of impacted sediment currently within the SWCS followed by discharge into San Diego Bay.

From this analysis, two source/pathways were brought forward to this RIFS Appendix A for evaluation. These pathways are migration of existing sediment impacts within the 60-inch SWCS to Convair Lagoon and migration of impacted groundwater to Convair Lagoon.

The only other SWCS to remain on-site after demolition activities have been completed is the 54-inch SWCS. The 54-inch SWCS was evaluated in the Risk Assessment Appendix A (Geosyntec, 2010). Movement of existing sediment was not considered a significant pathway within the 54-inch SWCS, as no tributary socks on the 54-inch SWCS have contained sampleable volumes of sediment since the January 2006 storm drain cleanout and the SWCS has remained essentially free of sediment accumulation.

Groundwater samples indicate that compounds of concern (COC) concentrations are below CTR standards in the vicinity of the 54-inch and 60-inch SWCS. As an additional measure, seeps into the 54-inch SWCS were patched in July 2009. For these reasons the 54-inch SWCS is not evaluated further in this RI/FS Appendix A.

The Risk Assessment Appendix A also presented a quantitative evaluation of a potential maintenance worker exposure scenario in the 60-inch SWCS, with recommendations for worker notifications and personal protective equipment until the remediation is complete.

1.2 Remedial Investigation/Feasibility Study Objective

The objective of this RI/FS Appendix A is to present the feasibility study of potential remedial alternatives for off-site groundwater and existing impacted sediment within the SWCS. Recommendations for remedial action are also provided. This document has been prepared in accordance with Directives D.3.a and D.3.b of the CAO.

This feasibility study evaluates potential options for mitigation of these impacts on the basis of effectiveness, implementability, protection of human health and the environment, and cost.

1.3 Report Organization

The remainder of this report consists of the following

- Section 2, "*Feasibility Study*," presents the screened potential remedial alternatives for each AOC, and detailed evaluations of each;
- Section 3, "*Conceptual Remedial Action Plan*," presents the recommended action for each AOC, and a conceptual implementation plan; and
- Section 4, "*References*," lists the documents cited in this report.

2.0 FEASIBILITY STUDY

This feasibility study evaluates the effectiveness, implementability, protection of Convair Lagoon receptors, and cost of each alternative for the groundwater impacts in the vicinity of Convair Lagoon and the sediment impacts in the 60-inch SWCS.

A recommended remedial alternative is presented based on the findings of the feasibility study in accordance with Directive D.3.c of the CAO. This feasibility study consists of a detailed analysis of remedies considered potentially appropriate.

2.1 Detailed Feasibility Analysis

Each remedial alternative retained from the screening analysis was subjected to a detailed analysis against four criteria. These criteria are presented below.

Effectiveness

Effectiveness was evaluated based on the ability of each alternative to prevent off-site impacts in excess of CTRs or background, as appropriate.

Implementability

Implementability was evaluated based on the ability to construct and reliably operate each alternative. Specific factors evaluated were availability of equipment, material, and technical personnel; ability to meet technology-specific regulations until the remedial action is complete; and operation, maintenance, replacement, and monitoring of the remedial alternative components. Each remedial alternative was rated as readily implementable, moderately implementable, or difficult to implement based on the criteria above.

Overall Protection of Convair Lagoon Receptors

Remedial alternatives were evaluated with respect to their overall ability to be protective of Convair Lagoon receptors during remedy implementation and after remediation is completed. Specific factors considered were the anticipated time frame required to reduce risk or hazard and the protection of the general public, environmental receptors within the lagoon, and site workers during the remedial action. A longer time frame to achieve remedial goals was considered less protective overall than a shorter time frame.

Cost

An evaluation of both capital and recurring costs was performed. Recurring costs are post-construction costs necessary to ensure the continued effectiveness of a remedial action alternative. The result of the cost evaluation is presented numerically. These cost estimates are only an approximation based on the currently understood potential remedial systems designs.

2.2 Remedial Alternatives for the Existing Sediment Impacts within the 60-Inch SWCS

Remedial alternatives considered for possible application to 60-Inch SWCS impacted sediment are described below. The technology which was eliminated from consideration is presented first, followed by the retained technologies.

Screened Technology

SWCS Excavation and Replacement was screened and eliminated from the proposed options based on economic infeasibility. Trenchless remediation of the SWCS with technologies such as cast-in-place pipe re-lining offers a much more cost-effective alternative to excavation and replacement, with far less disruption than a major trenching operation across a key transportation corridor such as North Harbor Drive.

Retained Technologies

The following remedial alternatives were retained for further analysis for the SWCS sediment pathway:

- No Action;
- 60-Inch SWCS Discharge Channel Monitoring and Maintenance;
- 60-Inch SWCS Cleaning; and
- 60-Inch SWCS Cleaning and Lining.

These alternatives are described below along with a discussion of their effectiveness and technical and economic feasibility.

2.2.1 No Action

This alternative consists of performing no work now or in the future to attempt to mitigate existing conditions.

2.2.2 60-Inch Discharge Channel Monitoring and Maintenance

This alternative consists of ongoing monitoring and periodic removal of accumulated sediment in the engineered channel at the Convair Lagoon Outfall to the 60-inch SWCS.

2.2.3 60-Inch SWCS Cleanout

This alternative would be implemented after Site demolition activities have removed all tributaries to the 60-inch storm drain. This alternative consists of installing plugs in the 60-inch SWCS, dewatering the isolated SWCS section, and then removing sediment from the storm drain line through a combination of manual pressure washing, sweeping, shoveling, and high pressure jetting and high vacuum technology. Sediment within the storm drain outfall would be removed at low tide.

2.2.4 60-Inch SWCS Cleaning and Lining

This alternative consists of installing plugs in the 60-inch SWCS, dewatering the isolated SWCS section, and then removing sediment from the storm drain line through a combination of manual pressure washing, sweeping, shoveling, and high pressure jetting. A cured-in-place pipe (CIPP) would then be installed within the on-site portion of the 60-inch SWCS. The CIPP technology results in a seamless pipe throughout the lined section. Sediment within the storm drain discharge channel would be removed at low tide.

2.3 Remedial Alternative Evaluation

This section compares the specific criteria of effectiveness, implementability, overall protection of human and ecological health, and cost of each alternative.

The alternatives which are identified as technically feasible are subsequently evaluated on a basis of economic feasibility as described in State Water Resources Control Board Resolution 92-49, in which the incremental benefit of attaining further reductions in the concentration of constituents are compared with the incremental cost of achieving those reductions. Evaluated benefits include, current and planned future land use and social

or economic impacts to the surrounding community. Based on this combined technical and economic evaluation, a recommended remedial action is presented.

2.3.1 Alternative 1 – No Action

Effectiveness

The relative ability of this alternative to prevent PCB discharges from the 60-inch SWCS to Convair Lagoon is low. Although background concentrations may be achieved over time after the tributaries are removed, this alternative does not include long-term monitoring. Changes to constituent concentration or potential offsite migration would not be documented.

This alternative would be unlikely to achieve remedial objectives, based on constituent concentrations and site conditions.

Implementability

The No Action alternative is readily implementable with regard to the criteria as defined in Section 2.1.

Overall Protection of Convair Lagoon Receptors

The overall ability of No Action to be protective of Convair Lagoon receptors is low, because the discharge channel can be expected to fill over time, eventually reducing its efficacy. Because potential surface sources and tributaries will be removed during Site demolition, it is possible that background concentrations would be achieved over time. However, without a monitoring program, future site conditions would be unknown.

Cost

No costs would be expected by implementation of this alternative.

2.3.2 Alternative 2 – 60-Inch Discharge Channel Monitoring and Maintenance

Effectiveness

The relative ability of this alternative to mitigate PCB discharges from the 60-inch SWCS to Convair Lagoon is moderate. A monitoring and periodic sediment removal program would (1) provide ongoing data to evaluate remaining discharge channel

sediment capacity, and (2) clean out sediment from the discharge channel as necessary to maintain capacity within the channel.

Background concentrations could potentially be achieved over time as impacted sediment is removed from the discharge channel after upgradient sources (SWCS tributaries) are removed during the Site demolition process. As PCB concentrations decline within the 60-inch SWCS and discharge channel sediment, the total mass of PCBs removed per cleanout activity will decline. Because of the significant cost of discharge channel dredging operations (approximately $100,000 per event), ongoing routine sediment removal actions may become economically infeasible without direct source reduction activities within the SWCS.

This alternative is moderately likely to reach objectives, but may require ongoing monitoring and periodic removal of accumulated sediment over a long period of time, based on existing PCB concentrations within the 60-inch SWCS.

Implementability

Discharge Channel Monitoring and Maintenance is readily implementable with regard to the criteria as defined in Section 2.1.

Overall Protection of Convair Lagoon Receptors

The overall ability of Discharge Channel Monitoring and Maintenance to protect potential receptors in Convair Lagoon is moderate. There would be a monitoring program in place to ensure that the 60-inch SWCS discharge channel continues to have sufficient sediment capacity to mitigate the migration of impacted sediment to Convair Lagoon. The sediment removal program would remove potentially impacted sediment from the system during each cleanout event. However, this is a long term remedy which does not immediately address impacted sediment currently within the 60-inch SWCS. There will also be ongoing risk that a significant storm event may mobilize sediments from within the channel into Convair Lagoon.

Cost

There would be no upfront capital cost to implement Discharge Channel Monitoring and Maintenance but this remedial option could potentially result in moderate ongoing O&M costs. The approximate cost of implementing this remedial option is $728,000. O&M costs would primarily be associated with approximately triennial trough cleanout,

sample collection and analysis, and reporting. The estimated cost assumes that this area would be monitored and maintained for 15 years.

2.3.3 Alternative 3 – 60-Inch SWCS Cleanout

Effectiveness

The relative ability of this alternative to mitigate PCB discharges from the 60-inch SWCS to Convair Lagoon is high. Although very high cleanout performance can be achieved, small volumes of sediment potentially impacted with PCBs may be left behind.

Because all tributaries will be removed and all potential PCB sources related to on-Site structures will be removed during Site demolition, the potential for recontamination of sediment within the 60-inch SWCS from an on-Site source is low.

This alternative has a moderately high ability to achieve background concentrations in the discharges from the 60-inch SWCS to Convair Lagoon through the direct removal of sediment from the SWCS and the discharge channel.

Implementability

The 60-Inch SWCS Cleanout alternative is moderately implementable with regard to the criteria as defined in Section 2.1. Due to the intertidal elevation of the SWCS and the nature of the storm drain construction, cleanout is technically challenging.

Overall Protection of Convair Lagoon Receptors

The overall ability of 60-Inch SWCS Cleanout to mitigate PCB discharges from the 60-inch SWCS to Convair Lagoon is high. The completeness of the cleanout would be observed and documented with a cleanup goal of removal of all visible sediment. Because the cleanout would be performed after on-site source removal (i.e., after Site demolition activities), it is very likely that 60-inch SWCS Cleanout would mitigate Site-related PCB discharges from the 60-inch SWCS to Convair Lagoon.

Cost

The 60-Inch SWCS and Channel Cleanout Alternative has a high capital cost. The approximate cost of implementing this remedial option is $590,000.

2.3.4 Alternative 4 – 60-Inch SWCS Cleanout and Lining

Effectiveness

The relative ability of this alternative to mitigate PCB discharges from the 60-inch SWCS to Convair Lagoon is high. This alternative will be performed after all tributaries to the SWCS are removed during Site demolition. The liners in the 60-inch SWCS will completely isolate this portion of the SWCS from potential residual sediment or infiltration.

This alternative has a high likelihood of achieving background concentrations in the discharges from the 60-inch SWCS to Convair Lagoon. However, because there are no documented PCB impacts in soil or groundwater in the vicinity of the on-site portion of the 60-inch SWCS, the incremental benefit of installing the lining system cannot be quantified, but is estimated to be small.

Implementability

The 60-Inch SWCS Cleaning and Lining alternative is moderately implementable with regard to the criteria as defined in Section 2.1. Due to the intertidal elevation of the SWCS and the nature of the storm drain construction, cleaning and lining are technically challenging.

Overall Protection of Convair Lagoon Receptors

The overall ability of 60-Inch SWCS Cleanout and Lining to mitigate PCB discharges from the 60-inch SWCS to Convair Lagoon is high. Because the cleaning and lining would be performed after source removal (i.e., after Site demolition activities), it is very likely that these remedial actions would mitigate Site related PCB discharges from the 60-inch SWCS to Convair Lagoon. However, current Site data do not indicate residual PCB impacts either in storm drain backfill or groundwater adjacent to the SWCS. Based on these observations, this alternative is not significantly more protective than Alternative 3. As no known residual concentrations are addressed by this remedial action, residual concentrations are not anticipated to unreasonably affect present and

anticipated beneficial use of water, or result in water quality less than that prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Boards.

Cost

The 60-Inch SWCS Cleanout and Lining alternative has a high capital cost. The approximate cost of implementing this remedial option is $1,350,000.

2.3.5 Recommended Remedial Option

Alternative 1 – "No Action" is considered technically feasible. However, this alternative is not sufficiently protective of Convair Lagoon receptors given current sediment concentrations in the SWCS.

Alternative 2 - "60-Inch Discharge Channel Monitoring and Maintenance" could be protective of Convair Lagoon receptors. Existing data from the Convair Lagoon Sand Cap study (Geosyntec, 2008) and the WDR monitoring program (WSSI, 2008) indicate the Convair Lagoon Discharge Channel is capable of mitigating PCB impacts to the Convair Lagoon Cap. Monitoring and maintenance of this channel is a feasible alternative for mitigating PCB impacts from the 60-inch SWCS. However this alternative does not directly address PCBs existing within the SWCS system and may not be effective during large storm events with high storm water flow rates.

This remedial alternative is less protective and requires a much longer O&M timeframe (currently estimated at 15 years) than the direct removal or lining proposed in Alternatives 3 and 4. The total estimated costs are approximately $140,000 more than Alternative 3 and $572,000 less than Alternative 4. This alternative has a moderate likelihood of meeting the remedial objective of mitigating PCB discharges from the 60-inch SWCS to Convair Lagoon.

Although this alternative could be implemented until background conditions are met in the SWCS, this would require a long time frame to achieve. As PCB concentrations decline within the 60-inch SWCS and discharge channel sediment, the total mass of PCBs removed per cleanout activity will decline. Because of the significant cost of a discharge channel dredging operations (approximately $110,000 per event), the cost for the remedy could quickly exceed projected costs for Alternative 3, direct removal of the sediment within the discharge channel and 60-inch SWCS.

Alternative 3 - "60-Inch SWCS Cleanout" would mitigate potential impacts to Convair Lagoon by removal of impacted sediment within the SWCS, after the tributary system is removed and Site demolition is complete. Although this alternative involves significant capital expense, this alternative is estimated to be less costly and more effective overall than Alternative 2. The benefit of this Alternative over Alternative 2 is the removal of impacted sediment within the on-site portion of the 60-inch SWCS, resulting in immediate source reduction in the system, and reduced potential for future Convair Lagoon impacts.

Alternative 3 has a high likelihood of mitigating PCB discharges from the 60-inch SWCS to Convair Lagoon and also has the potential to achieve background concentrations through the direct removal of impacted sediment following site demolition. This alternative is estimated to be less expensive than Alternative 2; with the additional benefit of direct source removal.

Alternative 4 "60-Inch SWCS Cleanout and Lining" would mitigate potential impacts to Convair Lagoon by elimination of potential pathways from within the SWCS through lining of the system, after the tributary system is removed during Site demolition and all visible residual sediments are removed. Liner installation costs make this alternative roughly $782,000 more expensive than Alternative 2 and $920,000 more than Alternative 3. The incremental benefit of Alternative 4 over Alternative 3 is that the complete relining of the 60-inch SWCS system results in a physical barrier which would prevent soil or groundwater from seeping into the SWCS. However, as current Site data do not indicate the presence of PCBs or other COCs in soil or groundwater in the vicinity of the 60-inch SWCS, the incremental benefit of installing the lining system cannot be quantified, but is estimated to be small.

While Alternative 4 has a high likelihood of mitigating PCB discharges from the 60-inch SWCS to Convair Lagoon, this alternative is more than double the cost of Alternative 2 and nearly three times the cost of Alternative 3. Although there are potential benefits to installing a physical barrier within the line, it is likely that this engineered control would require maintenance over time, while providing no quantifiable benefit to the people of the State.

The recommended remedial alternative for this AOC is Alternative 3 "60-Inch SWCS Cleanout". Alternative 3 provides direct source removal of impacted sediment from the SWCS and Channel, with documentation that all visible sediment is removed. Alternative 3 provides effective source control consistent with maximum benefit to the

people of the State, does not unreasonably affect present or anticipated beneficial use of water, and does not result in water quality less than that prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Quality Control Boards.

2.4 Remedial Alternatives for Off-Site Groundwater Impacts

Remedial alternatives have been considered for possible application to off-Site groundwater with dissolved metals, VOCs, SVOCs, and potential PCB impacts in excess of the CTR and in excess of background concentrations. Although several metals and SVOCs have been detected sporadically or at laboratory estimated concentrations above the CTR in groundwater wells in the vicinity of Convair Lagoon, none of these constituents appear to be Site related. Ultra high resolution PCB congener analyses were performed on groundwater samples from all Convair Lagoon vicinity monitor wells. Trace detections of PCBs exceeding the CTR have been reported for every sample collected from both the shallow and deeper monitor wells. All of these results were reported as estimated concentrations between the laboratory reporting and detection limit. Trace detections of PCBs exceeding the CTR have also been reported for every associated laboratory Method Blank.

During a site-wide sampling event in January 2010, groundwater was analyzed for PCBs in all on-site groundwater monitor wells. PCBs were only detected in one well, B120-MW2, at a concentration of 19 ug/L (**Geosyntec, 2010**). All other wells, including three wells located downgradient of B120-MW2 (B120-MW4, -MW5, and -MW7), were non-detect with detection limits of approximately 0.005 ug/L. The B120-MW-4, -MW5, and –MW7 results demonstrate that the PCBs detected at B120-MW2 have not significantly migrated. Similar or lower concentrations of PCBs in groundwater elsewhere on-Site (e.g., those potentially resulting from PCBs in LNAPL at the Building 120 South AOC) are similarly not expected to migrate. Step-out borings were performed to delineate the extent of LNAPL, which appears to be limited to within approximately 20 feet of the excavation (within the footprint of Building 120). The maximum aqueous solubility of the PCB Aroclors commonly detected on-Site (Aroclor 1248, 1254, and 1260) range from 2.7 ug/L to 54 ug/L (EPA, 1980). Groundwater concentrations substantively greater than the 19 ug/L recently detected at B120-MW2 aren't likely based on these low aqueous solubilities and the relatively low concentrations of VOCs remaining in on-site groundwater. Therefore, the trace detections of PCBs observed in the Convair Lagoon vicinity groundwater samples are not believed to result from on-site impacts. The trace detections in these samples may

result from sample contamination or a low-level ambient source such as historical PCBs in the original San Diego Bay dredge-fill material used to reclaim the land in this area.

Groundwater modeling was performed and presented in the Risk Assessment, Appendix A (Geosyntec, 2010). This modeling evaluated the detections of PCBs in groundwater (regardless of their source) and their potential mobility to Convair Lagoon. The model results show that trace detections of PCBs in groundwater in the Convair Lagoon vicinity are not predicted to impact Convair Lagoon pore water or surface water at concentrations exceeding the CTR. Therefore this pathway is not considered significant. However, it was recommended that this pathway be further evaluated in the RI/FS.

The technology which was eliminated from consideration is presented first, followed by the retained technologies.

Screened Technology

Groundwater Pump and Treat - The overall ability of pump and treat to protect human health and the environment is low. Due to the saline nature of the groundwater in the vicinity of Convair Lagoon, the only treatment alternative capable of meeting NPDES standards for surface water discharge is reverse osmosis. The brine effluent from the RO treatment process would create a significant hazardous waste stream, which would need to be disposed. This process would result in a costly and energy intensive treatment process which would lead to a net increase in hazardous material which needs to be handled and properly disposed. While groundwater with COCs in excess of background would be prevented from reaching Convair Lagoon, the net risk to the environment would be increased.

Retained Technologies

The following remedial alternatives were retained for further analysis for the off-site groundwater migration to Convair Lagoon pathway.

- No Action;
- Groundwater Monitoring;

These alternatives are described below along with a discussion of their effectiveness and technical and economic feasibility.

2.4.1 No Action

This alternative consists of performing no work now or in the future to attempt to mitigate existing conditions.

2.4.2 Groundwater Monitoring

An analytical groundwater model has been prepared and is discussed in the Appendix A to the Risk Assessment which predicts that the trace concentrations of PCBs observed in groundwater in the vicinity of Convair Lagoon are unlikely to migrate to Convair Lagoon at concentrations that exceed the CTR. This alternative consists of ongoing monitoring to evaluate trends in PCB concentrations in groundwater to determine if changes in PCB concentration are occurring over time which may affect the modeled scenario. Ongoing groundwater monitoring would also evaluate concentration trends in other COCs previously detected above background.

2.5 Remedial Alternative Evaluation

This section compares the specific criteria of effectiveness, implementability, overall protection of human and ecological health, and cost of each alternative.

The alternatives which are identified as technically feasible are subsequently evaluated on a basis of economic feasibility as described in State Water Resources Control Board Resolution 92-49, in which the incremental benefit of attaining further reductions in the concentration of constituents is compared with the incremental cost of achieving those reductions. Evaluated benefits include current and planned future land use and social or economic impacts to the surrounding community. Based on this combined technical and economic evaluation, a recommended remedial action is presented.

2.5.1 Alternative 1 – No Action

Effectiveness

The relative ability of this alternative to meet CTR or background concentrations is moderate. Although the current modeling data indicates that trace PCB impacts currently observed in the Convair Lagoon vicinity are unlikely to reach Convair Lagoon at concentrations in excess of the CTR, no sampling would be performed to evaluate these modeled results. Changes to constituent concentration over time would not be documented.

Implementability

The No Action alternative is readily implementable with regard to the criteria as defined in Section 2.1.

Overall Protection of Human Health

The overall ability of No Action to be protective of Convair Lagoon receptors is moderate. Current site data indicate that trace PCBs in groundwater are unlikely to migrate to Convair Lagoon at concentrations in excess of the CTR and other potential COCs detected sporadically in Convair Lagoon monitor wells are either below CTR concentrations or are not believed to be Site related. However, the No Action alternative does not include groundwater monitoring. As a result, trends in COC concentrations will not be monitored over time.

Cost

No costs would be expected by implementation of this alternative.

2.5.2 Alternative 2 – Groundwater Monitoring

Effectiveness

The relative ability of this alternative to meet CTR or background concentrations is moderate. Current modeling data indicates that trace PCB impacts currently observed in the Convair Lagoon vicinity are unlikely to reach Convair Lagoon at concentrations in excess of the CTR. Groundwater monitoring would be performed to evaluate these modeled results and to monitor trends in other COCs to determine if these concentrations are changing over the long-term.

Implementability

Groundwater monitoring is readily implementable with regard to the criteria as defined in Section 2.1.

Overall Protection of Human Health

The overall ability of Groundwater Monitoring to protect potential receptors in Convair Lagoon is high. There would be a monitoring program in place to document that groundwater concentrations continue to be protective of potential receptors in and

around Convair Lagoon. The length of monitoring would be determined by the ability to establish trends in constituent concentration over time.

Cost

There would be no upfront capital cost to implement Groundwater Monitoring but this remedial option could potentially result in moderate ongoing O&M costs. The approximate cost of implementing this remedial option is approximately $400,000. O&M costs would primarily be associated with semiannual monitoring and reporting for 10 years.

2.5.3 Recommended Remedial Option

Alternative 1 – "No Action" is considered technically feasible. However, this alternative is not sufficiently protective of Convair Lagoon receptors.

Alternative 2 - "Groundwater Monitoring" would be protective of Convair Lagoon receptors, providing a monitoring network to document trends in COCs in Convair Lagoon vicinity groundwater which could validate modeling results and identify potential concerns if increasing COC trends are observed.

The recommended remedial alternative for this AOC is Alternative 2 "Groundwater Monitoring". Alternative 2 provides ongoing monitoring to confirm the existing monitoring and modeling data. Alternative 2 meets the remedial objective of documenting that CTR standards are met for Site-related COCs, with maximum benefit to the people of the state, does not unreasonably affect present or anticipated beneficial use of water and does not result in water quality less than that prescribed in the Water Quality Control Plans and Policies adopted by the State and Regional Water Quality Control Boards.

3.0 CONCEPTUAL REMEDIAL ACTION PLAN

The conceptual remedial action plan (RAP) for the 60-Inch SWCS Cleanout is presented below. The conceptual RAP is based on the results of the feasibility study presented in Section 2. Descriptions of the conceptual design of the recommended alternatives are provided herein. These conceptual designs form the basis for the cost-comparisons within this Appendix, but do not represent final engineered design recommendations.

3.1 60-inch SWCS Cleanout

All tributaries to the 60-inch SWCS will be removed by the Port during Site demolition activities prior to the initiation of clean-out activities on the 60-inch SWCS. During the cleanout of the 60-inch storm drains, a sandbag berm will be constructed at low tide at the upgradient property boundary. This berm will prevent base-flow water from upstream portions of the storm drain from entering the working area. Upstream accumulated water will be re-routed from behind the sandbag berm, through a filtered containment bin, to the nearest available storm water catch basin. The location of this catch basin will be determined based on post-demolition construction storm water management plans, when available.

After upstream water is diverted, a plug will be installed at the 60-inch SWCS outfall. The plug will be equipped with a water relief drain at its base. For efficiency in water management, the 60-inch storm water line may be divided into several work sections divided by sand bag berms. Based on previous cleanout experience, this provides for more efficient water management and better dewatering results. Before cleanout activities begin, water within the working area will be pumped down to the greatest possible extent, filtered through a dewatering bin to capture any potentially suspended sediment, and discharged to the nearest available storm water conveyance. After cleanout activities have commenced, all water within the work zone (from cleanout activities and groundwater seepage) will be pumped from the SWCS, passed through a dewatering bin, and stored in frac tanks for characterization and discharge to the sanitary sewer under a batch discharge permit.

Sediment in the 60-inch SWCS will be removed through a combination of pressure washing, jetting, manual removal, and high-vacuum technology. The roof, walls and joints of the 60-inch SWCS will be hand-cleaned by a pressure washing tip attached to a jetter-vac hose to wash adhered sediment to the floor of the SWCS. The base of the storm drain will then be cleaned by pressure washing any remaining sediment down the storm drain to the nearest catch basin. This will be accomplished first mechanically using a jetter tip, followed by a polishing step of hand pressure washing the base of the

SWCS to collect any remaining sediment. Accumulated sediment from the SWCS discharge channel will also be removed prior to removing the storm drain plug during a low tide. The valve in the plug will be opened and the water level within the drain will be allowed to equilibrate prior to removal of the plug.

3.2 Waste Storage and Disposal

The water and sediment from the removal activities will be placed into a dewatering bin for separation. Water will be pumped off to a holding tank for characterization and discharged to the sanitary sewer under a batch discharge permit. The sediment will be separately characterized and hauled off-Site for disposal. The accumulated water and sediment will be characterized to meet the requirements of the appropriate disposal facility. Sediment and water will be stored on site during characterization, per the right of entry (ROE) agreement between the Airport and Geosyntec.

3.3 Decontamination

All equipment in direct contact with material from the storm drains will be steam-cleaned prior to leaving the Site. Dewatering bins are certified clean by the company providing the equipment prior to entering the Site and the bin provider will certify that they will be appropriately cleaned before re-use.

3.4 Health and Safety

The Site Health and Safety Plan will be modified for the specific tasks required for the storm drain cleanout activities. Significant confined space entry will be required by the subcontractor during manual removal of sediment from the storm drain. The storm drain contractor will develop a fully protective confined space entry plan for all foreseeable activities related to the storm drain cleanout and all on-site personnel will be 40-hour HAZWOPER trained during the completion of this activity. Safety considerations include provisions for audio communication with the surface, real-time monitoring for hazardous breathing conditions, supplied air, 2-man (buddy system) entry, with appropriate emergency rescue and confined space attendants.

3.5 Confirmation of Cleanout

The effectiveness of the storm drain cleaning will be documented through photographic or video evidence. Photographs of each section of storm drain will be taken after cleanout has been completed. A final inspection of the SWCS will be performed to document that all visible sediment has been removed from the storm drain.

Subject: **Calscience Work Order No.: 06-04-0831**
Client Reference: TDY / SC0307

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 4/14/2006 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of any subcontracted analysis is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

Work Order Case Narrative

Project Name: **TDY / SC0307**
Calscience Work Order Number: **06-04-0831**

1. Hexavalent Chromium:

The chain of custody requested that Hexavalent Chromium be analyzed by method EPA 7199. However, due to the samples having a high conductivity, method EPA 7196A was used to achieve the lowest reporting limit and to complete the analysis within the recommended holding time.

Glossary of Terms and Qualifiers

Work Order Number: 06-04-0831

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike or Matrix Spike Duplicate compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

RE: TDY/Project #SC0307

Dear Brian:

Enclosed are the results of the samples submitted to our laboratory on April 13, 2006. The samples were sent out for partial analysis to our Redding facility and Calscience Environmental Laboratories, Inc. Please find their reports attached. For your reference, these analyses have been assigned our service request number L0600641.

All analyses were performed in accordance with our laboratory's quality assurance program. Results are intended to be considered in their entirety and apply only to the samples analyzed. The soil samples were analyzed at our Redding lab. Their report is attached. Columbia Analytical Services is not responsible for use of less than the complete report. Your report contains 189 pages plus the attachment.

Columbia Analytical Services is certified for environmental analyses by the NELAP (certificate number: 02115CA) and Los Angeles County Laboratory ID (No. 10151).

The Canoga Park facility has moved from the 6925 Canoga Ave. address. We are currently receiving samples at 8030 Remmet Ave., Suite 2 Canoga Park, CA 91304 until the new facility at 2655A Park Center Dr. Simi Valley, CA 93065 has been completed.

If you have any questions, please call me at (818) 587-5550.

Respectfully submitted,

Columbia Analytical Services, Inc.

RE: TDY

Dear Ed:

Enclosed are the results of the samples submitted to our laboratory on April 13, 2006. For your reference, these analyses have been assigned our service request number L0600641.

All analyses were performed according to our Laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

If you have any questions, please call me at (530) 244-5269.

Respectfully submitted,

Columbia Analytical Services, Inc.

Karen Sellers for:

Douglas Burnett
Laboratory Manager

Current CAS Redding Accreditation Program s

Federal and National Programs

- U.S Air Force, Air Force Center for Environmental Excellence (AFCEE)
  Approved laboratory for Wastewater and Hazardous Waste
- U.S. Army Corps of Engineers – MRD, HTRW Mandatory Center of Expertise
  Validated for Wastewater and Hazardous Waste
- Department of the Navy, Naval Facilities Engineering Service Center (NFESC)
  Approved laboratory for Wastewater and Hazardous Waste

State and Local Programs

- State of Arizona, Department of Health Services
  Approved laboratory for Hazardous Waste
  Lab ID# AZ0604
- State of Arkansas, Department of Environmental Quality
  Approved laboratory for Wastewater and Hazardous Waste
  Lab ID# None
- State of California, Department of Health Services, National Environmental Laboratory Accreditation Program (NELAP)
  Approved laboratory for Drinking Water, Wastewater and Hazardous Waste
  Lab ID# 01105CA
  - Los Angeles County Sanitation District
    Approved laboratory for Wastewater
    Lab ID# 10243
- State of Florida, Department of Health (NELAP)
  Approved Environmental Testing Laboratory for Wastewater and Hazardous Waste
  Lab ID# E87203
- State of Kansas, Department of Health and Environment (NELAP)
  Approved laboratory for Hazardous Waste
  Lab ID# E-10323
- State of Massachusetts, Department of Environmental Protection
  Approved laboratory for Drinking Water, Wastewater
  Lab ID# M-CA025
- State of Oklahoma, Department of Environmental Quality
  Approved laboratory for General Water Quality/Sludge Testing
  Lab ID# 9952
- State of Oregon, Department of Human Resources, Health Division (ORELAP)
  Approved laboratory for Drinking Water, Wastewater, and Hazardous Waste
  Lab ID# CA200004
- State of Utah, Department of Health, Division of Laboratory Services (NELAP)
  Approved laboratory for Wastewater and Hazardous Waste
  Lab ID# QUAL1
- State of Washington, Department of Ecology, Environmental Laboratory Accreditation Program
  Approved laboratory for Wastewater and Hazardous Waste
  Lab ID# C037
- State of Wisconsin, Department of Ecology
  Approved laboratory for Wastewater and Hazardous Waste
  Lab ID# 999767340

Organic Department Qualifiers

Organic Sample ID Qualifiers

A This qualifier indicates that a TIC is a suspected aldol-condensation product

B Used when the analyte is found in the associated blank as well as the sample, indicating possible blank contamination. The data user should evaluate these compounds and their amounts carefully.

C The "C" flag indicates the presence of this compound has been confirmed by the GC/MS analysis.

D This qualifier is used for all the compounds identified in an analysis at a secondary dilution factor. "D" qualifiers are used only for the samples reported at more than one dilution factor.

E This flag indicates that the value reported exceeds the linear calibration range for that compound. Therefore, the sample should be reanalyzed at the appropriate dilution. The "E" qualified amount is an estimated concentration, and the results of the dilution will be reported on a separate Form I.

I The qualifier indicates that the reporting limit to the "I" qualifier has been raised. It is used when the chromatographic interference prohibits detection of a compound at a level below the concentration expressed on the Form I.

J Indicates an estimated value. It is used when the data indicates the presence of a target compound below the reporting limit or the presence of a Tentatively Identified Compound (TIC).

N This qualifier indicates presumptive evidence of a compound. This flag is only used for Tentatively Identified Compounds (TIC), where the identification is based on a mass spectral library research. It is applied to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the "N" qualifier is not used.

P This qualifier is used for target analytes when there is a greater than 40% difference for detected concentrations between the two columns or detectors. The concentration value is reported on Form I and flagged with a "P".

U Indicates the compound was analyzed for but not detected. The number adjacent to the "U" qualifier indicates the reporting limit for that compound. The reporting limit can vary from sample to sample depending on dilution factors or percent moisture adjustments when indicated.

Z Indicates an estimated value between the method detection limit and zero.

Organic Sample ID Qualifiers

These qualifiers may be appended to the Lab Sample ID and/or the Client Sample ID for organic analysis.

DL Diluted reanalysis. Indicates that the results were determined in an analysis of a secondary dilution of a sample or extract. A digit to indicate multiple dilutions of the sample or extract may follow the "DL" suffix. The results of more than one diluted reanalysis may be reported.

MS Matrix spike (may be followed by a digit to indicate multiple matrix spikes within a sample set).

MSD Matrix spike duplicate (may be followed by a digit as noted above in the MS explanation).

R Reanalysis. The extract was reanalyzed without re-extraction. The "R" is not used if the sample was also re-extracted. If followed by a digit, indicates multiple reanalysis of the sample at the same dilution.

RE Re-extraction analysis. The sample was re-extracted and reanalyzed. May be followed by a digit to indicate multiple re-extracted analysis of the same sample at the same dilution.

Inorganic Data Qualifiers
Cations

C (Concentration) Qualifier:

B – The reported value obtained was less than the CRDL, but greater than or equal to the MDL/IDL.

U – The value was less than the MDL/IDL or was not detected.

Q Qualifier:

E – The reported value is estimate because of interference.

M – Duplicate injection precision was not met. (Two analyses of the sample did not agree).

N – Spiked sample recovery not within control limits.

S – The reported value was determined by the Method of Standard Additions (MSA).

J – Post digestion spike for Graphite Furnace AA analyses is out of control limits (85% - 115%), while sample absorbance is less than 50% of spike absorbance.

***** – Duplicate analysis not within control limits.

+ – Correlation coefficient for the MSA is less than 0.995.

M (Method) Qualifier:

P – ICP

A – Flame AA

F – Furnace AA

CV – Cold Vapor

AV – Automated Cold Vapor

NR – Analyte was not required

C – Manual spectrophotometric

RRL (Reliable Reporting Limit):

RRL – The reliable reporting limit was established to qualify analytical results for which no CRDL was Available, or did not apply. The RRL is a concentration approximately four times the Method Detection Limit (MDL).

CASE NARRATIVE

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	GeoSyntec Consultants	**Service Request No.:**	L0600641
Project:	TDY / SC0307	**Date Received:**	4/15/06
Sample Matrix:	Soil & Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables.

Sample Receipt

Three soil and four water samples were received for analysis at Columbia Analytical Services on 4/15/06.

No discrepancies were noted upon initial sample inspection. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

Dissolved Metals

Elevated Method Reporting Limits:
Samples T-49 GW-11 and T-48 GW-11 required dilution due to the presence of elevated levels of Chromium. The reporting limits are adjusted to reflect the dilution.

Fuel Scan & Diesel Range Organics by EPA Method 8015B

Holding Time Exceptions:
The sample preparation of sample(s) T-49-5.5B, T-47-GT, T-48-6B was initially performed past the recommended holding time. The samples was initially tracked through the laboratory as per standard operating procedure, but due to miscommunication between the Organic Extraction and GC SVOA departments, the samples were not extracted within holding time. Efforts were made to extract the samples as soon as the error was identified. The data is flagged to indicate the holding time violation on Forms 9 and 11. (NCF# EXT-06002)

Subject: **Calscience Work Order No.: 06-04-0831**
Client Reference: TDY / SC0307

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 4/14/2006 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of any subcontracted analysis is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

Project Name: TDY / SC0307
Calscience Work Order Number: 06-04-0831

1. Hexavalent Chromium:

The chain of custody requested that Hexavalent Chromium be analyzed by method EPA 7199. However, due to the samples having a high conductivity, method EPA 7196A was used to achieve the lowest reporting limit and to complete the analysis within the recommended holding time.

Calscience Environmental Laboratories, Inc.

Glossary of Terms and Qualifiers

Work Order Number: 06-04-0831

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike or Matrix Spike Duplicate compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

QC Flag Legend

a - Target compound detected but, quantitated amount
    Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.

QC Flag Legend

a - Target compound detected but, quantitated amount
    Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.

RE: TDY/Project #SC0307

Dear Brian:

Enclosed are the results of the samples submitted to our laboratory on April 3, 2006. The samples were sent out for full analysis to our Redding facility. Please find their report attached. For your reference, these analyses have been assigned our service request number L0600578.

All analyses were performed in accordance with our laboratory's quality assurance program. Results are intended to be considered in their entirety and apply only to the samples analyzed. The soil samples were analyzed at our Redding lab. Their report is attached. Columbia Analytical Services is not responsible for use of less than the complete report. Your report contains 617 pages plus the attachment.

Columbia Analytical Services is certified for environmental analyses by the NELAP (certificate number: 02115CA), Los Angeles County Laboratory ID (No. 10151) and Arizona Department of Health Services (License number: AZ0550).

The Canoga Park facility has moved from the 6925 Canoga Ave. address. We are currently receiving samples at 8030 Remmet Ave., Suite 2 Canoga Park, CA 91304 until the new facility at 2655A Park Center Dr. Simi Valley, CA 93065 has been completed.

If you have any questions, please call me at (818) 587-5550.

Respectfully submitted,

Columbia Analytical Services, Inc.

RE: TDY/SC0307

Dear Ed:

Enclosed are the results of the samples submitted to our laboratory on April 03, 2006. For your reference, these analyses have been assigned our service request number L0600578.

All analyses were performed according to our Laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

If you have any questions, please call me at (530) 244-5269.

Respectfully submitted,

Columbia Analytical Services, Inc.

Douglas Burnett
Laboratory Manager

Organic Department Qualifiers

Organic Sample ID Qualifiers

A	This qualifier indicates that a TIC is a suspected aldol-condensation product
B	Used when the analyte is found in the associated blank as well as the sample, indicating possible blank contamination. The data user should evaluate these compounds and their amounts carefully.
C	The "C" flag indicates the presence of this compound has been confirmed by the GC/MS analysis.
D	This qualifier is used for all the compounds identified in an analysis at a secondary dilution factor. "D" qualifiers are used only for the samples reported at more than one dilution factor.
E	This flag indicates that the value reported exceeds the linear calibration range for that compound. Therefore, the sample should be reanalyzed at the appropriate dilution. The "E" qualified amount is an estimated concentration, and the results of the dilution will be reported on a separate Form I.
I	The qualifier indicates that the reporting limit to the "I" qualifier has been raised. It is used when the chromatographic interference prohibits detection of a compound at a level below the concentration expressed on the Form I.
J	Indicates an estimated value. It is used when the data indicates the presence of a target compound below the reporting limit or the presence of a Tentatively Identified Compound (TIC).
N	This qualifier indicates presumptive evidence of a compound. This flag is only used for Tentatively Identified Compounds (TIC), where the identification is based on a mass spectral library research. It is applied to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the "N" qualifier is not used.
P	This qualifier is used for target analytes when there is a greater than 40% difference for detected concentrations between the two columns or detectors. The concentration value is reported on Form I and flagged with a "P".
U	Indicates the compound was analyzed for but not detected. The number adjacent to the "U" qualifier indicates the reporting limit for that compound. The reporting limit can vary from sample to sample depending on dilution factors or percent moisture adjustments when indicated.
Z	Indicates an estimated value between the method detection limit and zero.

Organic Sample ID Qualifiers

These qualifiers may be appended to the Lab Sample ID and/or the Client Sample ID for organic analysis.

DL	Diluted reanalysis. Indicates that the results were determined in an analysis of a secondary dilution of a sample or extract. A digit to indicate multiple dilutions of the sample or extract may follow the "DL" suffix. The results of more than one diluted reanalysis may be reported.
MS	Matrix spike (may be followed by a digit to indicate multiple matrix spikes within a sample set).
MSD	Matrix spike duplicate (may be followed by a digit as noted above in the MS explanation).
R	Reanalysis. The extract was reanalyzed without re-extraction. The "R" is not used if the sample was also re-extracted. If followed by a digit, indicates multiple reanalysis of the sample at the same dilution.
RE	Re-extraction analysis. The sample was re-extracted and reanalyzed. May be followed by a digit to indicate multiple re-extracted analysis of the same sample at the same dilution.

Inorganic Data Qualifiers
Cations

C (Concentration) Qualifier:

B -- The reported value obtained was less than the CRDL, but greater than or equal to the MDL/IDL.

U -- The value was less than the MDL/IDL or was not detected.

Q Qualifier:

E -- The reported value is estimate because of interference.

M -- Duplicate injection precision was not met. (Two analyses of the sample did not agree).

N -- Spiked sample recovery not within control limits.

S -- The reported value was determined by the Method of Standard Additions (MSA).

J -- Post digestion spike for Graphite Furnace AA analyses is out of control limits (85% - 115%), while sample absorbance is less than 50% of spike absorbance.

***** -- Duplicate analysis not within control limits.

+ -- Correlation coefficient for the MSA is less than 0.995.

M (Method) Qualifier:

P -- ICP

A -- Flame AA

F -- Furnace AA

CV -- Cold Vapor

AV -- Automated Cold Vapor

NR -- Analyte was not required

C -- Manual spectrophotometric

RRL (Reliable Reporting Limit):

RRL -- The reliable reporting limit was established to qualify analytical results for which no CRDL was Available, or did not apply. The RRL is a concentration approximately four times the Method Detection Limit (MDL).

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables.

Sample Receipt

Seven water samples were received for analysis at Columbia Analytical Services on April 3, 2006.

No discrepancies were noted upon initial sample inspection. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

No exceptions were noted during this analysis.

Volatile Organic Compounds by EPA Method 8260B

No exceptions were noted during this analysis.

Semivolatile Organic Compounds by EPA Method 8270C

The current upper control criterion was exceeded for several analytes in Laboratory Control Samples (LCS/LCSD) of LWG0600535. The spike recovery for Benzo(a)pyrene in LCS (LWG0600535-1) was below current control criterion. All spike recoveries were within the method guidelines. With the exception of trace level Benzoic Acid, all other analytes in question were not detected in the associated field samples. Since the calibration verification standard met method criteria, the sample data is not significantly affected. No further corrective action was appropriate.

Approved by: _____ **Date:** 5/3/06

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.

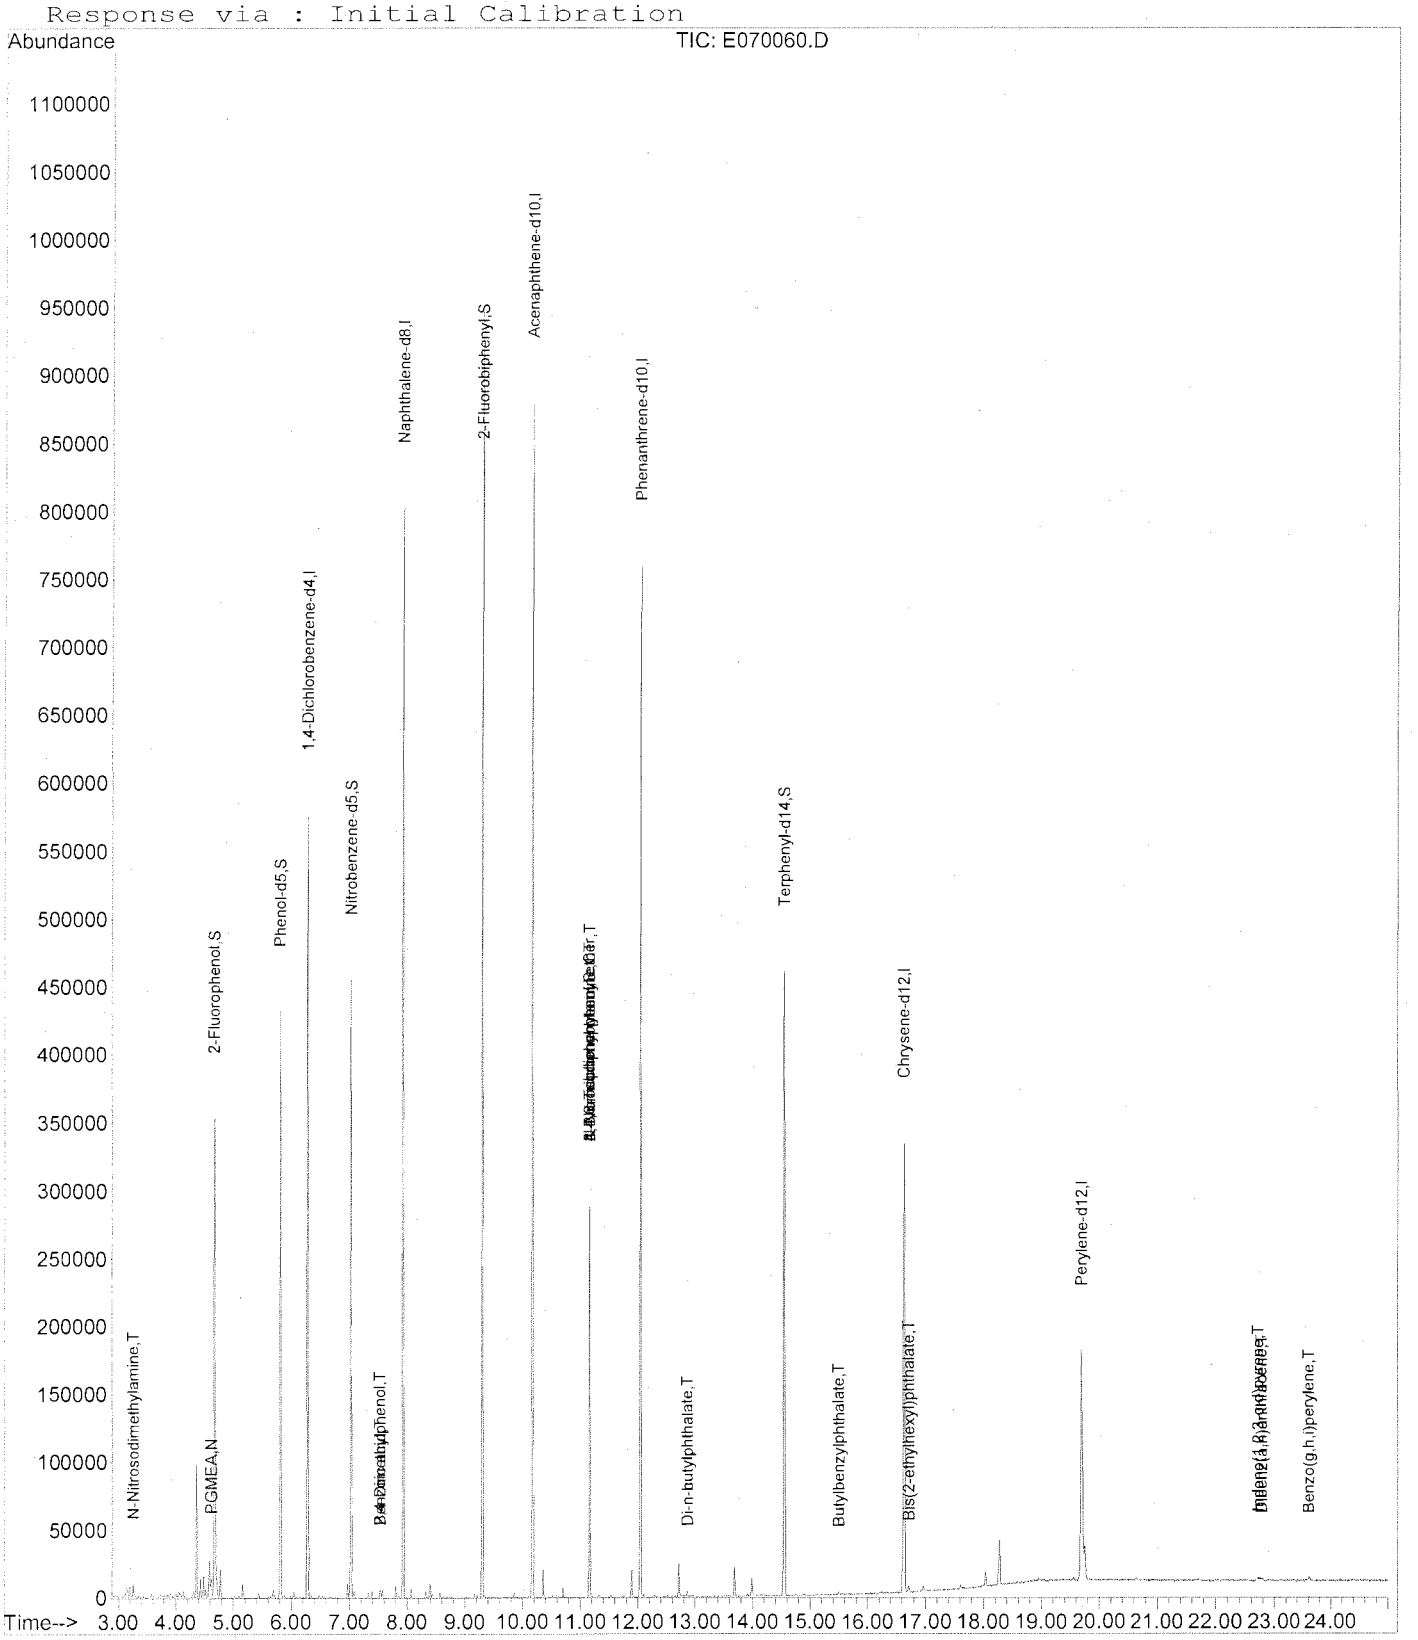
27) 2,4-Dimethylphenol	7.53	122	1445	0.42	mg/L #	1
28) Benzoic acid	7.53	122	1445	0.64	mg/L #	83
59) N-Nitrosodiphenylamine	11.17	169	1478	0.29	mg/L #	43
62) 4-Bromophenyl phenyl ether	11.17	248	1948	1.03	mg/L #	1
68) Di-n-butylphthalate	12.86	149	3140	0.29	mg/L #	92
74) Butylbenzylphthalate	15.50	149	789	0.20	mg/L #	69
78) Bis(2-ethylhexyl)phthalate	16.72	149	2040	0.40	mg/L #	94
85) Indeno(1,2,3-c,d)pyrene	22.71	276	2316	0.81	mg/L	91
86) Dibenz(a,h)anthracene	22.77	278	2415	0.98	mg/L #	89
87) Benzo(g,h,i)perylene	23.60	276	1266	0.54	mg/L #	59

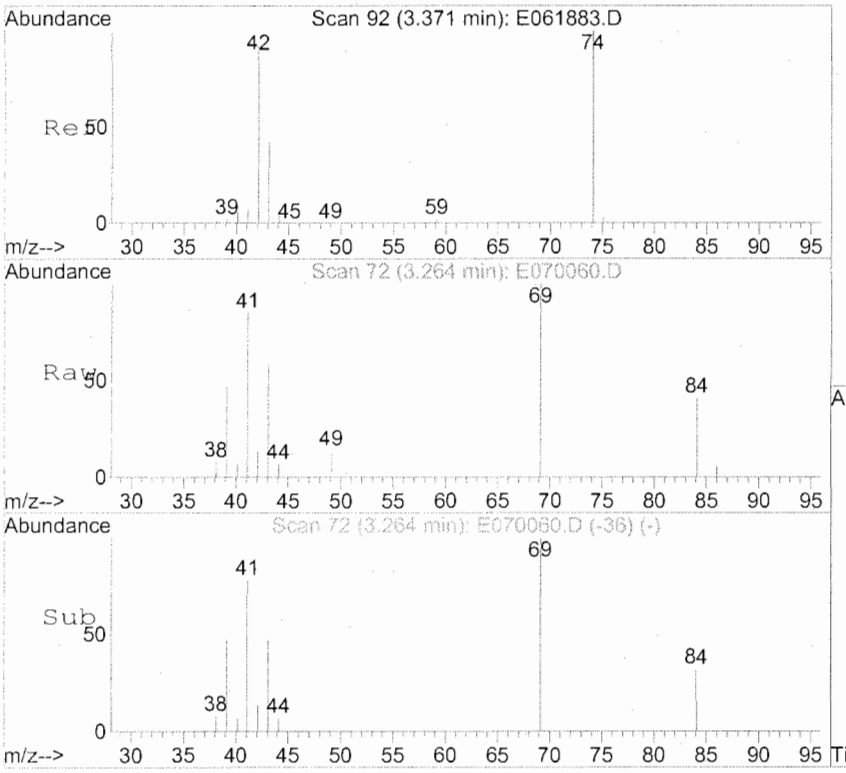
(#) = qualifier out of range (m) = manual integration (+) = signals summed

Quantitation Report (Not Reviewed)

Data File : C:\MSDCHEM\1\DATA\E070118\E070060.D Vial: 13
Acq On : 18 Jan 2007 7:04 pm Operator: GJ
Sample : D0700056-007 8270W 1/15/07 Inst : MSE
Misc : Multiplr: 1.00
MS Integration Params: rteint.p
Quant Time: Jan 19 8:53 2007 Quant Results File: BA061226.RES

Method : C:\MSDCHEM\1\METHODS\BA061226.M (RTE Integrator)
Title : MS09 EPA Method 625/8270C
Last Update : Thu Jan 18 14:16:28 2007
Response via : Initial Calibration

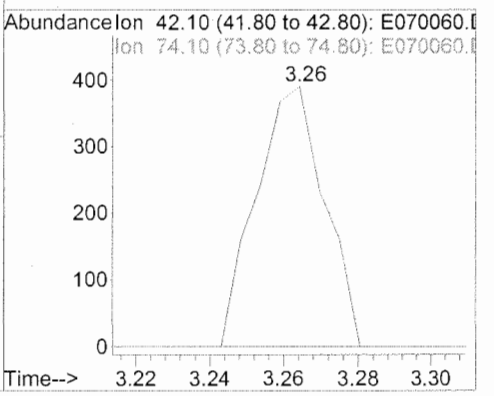


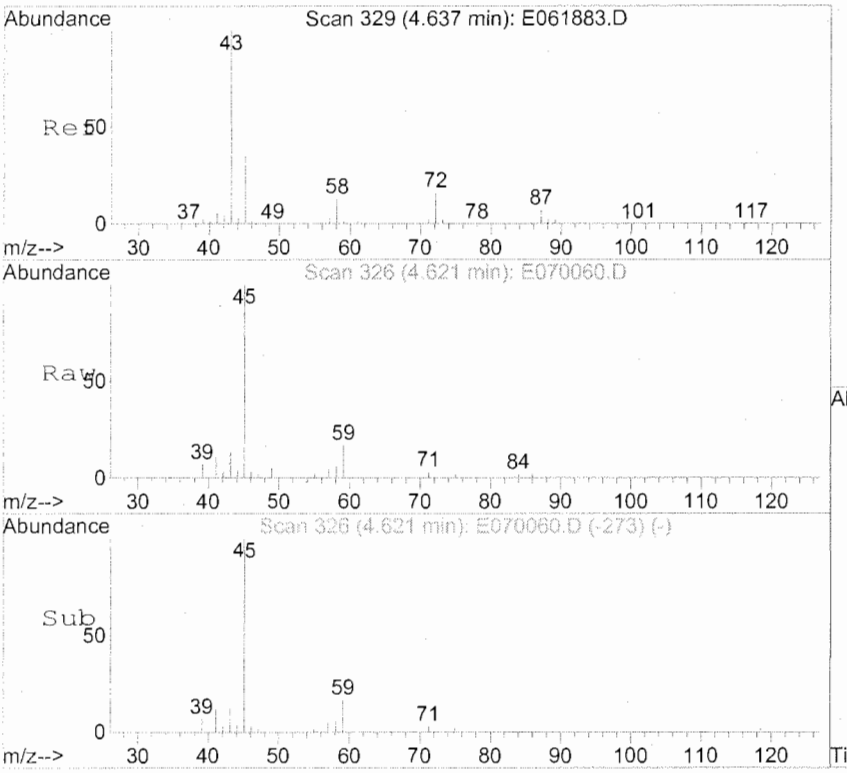


#3
N-Nitrosodimethylamine
Concen: 0.24 mg/L
RT: 3.26 min Scan# 72
Delta R.T. -0.11 min
Lab File: E070060.D
Acq: 18 Jan 2007 7:04 pm

Tgt Ion: 42 Resp: 498

Ion	Ratio	Lower	Upper
42	100		
74	0.0	99.0	148.4#

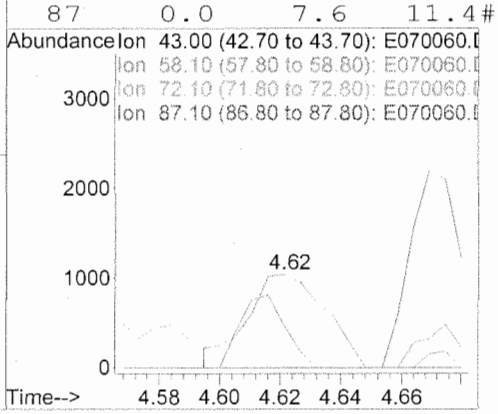


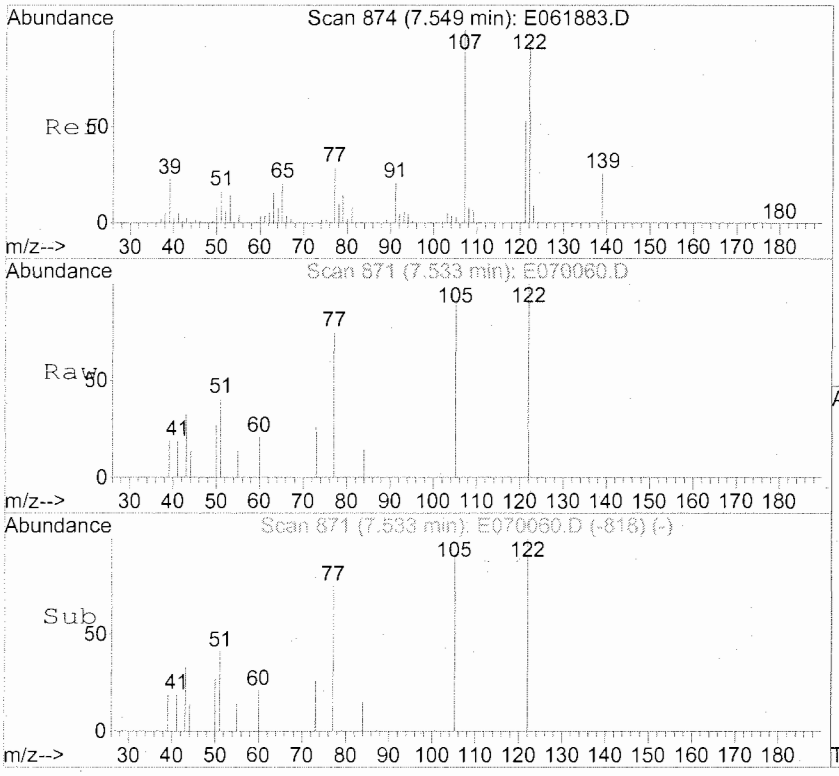


#5
PGMEA
Concen: 0.25 mg/L
RT: 4.62 min Scan# 326
Delta R.T. -0.02 min
Lab File: E070060.D
Acq: 18 Jan 2007 7:04 pm

Tgt Ion: 43 Resp: 1869

Ion	Ratio	Lower	Upper
43	100		
58	45.2	9.7	14.5#
72	0.0	20.4	30.6#
87	0.0	7.6	11.4#

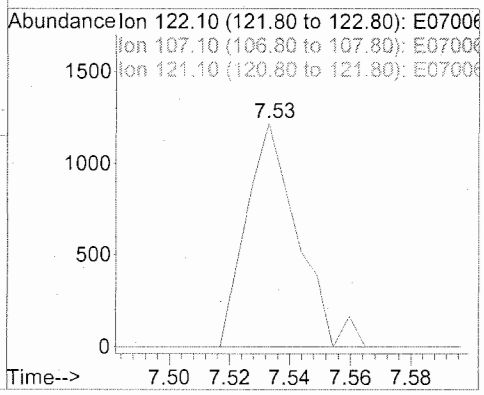


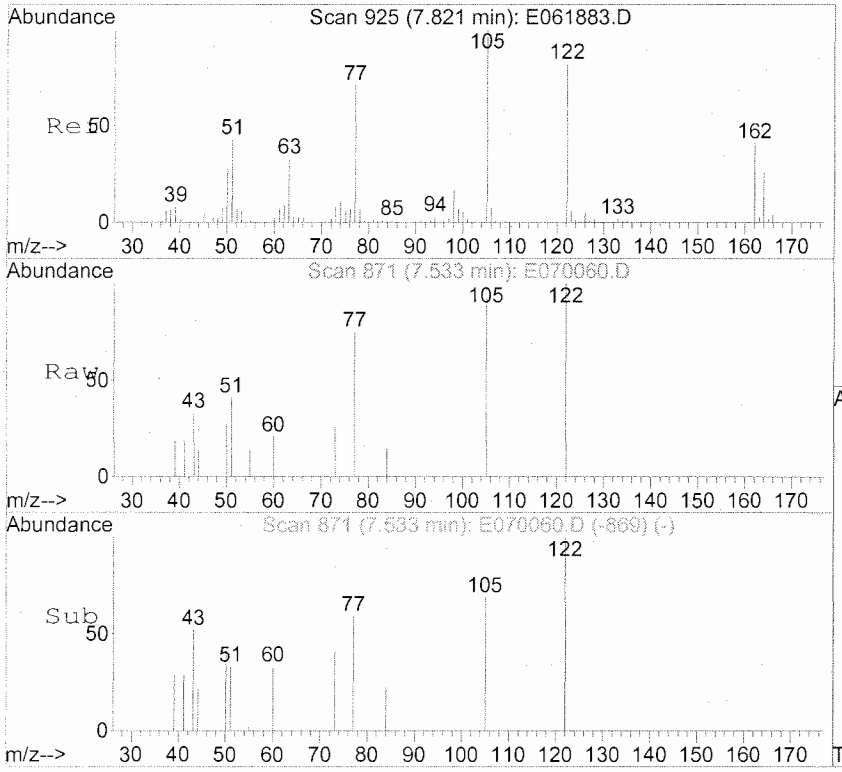


#27
2,4-Dimethylphenol
Concen: 0.42 mg/L
RT: 7.53 min Scan# 871
Delta R.T. -0.02 min
Lab File: E070060.D
Acq: 18 Jan 2007 7:04 pm

Tgt Ion:122 Resp: 1445

Ion	Ratio	Lower	Upper
122	100		
107	0.0	104.4	156.6#
121	0.0	46.2	69.2#





#28
Benzoic acid
Concen: 0.64 mg/L
RT: 7.53 min Scan# 871
Delta R.T. -0.29 min
Lab File: E070060.D
Acq: 18 Jan 2007 7:04 pm

Tgt Ion:122 Resp: 1445

Ion	Ratio	Lower	Upper
122	100		
105	121.6	110.2	165.2
77	88.4	89.8	134.8#
