Subject: Comments on Tentative Order No. R9-2012-0011, Administrative Draft of Permit Requirements for Discharges from the Municipal Separate Storm Sewer System in the San Diego Region

Dear Ms. Walsh and Mr. Chiu,

The Port of San Diego (Port) respectfully submits this comment letter to supplement the San Diego County Municipal Copermitees (Copermitees) comments on the Administrative Draft of Permit Requirements for Discharges from the Municipal Separate Storm Sewer System (MS4) in the San Diego Region.

The Port greatly appreciates the efforts of the San Diego Regional Water Quality Control Board (Regional Board) to consider this new approach to permit reissuance by seeking early stakeholder input on an administrative draft of a new MS4 permit prior to issuing the technical draft for formal review. Moreover, we found the workshops to be extremely productive and your team to be open to receiving input and considering permit changes. We feel this process has provided an effective, efficient mechanism to engage stakeholders and receive varying perspectives in an open transparent manner. We fully believe that this process will result in an MS4 permit that Copermittees can support and implement, and which will ultimately achieve improvements in water quality.

The Port is committed to developing an effective and efficient permit. We recognized at the start of the review process that we wanted to fully utilize the opportunity to review the Administrative Draft and have open discussion with the Regional Board and other stakeholders through focus meetings. To that point, the Port devoted at least 500 staff hours over the past five months towards reviewing and developing feedback to the Administrative Draft both internally and with the other Copermittees. The Port also participated on the panel for two of the focus meetings. Through the process, the Port has gained an understanding of the Regional Board's intent of the Administrative Draft and the Board's limitations. We trust that you have heard our concerns and input, and that the ideas and comments the Copermittees have provided will be reflected in the permit. Furthermore, we were encouraged by the feedback received at the September 5, 2012 focus meeting whereby the Regional Board listed concepts of the

Administrative Draft that they planned to change. It is our understanding the list was not exhaustive.

The Port understands that the Copermittees will collectively, through the County of San Diego, submit a red-line strikeout document recommending substantial changes to the permit language. The changes help to clarify permit compliance points, provide a more efficient monitoring program to support the end goal of improving water quality, and are aligned with the Copermittee vision of incorporating adaptive management into the Permit. The Port fully supports the Copermittee recommendations as, in our opinion, the modifications clearly meet the overall objective of the Clean Water Act to restore and maintain the physical, chemical, and biological integrity of receiving waters and provide a well-designed approach that will improve water quality. We strongly encourage you to consider the proposal.

The Port also has general and specific comments on the Administrative Draft as outlined below:

- Modifications to the Receiving Water Limitations in Provision A are required to ensure the implementation of the iterative process. The Port supports revisions to the receiving water limitations language that aligns with the State Board's policy that compliance with water quality standards is "to be achieved over time, through an iterative approach requiring improved BMPs". It is our understanding that a workshop will be held at the state level to discuss the receiving water limitations language in MS4 permits. The Port strongly recommends that language developed as part of the statewide process be incorporated into the permit.

- Although the Regional Board has confirmed verbally that implementation of a Regional Board-approved Water Quality Improvement Plan (WQIP) constitutes compliance with the permit, the Administrative Draft does not reflect that idea. The Port requests that this compliance point be clearly stated.

- As proposed in the Administrative Draft, the monitoring program is very prescriptive and will not allow for efficient or best use of Copermittee resources or for adaptive management. The Copermittees are proposing an alternate monitoring program, and we understand from the discussions at the workshops that the Regional Board is open to considering the Copermittees' proposed program. While we strongly encourage you to incorporate the Copermittee proposed program in its entirety, we recognize that there may be some changes. As such, we want to emphasize the following points in regards to developing the permit's monitoring requirements:

    - Monitoring is only one part in implementing an effective program; it must be coordinated with the other programmatic implementation efforts to provide the most useful information. To be most effective, a monitoring and assessment program should be tailored to the needs of each

Watershed Management Area (WMA). As such, it will need to be part of the WQIPs and developed in alignment with the other programmatic elements.

- The Copermittees' proposed monitoring program shifts the focus of the monitoring efforts from receiving waters to MS4 outfalls. This places a greater reliance on outfall data, prioritizing sources and conducting special studies to determine how to best implement solutions that lead to water quality improvements. This paradigm shift is based on the fact that the Copermittees have a solid understanding of the large-scale receiving water problems and need to now focus on understanding sources so that pollutant load reductions can occur. The Port supports this approach, as we feel this provides the most reasonable means to identify programmatic adjustments that will improve water quality.

- The Port encourages the use of a question-driven monitoring approach. This approach is widely supported by local, state and federal regulatory agencies. It is based on a logical hierarchy in which overall management objectives help define clear management questions. Additional specific questions and assessment frameworks can help to develop appropriate monitoring designs so that meaningful data are collected. This ensures that data and resources are aligned to focus on high priority issues and solutions that can be effective.

- Jurisdictional accountability is best achieved by requiring Copermittees to participate in the WQIPs and conducting monitoring within their portion of the WMA to evaluate whether their programmatic activities are reducing pollutant loads; boundary monitoring does not accomplish this purpose. Jurisdictional boundary monitoring, similar to what is being proposed in the Administrative Draft, has been found to be relatively ineffective in estimating water quality impacts and loading from MS4 discharges. Several factors lead to this finding, 1) typically there is high variability of the constituent concentrations in receiving waters and discharges, 2) there are relatively small percentages of MS4 discharged pollutant loads in the receiving waters, 3) MS4 flows are highly variable and 4) discharges to the MS4 are highly variable. As such, the inability to detect significant differences would be unlikely to support any programmatic changes or guide improvements to water quality.

- A two-part monitoring approach to address transient and persistent non-stormwater discharges is recommended. Rather than implement an extensive MS4 outfall chemical field screening and analysis for all outfall discharges, the Copermittees propose a screening program to appropriately identify and prioritize persistent flows that impact receiving water quality. Coupled with this, a broad, visual-based monitoring program is being proposed to find and eliminate transient discharges. The Port believes that an approach of this type is cost effective and may actually lead to the elimination of a greater number of transient discharges, while at the same time providing a better understanding of those persistent outfalls that are contributing to receiving water problems.

- While Copermittees may be able to identify sources outside of their MS4, the requirement to reduce/eliminate such discharges is outside the Copermittees control. Requirements to monitor non-stormwater discharges from sources outside of a Copermittee's jurisdictional authority should be removed.

- One element of the WQIP is the numeric targets. It was understood from the discussions at the focus meetings that those numeric targets are to be goals, but are not enforceable. The Port requests that this point is clearly specified in the permit language.

- As written, numeric action levels (NALs) and stormwater action levels (SALs) are triggers for immediate follow-up action. However, during the focus meetings, the Regional Board staff clarified that the NALs/SALs were intended to be used as a mechanism to measure progress and set priorities, and were not intended to be used for determining compliance. The Port requests that this point is clearly specified in the permit language.

- As proposed in the Administrative Draft, Priority Development Projects are to implement BMPs to retain the volume of runoff equivalent to the design capture volume. Due to the Port's location at the headwaters of San Diego Bay, a high groundwater table and existing soils with low infiltration rates, retention is not technically feasible on Port tidelands. The Port is at the bottom of the watershed so consequently retained runoff must be stored for a longer period of time after the peak of a storm. Large underground storage tanks to store the runoff would be infeasible because most tanks would have significant design constraints due to the high groundwater table, flat topography, and high receiving water elevation, making gravity flow drainage systems nearly impossible. Above ground storage tanks would be infeasible because most of Port tidelands are built-out and there is limited room for these facilities. Also, above ground storage tanks pose a vector hazard and a visual nuisance.

  Similarly, the proposed offsite mitigation option discussed in the Administrative Draft also is not feasible within the Port's jurisdiction. Furthermore, mitigation outside of the Port's jurisdiction is also not feasible because the Port would not have the authority to enforce the implementation and maintenance of BMPs outside of its jurisdiction. The Port requests that the retention requirement is removed from the permit.

On behalf of the Port, I wanted to thank you for providing us the opportunity to engage with you and the other stakeholders through the public workshops, and the ability to submit comments on the administrative draft. Please contact Allison Vosskuhler at (619) 686-6434 or avosskuhler@portofsandiego.org if you have any questions or would like additional clarification on the information provided.

Sincerely,

Randa Coniglio

Re: Comments on the Administrative Draft of Permit Requirements for Discharges from the Municipal Separate Storm Sewer System in the San Diego Region (Tentative Order No. R9-2012-0011)

Dear Ms. Walsh and Mr. Chiu:

The San Diego Unified Port District (Port) submits the following comments supplementing other comments by the Port to the Administrative Draft of Permit Requirements for Discharges from the Municipal Separate Storm Sewer System (MS4) in the San Diego Region (the Permit). We note at the outset that the Port supports the objectives of the Permit. We wish simply to address one point regarding the current draft Permit. The Permit should clarify that each Copermittee is responsible only for discharges from that portion of the MS4 which it owns and operates, not for discharges from all MS4 facilities within that Copermittee's jurisdictional boundaries.

The Clean Water Act upon which the MS4 permit is grounded defines "copermittee" as "a permittee to an NPDES permit that is only responsible for permit conditions relating to the discharge *for which it is operator*." (40 Code of Federal Regulations §122.6(b)(1) [emphasis added].) The Regional Board's recent September 7, 2012, letter addressing its authority states that "[t]he federal regulations make it clear that Copermittees need only comply with permit conditions relating to discharges from the MS4s ***for which they are operators***." (Emphasis added, citing 40 CFR Part 122.26(a)(3)(vi).) The Port is unaware of any legal authority that equates operation with jurisdictional location. Nor is such an interpretation consistent with the common and plain meaning of the word "operate." "Operate" strongly connotes the performance of a function or exertion of physical control or power over the object being operated.

This is a potentially significant distinction for the Port. The Port's jurisdiction overlaps with the jurisdiction of a number of Copermittees. Due to this fact, a significant amount of the MS4 facilities within the Port's geographic jurisdiction are not operated by the Port, but are instead owned and/or operated by others under easements or other forms of ownership and operation. Accordingly, the Permit should include language affirming the intent of the CWA on this point.

This distinction is also not a hypothetical concern, as the Regional Board has previously construed the Port's responsibility for MS4 facilities more broadly than the plain language of the CWA allows. The Port would propose the following clarifying language, which could be placed in the cover for the Permit, just ahead of Table 2 and just following the sentence added by the Copermittees in their proposed redline version of the Permit referencing 40 CFR §122.21(a)(vi):

"The location of an MS4 facility within any Copermittee's jurisdiction boundaries does not, of itself, make the Copermittee an owner or operator of that MS4 facility."

We emphasize that the Port strongly supports the objectives of the Permit. We welcome the opportunity to respond to any questions the Regional Board may have with respect to our comments. Please contact the undersigned or Bill Brown at (760) 633-4485 if you have any questions or would like any clarification of the Port's position.

Very truly yours,

Scott E. Patterson

Attention: Laurie Walsh

SUBJECT: COMMENTS ON THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) ORDER NO. R9-2012-0011 ADMINISTRATIVE DRAFT PERMIT FOR DISCHARGES FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS OF THE SAN DIEGO REGION

The City of Chula Vista appreciates the opportunity to provide comments on the Draft Order No. R9-2012-0011 (NPDES General Permit No. CAS0109266). City staff has carefully reviewed the Administrative Draft Order, and has specific comments that are presented in Attachment A to this letter. In addition, the City supports the comments and proposed revisions to the draft Administrative Order submitted by the County of San Diego on behalf of the San Diego Copermittees.

We trust that the San Diego Regional Board will give full consideration to our comments and recommendations in order to facilitate continued compliance, and increase effectiveness of the MS4 Permit for the San Diego Region.

Should you have any questions or if you need further information, please call me at (619) 397-6111. Thank you.

H:\NPDES\RWQCB-SWRCB Correspondence\Comments on Draft Administrative Order R9-2012-0011.doc

ATTACHMENT A – City of Chula Vista Comments on Administrative Draft Order No. R9-2012-0011

Comment No.	Page No.	Comment
PROVISION II.B – WATER QUALITY IMPROVEMENT PLANS		
1	19-20	II.B.4 – As Monitoring and Assessment (Provision II.D) is an integral component of WQIP development, Permit language should be revised to show that these two aspects are linked. As Copermittees establish and/or update priority water quality problems within their respective WMA(s), the Monitoring and Assessment plans should be modified to be consistent with these priorities.
PROVISION II.C – ACTION LEVELS		
2	22-25	II.C.1 and II.C.2 – The Permit requires Copermittees to incorporate NALs and SALs into their WQIPs, and Tables C-1 through C-5 include specific limits for which the Copermittees are to use to direct efforts for addressing MS4 discharges to receiving waters. However, Provision II.B requires that Copermittees develop WQIPs that focus on the highest water quality priorities in a watershed. The constituents as listed in Tables C-1 through C-5 may not be the highest watershed priorities for a particular WMA, which may lead to resources being used to address pollutants that are not the highest priority. More flexibility is needed in this provision for the Copermittees to develop NALs and SALs that address the highest priority pollutants in their respective WMA(s).
PROVISION II.D – MONITORING AND ASSESSMENT REQUIREMENTS		
3	26-52	Overall – The Monitoring and Assessment Program should follow a question-driven approach, allow Copermittees to make efficient use of resources for monitoring, incorporate past monitoring data into assessment, and utilize other region-wide monitoring programs.
4	26-52	Overall – Copermittees should only be responsible for discharges within their own jurisdictions.
5	41	II.D.2.b.(6) – Dry weather HMP monitoring should be conducted along with the Copermittees' existing HMP Monitoring Program and not as duplicate efforts or added requirements.
PROVISION II.E – JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS		
6	54	II.E.2.a – 40 CFR 122.26.(d).(2).(iv).(B).(1) provides municipalities with discretion to determine if certain non-storm water discharges are sources of pollutants to waters of the United States and should be addressed. Such discharges include water line flushing, landscape irrigation, discharges from potable water sources, lawn watering, individual residential car washing, dechlorinated swimming pool discharges, etc. The Administrative Draft Permit exceeds federal regulations in requiring the Copermittees to categorically address all discharges by eliminating Copermittee discretion.

PROVISION II.E (continued)		
Comment No.	**Page No.**	**Comment**
7	57	II.E.2.b.(1) – The entire MS4 and all the locations required to be identified on the MS4 map cannot be shown on a single map of practical size. It is recommended that the MS4 map should only show the MS4. Detailed locations should be available in GIS or other mapping system and be made available to the Regional Board upon request.
8	61	II.E.3.a – Change "all development projects" to "all non-exempt development projects." An exempt-projects category should be created to include projects such as tenant improvements, traffic signals, utility work, road resurfacing, and projects similar to those exempted under the definition of Redevelopment (Attachment "C").
9	61	II.E.3.a.(1)(c) – By definition, all MS4s are waters of the state. Permanent BMPs require to be connected to drainage systems by conveyance systems that are also considered MS4s. Therefore, permanent BMPs inevitably are located within waters of the state. Please consider deleting "or waters of the state" per Order No. R9-2007-0001.
10	62	II.E.3.a.(3)(c) – After "Conservation of natural areas within the project footprint including existing trees, other vegetation, and soils" add "to the maximum extent practicable."
11	64	II.E.3.b.(1)(b) – In the second line of this Provision, change "or" to "and" so the sentence will read, "…impervious surfaces on an already developed site, **and** the redevelopment project is a…"
12	66	II.E.3.b.(3)(a) – Directing runoff from sidewalks to landscaped areas may result in localized flooding, standing water, degradation/damage to sidewalks, and excessive infiltration into electrical and other utility trenches. It is recommended to provide categorical exemption for sidewalks from SUSMP requirements, similar to Order No. R9-2007-0001.
13	66	II.E.3.b.(3)(c) – After "Impervious trails" add "or maintenance access roads."
14	66	II.E.3.c.(1) – This Provision is redundant since Provision II.E.3.a.(2) is applicable to all projects per Provision II.E.3.a.
15	66	II.E.3.(c)(2) – The requirement to retain and treat pollutants onsite eliminates the option of regional shared treatment and hydromodification control BMPs which are allowed under Provision II.E.3.a.(1)(b) on Page 61. It is recommended to delete "onsite."
16	67	II.E.3.(c)(2)(a) – This provision is redundant since Provision II.E.3.a.(3) is applicable to all projects per Provision II.E.3.a.

PROVISION II.E (continued)		
Comment No.	**Page No.**	**Comment**
17	67	II.E.3.c.(2)(b) – Examples of LID BMPs that retain runoff should be provided. Retention facilities typically include retention basins, rain barrels, or underground vaults. Can these facilities be considered LID BMPs? What should be done with the retained water in situations where soils are impermeable and there is a lack of demand for irrigation water during the rainy season?
18	67	II.E.3.c.(2)(c) – In the last paragraph, mitigation is required for the portion of the pollutant load that is not retained onsite. Guidelines should be provided to calculate pollutant loads to be mitigated and sizing of mitigation if retrofitting projects or stream and/or habitat restoration are to be used, as provided in Provision II.E.3.c.(4)(c)(ii) on Page 71.
19	67	II.E.3.(c)(2)(d) – Sizing and pollutant removal efficiency criteria have been established for <u>onsite</u> treatment control BMPs. Do these criteria also apply to <u>offsite</u> treatment control BMPs?
20	68	II.E.3.c.(3) – Compliance with hydromodification control requirements on small projects is often infeasible and inefficient. It is recommended to adopt a lower threshold of one acre of impervious area (addition or replacement) for hydromodification control compliance, in line with the San Francisco Bay Area NPDES Municipal Permit.
21	68	II.E.3.c.(3) – Considering that the San Diego HMP has many layers of conservative assumptions, comparing developed condition runoff rates with naturally occurring conditions will add another conservative layer, which may make hydromodification control BMPs infeasible for many projects or may adversely affect the integrity of downstream channels and habitat. This is particularly true for many redevelopment and infill projects.
22	68	II.E.3.c.(3)(a)(ii) – The intent of this Provision is not clear. If it is because of possible future rehabilitation of the channel to its natural condition, then the exemption in Provision II.E.3.c.(3)(d)(ii) on Page 69 should not be allowed by the same reasoning.
23	68	II.E.3.c.(3)(a)(iii) – Monitoring data from Provision II.D.2.b.(6) will not provide necessary information to re-define the range of flows causing erosion.
24	68	II.E.3.c.(3)(b) – The Permit should provide guidelines to calculate sediment loss and the methods by which sediment loss can be compensated.

PROVISION II.E (continued)		
Comment No.	**Page No.**	**Comment**
25	69	II.E.3.c.(3)(d) – The Copermittees have spent over $1M and about four years to develop the Final HMP. The current HMP includes a monitoring plan that extends for five years. Data from the monitoring plan will determine if assumptions and criteria used in the Final HMP are appropriate or not. It is not reasonable to make any changes (including exemptions) to the HMP until monitoring data are available.
26	69	II.E.3.c.(4)(a)(iii) – The Permit requires project applicants to perform mitigation with a net result of at least the same level of water quality protection. The Permit should explain how the same level of water quality protection can be assessed if retrofitting projects or stream or habitat restoration is used as mitigation.
27	71	II.E.3.c.(4).(c)(iii) – It is hardly ever possible to synchronize mitigation projects with development projects. The requirement to complete mitigation prior to occupancy eliminates this option as a practical option.
28	71	II.E.3.c.(4)(c)(iv) – Pollutant credit system has not been explained in the Permit. This mechanism should be described in the context of this permit.
29	71	II.E.3.d – The update to the Design Manual should not include an update of the Final HMP for reasons discussed in Comment No. 25.
30	73	II.E.3.c.(2)(a) – Implementation of local SUSMPs in San Diego County started on 12/12/2002. Inventories of Priority Development Projects prior to that date are not available.
31	75	II.E.4.a.(1) and (3) – This Provision will create duplication of effort and overlap of responsibilities. The State Water Resources Control Board administers the Construction General Permit and has the authority to approve SWPPPs. While the Copermittees review SWPPPs during their construction site inspections, they enforce their own local storm water and grading ordinances. Further, SWPPPs are dynamic documents that reflect daily changes to construction activities on each site. Construction methods, site layout, and daily activities are planned by contractors. Prior to approval of construction or grading permits, such information is not generally available.
32	75	II.E.4.a.(4) – This requirement is already included in other environmental regulations and its inclusion in the Permit is redundant.

PROVISION II.E (continued)		
Comment No.	**Page No.**	**Comment**
33	79	II.E.5.a – The permit should provide the option for the Copermittees to use more than one data management system (inventory) to track the required information. For example, a GIS system can be used to identify and track the names and locations of existing facilities, while another system such as a business license database or a specially developed industrial/commercial database can provide the SIC codes, WDID No. etc.
34	79	II.E.5.a – The term "all its existing development" is too general and should not be used for identifying, tracking, inspections, implementation of BMPs, etc. A more selective term should be used for the purpose of this section.
35	79	II.E.5.a.(1), E.5.a.(2), E.5.a.(8), E.5.a.(9), E.5.a.(10), E.5.a.(11), E.5.a.(12) – Activities are not developments and should not be included in this section. Many of the requirements in Provision E.5 do not apply to activities. Such requirements include developing an inventory which includes names, locations, hydrologic sub-areas, SIC Codes, NOIs, WDID Nos., etc. It may be more appropriate to describe requirements for activities under a separate provision.
36	79	II.E.5.a.(8) – Pollutants generated and potentially generated by existing facilities, areas, and/or activities can only be identified for typical land uses and not individual facilities or areas.
37	83	II.E.5.d – Inspections of all parcels, streets, open spaces, drainage systems, sewage collections systems, etc. are neither feasible nor practicable. The permit should be more specific about the existing developments requiring inspections.
38	83	II.E.5.d.(1)(a) – Changes in property ownership or pollutant generating activities are not reported to the Copermittees in real time. They are generally identified during annual inspections.
39	86	II.E.6.a.(4) – This provision requires the Copermittees to determine if each identified non-storm water discharge is in exceedance of NALs developed pursuant to Provision C.1. For this purpose, the Copermittees would have to sample and test each and every non-storm water discharge, obtain laboratory results, and report to the San Diego Water Board within three business days. Clarification is needed regarding the intent of this requirement, since having qualified persons available for taking samples at multiple locations throughout the day and obtaining laboratory results within three business days are impossible tasks.

CITY OF DANA POINT

DEPARTMENT OF PUBLIC WORKS

September 13, 2012

San Diego Regional Water Quality Control Board
9174 Sky Park Court,
Suite 100,
San Diego, CA 92123-4340
Attn: Laurie Walsh, submitted via e-mail at lwalsh@waterboards.ca.gov

Subject: Comment letter – Regional Municipal Separate Storm Sewer System (MS4) Storm Water NPDES Permit, Tentative Order No. R9-2012-0011

Dear Ms. Walsh and Regional Permit Team:

The City of Dana Point very much appreciated the opportunity to participate in the stakeholder focus meetings to help draft an effective, implementable, and practical MS4 Permit for our region (Regional Permit). The City enjoyed its participation in these meetings, meeting the San Diego Regional Water Quality Control Board (SDRWQCB) team and hearing your ideas and intent for the next iteration of the MS4 Permit while discussing some of the broad concepts and issues.

The City agrees that the Water Quality Improvement Plan (WQIP) and adaptive management approach are an improvement over the current permit and will help Copermittees to progress in their continuing efforts to manage runoff and improve water quality. The focus meeting process and transparency also infused some vigor and enthusiasm into the regulatory atmosphere. We look forward to the continued dialogue and closer working relationship with your staff so that we can work cooperatively to achieve our common goals in an efficient and effective manner.

The City worked with our Principal Permittee, the County of Orange, to develop the redline/strike out version and general comments that will be submitted on behalf of the Orange County Copermittees by the County of Orange, and support the suggestions contained therein.

It is understood that the intent of the comments submitted at this juncture are to address broad topics based on the SDRWQCB's guidance that we received during the focus workshops. Not withstanding the recognition of the benefits and the progress

that has been made of this collaborative approach to draft the Regional Permit, there is concern that the Fact Sheet has not been made available during this process. In addition, the Report of Waste Discharge (ROWD), which represents the opportunity of the Copermittees to consider and apply experiential knowledge, appears largely irrelevant by the regional permit approach to date. Therefore, it is not the intent of this submittal to provide lengthy legal and extremely detailed technical comments and the City reserves its right to comment independently or cooperatively on any specific issue(s) when the revised final complete Draft Tentative Order is released for public comment in the future.

In addition to the suggestions provided by the County of Orange, the City of Dana Point would like to emphasize the following:

1. Please strongly consider the receiving water language (as provided in the County redline / strikeout version) that supports meaningful programs, supports the historical interpretation of State Board Policy and supports an adaptive management strategy. The recent Ninth Circuit NRDC/L.A. decision has put the Copermittees into a difficult situation.

   We believe that if the Copermittees are better able to adaptively manage their programs to focus their resources on those Best Management Practice (BMP) strategies and monitoring efforts that are identified in the approved Water Quality Improvement Plan (WQIP) as being most effective to address the watersheds priorities, overall progress to improving water quality will be improved.

   Local government certainly recognizes the importance of attaining water quality standards. At the same time, however, it was recognized by your staff in Finding 19, that immediately realizing this goal at the moment of permit adoption is not possible at all times. Indeed, this reality is reflected by the many TMDLs across the State that specifically recognize that current water quality standards cannot be immediately attained and can only be addressed by regulation that supports implementation of an adaptive program over a period of time.

   We also hope that the adaptive management approach will allow for flexibility to re-focus resources for special studies and/or technology improvements where it makes sense. We have a phenomenal resource base of scientists in our local regional that we can tap into; however we need the flexibility to re-allocate or refocus resources to get some of this work done. We have been successful at removing some of our beaches from bacteria 303(d) listing and a clear imperative to address our efforts in the San Juan Creek watershed at the beach with the greatest population use, Doheny State Park Beach.

   The City of Dana Point recognizes the need to continue to make significant progress toward attainment of water quality standards. However, we also believe that no regulatory benefit accrues from the Regional Board establishing permit provisions that result in the potential of immediate non-compliance for

Copermittees. For these reasons, the City of Dana Point requests Receiving Water Limitations language, as supported by the California Stormwater Quality Association (CASQA), and as provided in the redline/ strikeout version provided by the County of Orange be incorporated in the permit. We strongly support this language because it will enable regulated entities to focus and prioritize their resources on critical water quality issues and achieve environmental outcomes that are meaningful to the communities we serve. Importantly, it will also help ensure that good faith compliance is not the subject of significant legal liability and lawsuits.

2. Additionally, and as an alternate, the City of Dana Point strongly supports the revisions shown via track changes in **Attachment A** to this letter, for Section A of the Draft Permit regarding adaptive management.

3. Regarding monitoring, please consider a less prescriptive, flexible, question-driven monitoring and assessment program that can be adapted to provide meaningful answers to our programs. We feel that the monitoring should focus on the watershed and constituents of concern. Our previous dry weather monitoring program was effective and functional and provided a diagnostic tool to support the ID/IC program requirements.

   Although perhaps ideal in an ideal world, it is not practical to take samples every quarter mile. Even a one time effort would be prohibitively expensive and lead to a plethora of unanswerable queries. We have an existing and effective process to investigate exceedances and are learning more each year as technology is advanced. The City has installed numerous Best Management Practices (BMPs), such as diversions and treatment systems, to address runoff pollution at nearly every outlet to the ocean in priority areas in order to make improvements in the short term, while we continue to address long term goals and solutions.

4. Please also strongly consider the need for reasonable, feasible and meaningful hydromodification and development requirements, based on science, practice and experience. We ask for the flexibility to be able to allow for biofiltration and regional, offsite mitigation options that will work effectively in the real world. There was consensus at the workshops that a much larger benefit may be achieved with regional programming in certain circumstances. We hope that the Hydromodification Workshop that was held on August 30 in San Diego provided some additional insight as to the challenges and unknowns that exist at this time. We hope to be able to work together to craft effective requirements, based on what is known so as to avoid going in the wrong direction, requiring large investments without correlated benefits.

We respectfully ask that the Board staff understand that we believe the implementation of this permit does in fact include some unfunded mandates. To state in the Findings that "the local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this order" is misleading given the provisions of California Proposition 218. The voters have the authority. Please acknowledge this by referring to Proposition 218.

Thank you for your time, effort and investment in this stakeholder process to develop the next iteration of the MS4 Permit in our Region. If you have any questions regarding the above, please do not hesitate to contact Lisa Zawaski at 949-248-3584.

Respectfully,

Brad Fowler

Attachment A: Suggested Changes to Section A

ATTACHMENT A

SUGGESTED CHANGES TO SECTION A

II. PROVISIONS

THEREFORE, IT IS HEREBY ORDERED that the Copermittees, in order to meet the provisions contained in division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA and regulations adopted thereunder, must each comply with the following:

A. PROHIBITIONS AND LIMITATIONS

The purpose of this provision is to describe the conditions under which ~~storm water and~~ non-storm water discharges into ~~and from~~the MS4s are to be effectively prohibited or limited, and to describe how pollutants in discharges from the MS4, whether from storm-water or non-storm water, are to be reduced to the maximum extent practicable (MEP). The goal of this provision is to address the impacts of MS4 discharges so that such discharges do not impair water quality and designated beneficial uses of waters of the state. This goal will be accomplished through implementation of control measures that effectively prohibit non-storm water discharges into the Copermittees' MS4s, and reduce pollutants in ~~storm water~~all discharges from the Copermittees' MS4s to the MEP. The process for ~~determination of~~determining compliance with the Discharge Prohibitions (A.1), Receiving Water Limitations (A.2), and Effluent Limitations (A.~~3~~3, including effluent limitations derived from the TMDL requirements - Attachment E) is defined in Provision A.4.

1. Discharge Prohibitions

a. Except as ~~provided for in Provisions A.1.e or A.4,~~otherwise permitted herein, discharges from MS4s in a manner causing~~, or threatening to cause,~~ a condition of pollution, contamination, or nuisance in waters of the state are prohibited.

b. Non-storm water discharges into MS4s are effectively prohibited, unless such discharges are either authorized by a separate NPDES permit, or the discharge is a category of non-storm water discharges or flows that must be addressed pursuant to Provisions E.2.a.(1)-(5) of this Order.

c. Discharges from MS4s are subject to all ~~waste discharge prohibitions in the Basin Plan, included in Attachment A to this Order.~~applicable waste discharge prohibitions in the Basin Plan.

d. Storm water discharges from the City of San Diego's MS4 to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's MS4 to the Heisler Park ASBS are authorized under this Order subject to the Special Protections contained in Attachment B to State Water Board Resolution No. 2012-0012 applicable to these discharges, included in Attachment A to this Order. All other discharges from MS4s to ASBS are prohibited, unless authorized by a ~~subsequent Order~~separate order.

e. ~~For discharges associated with water body pollutant combinations addressed in a TMDL~~

~~in Attachment E of this Order, the affected Copermittees shall achieve compliance as outlined in Attachment E (Total Maximum Daily Load Provisions).~~

2. Receiving Water Limitations

a. Discharges from MS4s must not ~~have a reasonable potential to~~ cause or contribute to the violation of water quality standards in any receiving waters, including but not limited to all applicable provisions contained in the list below ~~including any modifications, unless the Regional Board determines~~, to the extent they remain in effect and are operative, unless such discharges are being addressed by the Copermittee(s) through the ~~process~~processes set forth in this Order (including Provision A.4 below and Attachment E – the TMDL Provisions):

(1) The San Diego Water Board's Basin Plan, including beneficial uses, water quality objectives, and implementation plans;

(2) State Water Board plans for water quality control including the following:

(a) Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries (Thermal Plan), and

(b) The Ocean Plan, including beneficial uses, water quality objectives, and implementation plans;

(3) State Water Board policies for water and sediment quality control including the following:

(a) Water Quality Control Policy for the Enclosed Bays and Estuaries of California,

(b) Sediment Quality Control Plan which includes the following narrative objectives for bays and estuaries:

(i) Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities, and

(ii) Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health,

(c) The Statement of Policy with Respect to Maintaining High Quality of Waters in California (State Water Board Resolution No. 68-16).

(4) Priority pollutant criteria promulgated by the USEPA through the following:

(a) National Toxics Rule (NTR)[1] (promulgated on December 22, 1992 and amended on May

[1] 40 CFR 131.36

4, 1995), and

(b) California Toxics Rule (CTR)[2,3]

~~b. For Receiving Water Limitations associated with a waterbody pollutant combination addressed in a TMDL in Attachment E of this Order, the Copermittees shall achieve compliance as outlined in Attachment E (Total Maximum Daily Load Provisions).~~

3. Effluent Limitations

a. Technology and Water Quality Based Effluent Limitations (including Effluent Limitations based on TMDLs).
Each Copermittee shall reduce pollutants in ~~stormwater~~ discharges from the MS4 to the maximum extent practicable (MEP[4]).

~~b. Water Quality Based Effluent Limitations (WQBELs)This Order establishes WQBELs consistent with the assumptions and requirements of all available TMDL waste load allocations assigned to discharges from the respective MS4s. Each Copermittee shall comply with applicable WQBELs as established for the TMDLs in Attachment E to this Order, pursuant to the applicable TMDL compliance schedules.~~ It is understood that compliance with this requirement will be achieved through the use of MEP-compliant best management practices (BMPs) or other controls that are consistent with the MEP standard.

4. Compliance with Discharge Prohibitions, Receiving Water Limitations, and Effluent Limitations

a. Each Copermittee must comply with the discharge prohibitions (A.1), receiving water limitations (A.2), and effluent limitations (A.~~3~~3, including effluent limitations developed based on TMDLs) of this Order through timely implementation of strategies, control measures and other actions as specified in Provisions B and E, and Attachment E (TMDLs) of this Order~~, including any modifications~~. The Water Quality Improvement Plans described in Provision B shall be designed to achieve compliance to the MEP standard with the discharge prohibitions, receiving water limitations, and all effluent limitations. If the ~~Regional Board~~Executive Officer approves ~~the~~a Water Quality Improvement ~~Plans~~Plan and subsequent updates as described in Provision B and F.1, and ~~the Regional Board Executive Officer determines they are~~ the plan is being implemented in a timely and good faith manner ~~that provides reasonable assurance of attaining the prohibitions and limitations~~

[2] 65 Federal Register 31682-31719 (May 18, 2000), adding Section 131.38 to 40 CFR

[3] If a water quality objective and a CTR criterion are in effect for the same priority pollutant, the more stringent of the two applies, unless a previous regulatory action (i.e., TMDL) has specified otherwise.

[4] This requirement does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants in ~~storm water~~ discharges to the MEP prior to entering receiving waters (e.g., low flow diversions to the sanitary sewer). Runoff treatment must occur prior to the discharge of runoff into receiving waters per Finding ~~8.~~**Error! Reference source not found.**.

~~described above through acceptance of the annual reports required by Provision F.3.b, such determination constitutes~~, such implementation of the plan shall constitute compliance with Provisions A.1, A.2, and A.3.

~~1. Except as provided in Parts A.4.3, A,4,4, and A.4.5 below, discharges from the MS4 for which a Permittee is responsible shall not have reasonable potential to cause or contribute to an exceedance of any applicable water quality standard.~~

~~2. Except as provided in Parts A.4.3, A,4,4, and A.4.5, discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible, shall not cause a condition of nuisance.~~

.

~~3.~~ b. In instances where discharges from the MS4 for which the permittee is responsible ~~(1)~~, causes or contributes to an exceedance of any applicable water quality standard or effluent limitation, or causes a condition of nuisance in the receiving water; ~~(2) the receiving water is not subject to an approved TMDL that is in effect for the constituent(s) involved; and (3)~~and the ~~constituent~~pollutant(s) associated with the discharge is otherwise not specifically addressed by a provision of this Order (such as specific scheduled actions in a Water Quality Improvement Plan), the Permittee shall comply with the following iterative procedure:

~~a.~~ 1. Submit a report to the ~~State or Regional Water Board (as applicable)~~Executive Officer that:

i. Summarizes and evaluates water quality data associated with the pollutant of concern in the context of the applicable water quality ~~objectives~~objective, discharge prohibition or effluent limitation including the magnitude and frequency of the exceedances.

ii. Includes a work plan to identify the sources of the constituents of concern (including those not associated with the MS4 such that non-MS4s sources can be pursued).

iii. Describes the strategy and schedule for implementing ~~best management practices (BMPs)~~MEP-compliant BMPs and other MEP-compliant controls (including those that are currently being implemented) that will address the Permittee's sources of constituents that are causing or contributing to the exceedances of any applicable water quality standard, discharge prohibition or effluent limitation, or causing a condition of nuisance, and are reflective of the severity of the exceedances. The strategy shall demonstrate that the selection of BMPs will address the Permittee's sources of constituents and include a mechanism for tracking BMP implementation. The strategy shall provide for future refinement pending the results of the source identification work plan noted ~~in A.4.3. ii~~ above.

iv. Outlines, if necessary, additional monitoring to evaluate improvement in water quality and, if appropriate, special studies that will be undertaken to support future management decisions.

v. Includes a methodology(ies) that will assess the effectiveness of the BMPs to address the exceedances.

vi. This report may be submitted in conjunction with the Annual Report unless the ~~State or Regional Water Board~~Executive Officer directs an earlier submittal.

~~b.~~ 2. Submit any modifications to the report that are required by the ~~State of Regional Water Board~~Executive Officer and that are consistent with the MEP standard within 60 days of notification from the Executive Officer. The report is deemed approved within 60 days of its submission if no response is received from the ~~State or Regional Water Board~~Executive Officer.

~~c.~~ 3. Implement the actions specified in the report in accordance with the acceptance or approval of the Executive Officer, including the implementation schedule ~~and any modifications to this Order~~.

.

~~d. As long as the Permittee has complied~~c. Compliance with the procedure set forth above for the subject pollutant or pollutants shall constitute compliance with the applicable discharge prohibition, receiving water limitation or effluent limitation (including the applicable TMDL) in issue, and ~~is implementing the actions,~~ the Permittee does not have to repeat the same procedure for continuing or recurring exceedances ~~of the same receiving water limitations unless directed by the State Water Board or the Regional Water Board to develop additional BMPs.~~

~~4. For Receiving Water Limitations associated with waterbody-pollutant combinations addressed in an adopted TMDL that is in effect and that has been incorporated in this Order, the Permittees shall achieve compliance as outlined in Attachment E (Total Maximum Daily Load Provisions) of this Order. For Receiving Water Limitations associated with waterbody-pollutant combinations on the CWA 303(d) list, which are not otherwise addressed by an applicable pollutant-specific provision of this Order, the Permittees shall achieve compliance as outlined in Part A.4.3 of this Order.~~

~~5. If a Permittee is found to have discharges from its MS4 causing or contributing to an exceedance of any applicable water quality standard or causing a condition of nuisance in the receiving water, the Permittee shall be deemed in compliance with Parts A.4.1 and A.4.2 above, unless it fails to implement the requirements provided in Parts A.4.3 and A.4.4 or as otherwise covered by a provision of this order specifically addressing the constituent in question, as applicable.~~

2.

The information developed pursuant to A.~~4.3~~4.b must be incorporated into the Water Quality Improvement Plans and/or the jurisdictional runoff management programs, as needed.

Re: CITY OF ESCONDIDO COPERMITTEE COMMENT SUBMITTAL ON THE ADMINISTRATIVE DRAFT MUNICIPAL SEPARATE STORM SEWER (MS4) PERMIT (TENTATIVE ORDER NO. R9-2012-0011)

Dear Ms. Walsh:

Thank you for the opportunity to comment on the Administrative Draft Municipal Separate Storm Sewer (MS4) Permit that is proposed to cover portions of San Diego County, Orange County, and Riverside County (Tentative Order No. R9-2012-0011). Although the City generally concurs with those comments that are provided as part of the San Diego Copermittees' submission, we do have a particular comment and request to make regarding our inclusion in the San Luis Rey (SLR) Watershed as part of the proposed 2012 draft permit.

During the 2007 draft permit issuance process, the City successfully applied for a waiver from participation/inclusion in the San Luis Rey (SLR) Watershed based on our minimal geographic representation in it. Escondido's 2008 JURMP submittal includes the following language that documents the approved rationale for our non-membership in the SLR Watershed:

1.4.1 San Luis Rey Watershed

Approximately 53 acres of the City are located within the San Luis Rey Watershed, which is associated with Daley Ranch, an open-space preserve that will remain undeveloped in perpetuity. This area occupies only 0.014 percent of the San Luis Rey Watershed and is far removed from any tributary that would convey runoff into San Luis Rey River. Because of this extremely low runoff contribution to the San Luis Rey Watershed, the City of Escondido is not included as a member agency in the management of this watershed. Therefore, for the purposes of assessing and controlling potential pollutants in runoff within watershed areas, the City focuses on the Carlsbad and San Dieguito River watersheds, which make up the majority of the City's jurisdiction.

The attached map provides a visual depiction of our continuing minimal and undeveloped footprint in the SLR Watershed. In addition, I have attached an email from the City of Oceanside, the lead for the SLR Watershed, which supports Escondido's continued exclusion.

The City of Escondido appreciates your consideration of this matter and looks forward to working with the Regional Board to further improve water quality in our region.

Sincerely,

Cheryl Filar

Subject: Exclude Escondido from SLR Watershed

Hi Cheryl,

I received your email regarding exclusion from the SLR Watershed in the draft administrative Stormwater Permit. I discussed this internally with Oceanside staff and we are fine with the exclusion. The City of Vista and the County of San Diego are fine with this exclusion as well. Also, in the San Diego County Copermittee comments to the RWQCB on the Draft Administrative Permit, Escondido is not included in table B-1 for the San Luis Rey Watershed Management Area.

Let me know if you have any questions.

Re: Comments on Administrative Draft MS4 NPDES Permit

Dear Ms. Walsh:

The City of National City (City) appreciates the opportunity to comment on the San Diego Regional Water Quality Control Board (Regional Board) Regional Municipal Separate Storm Sewer (MS4) Storm Water NPDES Permit (Tentative Order No. R9-2012-0011, hereafter "Administrative Draft"). In particular, the City would like to thank the Regional Board for the opportunity to participate in open focused meetings along with other stakeholders. These meetings have been helpful in helping the various stakeholders to better understand each others' positions, and, we believe, to reach consensus on some, although not all, issues.

City representatives have been actively involved in San Diego County Copermittee preparations for the focused meetings and in the process of developing a set of written comments on the Administrative Draft. The City is in general agreement with the Copermittee group comments that are being submitted to the Regional Board and therefore, for the sake of simplicity, is not submitting a separate group of comments at this time. We look forward to continuing to work with you and the rest of the staff at the Regional Board as this permit reissuance process goes forward.

Sincerely,

Stephen Manganiello
City Engineer

Cc:	joe.sunpools@yahoo.com
Subject:	NPDES Draft Permit (Order #R9-2012-0011) comment on a proposed additional rule

The purpose of this letter is to comment on a possible proposed rule addition to the NPDES Draft Permit (Order #R-9-2012-0011). On page 56 (4) (c) this document addresses "Dechlorinated swimming pool discharges". It has come to my attention that a "non-profit coastal group" is planning to propose an additional rule to require residents to use the services of an onsite reverse osmosis filtering company rather than drain their pool into either the MS4 or sanitary sewer. While water conservation is commendable, the scope and purpose of the NPDES is not water conservation but rather the elimination of pollutants entering the MS4. Therefore this proposed rule does not belong in this Permit. In addition, it should be noted that most swimming pool water in the Region covered by this Permit was on its way to the ocean when it was diverted for use in swimming pools, and when discharged (in compliance with the Permit) it finishes this journey. Therefore the water itself is not creating a burden upon the receiving waters (the Pacific Ocean).

If any clarification of this comment is needed please feel free to e-mail me or call me at 858-735-2565.

Respectfully submitted,

Bill Peck, owner, Wm. Peck Pool Services, San Diego, CA

Dear Ms. Walsh:

Re: Administrative Draft Order R9-2012-0011, NPDES No. CAS 0109266 and Waste Discharge Requirements for MS4s Draining the Watersheds within the San Diego Region

The Riverside County Flood Control and Water Conservation District (District) is submitting this comment letter on the above listed Administrative Draft Order, on behalf of the Riverside County MS4 Permittees within the San Diego Region (Riverside County Permittees) which includes the District, the County of Riverside and the Cities of Murrieta, Temecula and Wildomar. Administrative Draft Order R9-2012-0011 (Administrative Draft) was drafted by Board staff to cover Phase I municipal separate storm sewer system (MS4) permittees in San Diego County, Southern Orange County, and the portion of southwestern Riverside County referred to as the Santa Margarita Region. Although the Administrative Draft will initially only apply to the San Diego County MS4 permittees, Provision F.5.a mandates that it will apply to the Riverside County Permittees on expiration of their existing Santa Margarita Region MS4 permit in 2015, unless early enrollment is granted prior to Provision F.6. Since the Administrative Draft purports to cover the activities of the Riverside County Permittees, this letter, developed in consultation with the Riverside County Permittees, reflects those Permittees' most critical concerns. The Board's careful consideration of these critical concerns will be appreciated.

In the workshop on the Administrative Draft Order on April 22nd Regional Board staff identified the following desired outcomes of the Administrative Draft:

- Improving the quality of water discharged from the MS4
- Restoring or enhancing beneficial uses and receiving water quality

It was further identified by Board staff that to be able to meet those goals, the proposed regional MS4 permit needed to be 1) Strategic, 2) Adaptive, and 3) Synergistic.

While the Riverside Copermittees still have questions regarding the legal authority to issue this regional MS4 permit to Copermittees within the three counties, the Copermittees agree that being able to adapt and direct resources toward specific water quality priorities in a given watershed, rather than all-potential problems simultaneously, is more likely to result in actual / meaningful improvements in water quality. However, to be able to achieve those improvements the MS4 Permit must be written to allow the Copermittees to truly and fully adaptively manage their programs to focus their resources on those BMP strategies and monitoring efforts that are identified as being most effective, consistent with the MEP standard, at addressing the watershed's priorities.

Unfortunately, the prescriptive provisions and the receiving water limitations presented in the Administrative Draft are not supportive of achieving those outcomes, as it currently does not allow the Copermittees to be strategic with the use of their resources, nor to adapt their programs to focus on the highest priority water quality needs of the watershed. This comment letter identifies the fundamental issues which, if resolved, will address these limitations and facilitate the desired improvements. Among other issues, there needs to be a greater emphasis on the ***integration*** of the Monitoring, Water Quality Improvement Plans, and Jurisdictional Runoff Management Plans, which may require key elements of the Administrative Draft and, in particular, the proposed monitoring and jurisdictional requirements, to be simplified to provide the needed flexibility for effective implementation of an integrated adaptive management approach.

1 BACKGROUND

The Riverside County Permittees were issued an extensive and prescriptive MS4 Permit in November 2010 (2010 MS4 Permit) which greatly expanded monitoring obligations, required special studies, jurisdictional runoff management program, and watershed workplan requirements. Development and implementation of the 2010 MS4 Permit compliance requirements has been unduly expensive relative to the size, resources, and known beneficial use impairments in the Santa Margarita Region, and the demonstrated benefits of the mandated compliance requirements. These requirements have left other important societal needs unfulfilled by the Riverside County Permittees during a period of unprecedented and continuing economic distress. The Riverside County Permittees are still in the process of developing and implementing these requirements which is a concern given the different approach proposed in the Administrative Draft.

While the Riverside County Permittees have long sought a more flexible, adaptive, and outcome-oriented MS4 permit, the extraordinarily prescriptive compliance and monitoring mandates in the 2010 MS4 Permit have significantly limited the Riverside County Permittees' ability to participate in the focused meetings and to provide detailed comments on the Administrative Draft.

The Riverside County Permittees appreciate that Board staff were have been seeking MS4 permittee input during the focused meetings on the Administrative Draft. Unfortunately, the Riverside County Permittees were effectively precluded from participation in the first two focused meetings, due to the need to meet compliance deadlines set forth in the 2010 MS4 Permit issued by the San Diego Water Board just 18 months earlier. The Riverside County Permittees notified the Regional Board staff of these requirements both verbally and in written correspondence on multiple instances prior to the first focused meeting and stated that, without relief from the 2010 MS4 Permit requirements, the Riverside County Permittees could not attend the first two focused meetings. Nonetheless, Regional Board staff decided to proceed with those first two meetings without participation of the Riverside County Permittees, due to self-imposed goals for the adoption of this regional MS4 permit. Our ability to fully prepare for and participate in the second two focused meetings, and additionally to provide these written comments, continues to be constrained by the demands of developing and rolling out of additional compliance documents mandated in the 2010 MS4 Permit.

However, as the public noticing documents indicated, these comments on the Administrative Draft are considered to be informal and will not be responded to by staff. However, in an apparent contradiction, Regional Board staff has made other comments at focused meetings suggesting that a significant proportion of changes to the proposed regional MS4 permit will be made in response to comments on the Administrative Draft, and that proportionally fewer changes are expected based on (not yet submitted) comments on the (not yet drafted) Tentative Order. Under the Clean Water Act and California law, all interested persons, including the Riverside County Permittees, must be provided the full opportunity to review and comment upon the

Tentative Order, which will represent the actual proposed regional MS4 permit. To not give full consideration to address and respond to all comments on the Tentative Order, including the projected MS4 Permittees in the Santa Margarita Region, would be an abuse of discretion by the Regional Board. Not only should Regional Board staff provide full consideration of all comments on the Tentative Order, but Regional Board staff should have no pre-established expectation or limitation on the amount or scale of changes that will be considered as appropriate on the Tentative Order.

Further, due to the public policy significance of the shift to a regional permitting approach, a series of workshops in front of the Regional Board Members should, and are requested to be scheduled following release of the Tentative Order. Conducting such workshops for the Regional Board Members is critical to allow them to be fully informed of, and hear first-hand the issues from a variety of perspectives, before being asked by Regional Board staff to adopt a regional MS4 permit.

While the Riverside County Permittees appreciate this opportunity to comment on the Administrative Draft, we anticipate providing additional, and perhaps more significant, comments on the Tentative Order. As noted above, our opportunity to review, evaluate, participate in focused meetings on, and develop comments on the Administrative Draft has been significantly constrained by mandates to comply with the 2010 MS4 Permit. Moreover, the Riverside County Permittees reserve the right to make additional or different comments on the Tentative Order from those made on the Administrative Draft, including potentially on similar sections of the permits, as well as to submit redline comments and other exhibits. The provision of comments on the Administrative Draft does not, in any way, preempt the ability of the Riverside County Permittees to collectively or individually make comments on the Tentative Order, and any such comments should be fully considered at that time as part of the formal proceedings.

2 GENERAL COMMENTS

2.1 Authority to Require Regional Permit

Letters were sent by the Orange County and Riverside County Counsels' Offices to the State Water Board's Office of Chief Counsel in May, requesting the views of that office on the legal authority of the Regional Board to issue a single regional MS4 permit covering these three counties, across a number of separate watersheds, with no interconnected MS4, and for which no Report of Waste Discharge (ROWD) had been issued. The Office of Chief Counsel only provided a response to these letters a few days ago, several months after the original letters were sent. While we have reviewed their response, we believe that the response may not have fully considered the entirety of the Clean Water Act regulations regarding jurisdictions that can be regulated on a single permit. The Riverside County Permittees plan to address the Office of Chief Counsel letter separately.

While the Riverside County Permittees continue to reserve the right to contest inclusion in any regional MS4 permit, and wish to state that the submission of comments or participation in focused meetings regarding the Administrative Draft represents no waiver of such reservation, the Riverside County Permittees concur that they may voluntarily agree to enter into such a regional MS4 permit. While the participation of the Riverside County Permittees in focused meetings and workshops should not be construed as any agreement to voluntarily enter into a regional MS4 permit, they remain open to the concept of such a regional MS4 permit, depending on its terms.

2.2 Increase Flexibility to Account for Local Conditions

The Santa Margarita Region has distinctly different hydrology, soils, topography, climate, and water quality concerns than those found in Orange and San Diego Counties. These differences are significant and warrant MS4 permit provisions that are sufficiently flexible to account for them. In addition, the Riverside County Permittees are making significant resource and staff investments in developing and implementing compliance programs for the 2010 MS4 Permit, and are concerned that the inclusion of highly prescriptive requirements in the Administrative Draft, may unnecessarily conflict with the programs developed. If the Regional Board intends to adopt a tri-county regional MS4 permit, these factors must not be ignored or dismissed by Regional Board staff in the development of the Tentative Order, and need to be addressed by giving full consideration to, and not dismissing, each of the comments provided by the Riverside County Permittees.

2.3 Adaptive Management

The Riverside County Permittees are supportive of the adaptive management approach verbally advocated by the Regional Board staff; however the adaptive management approach proposed in the Administrative Draft will require modification to be feasible.

The Administrative Draft does not currently allow true/full adaptive management, and as such will not enable the MS4 Permittees to focus and prioritize their efforts and resources toward obtaining those improvements. The Administrative Draft also proposes an extraordinarily expansive monitoring data collection exercise that is not justified by water quality needs and potential benefits, and certainly not by the coniditons found in the Santa Margarita Region. This absence of flexibility and mandated commitment of resources to implement the monitoring program would severely restrict the ability of the Riverside County Permittee’s flexibility to redirect resources to address priority water quality concerns.
Recommendation

Effective implementation of an adaptive management approach requires broad compliance and budgetary flexibility to allow the Riverside County Permittees to focus their resources on those BMP strategies and monitoring efforts that are identified in the approved WQIP as being most effective, consistent with the MEP standard, to address the watersheds priorities. A figure entitled “Example Process for Integrated Adaptive Management Process” which illustrates the adaptive management process supported by the Riverside County Permittees is attached to this letter.

The Riverside County Permittees have attached a figure entitled “Example Process for Integrated Adaptive Management Process” wich illustrates the type of adaptive management process supported by the Permittees. Following is a narrative summary of the attached figure. Although Orange and San Diego Counties may be including similar figures in their comments, differences underscore the need to collaborate in the development of an effective adaptive management approach, including development of functional definitions of “adaptive management” and “iterative approach” as related to the implementation of compliance programs:

- WQIP:

The WQIP should be the primary driver for decisions regarding what programs should be implemented, and the relative scale and resources dedicated to those programs. To provide structure, predictability, and enforceability to that decision process, the WQIP should empower the MS4 Permittees to:

- Identify the highest water quality priorities that are affected by discharges from the MS4;
- Develop jurisdictional and regional BMP strategies, and identify monitoring and assessment efforts, which will be most effective at addressing the watershed's highest water quality priorities affected by discharges from the MS4;
- Develop an assessment system, including monitoring, to measure progress, and identify and control pollutant sources, etc;
- The Water Quality Improvement Plan (and the BMP strategies and Monitoring and Assessment Plans (MAP) therein), should be adaptively managed every five years (addressed in the ROWD), and as/if needed in between; and
- Each MS4 Copermittee should then be held accountable to implement its respective responsibilities as laid-out and scheduled within the WQIP, thereby constituting compliance with the proposed regional MS4 permit.

- *JRMP and Monitoring:*
  - There should not be an expectation (or requirement) that the JRMP and/or the Monitoring programs are separately adaptively managed outside the WQIP process. These plans/programs should be iteratively managed on an ongoing, as-needed basis, provided that WQIP commitments are met. For example, if the WQIP specifies a target for inspections of a particular existing development management area of every three months, a Copermittee should be able to change its internal inspection processes, inspection forms, etc. at any time, provided that the inspections still occur every three months. As illustrated in the attached figure, maintenance of baseline programs (e.g., IC/ID, public education, and others) will continue to be included. However, those baseline programs will be evaluated and revised to tailor to the specific needs of each watershed area and will likely result in changes from the programs described in the existing MS4 permits.
  - The JRMP and monitoring program requirements should be described in the regional MS4 permit as a "menu" of options, recognizing that the WQIP – which will be publically vetted and approved by the Regional Board - will specify those jurisdictional and regional activities that will be implemented to address that watershed's priorities, the appropriate frequencies, performance standards and other compliance elements. This Permit language must recognize that not all compliance requirements specified in the Administrative Draft may be required to appropriately manage high water quality priorities; otherwise if everything is still required all the time, the Copermittees' will NOT be able to focus their resources, and the desired outcomes will likely not be achieved.

2.4 Legal Authority

First, the Legal Authority Establishment and Enforcement provisions, E.1, must be modified to reflect the requirements of law. First, the requirement to address illicit discharges as written is much broader than the requirements of the federal regulations, which require MS4 permittees only to "effectively prohibit through ordinance, order or similar means, illicit discharges to the municipal separate sewer." 40 CFR § 122.26(d)(2)(i)()B). The permit should reflect this language, and should not include any goals or requirements to 'eliminate' or 'prevent' illegal discharges.

Second, the requirement to control discharges from industrial and construction activity should not include the responsibility to control sites covered by general stormwater permits, as that responsibility is that of the Regional Board and fees for the inspection of those facilities are already collected by the State.

Third, the regulations do not require interagency agreements between non-MS4 dischargers and third parties such as Native American tribes, Caltrans or the federal government, but only among MS4 permittees. The Regional Board has authority and responsibility under the Porter Cologne Water Quality Act to regulate discharges from other non-MS4 sources, and that responsibility cannot be transferred to the MS4 permittees. The MS4 copermittees can certainly work cooperatively with such third parties on a voluntary basis.

2.5 “Ensuring” Compliance

Provision E.4.d of the Administrative Draft requires MS4 permittees to conduct inspections of construction sites to “ensure” compliance with various requirements. Such terminology can be read as a requirement to ‘guarantee’ compliance. The MS4 permittees are not required under federal law to “ensure” (or guarantee) the compliance of third parties, and cannot in fact do so. These provisions should be modified to require that the MS4 permittees “confirm” that requirements are being met, and to conduct enforcement within their jurisdictional authority, where necessary, to prompt the party to come into compliance.

Additionally, the use of the term “ensure” can be found in other provisions in the Administrative Draft, and the Riverside County Permittees object to those usages as well. In particular, we note that the term is used in Provision E.3.e. (Priority Development Project BMP Impact and Oversight), E.4.a. (Construction Management Project Approval Process), E.5.d. (Existing Development inspections) and in the definition of Jurisdictional Runoff Management Program in the Glossary, which requires that JRMPs “ensure” that pollutants in MS4 discharges are reduced to the MEP. In all these cases, and elsewhere in the Administrative Draft where there is a requirement to “ensure” or otherwise guarantee compliance, the Riverside County Permittees request alternative language, such as “confirm,” which reflects the iterative process of compliance, one which reflects the real world impossibility of ‘ensuring’ compliance.

2.6 Fiscal Analysis

Provision E.8.A. requires that “Each Copermittee must secure the resources necessary to meet all the requirements of this Order.” This requirement is objectionable on several grounds. First, it exceeds the requirements of federal law or regulation. The MS4 regulations require *only* that MS4 permittees submit a “fiscal analysis” of the resources required to accomplish MS4 permit program activities, including a description of the sources of funds. 40 CFR § 122.26(d)(2)(vi). Second, this requirement ignores the real world limitations facing MS4 permittees in attempting to find funding to conduct the programs required under MS4 permits and ignores the economic conditions faced by the Riverside County Permittees. Third, neither the Clean Water Act nor the Porter-Cologne Water Quality Act give the Regional Board budget authority over municipalities or flood control districts. Thus, there is no legal authority for this provision. It should be deleted and replaced with language reflecting the requirements of the MS4 regulations, which are cited above.

2.7 Purpose of Clean Water Act

Throughout the Administrative Draft, it is stated that that the goal of various provisions of the Administrative Draft is to protect, preserve, enhance or restore water quality or designated beneficial uses of waters of the state. It is true that the Clean Water Act has as its basic goal to “restore and maintain the chemical, physical, and biological integrity of the Nation’s waters.” 33 U.S.C. § 1251(a) Congress, however, translated that goal for MS4 operators (which does not call for “enhancement” of those waters) in the provisions of Section 402(p)(3)(B), which require that MS4 operators “effectively prohibit” non-stormwater discharges into the MS4s and to “require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." 33 U.S.C. § 1342()(3)(B) Thus, the two Congressional requirements for MS4 operators in the Clean Water Act for MS4 Permits are (1) effective prohibition of non-stormwater discharges into the MS4 and (2) the control of pollutants discharged from the MS4, of whatever source, to the maximum extent practicable ("MEP").

Accordingly, Congress' intent was not to place the entire burden of achieving the goals of the Clean Water Act in a watershed upon owners/operators of the MS4, nor that the attainment of water quality standards or beneficial uses should be expressed as the 'goal' of an NPDES MS4 permit. The USEPA, the State Board and the Regional Boards regulate many other potentially significant sources of pollutants, including from industrial dischargers, publicly owned treatment works, federal and tribal sources and agricultural runoff, sources that are beyond the control of the MS4 owners/operators. It is through the combined and proper regulation – by the USEPA, State and Regional Boards, of each of those sources that the goals of the overall Clean Water Act can be met.

[Additionally, while the Water Board has the authority, under the Porter-Cologne Water Quality Act, to adopt requirements in a waste discharge requirement, that adoption requires the Regional Board to follow the requirements of state law, including those set forth in Water Code § 13263(a), and, without limitation, the requirements of Water Code § 13241. The Administrative Draft does not set forth that such requirements have been complied with, as was required by both state law and the California Supreme Court in *City of Burbank v. State Water Resources Control Board* (2005) 35 Cal. 4th 613, 625.]

2.8 Attempted Transfer of Regional Board Responsibilities

Under the Porter-Cologne Water Quality Act, the Legislature delegated primary responsibility for managing waters of the state to the Regional Boards. This includes developing and implementing multi-discharger watershed management approaches if/where necessary, including directly regulating all sources of pollutants in a watershed. Although MS4 dischargers are only one of those potential sources of pollutants, in several sections the Administrative Draft inappropriately attempts to transfer the entire responsibility and burden of watershed planning and attainment or restoration of beneficial uses to the MS4 Permittees, in the form of MS4 permit requirements and, to that extent, is thus inconsistent with this legislative mandate. These responsibilities include proposed requirements for the MS4 Permittees to singlehandedly take the lead in developing watershed plans, conducting receiving water monitoring; conducting special studies, controlling and regulating non-MS4 pollutant sources, and implementing retrofit and stream rehabilitation projects, each with the goal of restoring or rehabilitating beneficial uses in receiving waters. However, in adopting the Porter-Cologne Water Quality Act, the Legislature determined that the Regional Boards, not the MS4 Permittees (i.e., general purpose governments and flood control districts), are the most appropriate entities to implement such efforts. The Riverside County Permittees have demonstrated their commitment to *participate in* watershed management planning and to implement compliance programs that are focused obn addressing the watershed's highest water quality priorities specifically related to MS4 discharges to the extent of their authorities. However, the Riverside Copermittees are not willing to usurp what is otherwise the responsibility of the Regional Board, and to unilaterally pay for activities, such as previously mentioned, that which should be accomplished via the combined resources and proper regulation of all sources, including non-MS4 sources.

The Administrative Draft also attempts to assign all responsibility and liability for funding programs for improving receiving water quality and attaining water quality objectives in receiving waters on the MS4 dischargers. Development and implementation of water quality improvement plans, receiving water monitoring, and monitoring of non-MS4 sources of pollutants must be supported by all of the entities responsible for these pollutant sources. These other sources include Phase II facilities, sites permitted under the General Construction and Industrial Stormwater Permits, federal and state facilities (including Caltrans), agricultural sources, POTWs, purveyors of reclaimed water, and NPDES and waste discharge requirement dischargers otherwise authorized by the Regional Board. The requirement in the Administrative Draft for the MS4 permittees to fully fund the development and implementation of watershed improvement plans would constitute an attempted transfer of local public resources to support the activities of these other public and private entities. If the Regional Board's desired objective is to implement a watershed approach rather than a discharger-based approach, the Regional Board must require all dischargers and sources in the watershed to participate in jointly funding the watershed planning efforts.

Recommendation

If the Regional Board endeavors to accomplish the broader goals of the Clean Water Act, the proper means would be to focus existing Regional Board staff and resources on proper proactive regulation and permitting of all source categories, and bringing those sources together to implement the desired watershed and Basin Planning. All requirements or implications that any element of the MS4 permittees' programs should to singlehandedly take on or lead those responsibilities, or meet those broader Clean Water Act goals, must be removed in the Tentative Order.

In assigning responsibility for basin planning to the Regional Boards, the Legislature authorized the Regional Boards to issue permits and other mandates and to require funding of compliance requirements. The Riverside County Permittees request that the Regional Board retain its legislatively-mandated leadership role in basin planning and require that all sources of pollutants participate in funding monitoring, planning, compliance and other water quality management activities and that requirements which focus that effort only on MS4 permittees be removed from the Tentative Order. The approach described in the federal regulations for development and implementation of Total Maximum Daily loads is a possible model of such an inclusive process.

2.9 Update of Basin Plan

For outcome-based permitting to be successful, the desired outcomes must be achievable by the discharging entity and take into account the background conditions in the watershed (see previous comments about setting desired goals or outcomes at the broader Clean Water Act goals). The Basin Plan should be updated prior to adoption of a regional permit to identify realistic water quality standards which take into account data reflecting local conditions, not just a literature search.

Recommendation

The Riverside County Permittees support a comprehensive evaluation of the Basin Plan for the Santa Margarita River watershed to determine if water quality standards need adjustment to properly reflect localconditions. With the move to outcome based permitting, such an update is necessary to ensure that limited local resources are focused on solving real environmental problems. Such an update should be led by and adequately funded by the Regional Board with participation by the MS4 permittees and other dischargers and sources in the watershed.

2.10 Use of "including but not limited to" Language

Throughout the Administrative Draft, the wording "including but not limited to" is used to define various requirements. This language is impermissibly vague and ambiguous, and potentially leaves the MS4 permittees open to liability for permit violations due to their alleged failure to guess at additional requirements. The MS4 permittees must have certainty in the requirements of the MS4 Permit so that they can plan their compliance activities. The MS4 Permittees cannot be forced to guess at what additional, unstated requirements may be in the minds of Regional Board staff or citizen plaintiffs. The terms of the MS4 Permit are read like a contract. *Northwest Environmental Advocates v. City of Portland*, 56 F.3d 979, 982 (9th Cir. 1995). A provision requiring a MS4 permittee to perform "including but not limited to" certain identified tasks leaves the MS4 permittee with no certainty that performance of the identified tasks is enough for compliance. This basic uncertainty renders the MS4 permit vague and unenforceable and subject to abuse.

This or similar language can be found in the Administrative Draft at the following places:

A.2.a; B.2.a.6; B.2.c.4; B.5.a.1; B.5.b.1; E.3.c.4.(b); E.3.d.1; E.3.f.4.(a)(4); E.5.c.4.(a); F.3.b.1.(d); Attachment B, General Provision 2.g.2; Attachment B, General Provision j.1; Glossary, definition of "construction site."

The Riverside County Permittees object wherever this or similar language is found in the Administrative Draft, whether or not identified above.

Recommendation

The proposed MS4 permit can require that minimum steps be followed; if such steps are followed; however, the permittee is in compliance, though the permittee could voluntarily elect to follow additional steps

3 SPECIFIC CONCERNS

The following comments represent specific high level concerns that the Riverside Copermittees have identified at this time. It does not represent a comprehensive set of comments on all issues with the Administrative Draft.

3.1 Findings

The Riverside County Permittees have two separate sets of comments on the Findings set forth in the Administrative Draft. The first addresses the failure of the draft to include findings on important aspects of California law as well as the physical setting of the Santa Margarita Region. The second addresses issues raised by specific Findings that were included in the Administrative Draft.

3.1.1 Needed Additional Findings

The Administrative Draft fails to fully address the context and conditions under which the proposed regional MS4 permit requirements are to be applied. A more complete explanation of this background is necessary to ensure that the provisions ultimately included in the Tentative Order are credible and appropriate, and legally required, and that the provisions (which should stem from the Findings) are written in context of the broader issues that affect MS4. The Riverside County Permittees request that the Regional Board work with the MS4 permittees to expand the Findings, including the addition of findings to address the following:

- California Water Law – This body of law requires that downstream entities must accept runoff from upgradient properties. Owners and operators of MS4s are not exempt from this legal mandate, even if that runoff contains pollutants. A Finding which describes this mandate is fundamental to properly frame the role of the MS4 permittees, the difficulties in managing runoff from the MS4, and in turn provide the context for the requirements proposed within the MS4 permit.
- Porter-Cologne Water Quality Act – This legislation establishes the State Water Resources Control Board and the Regional Water Quality Control Boards, not the MS4 permittees, are the primary governmental entities responsible for adequately regulating sources of pollutants to meet beneficial uses in receiving waters in California. Please see discussion above.
- Flooding – Many areas that would be under the jurisdiction of a proposed regional MS4 Permit are subject to periodic catastrophic flooding resulting from natural conditions. This flooding exists even in the absence of development. Such flooding has and will result in loss of life, widespread property damage, and exposes runoff to significant amounts of pollutants from industrial, commercial, residential and agricultural land uses, thus damaging watercourses, habitat and the beneficial uses therein. Further, flooding can mobilize significant volumes of pollutants that can have significant and permanent detrimental effects. MS4 systems are designed and constructed to mitigate these impacts. A Finding describing these conditions is necessary to provide a context for the role of drainage system improvements in the management of flood waters and receiving water quality.
- Flood Control District Acts – The Legislature adopted separate acts to establish Flood Control Districts in Orange, Riverside, and San Diego Counties. In these Acts, the Legislature has determined that protection of life and property from the effects of flooding through the implementation of flood control improvements is a priority, and has assigned those Districts with the sole responsibility for the identification of necessary flood hazard mitigation efforts, and the construction and maintenance of those improvements that are necessary to manage and contain flood waters to prevent such negative impacts. These improvements are not only critical to the protection of life and property, but they represent fundamental water quality BMPs inasmuch as they reduce the widespread exposure of runoff to pollutants. Additionally, the Flood Control Districts, while being owners and operators of MS4s, have no authorities or powers beyond those granted by the Legislature in their Acts. The Legislature did not provide the districts authority to control the quality of runoff received by their MS4 facilities. Additionally, the Districts lack authority to govern land use activities since they are not municipal entities. Findings describing the legislative priority for flood control and the limitations on the governing power of the Flood Control Districts are necessary to provide context for the role of flood control improvements relative to water quality priorities and to provide context for the appropriate role of the Flood Control Districts as MS4 permittees.
- Limits of Permittee Legal Authority - The MS4 permittees lack the authority to regulate many of the categories of sources of pollutants that may impact surface receiving waters. For example, the Permittees lack authority to regulate pollutants discharged from federal and state lands and facilities, tribal lands, special districts, utilities, agriculture, and railroads. The Federal Insecticide, Fungicide, and Rodentcide Act (FIFRA) precludes local regulation of pesticides. In some instances, the Regional Board has authority to regulate these sources. A Finding(s) describing these limitations is necessary to provide context for properly assigning responsibilities to the MS4 permittees.

3.1.2 Findings 3, 4 and 16

Findings 3 and 4 of the Administrative Draft erroneously state that the Clean Water Act requires controls to reduce the discharge of pollutants "in storm water" to the MEP. Finding 16 states that non-storm water discharges from the MS4 are "not considered storm water discharges and therefore are not subject to the MEP standard, arguing that the MEP standard "is explicitly for 'Municipal . . . Stormwater Discharges" from the MS4s.

In fact, the plain language of the Clean Water Act is silent as to the nature of the waters discharged from MS4s which must be controlled to the MEP standard. See 33 U.S.C. § 1342(p)(3)(B)(iii). While the heading of 33 U.S.C. § 1342(p) refers to "Municipal and industrial stormwater discharges," this is not dispositive, as 33 U.S.C. § 1342(p)(3)(B)(ii) in fact refers specifically to "non-stormwater" discharges. Also, USEPA, in the preamble to the final stormwater regulations, made it clear that "MEP control measures" would be implemented to address not only pollutants in "storm water" but also from "non-storm water discharges."
As the preamble states:

> "Permittees are required to develop management programs for four types of pollutant sources which discharge to large and medium municipal storm sewer systems. Discharges from [such systems] are usually expected to be composed primarily of: (1) Runoff from commercial and residential areas; (2) storm water runoff from industrial areas; (3) runoff from construction sites; and (4) non-storm water discharges. Part 2 of the permit application has been designed to allow [permittees] the opportunity to propose MEP control measures for each of these components of the discharge."
> 55 Fed. Reg. at 48052. (emphasis supplied)

This language sets forth USEPA's understanding of the plain language of the Clean Water Act: "pollutants" must be controlled to the MEP from the MS4 "discharge," not merely pollutants in stormwater.

3.1.3 Finding 27

This finding purports to find that the regional MS4 permit proposed in the Administrative Draft does not constitute an unfunded state mandate. The Riverside County Permittees take issue with the subsections set forth in this finding. More importantly, the finding is without legal effect because exclusive jurisdiction as to whether a state mandate exists lies with the Commission on State Mandates. Government Code §§ 17751 and 17552; *Lucia Mar Unified School District v. Honig* (1988) 44 Cal.3d 830, 837; *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1546, 1596-97. The finding of an agency that has no jurisdiction to make that finding is entitled to no weight. This finding should be deleted.

3.1.4 Finding 29

The Riverside County Permittees believe that the receiving water limitation language set forth in the Administrative Draft renders compliance with the regional MS4 permit proposed in the Administrative Draft impossible, since exceedances of water quality standards may occur routinely through no fault of the MS4 Permittees. Please see discussion regarding Provision A, below. Moreover, this same language, as recently interpreted by the United States Court of Appeals for the Ninth Circuit in *Natural Resources Defense Council v. County of Los Angeles*, 673 F.3d 880 (9th Cir. 2011), *cert. granted*, ___ U.S. ___ (2012), renders any "iterative process" to comply with water quality standards or other requirements superfluous, since the Ninth Circuit ruled that the prohibitions against discharges that exceed water quality standards or create condition of nuisance must be read, and enforced, separately from the iterative process otherwise set forth in the MS4 permit. 673 F.3d at 892. The Riverside County Permittees view the exposure to third party litigation from the Receiving Waters Limitations language, highlighted by the *NRDC* case, to be one of the most significant detriments to the otherwise collaborative effort to design a regional MS4 permit that utilizes an iterative approach to achieve long term water quality improvement.

3.2 Provision A, Prohibitions and Limitations

As noted above, the requirements set forth in Provision A are of great concern to the Riverside County Permittees, especially in light of the recent *NRDC* decision by the Ninth Circuit. The Riverside County Permittees note that the State Water Board has proposed a workshop scheduled for November 20, 2012, in which the concerns of stakeholders regarding the current Receiving Water Limitations language (which is reflected in the Administrative Draft) and how it has been interpreted by the Ninth Circuit, will be addressed. Additionally, the Riverside County Permittees have reviewed comments submitted by South Orange County permittees on Provision A and believe that this approach may have merit.

The Riverside County Permittees generally support an approach to compliance that utilizes Water Quality Improvement Plans (WQIP). Additionally, the Riverside County Permittees have reviewed comments submitted by South Orange County permittees on Provision A and believe that this approach has merit in addressing the problems raised by the *NRDC* decision. However, the Permittees wish to note a concern that the basic benefit of the WQIP aproach, its prioritization of resources and effort to address the greatest threats to water quality, not be lost if the MS4 Permittees must develop 'additional BMP strategies' and 'schedules for implementation' for every exceedance of a water quality standard or other receiving water limitation that is not identified as a high priority for the watershed.

Recommendation

The Riverside County Permittees request that the Regional Board revise Provision A in a manner that ensures that a true iterative process be employed with respect to the Receiving Water Limitations language and further request that no Tentative Order version of Provision A be released until after the State Water Board has considered this issue.

In the absence of a revised precedential order from the State Water Board, the Riverside County Permittees further request that the Regional Board consider the alternative language being submitted by stakeholders on the Administrative Draft intended to address the loss of the iterative process originally set forth in State Board Order Nos. 99-05 and 2001-0015. *In particular*, to facilitate successful implementation of an Adaptive Management process, Provision A should not require that every exceedance to become a 'de-facto' high priority water quality concern outside of the WQIP prioritization process.

3.2.1 Provision A, Introduction (page 9)

The Riverside County Permittees have the following comments on this paragraph. First, the provision sets forth a goal that includes the enhancement and restoration of water quality and designated beneficial uses. Please see comments above regarding how Congress determined to implement the goals of the Clean Water Act through permits for MS4 dischargers. Second, the provision states that the MS4 permit will implement control measures that effectively prohibit non-storm water discharges "into and from the Copermittees' MS4." The Clean Water Act requires only the effective prohibition of non-stormwater discharges *into* the MS4. 33 U.S.C. § 1342(p)(3)(B)(ii). Third, the provision notes the pollutants "in storm water discharges" from the MS4 must be controlled to the MEP. As discussed above, the Clean Water Act does not differentiate between storm water and non-stormwater discharges from the MS4. Moreover, as noted above, these provisions do not acknowledge the fact that California water law requires that upstream runoff must be accepted, without exception as to the quality of the runoff. To manage the quality of MS4 discharges, the MS4 Permittees will necessarily rely on the proactive efforts to control discharges and sources not under their control.

3.2.2 Provision A.1.a (page 9)

The Riverside County Permittees have two comments. First, the provision prohibits "discharges into MS4s." Such discharges are not the responsibility of the MS4 operators but rather third party dischargers, and thus are beyond the scope of the MS4 permit. Second, the provision prohibiting discharges which are "threatening to cause" a condition of pollution, etc. is unenforceable, because it prohibits an action that, with respect to MS4 operators, is beyond their control. Also, there is no authority for such provisions in waste discharge requirements.

3.2.3 Provision A.1.b (page 9)

This provision in the Administrative Draft attempts to prohibit non-stormwater discharges "from" MS4s." As noted above, such discharges are subject to the MEP standard, not the "effective prohibition" standard. The "effective prohibition" standard in the Clean Water Act refers only to discharges of non-stormwater "into" MS4s. Also, the Clean Water Act requires that discharges of non-stormwater *into* the MS4 must be "effectively prohibited," so the word "effectively" should be added to this subsection.

3.2.4 Provision A.1.c (page 9)

This provision in the Administrative Draft requires the MS4 permittees to comply with the Basin Plan prohibitions listed in Attachment A. This list is over-inclusive, as it contains many requirements that are inapplicable to either any MS4 discharger, or to the Riverside County Permittees in particular. The Riverside County Permittees request that this provision be amended to read as follows: "Discharges from MS4s are subject to all applicable waste discharge prohibitions in the Basin Plan."

3.2.5 Provision A.2.a (pages 9-10)

The Riverside County Permittees have three comments on this provision of the Administrative Draft. First, as noted above, this provision and Provisions A.1. and A.3 should be subject to an iterative process described in A.4. The language employed in Provision A.2.a. as well as elsewhere in Provision A (in subsections A.1 and A.3.) has been interpreted to impose strict liability on MS4 Permittees for any exceedance of a water quality standard. *NRDC*, 673 F.3d at 892. Second, the provision uses the "including but not limited to" language discussed previously. Third, the Riverside County Permittees are concerned that the plans, policies, etc. set forth in Provision A.2.a.(1)-(4) may not all qualify as "water quality standards" or be applicable to the MS4 permittees. These subsections should be deleted, and replaced with a reference to "Water Quality Standards," which is a defined term in the Administrative Draft. Otherwise, the MS4 permit would become over inclusive with respect to what is considered a water quality standard. Such standards must be established in accordance with federal and state law. If this process has not been followed for a particular requirement, it is not a "water quality standard."

3.2.6 Provision A.2.c (page 10)

The Riverside County Permittees believe that this requirement should simply reflect that, for Receiving Water Limitations associated with a water body/pollutant combination addressed in a TMDL in

Attachment E, the MS4 Permittees must achieve compliance as outlined in Attachment E (Total Maximum Daily Load Provisions).

3.2.7 Provision A.3.a (page 11)

As discussed above, this provision erroneously states that pollutants "in storm water discharges" from MS4s must be reduced to the MEP. This MEP requirement applies to all discharges from MS4s as discussed above.

3.2.8 Provision A.3.b (page 11)

This provision should also provide that compliance with a TMDL constitutes compliance with those pollutants/water bodies subject to a TMDL.

3.2.9 Provision A.4.a (pages 11-12)

The Riverside County Permittees support an approach whereby compliance with Provisions A.1 through A.3 are achieved through a truly iterative approach, one which reflects the intent of the precedential State Water Board Order Nos. 99-05 and 2001-015. The Riverside County Permittees note again that the State Water Board is planning a workshop on November 20 to discuss Receiving Water Limitations language, and request that the Regional Board hold in abeyance *any* Tentative Order language on Provision A until that workshop has been held and any revisions to Receiving Water Limitations language are adopted by the State Water Board.

3.2.10 Provision A.4.b (page 12)

This provision proposed in the Administrative Draft, which requires the repeating of the procedure set forth in Provision A.4.a. unless directed not to do so by the Regional Board, does not reflect the language of State Water Board Order No. 99-05, which does not require such repetitions. This provision should reflect either the provisions reflected in precedential decisions of the State Water Board or potential new Receiving Water Limitations language to be adopted by the State Water Board in response to the *NRDC* decision.

3.2.11 Provision A.4.c (page 12)

This provision should be deleted. It affords the Regional Board untrammeled discretion to enforce the proposed MS4 permit, making any iterative process absolutely without meaning, and potentially further reinforcing the Ninth-Circuit Court of Appeals decision. While the Regional Board plainly retains its jurisdiction to enforce the MS4 permit, but the MS4 Permittees must be given the ability to address the requirements of Provision A through a true iterative process.

3.3 Provision B, Water Quality Improvement Plans

3.3.1 Provision B, introductory paragraph (page 13)

This paragraph states that the "goal" of the Water Quality Improvement Plan ("WQIP") "is to attain the reasonable protection, preservation, enhancement, and restoration of water quality and designated beneficial uses of water of the state." Such a goal is not a requirement for NPDES MS4 permittees, who are required under the Clean Water Act, again, to effectively prohibit non-stormwater discharges into the MS4 and to apply controls to the MEP to address discharges from the MS4. Please see the general comments above.

3.3.2 Provision B.2.d (page 17)

This provision requires that numeric targets and schedules must be used to measure progress towards "an ultimate outcome of protections, preservation, enhancement, and restoration of receiving water beneficial uses." As discussed above, meeting the broader goals of the Clean Water Act cannot be singlehandedly assigned to a single discharger group, in this case the MS4 permittees. The goals of an MS4 Permit are clearly established in the Clean Water Act; see comments above.

3.3.3 Provision B.3 (page 18)

The introductory paragraph again refers to the requirement to prevent or eliminate non-stormwater discharges "from the MS4" and reducing pollutants in "storm water discharges" to the MEP. As noted above, the Clean Water Act requires effective prohibition of discharges "into" the MS4, and does not distinguish between stormwater and non-stormwater in discharges from the MS4 subject to the MEP standard.

3.4 Retrofitting and Channel Rehabilitation

In Section II.E.5.b the Administrative Draft proposes to require the MS4 permittees to develop and implement a program to retrofit areas of existing development to reduce the discharge of pollutants in stormwater from the MS4 to the MEP and to restore impaired beneficial uses of streams within their jurisdictions. During the Focused Meeting on the Administrative Draft in Vista on August 22, Regional Board staff stated that all MS4 permittees would be expected to identify and implement retrofit and restoration projects.

The Riverside County Permittees have the following comments regarding these proposed requirements:

- These requirements not only go beyond the Clean Water Act requirements established in 33 U.S.C. § 1342(p)(3), they also could compromise public safety and flood control efforts, as described below.
- Flood control channels are generally not part of the MS4 but rather navigable waters of the United States. The Clean Water Act does not require "rehabilitation" of such navigable waters.
- As described in our comments on "Findings" above, the State Legislature has mandated that the Flood Control Districts, including the Riverside County Flood Control and Water Conservation District, implement measures necessary to protect lives and property from flooding. Achieving this protection may require the construction and maintenance of engineered channels. A requirement to "restore" or even rehabilitate such streams can conflict with these requirements, and must be removed. While there may be cases where rehabilitation can occur, it is up to the Flood Control Districts to determine when that is feasible consistent with their legislative mandate for protection of lives and property from flooding. It is inappropriate for the Regional Board to set policy within an MS4 permit that presumes and/or requires such restoration or rehabilitation to occur.
- The MS4 Permittees cannot be unilaterally held responsible for restoring receiving waters as has been discussed previously.
- Retrofitting and channel rehabilitation projects can only be considered warranted and responsible use of public funds where the WQIP has identified both that such projects are necessary and that funding is realistically available and, moreover, that the project will not interfere with an MS4 permittee's ability to meet other societal needs including the protection of public safety. Retrofit and channel rehabilitation projects should only be considered a 'tool in the toolbox' – not a mandated compliance requirement.

- "Rehabilitation" of flood control improvements should only be considered where such projects are determined to be consistent with Army Corps of Engineers mandates for navigable waters and flood protection applicable to such improvements. Such flood control channels are most likely navigable waters of the United States, and not MS4.

3.5 Monitoring

Provision D of the Administrative Draft proposes a 22-page detailed, prescriptive and expensive monitoring-centered approach that is extremely broad and excessive relative to the data needed to manage water quality in the Santa Margarita Region. The proposed monitoring provisions should be revised to provide for identification of monitoring programs that are specific to the needs of each hydrologic unit. Specifically, monitoring should have three purposes:

- Inform receiving water priorities in the WQIP (and future updates thereto)
- Help identify pollutant sources to those receiving water priorities
- Help assess the effectiveness of the BMP strategies

These purposes are part of the Monitoring Action Plan ('MAP' - part of the WQIP) – so the WQIP (not the permit itself) should define specifics of the 'where', 'when', 'how often', and 'for what' that needs to be monitored. The monitoring provisions in the proposed regional MS4 permit should be limited to broadly establishing the monitoring elements that need to be considered in developing the MAP, but leave the specifics to the WQIP.

3.6 Non-Stormwater

As previously stated, the Clean Water Act only requires the 'Copermitees' to 'effectively prohibit' Non-Stormwater discharges 'into' the MS4. It is not practical to presume, nor to require, that Non-Stormwater discharges need to be 'eliminated' everywhere. Proactive source IDs and elimination of pure non-stormwater, should ONLY be done if/when/where the WQIP dictates that is an appropriate strategy to address the watershed's highest priorities, or where there is an obvious pollutant (illegal) discharge. For example, if a non-stormwater discharge infiltrates and does not reach perennial surface waters, these discharges have little opportunity to affect the beneficial uses of the perennial surface waters. Redirecting resources to conduct source IDs and enforcement for such a discharge reduces the Copermittees' ability to implement efforts that are important to the watershed's priorities, and further diminishes the overall credibility of the MS4 permit programs. It would be better to allow the Copermittees to focus such efforts on discharges that are known or believed to be affecting those identified watershed priorities. In that case, during enforcement, the Copermittees can better explain to dischargers why a discharge needs to be eliminated.

4 CONCLUSION

The Riverside County Permittees are supportive of an MS4 Permitting approach that reduces compliance costs and provides for a more focused, flexible, and adaptive approach to addressing priority water quality concerns. Based on the markedly different climatic, hydrologic, and water quality conditions between the Santa Margarita Region and Southern Orange and San Diego Counties, a less prescriptive management approach that relies on a more robust and integrated adaptive management program is needed to cost-effectively address the priority water quality concerns in our watershed.

The Riverside County Permittees strongly support working with the Regional Board staff, the San Diego and South Orange County MS4 permittees and other interested parties in developing a more cost-effective integrated adaptive management approach to addressing high priority water quality concerns. The Riverside County Permittees request that the Regional Board staff continue to work with the MS4 Permittees in all three counties, prior to the release of a Tentative Order, to address the concerns of the three counties, including those discussed in this letter.

Very truly yours,

JASON E. UHLEY
Chief of Watershed Protection Division

Hi Laurie, attached to this email is our comment letter package.

I would hope that you and Wayne and Eric may have a few minutes to meet with us over the next month or so and discuss your thoughts on all the comments you received and where you/we are heading moving forward prior to the release of the next Permit draft.

I would be happy to discuss the issues at hand at any point. Regards,

Mark Grey, Ph.D.

Re: ADMINISTRATIVE DRAFT REGIONAL MUNICIPAL SEPARATE STORM SEWER SYSTEM (Tentative Order No. R9-2012-0011)

Dear: Ms. Walsh

On behalf of the Building Industry Association of Southern California, Inc. (BIA/SC) and the Construction Industry Coalition on Water Quality (CICWQ) and the members of both, we appreciate the opportunity to provide comments on the Administrative Draft of the San Diego County Regional MS4 Permit (Administrative Draft Permit). We submit these comments in addition to and in support of comments made by our affiliate in San Diego County, the Building Industry Association of San Diego and its coalition partners, and comments submitted by Rancho Mission Viejo.

BIA/SC is a nonprofit trade association representing nearly 1,000 member companies, which together have nearly 100,000 employees. BIA/SC's members have, for decades, built the majority of the homes in Ventura, Los Angeles, Orange, Riverside, and San Bernardino Counties in southern California. CICWQ is a water quality coalition comprised of representatives from five industry trade associations (in addition to BIA/SC) involved in the development of public and private building, infrastructure and roads throughout California (Associated General Contractors, Engineering Contractors Association, Southern California Contractors Association, Engineering and General Contractors Association, and United Contractors). All of the above trade associations and their members and the union labor work force are affected by the post-construction runoff control requirements proposed in the Draft Permit, and this letter and supporting attachments are intended to provide the San Diego Regional Board staff with constructive suggestions for improvement.

We appreciate the Regional Board's release of the Administrative Draft Permit in April 2012, and the extensive stakeholder involvement process that ensued over the summer of 2012. The comments provided here are intended to further meet the permit's underlying objective of protecting and improving water quality within the watersheds administered by the San Diego Regional Board. Our comments, supporting attachments, and suggested redline permit language modifications reflect years of working not only on MS4 permits issued by the San Diego Board, but other MS4 permits administered by the Los Angeles, Santa Ana, and San Francisco Bay Regional Water Quality Control Boards.

We have four primary concerns with the Administrative Draft Permit content and the following discussion summarizes those concerns and provides the technical basis for those concerns including supporting attachments:

1. **Administrative Draft Permit Provision E. 3.c.(2)(c) establishes a zero discharge standard for biofiltration-type LID BMPs that are designed with an outlet/underdrain. This type of LID BMP cannot meet the on-site design capture volume standard as it is written. Such a zero discharge standard is scientifically and technically unsound and unsupported.**

Biofiltration is an established LID BMP for use in attempting to mimic pre-development hydrology. The US EPA, in multiple guidance documents produced since 2006, have recognized the use of biofiltration-type systems such as curb contained biofilters, bioswales, rain gardens, and using landscape areas for impervious area disconnection as essential LID BMP elements to include in land development projects, a few of which are cited below. The inclusion of biofiltration BMPs in US EPA's menu is a reflection of the practical limitations to retention of stormwater – retention practices are not universally feasible or desirable. When appropriately selected and designed, biofiltration BMPs achieve high levels of pollutant removal, which may exceed pollutant removal achieved in retention BMPs, particularly in cases where retention BMPs are inappropriately applied.

The retention requirement is contrary to EPA's definition of LID because it disfavors development strategies designed to appropriately "filter" runoff, such as bioretention cells or other vegetated LID BMPs. There are five principal EPA documents regarding LID; and four of them identify the appropriate roles of biotreatment-type BMP, such as detention (i.e., slow down, treat through vegetation, and then release across property lines), filtration, and surface release of stormwater.

In a compilation of case studies by EPA, most of 17 exemplary projects included biotreatment elements, such as bioretention, swales, and wetlands. *See* U.S. EPA 841-F-07-006. Each of two case studies described in another EPA document (s*ee* Attachment 1 at pp. 1-2, EPA 841-B-00-005) included the use of underdrains, and the example in one of the two specifically fed into the MS4 system at issue. Another EPA document updated in January 2009 refers to the many practices used to adhere to LID principles of promoting a watershed's hydrologic and ecological functions, such as bioretention facilities and rain gardens. *See* Attachment 2 at p. 2, EPA-560-F-07-231 (describing "an under-drain system to release treated stormwater off site," permitting planted areas to "safely allow filtration and evapotranspiration of stormwater");

http://www.epa.gov/owow/nps/lid/ (fact sheet describing under-drains used to release treated stormwater off site and permitting planted areas to safely allow filtration of stormwater). Thus, EPA's literature and guidance clearly recognize the important and even necessary role that biofiltration/biotreatment approaches play in real-world implementation of LID principles.

The National Research Council, in their 2008 Report to Congress titled "Urban Stormwater Management in the United States" cite the use of biofiltration and bioretention systems in improving water quality and in attempting to mimic predevelopment hydrology at many different site contexts and locations across the United States. The 2008 NRC report contains and cites numerous examples of using biofiltration type systems to reduce runoff volume and pollutant loads. The 2008 NRC Report clearly recognizes the role that biofiltration systems play in the LID BMP feasibility and selection process, and in achieving runoff management goals. The report states "In some situations ARCD (Aquatic Resources Conservation Design) practices will not be feasible, at least not entirely, and the SCMs [stormwater control measures] conventionally used now and in the recent past (e.g., retention/detention basins, biofiltration without soil enhancement, and sand filters) should be integrated into the overall system to realize the highest management potential." Note that the NRC report definition of ARCD includes both retention and biofiltration elements.

From a management perspective, a review of 4th Term Phase I MS4 permits within California (San Francisco Bay Area, Sacramento Area, North and South Orange County, Western and Southern Riverside County, and San Bernardino County) shows that the use of biofiltration to meet water quality volume and flow control performance standards is clearly allowed (See matrices submitted by BIA/SC_CICWQ at the August 22, 2012 Stakeholder Meeting and provided to the Regional Board by Mark Grey on August 24, 2012). These Regional Boards in California recognize that biofilter-type LID BMPs are an integral component of applying site design principles which seek to mimic pre-development hydrology. Furthermore, these permits implement a clear LID BMP feasibility and selection process, one that first requires examination of on-site retention systems (infiltration, harvest and use, and evapotranspiration), before moving to the evaluation and potential selection of bioinfiltration (some infiltration achieved) and biofiltration systems. This feasibility evaluation hierarchy, which is clearly explained in the South Orange County and South Riverside County MS4 permits adopted by the San Diego Regional Board in 2009 and 2010, respectively, must be preserved and included in the next version of the Administrative Draft Permit.

In summary, the zero discharge standard established by the Administrative Draft Permit significantly narrows the definition of LID, which is contrary to US EPA guidance, the 2008 NRC Report, and the standards established in recently-adopted Permits by the San Diego Regional Board and other Regional Boards. In essence, the proposed provisions would establish a standard that (i) will be impracticable in a relatively large proportion of sites, and (ii) has not been demonstrated to be necessary to protect receiving water quality. We provide in Attachment 3 suggested permit language to address the continued use of biofiltration.

2. **A mitigation requirement is established when using flow-thru biofiltration-type LID BMPs to manage that portion of the SWQDv that is not retained on-site. This requirement is inconsistent with all other adopted Phase I MS4 permits in California and nationally. Biofiltration and bioretention BMPs are established LID practices; requiring accompanying mitigation of SWQDv that has already been biofiltered penalizes and dis-incentivizes use of these controls.**

Equally problematic, because it does not allow biofiltration type LID BMPs to meet the on-site storm water quality design volume (SWQDv) standard, is the current requirement in Administrative Draft Permit Provision E. 3.c.(2)(c) to “perform mitigation for the portion of the pollutant load that is not retained on-site.” In other words, the draft provisions would require that, if a project proponent cannot retain 100 percent of the SWQDv on-site, and must therefore use biofiltration LID BMPs (with a treated discharge), then the use and installation of these systems will trigger an off-site mitigation or in-lieu fee program participation requirement. This provision in the Administrative Draft Permit is technically unjustified, disfavors the use of all types of recognized biofiltration LID BMPs, and could theoretically require a project proponent to not only pay for the installation and O&M of a biofiltration LID BMP, but also require mitigation or fee payment for that portion of runoff managed by it.

Biofiltration BMPs including natural treatment systems such as those that are part of the Irvine Ranch Water District’s Natural Treatment System in Orange County (a regional example) can remove vast quantities of pollutant load, and provide other benefits such as habitat, flood control, and aesthetic, recreational and educational value. To relegate multi-benefit biofiltration or biotreatment BMPs applied at a site scale to a status inferior to on-site retention BMPs is not justified on a water quality basis, and is poor public policy, essentially depriving the region of an extremely important and effective approach to managing water quality.

While we agree that project proponents should be required to retain stormwater where technically and economically feasible, there are numerous conditions beyond a project’s control that make retention infeasible, undesirable and/or ineffective. For example, in achieving a zero discharge standard, it is necessary to either maintain pre-project ET (which is generally impracticable) or increase the volume of stormwater that is infiltrated (which is the common result). Over-infiltrating rainwater can have adverse consequences such as altering the natural flow regime of the receiving waters such that riparian habitat changes, mobilizing pre-existing contamination in shallow groundwater, increasing inflow and infiltration to sanitary sewers, causing damage from rising groundwater, and other potential effects. By discouraging the use of biofiltration LID BMPs where there are more appropriate than retention, the Administrative

Draft Permit irresponsibly encourages the use of retention where it may have adverse consequences.

Retention BMPs are not necessarily more effective than biofiltration BMPs as the Administrative Draft Permit implies, especially considering the back-to-back-to-back nature of storm systems that arrive in southern California during winter months and deliver the majority of total rainfall volume. The Administrative Draft Permit establishes a SWQDv that must be retained, but does not specify the time over which this volume must be drawn down (i.e., drained) in order to have capacity for the volume from subsequent storms. The rate at which the SWQDv can be drained is a function of the infiltration rates of soils and the demand for harvested water. Where soils are not sufficiently permeable and/or where harvested water demands are moderate to low, the drawdown time of retention BMPs can be in the range of several days to several weeks.

In comparison, biofiltration BMPs are designed with engineered soils that can generally drain the SWQDv much more quickly, on the order of several hours. In cases where retention opportunities are limited, this results in a higher level of capture and treatment by biofiltration BMPs than retention BMPs, which can more than offset the lower “treatment efficiency” afforded by biofiltration compared to full retention. For example, based on rigorous technical analysis contained in the Orange County Technical Guidance Document (Figure III.2, Page III-11), a hypothetical biofiltration BMP draining in 12 hours would achieve approximately 25 percent greater treatment of average annual stormwater runoff volume than an equivalently sized retention BMP that drains in 72 hours and approximately 60 percent greater treatment than a retention BMP that drains in 10 days.

Because drawdown time is an important factor in (i) assessing BMP effectiveness and (ii) evaluating the site-specific determination of whether retention or biofiltration are preferable, we strongly recommend (in addition to allowing the use of biofiltration or biotreatment systems to meet the retention standard) including a secondary performance metric of managing 80 percent of annual runoff volume using continuous simulation modeling. This provides a means of accounting for the performance of strictly on-site retention BMPs versus the addition of biofiltration or biotreatment BMPs which can be designed to manage a greater volume of average annual runoff volume than retention BMPs of the same size. The total amount of water captured and treated and associated pollutant load reduction should be a primary deciding factor in whether retention or biofiltration BMPs are selected for a given project. As written, the Administrative Draft Permit strongly discourages an entire group of effective practices which have the potential to provide better protection of water quality, when compared to retention, in a wide range of cases. Attachment 3 provides suggestions for permit language which corrects these deficiencies.

3. **Hydromodification control measures should allow use of the EP method to meet in stream standards; recognize multiple types of channel hardening when evaluating applications for hydromodification control exemptions**

In Attachment 3, we also make suggestions for improving the consistency of hydromodification control standards with those identified and allowed in the South Orange County MS4 permit. Specifically, we recommend providing for an in-stream hydromodification control performance standard using the erosion potential (EP) approach and recognizing that there are a number of different types of channel hardening that have been used for armoring in stream systems besides concrete.

The Administrative Draft Permit provides an "on-site" option for addressing hydromodification through flow duration control. This is an important element of the hydromodification control standard. However the Administrative Draft Permit is incomplete without an option to assess and demonstrate hydromodification control through in-stream metrics. In many cases, significant development within a watershed has already caused hydromodification impacts. Requiring project-by-project flow duration control for each new project may not address the existing issue as effectively as a regionally-coordinated approach that combines upland control with in-stream remedies. Including the EP standard enables the development of more comprehensive approaches that include both upland controls and stream modifications (i.e., restoration). This option is critical for more effectively and efficiently protecting the region's aquatic resources.

Additionally, the Administrative Draft Permit includes an unnecessarily narrow definition of hardened channels that includes only those channels lined with concrete. Other forms of artificial hardening may be comparably resistant to hydromodification impacts, such as channels that are lined with rip rap, armored with soil cement, or armored with other practices. While the Permittees or the project proponent should be responsible for demonstrating that a specific channel material is sufficiently stable, the narrow definition currently provided by the Administrative Draft Permit does not allow the use of sound engineering judgment and does not allow for use of innovative materials.

Finally, the Administrative Draft Permit should explicitly recognize the findings of hydromodification management plans (HMPs) that have been previously approved by this Board. The South Orange County HMP and the San Diego County HMPs were both the products of rigorous technical analysis based on the state of the practice, which were reviewed in detail by Board Staff. The findings of these efforts must not be jeopardized under the new terms of the Administrative Draft Permit. Specifically, findings regarding exempt water bodies must be appreciated and upheld, and they should be explicitly recognized in the Administrative Draft Permit per our suggested redline.

4. The Permit must preserve important provisions for watershed level design and implementation of LID BMPs.

The proposed development project criteria and requirements in the Administrative Draft Permit do not include the language in the current South Orange County Permit that provides for Alternative Compliance for Watershed-Based Planning (See page 40-41 of the 2009 Permit). We ask that the Regional Board continue to recognize the protections to water quality and enhancements to water bodies which are achieved through watershed-based projects such as the Rancho Mission Viejo Ranch Plan, as it has in the current South County MS4 permit, and define Watershed Planning as an alternative and co-equal approach to the project-specific requirements. Attachment 3 to this submittal contains suggested redline language for addition to the Administrative Draft Permit.

Concluding Remarks:

BIA/SC and CICWQ have been active participants and contributors to the creation of improved MS4 permits across southern California. We continue to believe that rational, *implementable*, and *effective* permit requirements are critical to achieving great progress concerning water quality and our environment. We hope that these comments are received in the manner in which they are intended – to continue the discussion of how we can create a workable permit that improves water quality to the maximum extent practicable. We remain committed to a positive dialog with the Board and its staff – one that will result in an informed, balanced and effective permit.

If you have any questions or want to discuss the content of our comment letter, please feel free to contact me at (951) 781-7310, ext. 213, (909) 525-0623, cell phone, or mgrey@biasc.org.

Sincerely,

Mark Grey

Bioretention Applications

Inglewood Demonstration Project, Largo, Maryland
Florida Aquarium, Tampa, Florida

Key Concepts:

- Retrofits
- Structural Controls
- Source Controls

LOW-IMPACT DEVELOPMENT CENTER

Introduction

Two case studies demonstrate the potential to use integrated management plans (IMPs) in the design of new parking facilities and as retrofits for existing parking facilities. The Inglewood study in Largo, Maryland, compared the pollutant removal efficiency of a bioretention cell in a laboratory setting to that of a comparable facility constructed in a parking lot. The Florida Aquarium study in Tampa, Florida, included monitoring of several storm events for volume and water quality control.

Inglewood Project Area

The project area is an existing 5-acre outdoor parking area located in a highly urbanized office park adjacent to Interstate 95. Runoff from adjacent areas does not flow across the lot. The slope of the parking area is approximately 3 percent. Parking stalls are aligned at 90-degree angles, and there are approximately 30 cars in each row of an aisle. At the end of each aisle are planting areas surrounded by curbs and gutters. Curb drainage inlets have been placed in some of the islands to intercept and collect runoff as sheet flow, which is piped to a downstream regional stormwater management facility.

Inglewood Project Description

The Inglewood project consisted of a laboratory segment and a field segment. The laboratory segment involved construction of a planter box filled with a typical bioretention facility soil mixture (50 percent construction sand, 20 to 30 percent topsoil, and 20 to 30 percent compost). This facility is approximately half the size in volume of the Inglewood facility. The box was planted with representative plants and mulched. A synthetic stormwater mixture was applied and the pollutant removal efficiency, temperature, and runoff volume rate were measured. The pollutant mix included metals (copper, lead, and zinc), phosphorus, organic nitrogen, and nitrate.

Project Benefits:

- Retrofit Opportunity
- Pollutant Removal
- Volume Reduction
- Cost-Effectiveness

A landscaped island measuring approximately 38 feet by 12 feet was chosen as the retrofit area. The island contains a curb inlet that drains into the municipal storm drain system. Almost the entire drainage area is impervious. A 4-foot slot was cut into the curb immediately before the inlet. The landscaped island was then excavated to a depth of 4 feet. An underdrain was installed and tied into the bottom of the existing inlet to completely drain the planting soil to avoid oversaturation. The underdrain was covered with 8 inches of 1- to 2-inch gravel and backfilled with typical bioretention soil mix. The backfill extended to a depth of about 12 inches below the top of the curb, which allows for a ponding depth of approximately 6 inches of water in the island

Figure 1. Bioretention landscaping at the Inglewood demonstration project site.

Table 1. Summary of bioretention pollutant removal results for the Inglewood demonstration project.

Pollutant	Input mean ± standard deviation	Output mean ± standard deviation	Output range	Output percent removal mean ± standard deviation
Cu dissolved (µg/L)	120 ± 27	63 ± 6.5	55–75	48 ± 12
Cu total (µg/L)	120 ± 27	69 ± 9.4	55–85	43 ± 11
Pb dissolved (µg/L)	54 ± 9.4	11 ± 6	6.7–25	79 ± 26
Pb total (µg/L)	54 ± 9.4	16 ± 7	6.7–26	70 ± 23
Zn dissolved (mg/L)	1.1 ± 0.021	0.24 ± 0.44	0.11–0.56	78 ± 29
Zn total (mg/L)	1.1 ± 0.021	0.39 ± 0.44	0.12–1.4	64 ± 42
Ca (mg/L)	44 ± 6.4	32 ± 6.1	24–41	27 ± 14
Cl^- (mg/L)	5.1 ± 0.48	162 ± 80	74–228	3,000[a]
Na (mg/L)	3.1	359 ± 170	68–497	11,000[a]
P (mg/L)	0.83	0.11 ± 0.017	0.10–0.13	87 ± 2
TKN (mg/L as N)	6.9 ± 0.81	2.3 ± 0.64	1.7–3.0	67 ± 9

[a]Shows percent production.

before a backwater is created at the curb opening. Subsequently the area was planted and covered with 3 inches of shredded hardwood mulch. Figure 1 shows the bioretention area after vegetation was established.

The stormwater mixture was applied to a 50-square-foot area in the field facility at a rate of 1.6 inches per hour for 6 hours. The removal rates for several pollutants are shown in Table 1. In addition to pollutant removal, the runoff temperature was lowered approximately 12 °C as the runoff was processed and filtered through the soil mixture. Most of the pollutant removal process occurred in the mulch layer.

A similar field investigation was conducted on an 8-year-old facility, and the metals removal rate was much higher (Davis et al., 1998). This effect might be attributed to slower flow rates through the soil, which has higher clay content, as well as greater pollutant uptake by vegetation.

Inglewood Project Summary and Benefits

This study showed the feasibility of retrofitting an existing parking facility and demonstrated the consistency of laboratory and field pollutant removal performance. The retrofit cost approximately $4,500 to construct and treats approximately one-half acre of impervious surface. The bioretention retrofit was a more cost-effective way to filter pollutants than many proprietary devices designed to treat the same volume of runoff. These proprietary devices could cost $15,000 to $20,000, would be more expensive to maintain, and would not significantly decrease runoff volume or temperature. Also, bioretention areas offer the ancillary benefit of aesthetic enhancement. It is interesting to note that a drought occurred after the installation of the plants, and although many of the other plants in the parking lot died or experienced severe drought stress, the plants in the bioretention facility survived because of the retained water supply.

Florida Aquarium Project Area

The Florida Aquarium site is an 11.5-acre, asphalt and concrete parking area that serves approximately 700,000 visitors per year. Runoff was controlled using the following IMPs:

- End-of-island bioretention cells
- Bioretention swales located around the parking perimeter
- Permeable paving
- Bioretention strips between parking stalls
- A small pond to supplement storage and pollutant removal

Figure 2 is an illustration of the site that details the type and location of runoff controls.

Florida Aquarium Project Description

A total of 30 storm events were monitored for one year at the Florida Aquarium site during 1998-1999. The Southwest Florida Water Management

District measured rainfall and flow from eight of the subcatchments in the parking area and collected water quality samples on a flow-weighted basis. Comparisons between pavement areas controlled by IMPs and uncontrolled asphalt areas were made for peak runoff rate, runoff volume, runoff coefficients, and water quality. Sediment cores from swales also were collected and analyzed.

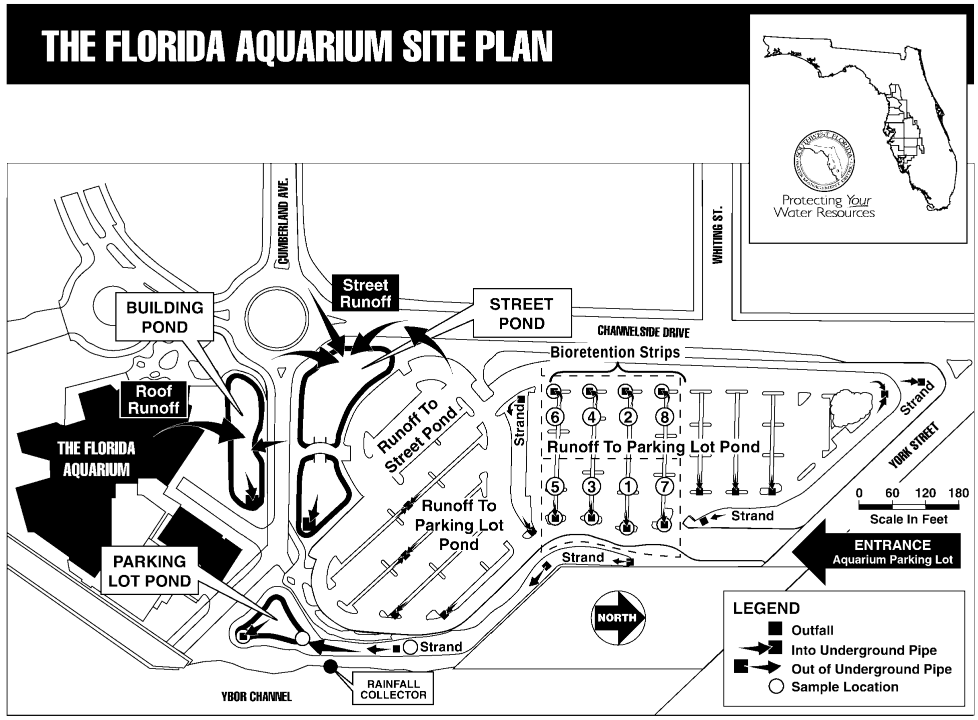

Figure 2. Layout of the Florida Aquarium site with IMPs. The eight basins outlined with dotted lines were evaluated in this part of the study.

Florida Aquarium Project Summary and Benefits

The parking areas controlled by IMPs showed a significant reduction in runoff volume and peak runoff rate. Table 2 shows pollutant load reductions for three pavement types; reduction is compared to pollutant loads in runoff from a basin without a swale. Much of the pollutant reduction is attributed to the reduced runoff in basins with swales. Because the swales are only the first element in the treatment train, even better removal efficiencies should be seen when data are analyzed for the entire system.

Table 2. Load efficiency of pollutants expressed as percent reduction for three types of pavement at the Florida Aquarium site.

Constituents	Percent pollutant reduction[a]		
	Asphalt w/swale	Cement w/swale	Porous w/swale
Ammonia	45	73	85
Nitrate	44	41	66
Total Nitrogen	9	16	42
Orthophosphorus	-180	-180	-74
Total Phosphorus	-94	-62	3
Suspended Solids	46	78	91
Copper	23	72	81
Iron	52	84	92
Lead	59	78	85
Manganese	40	68	92
Zinc	46	62	75

[a]The basins with swales were compared to a basin without a swale to determine the amount of reduction in pollutant loads possible using these small alterations. Notice that the efficiencies for phosphorus are negative, indicating an increase in phosphorus load in the basins with a swale.

Design Principles

for Stormwater Management on Compacted, Contaminated Soils in Dense Urban Areas

EPA's Brownfields Program is designed to empower states, communities, and other stakeholders in economic redevelopment to work together in a timely manner to prevent, assess, safely clean up, and sustainably reuse brownfields. A brownfield is a property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. EPA's Brownfields Program provides financial and technical assistance for brownfield revitalization, including grants for environmental assessment, cleanup, and job training.

What is Green Infrastructure?

Most development and redevelopment practices cover large areas of the ground with impervious surfaces such as roads, driveways, sidewalks, and new buildings themselves, which then prevent rainwater from soaking into the ground. These hard surfaces increase the speed and amount of stormwater that runs into nearby waterways, carrying pollutants and sediment each time it rains.

Green infrastructure seeks to reduce or divert stormwater from the sewer system and direct it to areas where it can be infiltrated, reused or evapotranspirated. Soil and vegetation are used instead of, or in conjunction with, traditional drains, gutters, pipes and centralized treatment areas. In many new and redevelopment projects, green infrastructure is implemented to manage and mitigate the polluted runoff created by precipitation that falls on rooftops, streets, sidewalks, parking lots and other impervious surfaces.

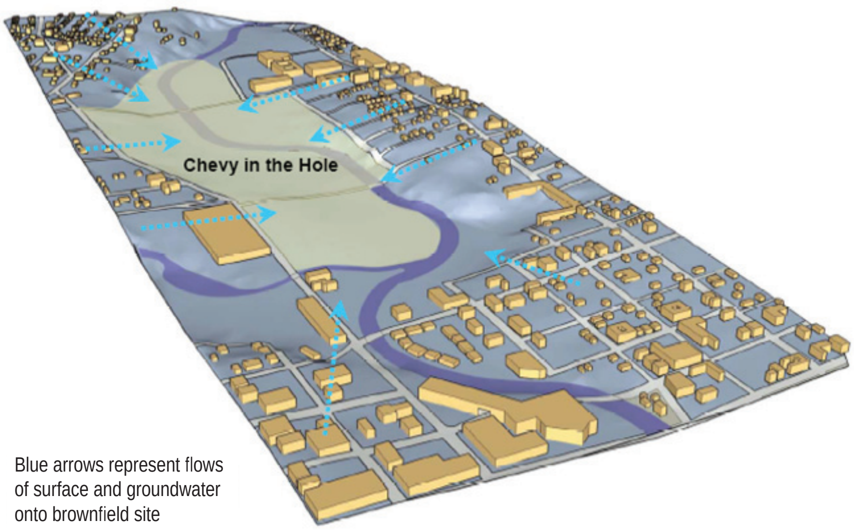
How can Green Infrastructure be Applied to Brownfield Sites?

Preparing brownfields for redevelopment often requires capping of contaminated soils, creating even larger impervious surfaces. The challenge for managing stormwater on brownfield sites is allowing this capping while mitigating the impervious surface conditions that can negatively impact local waterways.

Unlike many conventional developments, impervious footprints on brownfields cannot always be minimized through site designs that incorporate more porous surfaces to allow for infiltration. Direct infiltration on a brownfield site may introduce additional pollutant loads to groundwater and nearby surface waters. However, green infrastructure practices exist that can retain, treat and then release stormwater without it ever coming in contact with contaminated soils.

A bioswale in Wilmington, Delaware, designed to absorb and retain stormwater runoff.

The University of Michigan's School of Natural Resources and Environment developed design guidelines that use low impact development techniques on contaminated sites. Using a former industrial site in Flint, Michigan, called Chevy in the Hole, graduate students considered and refined methods to prevent residual contamination from moving with stormwater.



Blue arrows represent flows of surface and groundwater onto brownfield site

Design Considerations

A key component of using green infrastructure for brownfield sites is treatment and storage of stormwater, rather than complete infiltration. Most brownfields that have residual contamination need caps, so vegetated areas need to be located above caps and fitted with underdrain systems to remove overflow stormwater.

Development and redevelopment projects should start with keeping existing trees onsite, minimizing compaction of earth that inhibits water infiltration, and planting trees and other vegetation in areas where none exists. Retaining existing tree cover and vegetated areas helps infiltrate and evapotranspirate stormwater runoff while intercepting large amounts of rainfall that would otherwise enter waterways as runoff.

Buildings and other impervious surfaces can be strategically located to act as caps over areas with known contamination. Areas with fill caps can include soils and vegetation above the cap in the form of swales or rain gardens. If fitted with an under-drain system to release treated stormwater off site, these planted areas can safely allow filtration and evapotranspiration of stormwater. Additional features like impermeable liners or gravel filter blankets can be coupled with modified low impact development (LID) practices that safely filter stormwater without exposing the water to contaminated soils.

Green roofs are an ideal way to reduce the runoff from building roofs by encouraging evapotranspiration of rainwater. Another option for brownfield sites is the capture and reuse of stormwater for non-potable uses; this can include runoff storage in rain barrels for irrigation of green roofs or landscaped areas, or in cisterns that store rainwater for toilet flushing and other uses.

Site location within the watershed is very important. In particular, projects in groundwater recharge areas should avoid low impact development practices that promote infiltration, and use techniques that directly discharge treated stormwater instead. Furthermore, new and redeveloped sites near brownfields should use green infrastructure practices to prevent additional runoff from flowing onto potentially contaminated areas.

Overall, when developing a stormwater management plan on a brownfield, surrounding sites must be considered. *(Source: Flint Futures: Alternative Futures for Brownfield Redevelopment in Flint, Michigan.)*

The Matthew Henson Conservation Center in Washington, DC, utilizes a green roof.

General Principles for Using Green Infrastructure on Brownfield Sites

Guideline #1: Differentiate between groups of contaminants as a way to better minimize risks.

Guideline #2: Keep non-contaminated stormwater separate from contaminated soils and water to prevent leaching and spreading of contaminants.

Guideline #3: Prevent soil erosion using vegetation, such as existing trees, and structural practices like swales or sediment basins.

Guideline #4: Include measures that minimize runoff on all new development within and adjacent to a brownfield. These measures include green roofs, green walls, large trees, and rainwater cisterns.

Definitions

Bioswales are open channels with a dense cover of vegetation where runoff is directed or retained to evapotranspirate and filter.

Evapotranspiration is the return of water to the atmosphere either through evaporation or by plants.

Green Infrastructure and ***Low Impact Development (LID)*** both refer to systems and practices that use or mimic natural processes to infiltrate, evapotranspirate or reuse stormwater or runoff on the site where it is generated.

Green roofs can be used to effectively reduce or eliminate runoff from small and medium sized storms. A soil mixture is placed over a waterproof membrane and drainage system and then planted with water absorbent and drought tolerant plants. Most systems also have root barriers. These roofs soak up stormwater and release it back into the atmosphere through evaporation and plant respiration, while draining excess runoff.

Rain gardens serve the same purpose as stormwater planters and are appropriate where there is more area to plant vegetation. Sizing is dependent on the area of impervious surfaces draining to the rain garden, but they can be designed to only treat a portion of the runoff so they can be placed in most situations.

Stormwater harvest and reuse. Rainwater harvested in cisterns, rain barrels, or other devices may be used to reduce potable water used for landscape irrigation, fire suppression, toilet and urinal flushing, and custodial uses. Storage and reuse techniques range from small-scale systems (e.g., rain barrels) to underground cisterns that may hold large volumes of water.

Stormwater planters. Downspouts can be directed into stormwater planters. These planters are used to temporarily detain, filter and evapotranspirate stormwater using plant uptake.

EPA's *Protecting Water Resources with Higher-Density Development* report helps communities better understand the impacts of higher and lower density development on water resources. The findings indicate that low-density development may not always be the preferred strategy for protecting water resources. Available at: www.epa.gov/dced/water_density.htm.

Portland Metro's (Oregon) *Green Streets: Innovative Solutions for Stormwater and Stream Crossings* is a handbook that describes stormwater management strategies and includes detailed illustrations of "green" street designs that allow infiltration and limit stormwater runoff. Available at www.metro-region.org/article.cfm?articleID=262

EPA's *Protecting Water Resources with Smart Growth* is a report intended for audiences already familiar with smart growth concepts who seek specific ideas on how techniques for smarter growth can be used to protect water resources. The report describes 75 policies that communities can use to grow in the way that they want while protecting their water quality. Available at: www.epa.gov/dced/water_resource.htm

EPA's *Using Smart Growth Techniques as Stormwater Best Management Practices* reviews nine common smart growth techniques and examines how they can be used to prevent or manage stormwater runoff. Available at: www.epa.gov/dced/stormwater.htm

EPA's *Brownfields Program Website* (www.epa.gov/brownfields) provides information on and resources for assessing, cleaning up and redeveloping brownfields, including grant funding opportunities.

3. Development Planning

Each Copermittee must use their land use/planning authorities to implement a development planning program that includes, at a minimum, the following requirements.

a. Permanent BMP Requirements for All Development Projects

Each Copermittee must prescribe the following BMP requirements during the planning process (i.e. prior to project approval and issuance of grading or building permits) for all pollutant-generating[14] development projects (regardless of project type or size), where local permits are issued~~, including unpaved roads and flood management projects:~~

(1) General Requirements

(a) All BMPs must be located so as to remove pollutants from runoff prior to its discharge to any receiving waters~~, and as close to the source as possible~~;

(b) Multiple development projects may use shared permanent BMPs as long as construction of any shared BMP is completed prior to the use or occupation of any development project from which the BMP will receive runoff; and

(c) Permanent BMPs must not be constructed within a waters of the U.S. or waters of the state except those that have obtained a CWA Section 401 Water Quality Certification or Waste Discharge Requirement as applicable.

(2) Source Control BMP Requirements

The following source control BMPs must be implemented at all development projects where applicable and feasible:

(a) Prevention of illicit discharges into the MS4;

(b) Storm drain system stenciling or signage;

(c) Properly designed outdoor material storage areas;

(d) Properly designed outdoor work areas;

(e) Properly designed trash storage areas; ~~and~~

~~(f) Any additional BMPs necessary to minimize pollutant generation at each project.~~

[14] Pollutant generating development projects are those projects that generate pollutants at levels greater than natural background levels.

(3) Low Impact Development (LID) BMP Requirements

The following LID BMPs must be implemented at all pollutant generating development projects where applicable and feasible:

(a) Maintenance or restoration of natural storage reservoirs and drainage corridors (including topographic depressions, areas of permeable soils, natural swales, and ephemeral and intermittent streams);~~[14]~~[15]

(b) Buffer zones for natural water bodies (where buffer zones are technically infeasible, require project applicant to include other buffers such as trees, access restrictions, etc.);

(c) Conservation of natural areas within the project footprint including existing trees, other vegetation, and soils;

(d) Construction of streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided public safety is not compromised;

(e) Minimization of the impervious footprint of the project;

(f) Minimization of soil compaction to landscaped areas;

(g) Disconnection of impervious surfaces through distributed pervious areas;

(h) Landscaped or other pervious areas designed and constructed to effectively receive and infiltrate, retain and/or treat runoff from impervious areas, prior to discharge to the MS4;

(i) Small collection strategies located at, or as close as possible to, the source (i.e. the point where storm water initially meets the ground) to minimize the transport of runoff and pollutants to receiving waters;

(j) Use of permeable materials for projects with low traffic areas and appropriate soil conditions;

(k) Landscaping with native or drought tolerant species; and

(l) Harvesting and using precipitation.

~~14~~ 15 Development projects proposing to dredge or fill materials in waters of the U.S. must obtain a CWA Section 401 Water Quality Certification. Projects proposing to dredge or fill waters of the State must obtain Waste Discharge Requirements.

(4) Long-Term Permanent BMP Maintenance

Each Copermittee must require the project applicant to submit proof of the mechanism under which ongoing long-term maintenance of all permanent BMPs will be conducted.

(5) Infiltration and Groundwater Protection

(a) Infiltration and treatment control BMPs ~~designed to primarily function as large, centralized infiltration devices (such as large infiltration trenches and infiltration basins)~~ must not cause or contribute to an exceedance of an applicable groundwater quality objective. At a minimum, such infiltration and treatment control BMPs must be in conformance with the design criteria listed below, unless the development project applicant demonstrates to the Copermittee that one or more of the specific design criteria listed below are not necessary to protect groundwater quality. The ~~The design criteria listed below do not apply to small infiltration systems dispersed throughout a development project.~~ Permittees may establish different design criteria than those listed below for different BMP types based on the inherent degree of risk to groundwater quality (for example, dry wells versus bioretention).

(i) Runoff must undergo pretreatment such as sedimentation or filtration prior to infiltration;

(ii) Pollution prevention and source control BMPs must be implemented at a level appropriate to protect groundwater quality at sites where infiltration treatment control BMPs are to be used;

(iii) Infiltration treatment control BMPs must be adequately maintained to remove pollutants in storm water to the MEP;

(iv) The vertical distance from the base of any infiltration treatment control BMP to the seasonal high groundwater mark must be at least 10 feet. Where groundwater basins do not support beneficial uses, this vertical distance criteria may be reduced, provided groundwater quality is maintained;

(v) The soil through which infiltration is to occur must have physical and chemical characteristics (e.g., appropriate cation exchange capacity, organic content, clay content, and infiltration rate) which are adequate for proper infiltration durations and treatment of runoff for the protection of groundwater beneficial uses, unless first treated or filtered to remove pollutants prior to infiltration;

(vi) Infiltration treatment control BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee, unless first treated or filtered to remove pollutants prior to infiltration; and

(vii) Infiltration treatment control BMPs must be located a minimum of 100 feet horizontally from any water supply wells.

(b) The Copermittees may collectively or individually develop alternative mandatory design criteria to that listed above for infiltration and treatment control BMPs which are designed to primarily function as centralized infiltration devices. Before implementing the alternative design criteria in the development planning process the Copermitee(s) must:

(i) Notify the San Diego Water Board of the intent to implement the alternative design criteria submitted; and

(ii) Comply with any conditions set by the San Diego Water Board.

b. PRIORITY DEVELOPMENT PROJECTS

(1) Definition of Priority Development Project

Priority Development Projects include the following:

(a) All new development projects that fall under the Priority Development Project categories listed under Provision E.3.b.(2). Where a new development project feature, such as a parking lot, falls into a Priority Development Project category, the entire project footprint is subject to Priority Development Project requirements; and

(b) Those redevelopment projects that create, add, or replace at least 5,000 square feet of impervious surfaces on an already developed site, or the redevelopment project is a Priority Development Project category listed under Provision E.3.b.(2). Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to Priority Development Project requirements, the performance and sizing requirements discussed in Provisions E.3.c.(2) and E.3.c.(3) apply only to the addition or replacement, and not to the entire development. Where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development, the performance and sizing requirements apply to the entire development.

(2) Priority Development Project Categories

(a) New development projects that create 10,000 square feet or more of impervious surfaces (collectively over the entire project site). This category includes commercial, industrial, residential, mixed-use, and public development projects on public or private land which fall under the planning and building authority of the Copermittee.

(b) Automotive repair shops. This category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

(c) Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812), where the land area for development is 5,000 square feet or more.

(d) Hillside development projects. This category includes any development which creates 5,000 square feet or more of impervious surface which is located in an area with known erosive soil conditions, where the development will grade on any natural slope that is twenty-five percent or greater.

(e) Environmentally sensitive areas (ESAs). This category includes any development located within, directly adjacent to, or discharging directly to an ESA, which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. “Directly adjacent to” means situated within 200 feet of the ESA. “Discharging directly to” means outflow from a drainage conveyance system that collects runoff from the subject development or redevelopment site and terminates at or in receiving waters within the ESA.

(f) Parking lots. This category is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce that has 5,000 square feet or more of impervious surface.

(g) Streets, roads, highways, freeways, and residential driveways. This category is defined as any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles.

(h) Retail gasoline outlets (RGOs). This category includes RGOs that meet the following criteria: (a) 5,000 square feet or more or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day.

(i) Large development projects. This category includes any post-construction pollutant-generating new development projects that result in the disturbance of one acre or more of land.

(3) Priority Development Project Exemptions

Each Copermittee has the discretion to exempt the following projects from being defined as Priority Development Projects:

(a) Sidewalks constructed as part of new streets or roads and designed to direct storm water runoff to adjacent vegetated areas;

(b) Bicycle lanes that are constructed as part of new streets or roads but are not hydraulically connected to the new streets or roads and designed to direct storm water runoff to adjacent vegetated areas;

(c) Impervious trails constructed and designed to direct storm water runoff to adjacent vegetated areas, or other non-erodible permeable areas;

(d) Sidewalks, bicycle lanes, or trails constructed with permeable surfaces.

c. PRIORITY DEVELOPMENT PROJECT PERMANENT BMP PERFORMANCE AND SIZING REQUIREMENTS

In addition to the BMP requirements listed for all pollutant generating development projects under Provision E.3.a, Priority Development Projects must also implement permanent BMPs that conform to performance and sizing requirements.

(1) Source Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement applicable source control BMPs listed under Provision E.3.a.(2).

(2) Retention and Treatment Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement BMPs to retain and treat pollutants onsite in the following order:

(a) Each Priority Development Project must be required to implement LID BMPs as described in Provision E.3.a.(3);

(b) Each Priority Development Project must be required to implement LID BMPs that are sized and designed to retain the volume equivalent to runoff produced from a 24-hour 85th percentile storm ~~event[15]~~ event[16] (“design capture volume”).~~;~~

(c) If onsite retention using LID BMPs is technically infeasible per Provision E.3.c.(4), flow-thru LID ~~and/or conventional~~ treatment control BMPs, such as bioretention with an underdrain, must be implemented to treat the portion of the design capture volume that is not retained onsite. Flow-thru LID treatment control BMPs that are sized for the portion of the design capture volume that is not retained onsite may be used if full onsite retention is technically infeasible. Flow-thru LID treatment control BMPs must be designed for an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP. ~~Additionally, project applicants must perform mitigation for the portion of the pollutant load in the design capture volume that is not retained onsite, as described in Provision E.3.c.(4)(c).~~

(d) If it is shown to be technically infeasible per Provision E.3.c.(4) to retain and/or treat with flow-thru LID treatment control BMPs sized for the portion of the design capture volume that is not retained onsite, then the project must implement conventional treatment control BMPs in accordance with Provision E.3.c.(2)(d) below and must participate in the alternative compliance program in Provision E.3.c.(4)(c).

(~~d~~e) All onsite treatment control BMPs must:

(i) Be correctly sized and designed so as to remove pollutants from storm water to the MEP;

(ii) Be sized to comply with the following numeric sizing criteria:

[a] Volume-based treatment control BMPs must be designed to treat the remaining portion of the design capture volume that was not retained and/or treated with flow-thru LID treatment control BMPs sized for the portion of the design capture volume that is not retained onsite~~retained or onsite~~; or

[b] Flow-based treatment control BMPs must be designed to ~~mitigate (filter or~~ treat~~)~~ either: 1) the maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour, for each hour of a storm event; or 2) the maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity (for each hour of a storm event), as determined from the local historical rainfall record, multiplied by a factor of two, or 3) an alternative design rate that is demonstrated to result in the treatment of a volume of stormwater equivalent to that achieved under c.(2)(e)(ii)[a].

(iii) Be ranked with high or medium pollutant removal efficiency for the project's most significant pollutants of concern. Treatment control BMPs with a low removal efficiency ranking must only be approved by a Copermittee when a feasibility analysis has been conducted which exhibits that implementation of treatment control BMPs with high or medium removal efficiency rankings are infeasible for a Priority Development Project or portion of a Priority Development Project.

[15] This volume is not a single volume to be applied to all areas covered by this Order. The size of the 85th percentile storm event is different for various parts of the San Diego Region. The Copermittees are encouraged to calculate the 85th percentile storm event for each of its jurisdictions using local rain data pertinent to its particular jurisdiction. In addition, isopluvial maps may be used to extrapolate rainfall data to areas where insufficient data exists in order to determine the volume of the local 85th percentile storm event in such areas. Where the Copermittees will use isopluvial maps to determine the 85th percentile storm event in areas lacking rain data, the Copermittees must describe their method for using isopluvial maps in its BMP Design Manuals.

(3) Hydromodification Management BMP Requirements

Each Copermittee must require each Priority Development Project to implement hydromodification management BMPs so that:

(a) ~~(a)~~ Post-project runoff flow rates and durations do not exceed pre-development (naturally occurring) runoff flow rates and durations by more than 10 percent (for the range of flows that result in increased potential for erosion or degraded channel conditions downstream of Priority Development Projects).

OR

The erosion potential ratio is maintained to within 10 percent of the target value from the project discharge point to a downstream receiving water that is exempt from the hydromodification management BMP requirements per Provision E.3.c.(3)(d). Erosion potential is the ratio of total long-term sediment transport capacity or channel work in the proposed condition versus the pre-development (naturally occurring) condition.

(i) In evaluating the range of flows that results in increased potential for erosion of natural (non-hardened) channels, the lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or that erodes the toe of channel banks.

~~(ii) For artificially hardened channels, analysis to identify the lower boundary must use characteristics of a natural stream segment similar to that found in the watershed. The lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or erodes the toe of the channel banks.~~

(ii~~i~~) The Copermittees may use monitoring results pursuant to Provision D.2.b.(6) to re-define the range of flows resulting in increased potential for erosion or degraded channel conditions, as warranted by the data.

(b) ~~(b)~~ Post-project conditions ~~runoff flow rates and durations~~ must ~~compensate~~ manage for the loss of bed sediment supply due to the development project, ~~should~~ if significant loss of sediment supply occurs as a result of the development project.

~~(a)~~(c) If hydromodification management BMPs are technically infeasible per Provision E.3.c.(4), project applicants must perform mitigation for the portion of the runoff volume that is not controlled and will cause or contribute to increased potential for erosion of receiving waters downstream of the Priority Development Project, as described in Provision E.3.c.(4)(c).

~~(b)~~(d) Exemptions

Each Copermittee has the discretion to exempt a Priority Development Project from the hydromodification management BMP requirements where the project:

(i) Discharges storm water runoff into underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, ~~or~~ the Pacific Ocean, or exempt river reaches identified in Hydromodification Management Plans (HMPs) approved by the San Diego Water Board;

(ii) Discharges storm water runoff into conveyance channels whose bed and bank are ~~concrete lined~~artificially hardened all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, ~~or~~ the Pacific Ocean; ~~or~~or exempt river reaches identified in HMPs approved by the San Diego Water Board; or

(iii) Discharges storm water runoff into other areas identified by the San Diego Water Board as exempt from the requirements of Provisions E.3.c.(3)(a)-(c)~~.~~, ~~S~~such areas include those identified in HMPs approved by the San Diego Water Board.

(4) Alternative Compliance for Technical Infeasibility

At the discretion of each Copermittee, alternative compliance may be allowed for certain Priority Development Projects to comply with Provisions E.3.c.(2) and E.3.c.(3), subject to the following requirements:

(a) Applicability

Priority Development Projects may be allowed alternative compliance if:

(i) The Copermittee reviews and approves site-specific hydrologic and/or design analysis performed by a registered professional engineer, geologist, architect, or landscape architect;

(ii) The project applicant demonstrates, and the Copermittee determines and documents, that retention LID, flow-through LID treatment control BMPs, and/or hydromodification management BMPs per Provisions E.3.c.(2) and E.3.c.(3) were incorporated into the project design to the maximum extent technically feasible given the project site conditions;

(iii) The project applicant is required to perform mitigation described in Provision E.3.c.(4)(c) with a net result of at least the same level of water quality protection as would have been achieved if the Priority Development Project had fully implemented the retention LID, flow-through LID treatment control BMPs, and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) onsite.

(b) Criteria For Technical Infeasibility

Each Copermittee must develop, or develop in collaboration with the other Copermittees, criteria to determine technical infeasibility for fully implementing the retention LID and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) and include these requirements in the Permanent BMP Sizing Criteria Design Manual pursuant to Provision E.3.d. Technical infeasibility may result from conditions including, but not limited to:

(i) Locations that cannot meet the infiltration and groundwater protection requirements in Provision E.3.a.(5) due to the presence of shallow bedrock, contaminated soils, near surface groundwater, underground facilities, or utilities;

(ii) Brownfield development sites or other locations where pollutant mobilization is a documented concern;

(iii) The design of the site precludes the use of soil amendments, plantings of vegetation, or other designs that can be used to infiltrate and evapotranspirate runoff;

(iv) Soils cannot be sufficiently amended to provide for the requisite infiltration rates;

(v) Locations with geotechnical hazards;

(vi) Insufficient onsite and/or offsite demand for storm water use;

(vii) Modifications to an existing building to manage storm water are not feasible due to structural or plumbing constraints; and

(viii) Smart growth and infill or redevelopment locations where the density and/or nature of the project would create significant difficulty for compliance with Provisions E.3.c.(2) and E.3.c.(3) onsite.

(c) Mitigation

Priority Development Projects that meet the Copermittee's technical infeasibility criteria developed pursuant to Provision E.3.c.(4)(b) must be required to mitigate for the increased flow rates, increased flow durations, and/or increased pollutant loads expected to be discharged from the site. For the pollutant load in the volume of storm water not retained onsite with retention LID BMPs treated with flow-thru LID treatment control BMPs sized for the portion of the design capture volume that is not retained onsite, ~~, tre~~ or increased potential erosion of downstream receiving waters not fully controlled onsite with hydromodification management BMPs, the Copermittee must require the project applicant to either 1) implement an offsite mitigation project, and/or 2) provide sufficient funding for a public or private offsite mitigation project via a mitigation fund.

(i) *Mitigation Project Locations*

Offsite mitigation projects must be implemented within the same hydrologic unit as the Priority Development Project, and preferably within the same hydrologic subarea. Mitigation projects outside of the hydrologic subarea but within the same hydrologic unit may be approved provided that the project applicant demonstrates that mitigation projects within the same hydrologic subarea are infeasible and that the mitigation project will address similar potential impacts expected from the Priority Development Project.

(ii) *Mitigation Project Types*

Offsite mitigation projects must include, where applicable and feasible, retrofitting opportunities and stream and/or habitat rehabilitation or restoration opportunities identified in the Water Quality Improvement Plans, identified pursuant to Provision B.3.a. Other offsite mitigation projects may include green streets or infrastructure projects, or regional BMPs upstream of receiving waters. In-stream rehabilitation or restoration measures to protect or prevent adverse physical changes to creek bed and banks must not include the use of non-naturally occurring hardscape material such as concrete, riprap, or gabions. Project applicants seeking to utilize these alternative compliance provisions may propose other offsite mitigation projects, which the Copermittees may approve if they meet the requirements of Provision E.3.c.(4)(a).

(iii) *Mitigation Project Timing*

The Copermittee and/or project applicant must develop a schedule for the completion of offsite mitigation projects, including milestone dates to identify, fund, design, and construct the projects. Offsite mitigation projects must be completed upon the granting of occupancy for the first project that contributed funds toward the offsite mitigation project, unless a longer period is authorized by the San Diego Water Board.

(iv) *Mitigation Fund*

A Copermittee may choose to implement additional mitigation programs (e.g., pollutant credit system, mitigation fund) as a means for developing and implementing offsite mitigation projects, provided the projects conform to the requirements for project locations, types, and timing described above.

(5) Alternative Compliance for Watershed-Based Planning

Where a development project, greater than 100 acres in total project size or smaller than 100 acres in size yet part of a larger common plan of development that is over 100 acres, has been prepared using watershed and/or sub-watershed based water quality, hydrologic, and fluvial geomorphologic planning principles that implement regional LID BMPs in accordance with the sizing and location criteria of this Order and acceptable to the Regional Board, such standards shall govern review of projects with respect to Provision E.3. of this Order and shall be deemed to satisfy this Order's requirements for LID site design, buffer zone, infiltration and groundwater protection standards, source control, treatment control, and hydromodification control standards. Regional BMPs must clearly exhibit that they will not result in a net impact from pollutant loadings over and above the impact caused by capture and retention of the design storm. Regional BMPs may be used provided that the BMPs capture and retain the volume of runoff produced from the 24-hour 85th percentile storm event as defined in Provision E.3.c. and that such controls are located upstream of receiving waters. Any volume that is not retained by the LID BMPs, up to the design capture volume, must be treated using LID biofiltration sized for the design capture volume that has not been retained. Where regional LID implementation has been shown to be technically infeasible (per Provision E.3.c.(4)(b)) any volume up to and including the design capture volume, not retained by LID BMPs, nor treated by LID biofiltration, must be treated using conventional treatment control BMPs in accordance with Provision E.3.c.(2)(d) and participation in the mitigation program in Provision E.3.c.(4)(c).

Re: REVISED ADMINISTRATIVE DRAFT REGIONAL MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) (Tentative Order No. R9-2012-0011)

Dear Ms. Walsh:

The following trade and professional associations, for the purposes of this communication known as, the regulated community, are responding as a Coalition. Spearheaded by the Building Industry Association of San Diego County (BIASD), Business Leadership Alliance (BLA), Associated General Contractors, San Diego (AGC), NAIOP (National Association of Industrial & Office Properties), Associated Builders & Contractors (ABC), the San Diego Regional Chamber of Commerce, the San Diego Association of Realtors® (SDAR), and the Building Owners & Managers Association (BOMA) and the members thereof, we appreciate the opportunity to provide comments on the Administrative Draft of the San Diego County Regional MS4 Permit (Administrative Draft Permit). We submit these comments in addition to and in support of comments made by our affiliate the Building Industry Association of Southern California and its coalition partners. This Coalition employs over 200,000 San Diegans and generates in excess of $ 3 billion dollars of economic activity in the San Diego region.

Alternative Methodologies to Address Water Quality and Hydromodification Concerns

The Coalition supports stream and habitat restoration/rehabilitation as an essential part of hydromodification control, and recommends that alternative compliance presented in the Administrative Draft permit Section E.3.c.(4)(c), Mitigation, should be encouraged. Hydromodification management is an issue that is larger than the individual discharger and needs to be addressed at the local watershed level. Within a watershed, a combination of conventional on-site controls for some projects and alternative compliance for other projects is appropriate.

In some cases, restoration/rehabilitation projects can provide more benefit to the receiving waters than conventional on-site low impact development (LID) and hydromodification management practices. For example, new developments in watersheds that are already experiencing hydromodification from existing development could potentially provide a greater benefit to the receiving water by directing funds to alternative compliance mitigation projects in the stream rather than conventional BMPs on the project site. Within already developed watersheds, the benefit of conventional on-site BMPs may be measurable when compared to the hydromodification effect of existing development.

The Coalition recommends that alternative compliance should be an option accorded equal status with conventional on-site low impact development and hydromodification management practices, and that the permit should provide a simple path or "off-ramp" to alternative compliance. The permit Sections discussed below should be modified to simplify the path to alternative compliance, which would encourage project applicants to pursue this path.

Section E.3.c.(4)(a)(i) of the Administrative Draft permit requires a site-specific and/or design analysis performed by a registered professional engineer, geologist, architect, or landscape architect be provided by the project applicant in order for a Copermittee to approve alternative compliance. The analysis would be required to prove technical infeasibility of retention LID and hydromodification management BMPs. If stream and habitat restoration/rehabilitation projects enhance the beneficial uses within the watershed and provide the same or better level of water quality protection, they should not require proof of infeasibility of on-site retention LID and hydromodification management BMPs.

Section E.3.c.(4)(a)(ii) of the Administrative Draft permit requires a project applicant to demonstrate that retention LID and/or hydromodification management BMPs per Provisions E.3.c.(2) and E.3.c.(3) were incorporated into the project design to the maximum extent technically feasible given the project site conditions. Section E.3.c.(2)(c) requires the project must implement flow-thru LID BMPs for the portion of the design capture volume of runoff that is not retained on-site. Altogether this means the project must implement a mix of conventional retention LID BMPs and flow-thru LID BMPs in addition to alternative compliance. In some cases the benefit of conventional BMPs may be unmeasurable in the context of a watershed that is already experiencing hydromodification, and it would be more beneficial to direct all funds toward stream restoration/rehabilitation (alternative compliance). If stream and habitat restoration/rehabilitation projects enhance the beneficial uses within the watershed and provide the same or better level of water quality protection, projects should not be required to provide a mix of conventional retention LID BMPs and flow-thru LID BMPs in addition to alternative compliance.

The following are recommended changes to the language of the Administrative Draft permit. In addition to the suggested revisions below, the permit should clarify when and how the Regional

Water Quality Control Board will be involved in the review and approval of alternative compliance projects.

PROPOSED CHANGES TO PRIORITY DEVELOPMENT PROJECT PERMANENT BMP PERFORMANCE AND SIZING REQUIREMENTS

Section E.3.c.(2)

In addition to the BMP requirements listed for all development projects under Provision E.3.a, Priority Development Projects must also implement permanent BMPs that conform to performance and sizing requirements.

(2) Retention and Treatment Control BMP Requirements Each Copermittee must require each Priority Development Project to implement BMPs to retain and treat pollutants onsite in the following order or provide alternative compliance pursuant to Provision E.3.c.(4):

Section E.3.c.(4)(a)

(a) Applicability

Priority Development Projects may be allowed alternative compliance if:

(i) ~~The Copermittee reviews and approves site-specific hydrologic and/or design analysis performed by a registered professional engineer, geologist, architect, or landscape architect;~~ The project applicant is required to perform mitigation described in Provision E.3.c.(4)(c) with a net result of at least the same level of water quality protection as would have been achieved if the Priority Development Project had fully implemented the retention LID and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) onsite; or ~~;~~

(ii) The project applicant demonstrates, and the Copermittee determines and documents, that retention LID and/or hydromodification management BMPs per Provisions E.3.c.(2) and E.3.c.(3) were incorporated into the project design to the maximum extent technically feasible given the project site conditions~~;~~ and the project applicant is required to perform mitigation described in Provision E.3.c.(4)(c) for the balance of the project design capture volume that is not retained on-site.

(iii) ~~The project applicant is required to perform mitigation described in Provision E.3.c.(4)(c) with a net result of at least the same level of water quality protection as would have been achieved if the Priority Development Project had fully implemented the retention LID and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) onsite.~~

Illicit Discharge Detection and Elimination

The Coalition is concerned about the unanticipated consequences associated with the Permit's definition of "illicit discharges" and the application of that definition to discharges of ground water through subsurface drains. The permit defines an "illicit discharge" as "Any discharge to the MS4 that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from firefighting activities [40 CFR 122.26(b)(2)]." The permit goes on to define a non-storm water discharge as "All discharges to and from a MS4 that do not originate from precipitation events (i.e., all discharges from a MS4 other than storm water). Non-storm water includes illicit discharges and NPDES permitted discharges." Finally, the permit presumes that any flow in a storm drain that occurs seventy two hours after a rain event is a non-storm water flow and thus an illicit flow in violation of the permit and the clean water act. For the reasons described below, this interpretation is neither enforceable nor technically feasible.

The proposed permit requires development and redevelopment projects to retain the 85th percentile storm event on the project site and either use or infiltrate that water. [Citation] The available area where soil is conducive to infiltration within the County of San Diego is extremely limited. These available areas include soil adjacent to river or stream beds, coastal sandy deposits, and valleys (e.g. along San Luis Rey River, beaches, and Mission Valley) and are a small fraction of the County area. Therefore, the parameters in the permit cannot be met on most projects. About 90 percent of the area of San Diego County belonging to Region 9 is likely deemed unfeasible for infiltration (soils Type C and D, see California Geological Survey - Preliminary Surface Geological Materials Map attached hereto).

Normally, these areas where infiltration can be performed are protected for environmental purposes (i.e. canyon drainages where the existing vegetation protects animal and waterway environments) However, in those areas where the native soils are permeable and development or redevelopment are permitted, building ordinances and design specifications require compacted fill at grade for higher density projects. The compacted fill has a reduced void structure and therefore does not facilitate water infiltration. Thus, this infiltration requirement as written pits the goal of minimizing urban sprawl though high density development with an attempt to infiltrate precipitation.

Because of the soil conditions in the geographic area regulated by this permit, much of the infiltrated water does not reach ground water aquifers but rather becomes perched water which tends to collect around subsurface utility lines, foundations and other structures. Unless the perched water can be allowed to escape there is a high probability of damage to critical infrastructure such as roads, utilities necessary to protect the health, safety and welfare of the community.

The Permit offers the alternative of retention and use of water on site. As discussed at the Permit workshops, this alternative is both impractical and likely in violation of California law. First, because of the unique rain patterns in Southern California the scale of any retention structures would be enormous and costly well beyond any benefit to water quality particularly as applied to critical infrastructure projects such as roads and airports. Second, assuming that it is technically feasible to capture the runoff, doing so is likely to contravene other state laws and policies such as protection of wetland habitats[1], and previously granted water rights.[2]

The permit impermissibly assumes that any water flowing in a storm drain seventy two hours after an arbitrary 0.1 inch storm event is non-storm water. First, the natural drainage from even an undeveloped site can take more than seventy two hours in many cases. As a matter of fact, a simple review of USGS precipitation and runoff records in a natural watershed in the area, such a San Mateo Creek, proves without a doubt that wet periods may take more than a month to fully drain natural runoff especially in wet years even for relatively small watersheds. Second, natural precipitation which is infiltrated on site is likely to emerge as perched water and enter the storm drain system day, weeks or months after was originally infiltrated. Third, hydromodification BMPs may take much more than 72 hours to drain, especially for those BMPs were a significant volume of detention occurs under amended soil and the drainage is constrained by a very small orifice. Thus, the seventy two hour definition after a 0.1 inch storm event lacks any scientific bases and is, therefore, both arbitrary and capricious.

For the reasons stated above, the Coalition recommends that the Permit language be modified as follows:

ILLICIT DISCHARGE DETECTION AND ELIMINATION -- NON-STORM WATER DISCHARGES

Section 2.a.1

(1) Discharges of non-storm water to the MS4 from the following categories must be addressed as illicit discharges unless the discharge has coverage under NPDES Permit No. CAG919001 (Order No. R9-2007-0034, or subsequent order) for discharges to San Diego Bay, or NPDES Permit No. CAG919002 (Order No. R9-2008-0002, or subsequent order) for discharges to surface waters other than San Diego Bay:

(a) Uncontaminated pumped ground water;

~~(b) Discharges from foundation drains;~~

~~(c) Water from crawl space pumps; and~~

~~(d) Water from footing drains.~~

[1] By capturing all events smaller or equal than the 85th percentile rain event, the runoff volumes are likely to be less than they were in the predevelopment condition, thereby drying up streams and valuable wetland habitat. The use of a universally accepted rainfall-runoff methodology such as the NRCS Method proves that events smaller than the 85th percentile rainfall event may generate a significant percentage of their volume as a runoff, depending on the soil type, antecedent conditions and vegetation type.

[2] If the amount of water being retained on site exceeds the amount of water retained in pre development condition, the additional water being retained will likely violate the prior appropriation rights and pueblo rights of others.

(2) Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges unless the discharge has coverage under NPDES Permit No. CAG 679001 (Order No. R9-2010-0003, or subsequent order). This includes water line flushing and water main break discharges from water purveyors issued a water supply permit by the California Department of Public Health or federal military installations. Discharges from recycled or reclaimed water lines to the MS4 must be addressed as illicit discharges, unless the discharges have coverage under a separate NPDES permit.

(3) Discharges of non-storm water to the MS4 from the following categories must be addressed by the Copermittee as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a source of pollutants to receiving waters:

(a) Diverted stream flows;

(b) Rising ground waters;

(c) Uncontaminated ground water infiltration to MS4s;

(d) Springs;

(e) Flows from riparian habitats and wetlands; ~~and~~

(f) Discharges from potable water sources~~.~~;

(g) Foundation and footing drains

(h) Water from crawl space or basement pumps

(i) Hillside/canyon drains

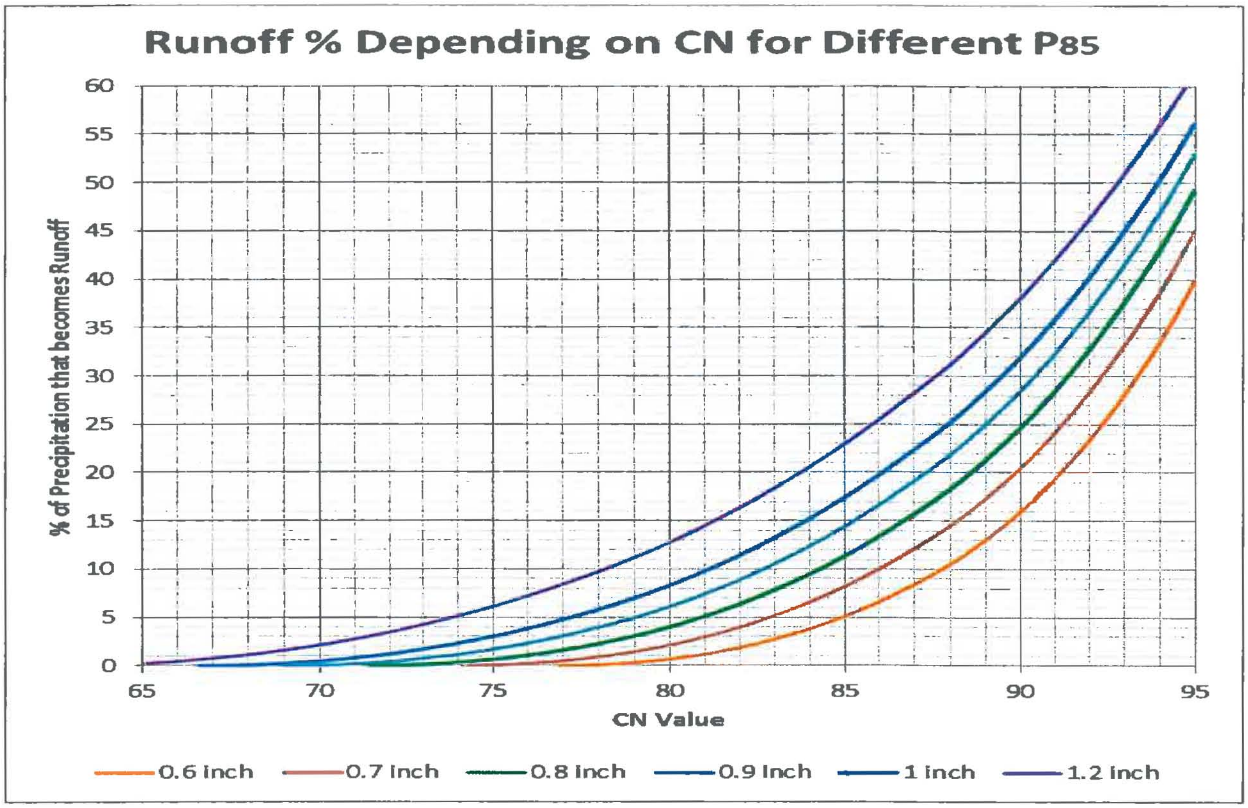
Add to Appendix C – Definitions:

Groundwater – water that occurs beneath the water table in soil and geologic formation that are fully saturated as evaluated by a licensed geotechnical consultant or geologist.

BMP Performance and Sizing Requirements

The Coalition is concerned about the unintended consequences associated with the Permit's definition of LID implementation. We propose a more detailed and clear definition of the volume required for LID, as runoff should not be reduced below the expected runoff produced by the 24 hour – 85th percentile storm in natural conditions (nor the runoff produced by smaller storms in those cases where they indeed generate runoff). In natural conditions, runoff is not only a function of the precipitation event (the main variable) but also a function of the soil type, the natural vegetation type, and the Antecedent Moisture Condition (AMC) before the storm event (degree of saturation of the soil at the beginning of the storm). The current definition also lacks clarity in terms of the intent of the infiltration/retention LID: it is not clear if the volume retained is associated with the first storms of the season, or if it is associated with all storms smaller or equal than the 24 hour – 85th percentile storm event.

In San Diego County, many times the 24 hour - 85th percentile precipitation event (P_{85}) generates runoff in natural conditions, as impervious soils (Type D) are predominant in the County, and poor or fair natural vegetation is common in many areas. The Coalition has prepared a figure that illustrates the percentage of runoff as a function of the Curve Number value (a well-known parameter for hydrologists and engineers to determine runoff via NRCS (SCS) method, which is a function of soil type, vegetation, and AMC), for different values of P_{85}. It is clear that runoff as a percentage of the precipitation can be as small as 0% or as large as 60% depending on the conditions of the natural terrain and the size of P_{85}.



Removal of naturally occurring flows generated by storms similar to the 24 hour – 85th percentile storm for those natural environments where such flows do occur may have negative impacts to existing habitats, as excessive retention may alter the natural water balance. Additionally, excessive retention in soils that have a naturally limited capacity for infiltration increases the risks of failure on vital infrastructure due to lateral water migration.

Also, the intent of the permit to retain the seasonal first flush only (and not all runoff from all events smaller or equal than the 24 hour – 85th percentile event) is not clear in the current language. It is clear in the technical literature (see for example CALTRANS CTSW-RT-05-73-02.6) that first flush treatment has a justification based on the fact that most of the time, in Southern California, treating the first storm of the season may remove built up contamination. Additionally, the first 20% - 40% of the storm volume may remove 50% - 70% of the total contaminant load (excluding sediments and trash). Finally, first flush treatment is justified by the theory of diminishing returns, because

BMPs have a better efficiency removing higher loads, and the cost of treatment is more dependent on the volume of water than on the concentration of contaminants.

For the reasons stated above, the Coalition recommends that the Permit language be modified as follows:

Section E.3.c.(2)(b)

Each Priority Development Project must be required to implement LID BMPs that are sized and designed to retain the volume equivalent to the runoff volume produced from a 24-hour 85th percentile storm event produced in natural conditions. 15 ("design capture volume");

Footnote 15~~: This volume is not a single volume to be applied to all areas covered by this Order. The size of the 85th percentile storm event is different for various parts of the San Diego Region. The Copermittees are encouraged to calculate the 85th percentile storm event for each of its jurisdictions using local rain data pertinent to its particular jurisdiction. In addition, isopluvial maps may be used to extrapolate rainfall data to areas where insufficient data exists in order to determine the volume of the local 85th percentile storm event in such areas. Where the Copermittees will use isopluvial maps to determine the 85th percentile storm event in areas lacking rain data, the Copermittees must describe their method for using isopluvial maps in its BMP Design Manuals.~~ – Runoff volumes must be calculated using the NRCS Method applying average AMC-II conditions, natural NRCS soil types, and the corresponding natural vegetation that exist or existed prior to development; a different hydrologic method could be approved by the Copermittees. LID is not intended to retain the runoff of all events that generate a runoff volume equal to or smaller than the runoff produced by the 24 hour - 85th percentile storm event; rather to retain the first flush up to the 85th percentile runoff difference. The 85th percentile runoff in natural conditions could be 0 or larger depending on the original natural vegetation and soil type. The time needed to use the totality of volume retained must be compatible with current regulations and water usage in the area. Proper vector control will be required in the retention facility if usage and infiltration of the retained water is expected to exceed 96 hours.

Sediment Supply Requirements

The requirement to address sediment balance is briefly mentioned in the new permit in the form of compensation of the potential sediment supply loss due to the proposal of a priority project. The sediment balance within a watershed (or the establishment of new sediment equilibrium as a consequence of many years of development in multiple watersheds) is an extremely complex issue. The Coalition is therefore very concerned about the lack of direction regarding this issue, the myriad of factors affecting a highly variable phenomena and the possibility of wasting valuable resources preparing a useless Sediment Management Plan for Priority Projects. Such plans lack direction, proper design equations, and basic understanding of the sediment transport phenomena in Mediterranean climates.

Sediment yield and sediment transport are functions of the geology of the terrain, the topography of the watershed and the slope of the main channels, the grain size distribution of the sediments existing in the network of channels, the vegetation, the annual precipitation and its distribution, the state of the vegetation prior to the rainfall (burned, dry, stable), the geometry of the main creeks and channels, the Antecedent Moisture Condition of the soil, the equilibrium conditions of slopes and of the sediments already in the network of channels in terms of stability, the existence of reservoirs or dams and the frequency and duration of their discharges in extreme events, and many other factors.

Trying to accommodate such complex factors into a one-size-fits-all solution is a recipe for disaster. Also, trying to deal with the sediment problem in a typical pre-formatted Sediment Management Plan is not only impractical, but also ineffective and resource-consuming. Sediment transport analysis made in the Tijuana River with 73 years of daily runoff data has proven, for example, that more than 70% of the sediment transport occurs less than 0.15% of the time; sediment analysis in the Santa Clara watershed has generated very similar results, with the added complication of hyperpycnal flow transport (flows with density higher than the salt water due to high sediment content), generating significant geomorphological changes in the watershed.

In addition to the complexity of the problem, many proposed solutions (such as the use of the Lane Relationship) denote the lack of understanding of sediment transport theory, as the Lane Relationship is not a quantitative equation that can be used for design, but a qualitative relation that only can be used for the purposes of discussion about the main factors affecting sediment equilibrium.

An added difficulty is related to the compensation process. It is evident that, even if sediment supply loss can be proven for a given project, adding artificial sediments to a natural creek triggers so many permits and environmental and water quality constraints, that such an alternative is infeasible. Even if the sediment addition is allowed, it is not clear what amount, size distribution, and time-variable sediment injection is required to mimic a naturally variable sediment production and transport condition that is not clearly measured nor understood.

For the above stated reason, the Coalition recommends that the permit language be modified as follows:

Section E.3.C(3)(b)

First option:

Eliminate the language until a more comprehensive and reasonable approach is developed to deal with restoration/rehabilitation projects and measurement of loss of sediment supply:

(~~b)~~ ~~Post-project runoff flow rates and durations must compensate for the loss of sediment supply due to the development project, should loss of sediment supply occur as a result of the development project.~~

Second option:

Incorporate rehabilitation/restoration projects and/or protection of clearly identifiable sediment producing areas as the only feasible alternative to deal with sediment supply:

(b) Post-project runoff flow rates and durations must compensate for the loss of sediment supply due to the development project, should loss of sediment supply occur as a result of the development project. Redevelopment projects that increase pervious areas from pre-development conditions are not subject to such compensation. Compensation should be tied to restoration/rehabilitation projects for downstream creeks and/or funding for protection of identified sediment-supply areas in the watershed.

Thank you for consideration of the Coalition's comments on the Administrative Draft of the Permit. We look forward to working with the Regional Quality Control Board and its staff on improving the final draft with a goal toward achieving improved water quality in harmony with the Regional Board's Basin Plan.

Very truly yours,

Borre Winckel
President & CEO of the BIASD
On behalf of the Coalition

David Gibson
Executive Director
San Diego Regional Water Quality Control Board
9174 Sky Park Ct., Suite 100
San Diego, CA 92123-4340

Dear Mr. Gibson

The purpose of this communication is to add the voices of our member organizations in opposition to the Draft Administrative MS 4 permit released on April 9th of this year. Our organization includes over forty business organizations throughout the San Diego region, including Chambers of Commerce, Economic Development Corporations and trade organizations that range from CleanTech to the Hospital Association of San Diego and Imperial Counties. Our member organizations in turn represent over 17,000 businesses that provide jobs to San Diego County residents.

On August 4, 2012, our member organizations voted unanimously to support the BIA's coalition comment letter advocating a regional, watershed-based approach to improving stormwater water quality. Our member organizations fully support efforts to reduce pollution to our watershed, beaches and bays, but we believe in a realistic, regional approach rather than a property-by-property approach. The lot-by-lot approach proposed in the draft administrative permit is cumbersome, unrealistic to implement, costly to local business, and will take more than a lifetime to achieve actual positive results.

The BLA supports the BIA coalition comment letter and the solutions presented there. We believe this regional approach is the most wide-reaching, direct and cost effective solution to a problem that has been years in the making, yet minimizes the negative effects that a proscriptive permit will cause to employers and local governments in the region. Please consider incorporating the comments provided by the BIA and supported by the Business Leadership Alliance when revising your Administrative Draft MS4 permit.

Working collaboratively, we can achieve better water quality faster with more reasonable financial impacts to our communities.

Sincerely,

Laurie Madigan

Re: Comments on Administrative Draft San Diego Regional MS4 Permit

Dear Mr. Gibson,

The purpose of this letter is to submit limited legal comments[1] on the Administrative Draft Permit ("Draft Permit") issued by the San Diego Regional Water Quality Control Board ("Regional Board") on April 9, 2012. I am submitting these comments on behalf of the Cities of Aliso Viejo, Lake Forest, and Santee. Each City may ultimately be regulated under the Draft Permit, if adopted, and each City therefore has a significant interest in the Draft Permit's development. My limited legal comments on the Draft Permit follow.

I. THE RECEIVING WATER LIMITATIONS PROVISIONS IN THE DRAFT PERMIT NEED TO BE REVISED.

The current language in the Draft Permit (Provision A) might be interpreted to require strict compliance with the water quality standards established by the San Diego Basin Plan and with other receiving water limitations established by other specified documents. The State Board has determined that its mandatory receiving water limitations language "does not require strict compliance with water quality standards." Rather, it is State Board policy that compliance with water quality standards is "to be achieved over time, through an iterative approach requiring improved BMPs." (State Water Board Order WQ 2001-15.) Because, as discussed below, the current language in the Draft Permit has been interpreted by the Ninth Circuit in a manner that is not consistent with State Board policy, it must be revised.

---

[1] The Draft Permit raises many other legal issues not addressed in this letter. Additional legal comments will be submitted if and when the Draft Permit is reissued for public review as a Tentative Order. We believe that a meeting with legal counsel for the Regional Board would be beneficial to address the limited issues expressed in this letter as well as the broader legal issues raised by the Draft Permit.

State Board policy is, and has been, that water quality standards are to be achieved over time through the iterative process. In State Board Order WQ 2001-15, *In the Matter of the Petitions of Building Industry Assoc. of San Diego County and Western States Petroleum Assoc.* (2001), the State Board explained, in the context of its review of the 2001 San Diego MS4 Permit, that:

> In reviewing the language in this permit, and that in Board Order WQ 99-05, we point out that our language, similar to U.S. EPA's permit language discussed in the *Browner* case, does not require strict compliance with water quality standards. Our language requires that storm water management plans be designed to achieve compliance with water quality standards. Compliance is to be achieved over time, through an iterative approach requiring improved BMPs.
>
> (*Id.*, at 7.)

The State Board's explanation that water quality standards were to be achieved over time through the iterative process was set forth in response to BIA's claim that the Ninth Circuit's decision in *Defenders of Wildlife v. Browner* rendered requirements in the San Diego County MS4 Permit unnecessary and contrary to the MEP standard. While retaining the requirement that the San Diego permit prohibit discharges that cause or contribute to violations of water quality standards, the State Board made clear that compliance with this requirement was to be achieved through the iterative process, and that the water quality standards themselves were not hard compliance targets. The State Board thus established a "middle ground" position where MS4 permits had to require compliance with water quality standards but where compliance was to be achieved over time in recognition of the unique nature of stormwater discharges. As the State Board explained:

> We are concerned, however, with the language in Discharge Prohibition A.2, which is challenged by BIA. This discharge prohibition is similar to the Receiving Water Limitation, prohibiting discharges that cause or contribute to exceedance of water quality objectives. The difficulty with this language, however, is that it is not modified by the iterative process. To clarify that this prohibition also must be complied with through the iterative process, Receiving Water Limitation C.2 must state that it is also applicable to Discharge Prohibition A.2. The permit, in Discharge Prohibition A.5, also incorporates a list of Basin Plan prohibitions, one of which also prohibits discharges that are not in

> compliance with water quality objectives. (See, Attachment A, prohibition 5.) Language clarifying that the iterative approach applies to that prohibition is also necessary.
>
> (*Id*., at 8-9.)

The State Board's position on the receiving water limitations language has thus been consistent and clear: water quality standards are to be achieved over time through the iterative process.

Unfortunately, the Ninth Circuit Court of Appeals, in *NRDC v County of Los Angeles*, 673 F.3d 880 (9th Cir., 2011), interpreted the State Board's mandatory language in a manner inconsistent with State Board policy. The Ninth Circuit held that the State Board's mandatory language requires strict compliance with water quality standards and that such compliance was not modified by the iterative process. Because the language in the Draft Permit is modeled after the State Board's language, it must be revised in light of the Ninth Circuit's decision to align the language with the State Board's policy.

Several interested parties have submitted suggestions on how to revise the Draft Permit's language. These submittals include sample language prepared by the City of San Diego, the City of Dana Point, and the California Stormwater Quality Association ("CASQA"). The purpose of this letter is not to advocate for one of these suggested revisions over the others but to bring to the Regional Board's attention the importance of revising the existing requirements, and to remind the Regional Board that *existing* State Board policy is to allow municipal dischargers to attain compliance through the iterative process. The Regional Board should also consider delaying the reissuance of the Draft Permit until after the State Board completes its review of this issue. As the Regional Board is likely aware, the State Board will be holding a workshop on this issue on November 20th of this year.

II. "EFFECTIVELY PROHIBIT" DOES NOT REQUIRE AN ABSOLUTE PREVENTION OF DISCHARGES INTO THE MS4.

The Draft Permit misapplies the provision contained in 33 U.S.C. § 1342(p)(3)(B)(ii) that MS4 permits "include a requirement to effectively prohibit non-stormwater discharges into the storm sewers" and needs to be revised. Section 1342(p)(B)(ii) is simple and straightforward. It requires that the Draft Permit include a single requirement that the dischargers shall effectively prohibit dischargers into their MS4. Compliance with this requirement can be attained through an ordinance, regulation or policy of the discharger that effectively prohibits discharges to the MS4. It is *not* an absolute prohibition such that the dischargers are in violation of their permit if any unauthorized discharge into their system occurs.

This issue was also addressed by the State Board in Order No. WQ-2001-15, *In the Matter of the Petitions of Building Industry Assoc. of San Diego County and Western States Petroleum Assoc.* (2001). The State Board clarified that discharges into the MS4 are allowed, and are to be controlled through the use of BMPs and other control techniques. The State Board held:

> An NPDES permit is properly issued for "discharge of a pollutant" to waters of the United States. (Clean Water Act § 402(a).) The Clean Water Act defines "discharge of a pollutant" as an "addition" of a pollutant to waters of the United States from a point source. (Clean Water Act section 502(12).) Section 402(p)(3)(B) authorizes the issuance of permits for discharges "from municipal storm sewers."
>
> We find that the permit language is overly broad because it applies the MEP standard not only to discharges "from" MS4s, but also to discharges "into" MS4s. . . [T]he specific language in this prohibition too broadly restricts all discharges "into" an MS4, and does not allow flexibility to use regional solutions, where they could be applied in a manner that fully protects receiving waters. It is important to emphasize that dischargers into MS4s continue to be required to implement a full range of BMPs, including source control. In particular, dischargers subject to industrial and construction permits must comply with all conditions in those permits prior to discharging storm water into MS4s.
>
> (*Id.*, at 9-10.)

The State Board's decision in the *BIA* matter makes clear that the Clean Water Act does not include a blanket prohibition on discharges of non-stormwater into the MS4. Of course, source control and illicit discharge detection play a vital role in an effective MS4 program. However, to the extent the Draft Permit would hold the dischargers liable in the event that any discharge into the MS4 occurs, the Draft Permit exceeds the requirements of the Clean Water Act.

To avoid this outcome, the text of Section II.A of the Draft Permit needs to be revised to remove prohibitions on discharges into the MS4. These references need to be replaced with a requirement and acknowledgement that non-exempt, non-stormwater discharges into the MS4 are to be effectively prohibited by the dischargers, meaning that the dischargers must adopt ordinances and implement programs to control such discharges.

BEST BEST & KRIEGER LLP
ATTORNEYS AT LAW

III. THE CLEAN WATER ACT'S GOALS ARE NOT AN INDEPENDENT SOURCE OF AUTHORITY TO REGULATE MS4 DISCHARGES

Section 101 of the Clean Water Act (33 U.S.C. § 1251) states the goals and the national policy of the Clean Water Act. Section 1251 states:

> The objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters. In order to achieve this objective it is hereby declared that, consistent with the provisions of his Act
>
> (1) it is the national goal that the discharge of pollutants into the navigable waters be eliminated by 1985;
>
> (2) it is the national goal that wherever attainable, an interim goal of water quality which provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water be achieved by July 1, 1983;

These goals are a cornerstone of the Clean Water Act. They play a key role in the development of water quality standards across the United States. They are not, however, an independently enforceable requirement that may be imposed upon municipal dischargers in their NPDES permits. To the contrary, compliance with the Clean Water Act, and its stated goals, is to be attained through compliance with the permitting and water quality planning programs contained in the Act itself. For MS4 permits, the program is set forth in Section 402(p)(3)(B)(i)-(iii). This portion of the Act, and not the overarching goals of the Act, provides the regulatory structure in which the Regional Board must operate.

The Courts have made it very clear that the goals of the Act are not an independent source of regulatory authority. For example, in *National Wildlife Federation v. Gorsuch* (D.C. Cir. 1982) 693 F.2d 156, the Court held that the general goals of the Act did not trump express provisions of the Act or provide separate regulatory authority. The Court noted that "[c]aution is always advisable in relying on a general declaration of purpose to alter the apparent meaning of a specific provision." The Court further noted that "it is one thing for Congress to announce a grand goal, and quite another for it to mandate full implementation of that goal. Read as a whole, the Clean Water Act shows not only Congress' determined effort to clean up our polluted lakes and rivers but also its practical recognition of the economic, technological, and political limits on total elimination of all pollution from all sources."

BEST BEST & KRIEGER LLP
ATTORNEYS AT LAW

That the goals of the Act do not provide an independent basis for regulation applies with even greater force in the context of MS4 permits. As the Ninth Circuit expressly held in the *Browner* decision (discussed more fully below), the MEP standard applicable to MS4 permits is a "lesser standard" than the standard applicable to other NPDES dischargers. It is thus particularly important to apply the standard adopted by Congress for MS4 discharges, and not to augment that standard by reference to the goals of the Act.

Despite this legal authority, the Draft Permit seeks to directly apply these goals to the dischargers through, among other things, the discharge prohibitions and water quality improvement plan requirements. These aspects of the Draft Permit would require the dischargers to seek restoration opportunities as a matter of permit compliance. Regional Board staff has stated that these requirements are necessary to meet the goals set forth in Section 1251. Nowhere does the Clean Water Act impose the policy statements of Section 1251 directly onto MS4 dischargers.

The NPDES program is a technology based program designed to limit the discharge of pollutants into the waters of the United States. (*Defenders of Wildlife v. Browner* 191 F.3d 1159, 1163 (9th Cir. 1999).) The relevant standard that must be applied to MS4 discharges is the maximum extent practicable standard set forth in 33 U.S.C. § 1342(p). (*Id.*, at 1166-67.) Moreover, the Clean Water Act "unambiguously" does not require MS4 discharges to comply strictly with water quality standards or other more stringent limitations that apply to other NPDES dischargers. (*Id.*, at 1164.) This would include the stated goals set forth at Section 1251, or the water quality standards adopted to achieve those goals. (*Id.*)

For these reasons, the Draft Permit's reliance on the goals of the Clean Water Act as a source of authority to impose restoration or other requirements not required by Section 402(p)(3)(B) on the Co-permittees is misplaced and needs to be revised consistent with the MEP standard. Ultimate achievement of the goals of the Act is a shared value. However, the manner in which those goals are to be achieved has been established by Congress through the MS4 program.

SUBJECT: Comments on Administrative Draft, Tentative Order No. R9-2012-0011

Dear Ms. Walsh:

The City of Coronado (City) appreciates the opportunity the San Diego Regional Water Quality Control Board (Regional Board) has provided to the City and the Copermittees to provide initial comments on the Administrative Draft of Tentative Order No. R9-2012-0011, NPDES No. CAS0109266 for Discharges from the Municipal Separate Storm Sewer Systems (MS4s).

City representatives participated in the expanded public involvement efforts lead by the Regional Board through the focused meetings held between June and September 2012. We found the meetings to be very productive and informative, and an excellent approach that promises to result in an improved permit for the San Diego region. We encourage Regional Board staff to continue the dialogue with Copermittees and stakeholders during the next phase of Permit preparation so that we may provide clarification of permit language or explanations of the recommended changes, as necessary.

The County of San Diego, as the Principal Copermittee for the San Diego Copermittees, has submitted a comment document on behalf of the 21 Copermittees in San Diego County. The comment submittal represents a consensus opinion of the San Diego Copermittees and includes comments prepared by the City. The City may provide additional comments in the future when the proposed requirements are presented in the next draft of the permit and public comment period. The City's goal is to recommend language that best addresses any potential differences in the implementation strategies for the City and its unique population, land use, location, and characteristics.

The City's key areas of concern in the Administrative Draft of the permit are listed below.

1. **Adaptive Management.** The City supports the San Diego Copermittees comments and recommendations for adaptive management strategies as submitted by the County of San Diego. In addition, we respectfully recommend that the Regional Board take into consideration the overall approach to the requirements in the permit to clearly identify and consider the distinction between mandatory provisions and requirements, and procedural

and program management requirements imposed on the Copermittees. For example, the permit should direct Copermittees to develop, implement and manage an existing development management program (as part of their jurisdictional runoff management program or JRMP) that addresses the commercial and industrial sectors. The permit should refrain from listing the specific programmatic requirements to be included in the JRMP, such as, types and frequency of inspections, documentation entries (inspection date, time, weather conditions, etc.). The permit should target the highest level requirements and goals within each provision or program, and allow the Copermittees to define the details of program implementation and operational procedures as part of the development of the JRMP. This example is typical of the current prescriptiveness of the permit requirements associated with the JRMP (Permit Section II.E).

We believe that long-term adaptive management will only be possible if the day-to-day operational procedures are set forth in JRMP, as the programmatic document, that demonstrates compliance with the permit requirements. Otherwise, adaptive management may be stifled by the prescriptiveness of the program implementation requirements and operational procedures, and not allow Copermittees the needed flexibility and responsiveness required to adapt programs to changing water quality and other conditions.

2. **Development Planning.** Numerous modifications to the Administrative Draft have been proposed by the San Diego Copermittees. The City has specific concerns with the following new proposed program requirements: (1) single-family residential redevelopment, and (2) alternative compliance program options.

    a. **Single-family residential redevelopment.** The City is mainly residential land use and experiences numerous redevelopment projects of single-family residences per year. The exclusion of single-family residential properties from the priority development project category will allow for these properties to be improved compared to existing conditions by meeting specific requirements to be defined in the BMP Design Manual without the prohibitive and stringent retention and treatment control BMPs that are known to have existing infeasibility conditions of shallow groundwater levels and other physical constraints. We strongly support the San Diego Copermittees recommendation to exempt single-family residential projects from the priority project category. This will support single-family residential development without the need for costly, extensive engineering and technical documentation of infeasibility for this category.

    b. **Alternative compliance program options.** The City's redevelopment of commercial properties may be severely limited, to the possible detriment of water quality, if land-locked commercial properties are limited in their redevelopment options as a result of stringent priority development project on-site retention, treatment control BMP and off-site mitigation requirements currently presented in the Administrative Draft. We encourage the Regional Board to consider the proposed language that allows alternative compliance program options and to weigh the benefits of redevelopment that includes minimum treatment BMPs compared with very stringent, costly on-site retention and treatment BMPs designed to a specified design capture volume, and/or off-site mitigation that limit redevelopment of properties that currently have no treatment BMPs. Costly,

=

comprehensive infeasibility evaluations and documentation should be exempt for redevelopment projects in areas already known for having shallow groundwater and other conditions as long as established minimum LID and treatment BMPs to the MEP are implemented per the BMP Design Manual.

The City looks forward to the next phase of collaborative effort with the Regional Board in the permit reissuance process.

Please feel free to contact me at 619.522.7380 if you have any questions.

Respectfully submitted,

Kim Godby

SUBJECT: ADMINISTRATIVE DRAFT MUNICIPAL SEPARATE STORM SEWER PERMIT TENTATIVE ORDER NO. R9-2012-0011

Dear Ms. Walsh:

Thank you for the opportunity to engage in the focused meeting process regarding the Administrative Draft Tentative Order R9-2012-0011. The process has allowed stakeholders to participate in shaping the Public Draft Tentative Order by providing ideas and concepts that support an MS4 Permit that moves us towards our goal – improved water quality and receiving water conditions.

The City of Del Mar has participated in the development of the San Diego County Regional Copermittees comment process. Those comments, including an electronic version of recommended changes (e.g., redline/strikeouts), are to be submitted under separate cover by the County of San Diego on behalf of the San Diego County Regional Copermittees.

The City of Del Mar looks forward to reviewing the Public Draft Tentative Order upon its release and continuing our dialog with Regional Water Quality Control Board staff during the next phases of the permit reissuance process. If you have any questions, please contact me at (619) 994-7074.

Sincerely,

Mikhail Ogawa, P.E.
City of Del Mar
Clean Water Manager

Ms. Laurie Walsh
9174 Sky Park Court, Suite 100
San Diego, CA 92123-4340

Dear Ms. Walsh,

CITY OF OCEANSIDE COPERMITTEE COMMENT SUBMITTAL ON THE ADMINISTRATIVE DRAFT MUNICIPAL SEPARATE STORM SEWER (MS4) PERMIT (TENTATIVE ORDER NO. R9-2012-0011)

Dear Ms. Walsh,

Thank you for the opportunity to comment on the Administrative Draft Municipal Separate Storm Sewer (MS4) Permit. As participants in the Project Planning Subcommittee, Monitoring and Land Development Workgroups, and focused meetings, the City of Oceanside – Clean Water Program staff have been able to work closely with the San Diego Copermittees, the Regional Water Quality Control Board (Regional Board) staff, and other stakeholders to create a revised Administrative Draft MS4 permit which is sustainable in terms of meeting the "triple bottom line" of integrating the economic, environmental, and social needs in our communities. As a Copermittee the City of Oceanside submits the attached comments for your consideration.

We appreciate the opportunity to participate in the focused meetings and acknowledge the verbal consensus that has been reached on many permit concepts between the San Diego Copermittees and the Regional Board. The County of San Diego, as the lead Copermittee, has submitted Copermittee comments and the City of Oceanside supports these comments, except as follows:

1. Inclusion of Single-Family Development (SFD) in the Priority Development Project (PDP) with Commercial and Industrial uses with a 10,000 square foot impervious area threshold (Section E.3.b.(2)(a)).

   The inclusion of SFD in the same PDP category with Commercial and Industrial development, and the application of a 10,000 square foot impervious area threshold, is not consistent with the separate Residential category and incremental reduction in impervious area cited in preceding the San Diego County MS4 Permits (Orders No. 2001-01 and R9-2007-0001). The two preceding San Diego County MS4 Permits cite SFD PDP as a subdivision of 10 or more units.

To be consistent with the "watershed approach" to regulation, the City of Oceanside submits that the San Diego County watersheds continue the separate categorization of SFD and the PDP be defined as residential development of five (5) or more parcels or condominiums, consistent with a final map. This approach represents a compromise that reflects the incremental reduction in SFD PDP contained in previous San Diego County MS4 Permits.

Implementation of a lower impervious area threshold may reduce land development and redevelopment activities, and negatively affect funding sources that subsidize storm water programs.

2. Onsite retention of the 85th percentile volume (Section E.3.c.(2)(b)).

   Retention of 85th percentile volume has the potential to negatively affect habitat located in and adjacent to receiving waters by creating reduced runoff conditions that mimic a drought state. A review of historic rainfall data indicates that more than two-thirds of annual rainfall events do not meet the 85th percentile volume. The requirement to capture low-flow runoff has the potential to negatively affect habitat quality and may reduce the size of sensitive habitats.

3. Application of the "Naturally occurring pre-development condition" to Hydromodification Management Plan (HMP) calculations (Section E.3.c.(3)(a)).

   The proposed naturally occurring condition requirement will remove the incentive to redevelop existing sites by significantly increasing development costs. The application of the "naturally occurring pre-development condition" to HMP calculations is not consistent with the goals of the HMP, does not foster improvements in water quality, and conflicts with the recently implemented five (5) year HMP monitoring plan. Whereas, redevelopment of existing sites promotes improved water quality by decreasing pre-project impervious area, requires the implementation of Low Impact Development (LID) practices, and necessitates the installation of HMP facilities. Without redevelopment of existing projects, receiving waters will remain subject to unmitigated discharges.

   The adoption of a naturally occurring pre-development condition may cause a reduction in the redevelopment of existing sites and negatively affect funding sources that subsidize storm water programs.

The Administrative Draft MS4 Permit indicates the "San Diego Water Board recognizes that the degradation of water quality and impacts to beneficial uses of the waters in the San Diego Region [have] occurred over several decades" and "further recognizes that a decade or more may be necessary to realize demonstrable improvement to the quality of waters in the Region." The Permit "includes a long term planning and implementation approach that will require more than a single permit term to complete."

The City of Oceanside supports the long term planning and implementation approach to improving water quality. Support of this approach is reflected in the proposed changes to the Administrative Draft MS4 Permit. The proposed changes discussed in this correspondence continue to represent a reduction in possible impacts due to development, as compared to previous Permits, and provides incentive to foster improvement in water quality through the redevelopment of existing unmitigated sites.

The City of Oceanside – Clean Water Program extends its gratitude to the Regional Board for providing a forum for open discussion as part of the permit reissuance process. We respectfully submit these comments for your consideration. Please contact me if you have questions.

THE CITY OF SAN DIEGO

September 14, 2012

Mr. David Gibson
Executive Officer
San Diego Regional Water Quality Control Board
9174 Sky Park Court, Suite 100
San Diego, CA 92123

Subject: Administrative Draft Tentative Order No. R9-2012-0011

Dear Mr. Gibson:

Thank you for the opportunity to comment on the Regional Water Quality Control Board's Administrative Draft San Diego County Municipal Storm Water Permit (Tentative Order No. R9-2012-0011, hereinafter referred to as "Draft Permit"), released April 9, 2012. The City of San Diego (City) is committed to protecting and improving water quality in the San Diego Region. The Draft Permit represents a significant opportunity for the City to more efficiently achieve our storm water quality goals by facilitating a paradigm shift from prescriptive requirements to outcome-based goals that allow for innovation through adaptive management. Regional Board staff, including David Barker, Eric Becker, Wayne Chiu, Laurie Walsh, and Christina Arias should be commended for their efforts in meeting with the City and other Copermittees to better understand our opportunities and constraints. We are hopeful that together we are helping to improve the Draft Permit.

Attached to this letter are the City's requested changes to the Draft Permit with supporting rationale (see Attachments 1 and 2). Key recommendations in the City's comment table are summarized below.

- *Direct Regional Board staff to work with the Copermittees to update the Receiving Water Limitations language.* A key area of input requested by your staff during the review process is how the Draft Permit can be written so that jurisdictions can more clearly articulate their funding needs. The City believes the primary way is to ensure that compliance is clearly defined through implementation requirements. However, the "cause or contribute" language in Provision A has been judicially interpreted to prohibit any discharge from an MS4 outfall which exceeds a receiving water standard. Copermittees now face immediate and substantial liability if there is a single exceedance, irrespective of the City's efforts adhering to the Draft Permit's implementation requirements. This lack of a clear compliance pathway will make funding our compliance implementation programs and meeting our shared storm water quality goals more difficult. Specifically, required implementation activities would have to compete for limited funding with the need to respond to every exceedance, in order to avoid liability. To facilitate continued discussions with your staff, the Copermittees have proposed a redline of Provision A that remedies this problem and achieves the stated intent of Regional Board staff to support adaptive management and priority setting based on water quality needs. In addition, the City recommends incorporating any updated language that is developed as a result of the State Board's Receiving Water Limitations Language workshop scheduled for November 20, 2012.

- *Revise the land development requirements to provide more opportunities to comply on-site.* The City recommends an approach that encourages applicants to comply on-site, rather than offering off-site mitigation as the first compliance option. For example, the City supports encouraging implementation of Low Impact Development practices on development sites by providing alternative design standards that are reasonable and achievable on-site (see proposed revisions to Section II.E.3).

- *Replace the monitoring requirements in the Draft Permit with the strategic monitoring approach developed collectively by the Copermittees.* The Copermittees' approach will more efficiently and effectively address critical questions necessary to adaptively manage the City's programs and realize our storm water quality goals.

We appreciate this opportunity to share our comments and look forward to continued discussions in finding ways to improve and protect water quality. If you have any questions please contact Drew Kleis, Program Manager at (858) 541-4329.

Sincerely,

Kris McFadden

Attachments: 1. City of San Diego comment table
2. City of San Diego proposed changes to Draft Permit

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
Cover Page	1-2	Cover Page	The Copermittees request clarification that waste discharge requirements are for their respective jurisdictions, in order to limit the entire permit to within each Copermittee's jurisdictional boundaries and preempt any such clauses that would extend requirements beyond the Copermittee's jurisdiction.	**As shown in the attached revised Permit, revise the cover page as follows:** "The San Diego County Copermittees in Table 1a are subject to waste discharge requirements <u>within their respective jurisdictions</u> set forth in this Order" This change is also requested for other sections of the Permit, including Provision A. Add the same language for Orange and Riverside County Copermittees. **Also make this change to the cover page:** This Order provides permit coverage for the Copermittee discharges described in Table 2. <u>"Copermittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators." 40 CFR §122.26(a)(3)(vi).</u>
General Comment	Multiple	Multiple	The term "prohibit" is broader than Clean Water Act requirements, and should be changed to "effectively prohibit." CWA section 402(p) (3) (B) (ii) reads as follows: (B) Municipal Discharge – Permits for discharges from municipal storm sewers – (ii) shall include a requirement to <u>effectively prohibit</u> non-stormwater discharges into the storm sewer; (<u>Emphasis</u> added)	**Revise language throughout the Permit to read as follows:** Change "prohibit" to "effectively prohibit."

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			The provision does not provide any reference to exemptions. Rather the section may be read that a permit shall "effectively prohibit non-stormwater discharges" but may exempt certain discharges that are not significant sources of pollutants from the prohibition. The section does not require a full prohibition but rather an effective prohibition. The operative word is "effective". The more precise and correct finding/provision should note that non-stormwater discharges are effectively prohibited (per 402 (p) (3) (B) (ii)). However discharges that are not significant sources of pollutants are exempted from the prohibition. In a practical sense the use of word "effective" provides flexibility to assess the impacts of relatively benign discharges such as landscape irrigation, air condition condensate, individual car washing, and non-emergency fire fighting flows or non-anthropogenic sources before instituting a prohibition.	
General Comment	Multiple	Multiple	Jurisdictional boundaries only partially define the geographic extent of areas where Copermittees can control, reduce, or prohibit stormwater pollutants. The other component that must be incorporated into the Permit language is ownership/operation. There can be multiple MS4s within a municipal boundary (e.g., Phase 2 MS4s), and some MS4 areas are neither owned nor operated by Copermittees, preventing them from controlling pollutants or flows. The	**Clarify/Make distinction between different MS4 classifications:** Throughout the Permit replace "MS4s" with "MS4s owned and operated by the Copermittee".

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Permit should clarify that Permit requirements apply to MS4s owned and operated by the Copermittees. Other MS4 permits in California, including the Los Angeles County MS4 permit, include the "owned and operated" distinction.	
I. FINDINGS				
8	2	Jurisdiction	40 CFR 131.10(a) is applicable to waters of the U.S. for beneficial use designations. Application to waters of the state, which the Regional Board has asserted includes the MS4, beyond beneficial use designations is too broad of an interpretation. It could mean that, for example, storm drain inlet drainage inserts are no longer allowed as they would be a TCBMP in a waters of the state. This finding also conflicts with other Provisions requiring TCBMPs.	**As shown in the attached revised Permit, revise the sentence as follows**: Treatment control best management practices (BMPs) must not be constructed in waters of the U.S.
9	2	Discharge Characteristics and Runoff Management	Discharges may contain waste or pollutants, but it should not be presumed that they necessarily always contain waste or pollutants.	**As shown in the attached revised Permit, revise the section to:** "Discharges from the MS4s <u>may</u> contain waste, as defined in the CWC, and pollutants that adversely affect the quality of the waters of the state. A discharge from an MS4 is a "discharge of pollutants from a point source" into waters of the U.S. as defined in the CWA. Storm water and non-storm water discharges from the MS4s <u>may</u> contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the Basin Plan."
11	3	Discharge Characteristics and Runoff Management	This finding does not apply to developed area that is subject to SUSMP or HMP requirements. These requirements are specifically designed to reduce loads.	**As shown in the attached revised Permit, revise the section to:** "Therefore, runoff leaving a developed area <u>not subject to SUSMP or HMP requirements</u> contains greater pollutant loads and is significantly greater in runoff volume velocity, and peak flow rate than pre-development runoff from the same area."
II. PROVISIONS				
A. Prohibitions and Limitations				

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
A	9	Prohibitions and Limitations	The goals of Provision A are multiple, and the Copermittees appreciate the Regional Board's mission to "protect, preserve, enhance, and restore" water quality. For NPDES compliance purposes, however, a concise goal statement that is more central to MS4 permitting is requested. This goal statement provides context to several requested revisions to subsequent provisions. This goal statement is consistent with the intent of the permit program established by Section 402(p)(3)(B) of the Clean Water Act.	**As shown in the attached revised Permit, revise the second sentence of the introductory paragraph of Provision A to:** "The goal of this provision is to ~~protect, preserve, enhance, and restore the~~ address the impacts of MS4 discharges so that such discharges do not impair water quality and designated beneficial uses of waters of the U.S."
A	9	Prohibitions and Limitations	The proposed Prohibitions and Limitation provisions may be construed as stand-alone provisions that could expose the Copermittees to state and federal enforcement actions, as well as to third party actions under the federal Clean Water Act's citizen suit provisions. Consistent with the recent 9th Circuit Court of Appeal decision, each provision of the permit could be read separately so if provision A.2.a states that "the MS4 must not cause or contribute to a violations of a water quality standard" then that is the stand-alone provision, and the accompanying language found in A.4 (Compliance with Discharge Prohibitions) regarding compliance may be considered irrelevant. As such, a clear linkage between the compliance provisions and the prohibitions, receiving water limitations, and effluent limitations must be	**As shown in the attached revised Permit, insert the following sentence at the end of the introductory paragraph of Provision A:** "The process for determination of compliance with the Discharge Prohibitions (A.1), Receiving Water Limitations (A.2), and Effluent Limitations (A.3) is defined in Provision A.4." In this manner, Provisions A.1, A.2, and A.3 are clearly linked to A.4, as opposed to being standalone provisions.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			established.	
A.1.a (and throughout)	9	Prohibitions and Limitations	Discharge prohibitions in this section should be limited to discharges from MS4s owned and operated by a Copermittee into waters of the U.S.	"Discharges ~~into and~~ from MS4s owned and operated by a Copermittee "
A.1.a (and throughout)	9	Prohibitions and Limitations	Provision A.1.a prohibits certain discharges into waters of the state. NPDES permits under the authority of the Clean Water Act regulate discharges into navigable (surface) waters. Expanding the scope of the Discharge Prohibitions to waters of the state would expand the scope of the Permit to protect groundwater. While the Board has legal authority to protect groundwater under Porter-Cologne, this exceeds federal requirements and would represent an unfunded mandate. Other MS4 permits in California, including the Los Angeles County MS4 permit, protect "waters of the United States." Also, see comment A.1.a.	Throughout the Permit, change "waters of the state" to "waters of the United States", where applicable (and throughout the Administrative Draft). The change for Provision A.1.a is as follows:
A.1.a	9	Prohibitions and Limitations	The Discharge Prohibitions do not establish a sufficient linkage with approved compliance schedules for TMDLs that have been incorporated into the Basin Plan. TMDLs adopted within the region include a schedule to provide MS4 Permittees the time necessary to develop and implement a plan to achieve water quality standards in impaired waters. The compliance schedules for effective TMDLs have been incorporated into Attachment E and language is included in the RWLs provisions (A.2.c.) and the Effluent	**As shown in the attached revised Permit:** "…in receiving waters of the United States ~~state~~ are effectively prohibited, unless the Copermittee is addressing the discharges through Provision A.1.e or A.4 through the process set forth in Provision A.4."

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Limitations provisions (A.3.b.) pointing to the TMDL compliance schedules. However, by not including similar language within Discharge Prohibitions, these provisions could result in violations of the permit even though the implementation compliance dates have not yet passed. Without modification, the Discharge Prohibitions *conflict* with TMDL compliance schedules. Language should be included to clarify that in instances where a TMDL is in place, or a TMDL is being developed, the permittees shall achieve compliance with these provisions as outlined in Attachment E (Specific Provisions for Total Maximum Daily Loads).	
A.1.c	9	Prohibitions and Limitations	See comment A.1.a	Add the following: "…included in Attachment A to this Order<ins>, unless the Copermittee is addressing the discharges through Provision A.1.e or A.4 through the process set forth in Provision A.4.</ins>"
A.1.d	9	Discharge Prohibitions	The first sentence seems to conflict with the remainder of the paragraph and may create a conflict with the State Water Board's policy if not clarified. The revised language clarifies authorized and unauthorized discharges to the ASBS and limits the jurisdiction. Furthermore, this Discharge Prohibition covers MS4 impacts on ASBS, and thus the Receiving Water Limitation is unnecessary and conflicting.	**As shown in the attached revised Permit, revise A.1.d as follows:** "~~Discharges from MS4s to ASBS are prohibited.~~ Stormwater discharges-from the City of San Diego's MS4 to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's MS4 to the Heisler Park ASBS are authorized under this Order subject to the Special Protections contained in Attachment B to State Water Board Resolution No. 2012-0012 applicable to these discharges, included in Attachment A to this Order. <ins>All other discharges from MS4s to ASBS are prohibited, unless authorized by a subsequent order.</ins>" In addition, A.2.c should be deleted.
	9		See comment A.1.a	**Add new part 1.e as follows:** "For discharges associated with

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
A.1.e (new)		Prohibitions and Limitations		water body pollutant combinations addressed in a TMDL in Attachment E of this Order, the affected Copermittees shall achieve compliance as outlined in Attachment E (Total Maximum Daily Load Provisions).
A.2.a	9-10	Receiving Water Limitations	The receiving water limitations language contained in Provision A raises significant legal and policy issues that require further discussion and revision. The receiving water limitations language in Provision A generally follows the language required by the State Board's precedential Order WQ 99-05. In the State Board's precedential Order WQ 2001-15, the State Board determined that the mandatory receiving water limitations language found in Order 99-05 "does not require strict compliance with water quality standards." Instead, the State Board concluded that compliance with water quality standards is "to be achieved over time, through an iterative approach requiring improved BMPs." Despite this policy statement from the State Board, in 2011, the 9th Circuit interpreted the State Board's mandatory language in a manner that requires strict and immediate compliance with water quality standards. The State Board has recently scheduled a workshop for November 20 to address the receiving water limitations language. The San Diego Co-Permittees support revisions to the receiving water limitations language that align the language with the State Board's policy that compliance with water quality standards is "to be achieved over time, through an iterative approach	**To provide a more direct tie in between Provision A.2.a, TMDL compliance schedules and A.4.a. the following language is proposed, as shown in the attached revised Permit**. Provision A.2.a should be revised to make clear that compliance with the Receiving Water Limitations is determined by compliance with the iterative process. The City of San Diego has proposed redline language, however, at this time in anticipation of the State Board's forthcoming November workshop on this important issue, which will presumably inform the development of state-wide language, the City of San Diego requests the Regional Board staff coordinate with the City and the Copermittees to develop updated RWL language.. The proposed language provided in the strikeout version of Provision A.1.a provides an example of an approach for addressing this issue in Provision A.2.a.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			requiring improved BMPs." The redlines submitted with these comments are not designed to address all the issues raised by this conflict. Instead, the redlines address, for this draft permit, how compliance with water quality standards will be achieved for water bodies covered by an adopted TMDL or covered in the WQIPs. The City of San Diego will participate in the State Board process regarding the larger issues involving the receiving water limitations language, and encourage the Regional Board to do so as well. Without modification to the RWLs, they conflict with TMDL compliance schedules. Language should be included to clarify that in instances where a TMDL is in place, or a TMDL is being developed, the permittees shall achieve compliance with these provisions as outlined in Attachment E (Specific Provisions for Total Maximum Daily Loads). Without the requested change, the RWLs put the municipalities in immediate and ongoing non-compliance with the permit, as opposed to incorporating TMDL implementation schedules.	
A.2.a.3.b	10	Receiving Water Limitations	The Sediment Quality Control Plan applies specifically to bays and estuaries and only and subtidal surficial sediments that have been deposited or emplaced seaward of the intertidal zone. Many Copermittees do not discharge to the intertidal zone. Text must	**As shown in the attached revised Permit, revise A.2.a.3.b as follows**: "Sediment Quality Control Plan which includes the following narrative objectives <u>for bays and estuaries:"</u>

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			be revised to clarify that this does not apply to inland MS4 discharges.	
A.2.a.4.b.	10	Receiving Water Limitations	Footnote to A.2.a.4.b requires Copermittees to not cause or contribute to the more stringent of a water quality objective or a CTR criterion. Instances may exist where it has been determined that one or the other is more appropriate given site specific conditions or analysis (i.e., a TMDL has been established).	**As shown in the attached revised Permit, attach the following to the end of footnote 3 regarding the California Toxics Rule**: "unless a previous regulatory action (i.e., TMDL) has specified otherwise."
A.2.b	10	Receiving Water Limitations	See Comment A.2.a	**As shown in the attached revised Permit, add the following as A.2.b**: "For receiving water limitations associated with a water body pollutant combination addressed in a TMDL in Attachment E of this Order, the Copermittees shall achieve compliance as outlined in Attachment E (Total Maximum Daily Load Provisions)."
A.3	11	Effluent Limitations	Two types of effluent limitations, technology-based and water-quality based, are described in A.3, which should be reflected in the Permit.	**As shown in the attached revised Permit, add subsections (a) for Technology-based and (b) and Water Quality-based Effluent Limitations, respectively.**
A.3	11	Effluent Limitations	Similar to the WQBELs, the technology-based effluent limits should be linked to Provision A.4 as described in the comment A.3 below.	**As shown in the attached revised Permit, please add the following language to the end of the sentence that ends with "must be reduced to the MEP":** "reduced to the MEP~~.~~, through timely implementation of control measures and other actions as specified in Provisions B and E as described in Provision A.4."
A.3	11	Effluent Limitations	The effluent limitations and compliance with limitations should be more accurately linked to Attachment E; currently the language reads in a manner that is stand-alone from Attachment E. Instead, the language should reference Attachment E	**As shown in the attached revised Permit, revised the WQBEL language in A.3(b) as follows to better reflect the role of Attachment E:** "For a water body-pollutant combination addressed in a TMDL in Attachment E of this Order, ~~Pollutants~~ pollutants in discharges from MS4s must be reduced to comply with ~~any~~ effluent

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			and the compliance determination language the Copermittees propose for inclusion therein. The language should say "as described in" Attachment E rather than "in." In addition, compliance with effluent limitations should be linked to Provision A.4 as described in the next comment.	limitations expressed as WQBELs required to meet the WLAs established for ~~the~~ those TMDLs as described in Provision A.4 and Attachment E to this Order, pursuant to the applicable TMDL compliance schedules."
A.4	11	Compliance with Discharge Prohibitions and Receiving Water Limitations	The intent of Provision A.4 is to determine compliance with A.1, A.2, and A.3 through the Water Quality Improvement Plan(s). As such, the title should reference all three Provisions. References should also be added in the introductory paragraph for clear linkage with the applicable Provisions (A.1, A.2, A.3, B, and F.1).	Change Provision A.4 title to : "Compliance with Discharge Prohibitions, Receiving Water Limitations, and Effluent Limitations" Modify language as follows: "Each Copermittee must comply with the discharge prohibitions (A.1), ~~and~~ receiving water limitations (A.2), and effluent limitations (A.3) of this Order through timely implementation of strategies, control measures, and other actions as specified in Provisions B and E of this Order, including any modifications. The Water Quality Improvement Plans described in Provision B shall be designed to achieve compliance with the discharge prohibitions, receiving water limitations, and effluent limitations. Copermittees shall be considered in compliance with A.1, A.2, and A.3 unless the Regional Board has denied approval of a Water Quality Improvement Plan or subsequent update as described in Provisions B and F.1."
A.4.a.1	11	Compliance with Discharge Prohibitions and Receiving Water Limitations	Provision A.4 describes the iterative process for MS4s to respond to exceedances of water quality standards that persist. However, the language in A.4 appears too broad and suggests the Copermittees should revise their WQIPs even in cases when (1) TMDL pollutant WLAs are exceeded but the TMDL compliance date has not yet occurred and (2) non-TMDL pollutant RWLs are exceeded and the pollutant is a	**As shown in the attached revised Permit, modify language as follows:** "For pollutants that are not in the process of being addressed via specific, scheduled actions in the Water Quality Improvement Plan, u ~~U~~pon determination by either the Copermittees or the San Diego Water Board that discharges from the MS4 are causing or contributing to an exceedance of an applicable water quality standard…"

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			WQIP priority but the BMP implementation schedule described in the WQIP has not yet been exhausted. In these two cases, the water quality standards exceedances are "expected" and no WQIP update is needed; instead the Copermittees should simply complete the implementation of actions identified in the WQIP.	**Insert a new A.4.a.(2) as follows:** "For pollutants in the process of being addressed via a specific, scheduled program in a Water Quality Improvement Plan, the Copermittee(s) shall continue to implement that program as described in the Water Quality Improvement Plan approved by the Regional Board."
A.4.a.1	11	Compliance with Discharge Prohibitions and Receiving Water Limitations	Provision A.4.a.1 states that in the case of persistent water quality standard exceedances, Copermittees shall update their WQIPs in their Annual Reports, "unless the San Diego Water Board directs an earlier submittal." This provision should also consider the scenario where a TMDL is in the process of being developed. In this case, the Copermittees should update their numeric targets/goals to reflect the TMDL WLAs. However, until the TMDL is adopted, the Copermittees have no TMDL WLAs on which to base their numeric goals.	**As shown in the attached revised Permit, add an exception to Provision A.4.a.(1) to acknowledge forthcoming TMDLs, as follows:** "…the Copermittees must submit the following updates to the Water Quality Improvement Plan required under Provision B as part of the Annual Report required under Provision F.3.b<u>, or Water Quality Plan Update Provision B.5.a,</u> unless the San Diego Water Board <u>either:</u> <u>1)</u> directs an earlier submittal; <u>or 2) allows for the adoption of a forthcoming TMDL to establish wasteload allocations that will form the basis of revisions to the Water Quality Improvement Plan</u>:"
A.4.a.1.b	11	Compliance with Discharge Prohibitions and Receiving Water Limitations	Language clarification.	**As shown in the attached revised Permit, revise wording, as follows:** "~~Additional w~~ <u>W</u>ater quality improvement strategies (<u>e.g.,</u> BMPs, retrofitting projects, stream and/or habitat rehabilitation, restoration projects<u>, etc.</u>)"
A.4.a.1.e and A.4.a.1.f	12	Compliance with Discharge Prohibitions and Receiving Water Limitations	Copermittees need more than 30 days to update and implement their plans. The San Diego Water Board should also provide a timeline for providing comments and requesting modifications. The timeline should be reasonable and consistent with the Copermittee implementation timeline. Most importantly, the revision process should be identical to the modification and submission	**As shown in the attached revised Permit, revise section A.4.A.2., as follows:** Strike the current language in sub-bullet (e) and replace it, as follows: (e) "<u>As described in Provision B.6, Copermittees must submit requested modifications to the Water Quality Improvement Plan either in the Annual Report required pursuant to Provision F.3.b,</u>

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			process described in Provision B.	<u>or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision F.5.b</u>." Replace the language in sub-bullet (f) with language that is identical to the language in Provision B, as follows: (f) "<u>As described in Provision B.6, upon</u> ~~Within 30 days of the~~ San Diego Water Board determination that the update to the Water Quality Improvement Plan meets the requirements of this Order, the Copermittees must <u>submit requested modifications to the jurisdictional runoff management programs either in the Annual Report or Report of Waste Discharge (ROWD) required pursuant to Provision F.5.b.</u>" Strike the remaining language in (f).
A.4.b	12	Compliance with Discharge Prohibitions and Receiving Water Limitations	Provision A.4.b notes that should water quality exceedances continue to occur even after the MS4 has engaged in the "iterative" process and is implementing enhanced water quality improvement strategies, the MS4 must still redo the "iterative" process unless the Regional Board decides otherwise. This approach is not consistent with other stormwater permits (e.g., the recent Caltrans permit) in which the Copermittee does not have to reinstitute the iterative process unless directed to do so by the Regional Board. This distinction is important, as the WQIP process will be underway throughout the course of the Permit, and being required to "re-iterate" when a process is already underway to address exceedances is unreasonable.	**To match the language in Order 99-05, as shown in the attached Revised, replace A.4.b with the following language:** "<u>So long as the Copermittees have complied with the procedures set forth above and are implementing the Water Quality Improvement Plan(s) approved by the Regional Board, the Copermittees do not have to repeat the same procedure for continuing or recurring exceedances of the same discharge prohibitions, effluent limitations, and receiving water limitations unless directed to by the San Diego Water Board</u>. "
A.4.c	12	Compliance with Discharge Prohibition and	The Copermittees envision WQIPs as the foundation for a BMP-based compliance	**Remove Section A.4.c.**

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Receiving Water Limitations	approach for the Discharge Prohibitions and RWLs. However, the language in the Provision A does not clearly link compliance with the iterative process set forth in the WQIPs. In essence, the language suggests that even if Copermittees expend significant resources to develop and fully implement WQIPs that are progressing towards attainment of water quality standards, they may still be found to be out of compliance for single exceedances. The iterative process is a fundamental aspect of MS4 programs, as envisioned by State Water Board Order 99-05 and later reconfirmed in Order WQ 2001-15 (BIA Order), and is the mechanism by which MS4 Permittees should <u>demonstrate</u> compliance (i.e., implementation of the iterative process equals compliance). The WQIPs now provide a mechanism to "raise the bar" with regards to the detail and quantitative analyses used to identify pollutant sources, implement BMPs to address those sources, and increase the number or size of BMPs until water quality standards are attained. However, as Provision A.4 is written, the envisioned strategic compliance process falls short, and the WQIPs are simply documents that do not appear to have a meaningful linkage to MS4 compliance. An unintended but potentially significant consequence of this compliance uncertainty is that Copermittees will be faced with	

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			increased difficulty successfully securing program funding because even substantial increases in funding would not eliminate the potential for non-compliance.	
B. Water Quality Improvement Plans				
B	13	Water Quality Improvement Plans	Similar to comments regarding the goal statement in Provision A, the Copermittees request a revision to the WQIP goal statement. A concise goal statement that is more central to MS4 permitting is requested. This goal statement provides context to several requested revisions to subsequent provisions.	**As shown in the attached revised Permit, revise the second sentence of the first paragraph of Provision B as follows:** "The goal of the Water Quality Improvement Plan is to 1) effectively prohibit non-storm water discharges into the MS4s, 2) reduce pollutants in storm water discharges from the MS4s to the MEP, and 3) support the attainment and reasonable protection, preservation, and enhancement ~~and restoration~~ of water quality and designated beneficial uses of waters of the state."
B	13	Water Quality Improvement Plans	Similarly, the Copermittees request revisions to the required/critical elements of the WQIPs. These elements reflect several requested revisions to the WQIP process (e.g., B.2), described below.	**As shown in the attached revised Permit, revise the second paragraph of Provision B as follows:** The Copermittees must develop Water Quality Improvement Plans for each Watershed Management Area that 1) prioritize water quality ~~issues~~conditions resulting from the Copermittee's MS4 discharges to and from the MS4s within each Watershed Management Area, 2) identify MS4 pollutant sources and other stressors associated with ~~those~~the water quality priorities, 3) define numeric ~~targets~~goals and schedules to ~~achieve improvement of~~address water quality priorities, 4) describe water quality improvement strategies to achieve numeric ~~targets~~goals, and 5) develop and execute a coordinated monitoring and assessment program to facilitate adaptive management of the Water Quality Improvement Plans and ~~determine progress towards achieving improved water quality~~those goals.
B	13	Water Quality	The Copermittees envision the WQIPs as the foundation for a BMP-based compliance	**As shown in the attached revised Permit, insert the following into the first paragraph of Provision B:**

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Improvement Plans	approach for the Discharge Prohibitions and RWLs. However, language needs to be added to Provision B to provide a clear linkage between Provision A and B. Note that Provision A.2 is excluded to acknowledge the State's November workshop regarding Receiving Water Limitations. However, it seems logical that RWLs would be included, and we request that Regional Board staff coordinate with the Copermittees to develop updated RWL language.	Therefore, implementation of the WQIPs also provides the basis for complying with Provisions A.1 and A.3, as described in Provision A.4.
B	13	Water Quality Improvement Plans	It is unclear whether the 12-month timeline identified in the third paragraph of Provision B applies to the development of the WQIP or the implementation of the BMPs identified in the WQIP. It would appear that the provision requires that the MS4s must *implement* all the requirements (including BMPs) of Provision B within 12 months of permit adoption.	**As shown in the attached revised Permit, revise the last introductory paragraph of Provision B, as follows:** The Copermittees must submit Water Quality Improvement Plans for public review and Regional Board Executive Officer review and approval per the schedule outline in Provision B.
B	13	Water Quality Improvement Plans	The development of a WQIP will require at a minimum of 18 months and BMP implementation will likely be staggered over a certain time frame. Once the permit is adopted, Copermittees will begin the planning process. However, Copermittees must have at least one full fiscal year budgeting cycle within which to seek additional funding to implement the WQIP from our governing bodies (i.e., City councils and County supervisors). Thus the more reasonable time schedule is to require	**See the proposed changes to the last paragraph of the opening section of Provision B in the attached revised Permit.** Also see the new Section B.6, which combines the submittal, modification, and implementation requirements. 1. The complete WQIPs and corresponding jurisdiction measures are submitted within 18 months. (B.6.a) 2. WQIP implementation is initiated at the beginning of the next fiscal year. (B.6.a) 3. JRMPs are modified in accordance with WQIP

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			the development of the WQIP within 18 months and the implementations of the BMPs to occur consistent with the final approved WQIP.	modifications (B.6.b)
B.1	13-14	Watershed Management Areas	Several changes to Table B-1 are requested. The Copermittees request addition of a tenth WMA, for Mission Bay which is entirely in the jurisdiction of the City of San Diego. Furthermore, the City of Poway is not a responsible Copermittee for San Diego River. City of Escondido is not a responsible Copermittee for San Luis Rey River. Finally, the waterbody Loma Alta Slough should be listed under the Carlsbad WMA. Peñasquitos WMA includes Miramar Reservoir HA and Poway HA.	**Make the following changes to Table B-1, per the attached revised Permit:** 1. Add a WMA for Mission Bay which includes Scripps HA, Miramar HA, and Tecolote HA. 2. Remove Peñasquitos HA and Mission Bay HA from Peñasquitos WMA and insert Miramar Reservoir HA and Poway HA. 3. Remove City of Poway from San Diego River 4. Remove City of Escondido from San Luis Rey River. 5. Add the waterbody "Loma Alta Slough" to the Carlsbad WMA.
B.2	15-18	Identification of Water Quality Priorities	The Copermittees have fully embraced the concept of WQIPs and appreciate the Regional Board's approach to identifying priorities, setting goals, and developing a strategy and schedule to meet those goals. The Copermittees have identified an alternative to Provision B.2, which follows the general approach proposed by the Regional Board but increases focus on addressing MS4 impacts.	The following changes are requested, as detailed in the attached revised Permit section B and further described in subsequent comments: 1. Revisions are proposed to section B.2.a to refine the purpose and add considerations for assessing receiving water conditions. 2. A new section B.2.b is proposed to provide a linkage between receiving water conditions and corresponding impacts from the MS4s (versus other sources). 3. Section B.2.c is expanded to describe the considerations when identifying priority receiving water conditions. 4. Section B.2.d is refined to focus on MS4 impacts and pollutant generating activities. 5. Section B.2.e is refined to elucidate the meaning of numeric goals and their implication for MS4 compliance. 6. The schedule component of B.2.e is moved to a new section B.6 to improve organization of WQIP concepts.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
B.2.a	15-16	Assessment of Receiving Water Conditions	The assessment of receiving water conditions is a critical first step to WQIP development. Changes to purpose of this step are proposed, to focus on water quality issues related to MS4s. Further, data quality and relevance are critical to this assessment, and requirement to consider "all available data" should be refined to address accessibility and quality control issues. Finally, whether a receiving water condition can be achieved and maintained should be assessed.	**As shown in the attached revised Permit, the following changes/revisions were made in Permit section B.2.a:** **Revise the opening paragraph**: "The Copermittees must consider the following, at a minimum, to support the identification of water quality priorities based on the impacts of MS4 discharges on receiving water beneficial uses:" **Under part (7):** replace "All available data" with "Available, relevant, and appropriately collected…data meeting appropriate QA/QC standards" **Insert a new part (10):** "The potential for long-term achievement and maintenance of beneficial use attainment in the Watershed Management Area."
Language Addition B.2.b	Not in original 16	Assessment of MS4 Discharge Quality and Impacts	For WQIP development, it is critical to differentiate between receiving water conditions and MS4 discharges and impacts. Many receiving water conditions are not driven by MS4 impacts, and Copermittees can have the greatest effect on receiving water quality by focusing on reduction of pollutants discharged by their MS4s.	**As shown in the attached revised Permit, add a new section B.2.b titled "Assessment of MS4 Discharge Quality and Impacts", as follows:** "To support the identification of priorities based on the impacts of MS4 discharges on receiving water beneficial uses, the Copermittees must review appropriately collected MS4 discharge quality data and consider the extent to which MS4s cause or contribute to the adverse impacts to receiving water beneficial uses identified in B.2.a. Considerations include: (1) Locations of the Copermittees' MS4 discharges with respect to receiving waters; (2) MS4 discharge quality results relevant to impacts in receiving waters and action levels, including the temporal and geographic variation of the results: (3) The requirements of Provisions A.1 and A.3.; and (4) Whether MS4 discharge quality is sufficiently well known or other information is available to assess whether MS4 discharges are causing or contributing to specific receiving water

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				conditions, or whether additional data need to be collected through the Monitoring and Assessment Program developed as part of the Water Quality Improvement Plan."
B.2.b	16-17	Identify Priority Pollutants and Receiving Water Conditions	We appreciate the Regional Board's approach to identifying priorities for receiving water conditions. Our proposed revisions to the Permit add several elements that should be included by Copermittees when identifying priority receiving water conditions. Following the Regional Board's approach, "priorities" are also differentiated from "highest priorities." Note the proposed revision to the title of the section, which better reflects the envisioned effort/outcome.	Move B.2.b down to B.2.c. **As shown in the attached revised Permit, make two changes:** **#1: Revise the last paragraph of B.2.c as follows:** The Copermittees must identify the highest water quality priorities to be addressed by the Water Quality Improvement Plan, <u>and describe the reasoning for selecting a subset of receiving water conditions as the highest priority(ies).</u> **#2: Rename section to "Identification of Priority Receiving Water Conditions" and add the following to the end of the Section B.2., as follows:** The Water Quality Improvement Plans shall describe the following for the highest priority receiving water condition(s): (1) The beneficial use(s) and pollutant(s) associated with the priority receiving water condition(s); (2) The geographic extent of the priority receiving water condition(s)within the WMA, if known; (3) The Copermittees with MS4s that contribute discharges to the priority water receiving condition(s); (4) The temporal extent of the priority receiving condition(s) (i.e., dry weather and/or wet weather); and (5) Whether receiving waters have been monitored sufficiently to adequately characterize the priority receiving condition(s), including a consideration of spatial and temporal variation"
B.2.c	16-17	Pollutant Source and/or Stressor	The success of WQIPs will hinge on the ability of MS4s to identify and abate	**As shown in the attached revised Permit, rename section to**

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Identification	sources of pollutants within the MS4s. The pollutant source identification process proposed by the Regional Board is too broad and inhibits the Copermittees from focusing on the sources they are most able to control. In addition, some pollutants are poorly understood and need to be further investigated to allow for design of pollutant control strategies [new sub-bullet d.(4).(5)]. The proposed revisions to the Source ID section are intended to effectively focus the WQIP prioritization process.	**"MS4 Pollutant Source Identification" and revise the section, as follows:** See the changes proposed in the attached revised Permit, which focuses the Source ID section on MS4 sources and impacts. **The new section B.2.d follows:** "The Copermittees must identify <u>and prioritize </u>known and suspected storm water and non-storm water pollutant sources within the MS4 associated with the highest priority receiving water conditions identified under B.2.c. The identification of known and suspected sources of the highest water quality priorities as identified for Provision B.2.c shall consider the following : (1) Land uses and their potential contribution to the highest priority receiving water conditions; (2) Pollutant generating facilities, areas, and/or activities within the Watershed Management Area;: (3) Locations of the Copermittees' MS4s outfalls. (4) Review of available data, including: (a) Findings from the Copermittees' illicit discharge detection and elimination programs, (b) Findings from the Copermittees' MS4 outfall monitoring, (c) Other available, relevant, and appropriately-collected data, information, or studies related to pollutant sources and pollutant-generating activities that contribute to the highest priority receiving water conditions identified in Provision B.2. (5) Whether MS4 sources are sufficiently well known to design an effective, directed control strategy, or whether additional source/stressor identification needs to be conducted through the Monitoring and Assessment Program developed as part of the Water

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				Quality Improvement Plan to identify and prioritize sources/stressors within the watershed."
B.2.d	17-18	Numeric Targets and Schedules	We appreciate the Board staff efforts to allow the MS4s to prioritize their water quality issues and to develop a plan to address these issues. However, the terminology in Provision B.2.d regarding interim and final targets are terms used in TMDL program and their use here confuses the issue. In fact, Provision 2.d (3)(e) clearly ties the numeric "targets" with a TMDL. The WQIP should identify interim and final numeric "goals" to keep the distinction clear between a TMDL and a WQIP. It is entirely possible that the interim goal may in fact be the same as an interim TMDL target but not necessarily.	**Replace "numeric target" with "numeric goal" throughout Provision B.**
B.2.e	17-18	Numeric Targets and Schedules Numeric Goals (Title Revision)	It will be critical to quantify the expected outcomes of WQIP implementation efforts, and numeric goals serve to elucidate those expected outcomes. Based on the proposed revisions to the WQIP goals and elements, revisions to the description of the purpose of numeric goals are also proposed. Furthermore the notation of "target" implies a compliance effluent limit and thereby subject to enforcement action, versus goals set by the Copermittees that do not trigger any enforcement action by themselves.	**As shown in attached revised Permit, revise section B.2.e.(1)-(2), as follows:** The Copermittees must develop and incorporate interim and final numeric goals into the Water Quality Improvement Plans. Numeric goals and schedules are intended to support Water Quality Improvement Plan development and to measure progress towards addressing the highest priority receiving water conditions identified under B.2.b. Numeric goals are not enforceable compliance standards, effluent limitations, or receiving water limitations. When establishing numeric goals and corresponding schedules, the Copermittees must consider the following: (1) Final numeric goals must be based on measureable criteria or indicators, to be achieved in the receiving waters and/or MS4 discharges for the highest priority receiving water conditions which will be capable of demonstrating progress toward the achievement of the

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				restoration and/or protection of water quality standards in receiving waters; and (2) Interim numeric goals must be based on measureable criteria or indicators that can demonstrate incremental progress toward achieving the final numeric goals in the receiving waters and/or MS4 discharges. **Footnote 7:** "Interim and final numeric goals may take a variety of forms such as TMDL targets, TMDL wasteload allocations, TMDL based WQBELs incorporated in Attachment E of this Order, action levels, pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric goals are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators. To the extent that a goal is not based on an enforceable regulatory mechanism (i.e., TMDL, WLA), WQIP goals and schedules may be revised through the iterative process. Numeric goals are not subject to enforcement or non-compliance actions under this Order."
B.3	18-19	Water Quality Improvement Strategies and Schedules	The current version of B.3 requires that the MS4s have all of the following water quality improvement strategies in their WQIP (sub-bullets B.3.a.1 through B.3.a.4): structural and non-structural BMPs, retrofit projects, stream and/or habitat rehabilitation, and other water quality improvements associated with eliminating non-stormwater discharges to the MS4s. This may be an appropriate menu of actions to choose from, but pending the water quality issues and the watershed, the WQIP strategies may include all or only one of the	**As shown in the revised Permit, revise section B.3, as follows:** See the changes proposed in the attached revised Permit section B.3. Sub-bullets B.3.a.1 through a.4 are revised and condensed into two sub-bullets, one for JRMP activities and one for other structural and non-structural BMPs. The two sub-bullets (1) and (2) compose the universe of BMPs that would be implemented by the Copermittees to meet the WQIP numeric goals. **a. WATER QUALITY IMPROVEMENT STRATEGIES** The water quality improvement strategies must prioritize, based on their likely effectiveness and efficiency, and

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			strategies listed.	implement measures, as appropriate, to effectively prohibit non-storm water discharges into its MS4, reduce pollutants in storm water discharges from its MS4 to the MEP, and achieve the interim and final numeric goals in accordance with the schedules in Provision B.2.e. Measures include: (1) Copermittee-selected activities identified in Provision E ,either as described in the jurisdictional runoff management programs or as modified with justification, that will address priority receiving water conditions; and (2) Additional structural and/or non-structural BMPs, as selected by the Copermittee, that are designed to achieve the interim and final numeric goals identified in Provision B.2.e.
B.3.b	19	Implementation Schedules	The requirement that "Final dates for achieving final numeric targets must not extend more than 10 years..." may be broadly misinterpreted as currently written with major implications. Based on conversations with Regional Board staff, it is understood that goals can take a number of forms and the "10 year" requirement is not intended as a requirement to attain all Basin Plan water quality standards within 10 years. However, to ensure this requirement is not misinterpreted by third parties, language should be added to make this clarification.	**As shown in the attached revised Permit, add a footnote to sub-bullet (5), as follows:** "Achievement of final numeric goals within 10 years represents progress towards attainment of water quality standards, but is not a requirement to fully attain all applicable water quality standards or all priority receiving water conditions within 10 years."
B.4	19-20	Water Quality Improvement	Monitoring and assessment will be a critical component of the WQIP process. The vision for WQIP monitoring and assessment is	As shown in the attached revised Permit revise section B.4, as follows:

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Monitoring and Assessment	reflected in the proposed revised language for Permit section B.4. A major aspect of this vision is that monitoring requirements in Provision D will be fully integrated into the WQIPs and modified as the WQIPs evolve. The proposed language clarifies the Copermittee's vision for purpose and components of WQIP monitoring and assessment. The requested linkage with Provision D is highlighted through the proposed revision.	The Copermittees in each Watershed Management Area must develop an integrated Water Quality Improvement Plan Monitoring and Assessment Program that assesses: 1) progress toward achieving the numeric goals and schedules, 2) progress toward addressing the highest priority receiving water conditions for each Watershed Management Area, and 3) each Copermittee's overall efforts implementing the requirements of Provision B[10]. The water quality improvement monitoring and assessment program must include the monitoring and assessment requirements of Provision D, which may be modified for consistency with the priority receiving water conditions of each Watershed Management Area and associated Copermittees. For Watershed Management Areas with applicable TMDLs, the water quality monitoring and assessment program must incorporate the specific monitoring and assessment requirements of Attachment E. For Watershed Management Areas with any ASBS, the water quality monitoring and assessment program must also incorporate the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A).
B.5	20-21	Adaptive Management Process	The WQIPs provide an opportunity to synchronize water quality improvement strategies (e.g, TMDL implementation) and jurisdictional runoff management programs. The Adaptive Management section B.5 proposed by the Regional Board has two components: WQIP adaptive management and JRMP adaptive management. With the proposed expanded scope of the WQIPs proposed by the Copermittees, the two components of the adaptive management process are not WQIP and JRMP, instead the components are (1)	**As shown in the attached revised Permit revise section B.5, as follows:** The Copermittees in each Watershed Management Area must implement the iterative process, adapting the Water Quality Improvement Plan, jurisdictional runoff management programs and monitoring and assessment programs, as necessary, to become more effective and meet the requirements of Provisions A, and shall consider the following: **a. PRIORITY RECEIVING WATER CONDITIONS AND NUMERIC GOALS** The priority receiving water conditions and numeric goals, developed pursuant to B.2.c. and B.2.e respectively, shall guide jurisdictional implementation efforts for the duration of this Order. Recommendations

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Priority Receiving Water Conditions and Numeric Goals and (2) Water Quality Improvement Strategies and Schedules. The proposed revisions to section B.5 reflect the Copermittee's vision for WQIP implementation. Most of the components of the adaptive management process proposed by the Regional Board (sub-bullets B.5.a.1.a thru h and B.5.b.1.a thru e) are included. The proposed language adds clarification on the purpose of the adaptive management process and re-organizes into two alternative management categories: (1) Priority Receiving Water Conditions and Numeric Goals and (2) Water Quality Improvement Strategies and Schedules. Note that these two management categories are adapted on different timelines: • Priority Receiving Water Conditions and Numeric Goals would be adapted, at a minimum, on a frequency that corresponds to Permit cycles (every 5 years). In this manner the ROWD for future permits is supported by the WQIP process. It is <u>not</u> expected that priority receiving water conditions and numeric goals would vary on a shorter frequency, and thus resources for adaptive management should be focused on the strategies/BMPs used to *achieve* the	for changes to priority receiving water conditions and numeric goals shall be provided in the Report of Waste Discharge and shall consider the following: (1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan; (2) Progress toward achieving interim and final numeric goals in receiving waters and/or MS4 discharges for the highest water quality priorities in the Watershed Management Area (3) New scientific information or new or updated policies or regulations that affect identified numeric goals including revised water quality objectives or TMDLs; (4) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality problems and implementation measures to address the highest priority receiving water conditions; (5) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees; (6) The factors listed in Provision B.2.a.(1)-(10); (7) San Diego Water Board recommendations; and

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			numeric goals. • Water Quality Improvement Strategies and Schedules would be adapted annually, allowing modification to the JRMP elements, structural BMPs, and non-structural BMPs for achieving numeric goals. Finally, to improve organization, it is proposed that the requirements regarding WQIP and JRMP modification and submittals (sub-bullets B.5.a.2 thru 3 and B.5.b.2 thru 3) be moved to a new section B.6.	(8) Recommendations for modifications solicited through a public participation process. **b. WATER QUALITY IMPROVEMENT STRATEGIES AND SCHEDULES** The water quality improvement strategies and schedules required pursuant to B.3and B.4 shall be adapted as new information becomes available to inform more effective and efficient means of achieving the numeric goals established in B.2.e. Copermittees shall consider adaptation to jurisdictional programs and monitoring and assessment strategies and schedules at least annually considering the following when applicable: (1) Changes to priority receiving water conditions and numeric goals based on recommendations from B.5.a.; (2) Measurable or demonstrable reductions of non-storm water discharges to each Copermittee's MS4; (3) Measurable or demonstrable reductions of pollutants in storm water discharges from each Copermittee's MS4 to the MEP; (4) Information on the MS4 sources and/or pollutant-generating activities determined to be most significantly contributing to priority receiving water conditions; (5) Efficiency in implementing the Water Quality Improvement Plan; (6) San Diego Water Board recommendations; and

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				(7) Recommendations for modifications solicited through a public participation process.
B.6	21	Water Quality Improvement Plan Implementation	The development of a WQIP will require at a minimum of 18 months and BMP implementation will likely be staggered over a certain time frame. Once the permit is adopted, Copermittees will begin the planning process. However, Copermittees must have at least one full fiscal year budgeting cycle within which to seek additional funding to implement the WQIP from our governing bodies (i.e., City councils and County supervisors). Thus the more reasonable time schedule is to require the development of the WQIP within 18 months and the implementations of the BMPs to occur consistent with the final approved WQIP. Furthermore, adaptive management submittals (i.e., WQIP, JRMP and monitoring modifications) and modifications should be specified under Provision F. In this manner, submittal requirements will be organized and easier for Permittees to follow. As such, the submittal requirements that were previously described under section B.5.a.2 thru 3 and section B.5.b.2 thru 3 were modified and moved to Provision F.	**As shown in the attached revised Permit revise section B.6, as follows:** **6. Water Quality Improvement Plan Submittal, Implementation, and Modifications** Requirements for Water Quality Improvement Plan submittals and modifications are described in Provision F. Requirements for corresponding modifications to the jurisdictional runoff management programs and monitoring and assessment program are also described in Provision F. Copermittees must commence with implementation of the Water Quality Improvement Plan no later than the fiscal year (July 1) following San Diego Water Board approval of the Water Quality Improvement Plan.
C. Action Levels				
C. (Intro)	22	Action Levels	The Draft Order in Provision B states that	**As shown in the attached revised Permit, revise introductory**

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			the goal of the WQIP is to identify the highest water quality priorities within a watershed and implement strategies to achieve improvements in the quality of discharge and receiving waters. Furthermore in Provision B.2.d the Permittees are required to develop and use *interim and final numeric targets/goals* to measure progress towards the protection/enhancement of the receiving waters and beneficial uses. The choice of the target/goals of the watershed may be biological, chemical, or physical based and may include multiple criteria and/or indicators. The permit should provide a clear linkage between Provision B and Provision C and state that the WQIP should guide the customization of the NALs/SALs to meet the highest water quality priorities in a given watershed and that NALs/SALs will be used to assist Copermittees in reaching the goals specified in the WQIP. The introduction to Provision C indicates that the *action levels* (NALs and/or SALs) will be incorporated into the WQIPs (B.2.d) and used to: a) Measure progress towards the protection/ enhancement of the receiving waters and beneficial uses (B.4) ; b) Direct and focus the JRMP implementation efforts for addressing MS4 discharges (D.4.a); and	**paragraphs of section C, as follows:** "The purpose of this provision is for the Copermittees to incorporate numeric non-storm water and storm water action levels in the Water Quality Improvement Plans. The action levels shall be used to guide the following program planning efforts and measure progress towards attaining the reasonable protection, preservation, and enhancement of water quality and designated beneficial uses of waters of the state: 1) Support development and prioritization of water quality improvement strategies through the Water Quality Improvement Plans. Discharge data above action levels can be evaluated using a statistical approach considering the frequency, magnitude, and loading of discharges to the receiving waters to support development of actions and prioritization of their implementation. 2) Assist in the effective prohibition of non-stormwater discharges from the MS4 pursuant to Provision E.2. 3) Support the detection and elimination of illicit discharges to the MS4 pursuant to Provision E.2. These goals will be accomplished through monitoring and assessing the quality of the MS4 discharges prior to and during the implementation of the Water Quality Improvement Plans. Exceedances of action levels are not subject to enforcement or non-compliance actions under this Order. "

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			c) Detect and eliminate non-stormwater and illicit discharges to the MS4 (E.2) Although action levels will be used for several different purposes, the action levels defined in Provision C.1 and C. 2 are chemically based and may be in conflict with the selected watershed metrics. As an example, if the watershed metric is improved IBI scores for a water body, then NALs and SALs associated with water chemistry are unlikely to be the best metric to evaluate progress towards improving IBI scores or for assessing our implementation efforts. Thus, the chemically based NALs/SALs may direct resources away from the watershed priorities. Since Provision C indicates that there are three different purposes for the action levels, the permit should recognize that the action levels for each permit provision (B.4, D.4.a, and/or E.2) may be based on different constituents, metrics, and/or may be different values. As a result, the permit should establish the purposes of the action levels and then allow the Copermittees to establish the numeric action levels. For our purpose we would submit that the action levels should be developed to support program planning and measure progress towards attaining the protection of the beneficial uses.	
C. (Intro)	22	Action Levels	The development of action levels, including	**As shown in the attached revised Permit, revise concluding**

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			the timeline should be clearly linked to the Water Quality Improvement Plans. A timeline that is separate and different from the development of the Water Quality Improvement Plans is not necessary. Previously developed action levels should serve as interim action levels until the Water Quality Improvement Plans are completed.	**paragraph of section C, as follows:** Action levels will be developed and incorporated into the Water Quality Improvement Plans (Provision B) including the Illicit Discharge Detection and Elimination (IDDE) Program (Provision E.2). Depending upon the goals/objectives for the use of the action levels and the priority receiving water conditions, the constituents and values at which they are set may differ between watersheds. Copermittees may develop Watershed Management Area specific numeric action levels for non-storm water and storm water MS4 discharges using an approach approved by the Regional Board or use the default non-stormwater and stormwater action levels prescribed within C.1 and C.2 below, respectively. The Copermittees will submit action levels as part of their Water Quality Improvement Plan(s). The action levels established as part of R9-2007-0001 will serve as the interim action levels until the Water Quality Improvement Plans are completed and approved.
C.1	22-24	Non-Stormwater Action Levels	Referencing the CTR as a "source" is misleading. It is unclear why the Board is excluding the conversion factor from the CMC and CCC Metals Criteria equations from the CTR to generate total recoverable metals criteria. Table notes need to be updated to explain how NALs were derived. It should be made clear that the MDALs and AMALs were calculated using State Implementation Standard (SIP) procedures.	Add appropriate references to the State Implementation Standard procedures and provide a narrative explanation for reasoning and application in the fact sheet, when provided.
C.1	22-24	Non-Stormwater Action Levels	Provision C.1.b of the permit requires that additional NALs must be incorporated into the Permit for any constituents causing or contributing to conditions associated with the highest non-stormwater related water quality priorities. However the provision	The permit should provide a clear linkage between Provision B and Provision C and allow the WQIP to guide the customization of the NALs based on the watershed needs. Furthermore the permit should identify past and current dry weather monitoring as a basis for the development of NALs that are watershed specific.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			does not identify other options for the development of NALs. The Copermittees believe it necessary to have the flexibility to develop NALs that are relevant to their watershed issues.	
C.2	25	Storm Water Action Levels	Provision C.2.b requires that additional SALs must be incorporated into the Permit for any constituents causing or contributing to conditions associated with the highest non-stormwater related water quality priorities. The development of SALs may be based on one of 3 options: 1) water quality standards; 2) site specific conditions; and 3) numeric WQBELs. As noted previously the Copermittees believe that it is critical that flexibility be provided in the development and implementation of the SALs to allow the Copermittees to address their highest water quality issue(s). Consequently the Copermittees support other options for developing SALs.	Other options that should be included for the development of the SALs in the Permit are the approaches identified in the California Storm Water Panel in its report, "The Feasibility of Numerical Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities" (June 2006). As previously noted, if the Copermittees do not establish action levels to support the WQIP then the Copermittees must use the SALs identified in Provision C.
D. Monitoring and Assessment Requirements				
D	26-52	Monitoring and Assessment Requirements	Current provisions are overly prescriptive and constrain the efficient or best use of Copermittee resources or for adaptive management. Significant efforts have been invested by the State and Regional Boards as well as Copermittees to develop a structured, question-driven monitoring approach. These efforts provide for the development of an effective and appropriate alternative to address the monitoring needs of the permit, which include an evaluation of the effective prohibition of non-stormwater discharges, attainment of MEP, evaluation of impacts to and improvements	Remove current Provision D and replace with the Provision D attached.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			in receiving waters, and collection of data to support management of stormwater programs.	
D.1.a	26	Jurisdictional Non-Stormwater Monitoring	The Copermittees' past monitoring results illustrate that chemical water quality monitoring data for dry weather inter-MS4 flows is not effective for eliminating dry weather discharges. The approach outlined in the Administrative Draft Tentative Order would generate a great deal of water quality data for dry weather flows and identify some IC/IDs. However, since the purpose of the program is to eliminate dry weather flows and IC/ID flows entirely, there is little value to collecting extensive dry weather water quality data for MS4 sites. Very little of the water quality data collected would support assessment of the stated program management objective to effectively prohibit non-storm water discharges to the MS4s. Consequently, this extremely resource intensive approach will be relatively inefficient in eliminating the MS4 flows and IC/IDs with any potential to adversely impact receiving waters. *See the Dry Weather Outfall Monitoring and Discussion of IDDE Program Efficiency and Effectiveness Sections of the Alternative Provision D Supporting Documentation for additional details.*	*If Provision D is not replaced, modify language to allow greater flexibility in monitoring to eliminate IC/IDs based on Copermittees' experience and understanding of how to effectively address non-stormwater discharges.*
D.1.a.1.a.	26	Jurisdictional Monitoring Requirements	Guideline ii is worded (i.e., must be selected) to require a station in each cell; however, guideline vi appears to provide some off ramps to this requirement and guideline vii sets an upper limit on the	If Provision D is not replaced, the following language should be revised: (ii) At least one non-storm water MS4 station must be selected in each cell containing a segment of the Copermittee's MS4, subject

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			number of stations even if the number of cells is greater than 500.	to the provisions in guidelines vi and vii, which must ….
D.1.a.1.a.	26	Jurisdictional Monitoring Requirements	Guideline ii requires sampling through manholes if outfalls are not available in a grid cell. Such confined space sampling can be very expensive because of additional safety requirements for the crew and the need to coordinate with police regarding traffic impacts. It can also be more hazardous for crews because they are climbing in and out of manholes in the middle of the street.	If Provision D is not replaced, the following language should be revised: (ii) [c] Other point of access (e.g., manhole) if absolutely necessary to investigate contributions from upstream sources based on downstream data from an outfall
D.1.a.1.a.	26	Jurisdictional Monitoring Requirements	Guideline ii potentially contradicts guideline iii; areas defined in iii may not exist in each cell.	If Provision D is not replaced, the following language should be revised: (iii) Where applicable, each non-storm water MS4 monitoring station ….
D.1.a.1.a.	26	Jurisdictional Monitoring Requirements	Guideline vi lists factors such as safety and traffic to consider in the location of each monitoring station. However, it does not say that these factors could result a decision to not monitor in a cell if, for example, the only potential access point was a manhole in the middle of a major arterial.	If Provision D is not replaced, the following language should be revised: vi) The following factors should be considered in determining the location and feasibility of sampling of each non-storm water…
D.1.a.1.c.i.a.3.A	29	Jurisdictional Monitoring Requirements	It is not clear if the total number of stations is 5 or if 5 stations in each of the three land use types is required, for a total of 15 stations.	If Provision D is not replaced, the following language should be revised: Add clarification that only 5 stations are required.
D.1.a.2	32	Dry Weather Ambient Receiving Water Monitoring Program	TO Provision D does not take advantage of the current state of knowledge of receiving water conditions and does not integrate the many existing receiving water monitoring efforts. The proposed monitoring would result in a significant and unnecessary duplication of monitoring efforts by the Copermittees in receiving waters.	*If Provision D is not replaced, modify language to allow greater flexibility and coordination of monitoring to achieve program objectives considering existing receiving water programs that may already meet the goals of Provision D.*

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Copermittees propose to integrate the numerous receiving waters programs at the WMA level. *See the Receiving Water Monitoring Section of the Alternative Provision D Supporting Documentation for additional details.*	
D.1.a.2	32	Dry Weather Jurisdictional Receiving Water Boundary Monitoring	Jurisdictional receiving water dry weather boundary monitoring proposed in the TO does not support the three key monitoring goals. Monitoring conducted by the Copermittees' and others have shown jurisdictional boundary monitoring of the type proposed in the TO to be ineffective in estimating water quality impacts and loading from MS4 discharges (particularly from one jurisdiction to the next). This is due to a combination of factors, including high variability of the constituent concentrations in receiving waters and discharges, typically small percentages of MS4 discharge flows and pollutant loads in the receiving waters, and uncertainty of the source of flow changes within jurisdictional boundaries. The combination of high variability and relatively small impacts or differences requires high numbers of samples to detect significant and programmatically relevant differences and would be unlikely to support programmatic changes or guide improvements to water quality. *See the Discussion of Jurisdictional Boundary Monitoring of the Alternative Provision D Supporting Documentation for*	*If Provision D is not replaced, remove the jurisdictional receiving water boundary monitoring.*

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			additional details.	
D.1.a.2	32	Jurisdictional Monitoring Requirements	It would be useful to call for the monitoring program to adhere to the design recommendations in the SWAMP Assessment Framework, which calls for structured, question-driven monitoring.	If Provision D is not replaced, the following language should be revised: "…within and through its jurisdiction. <u>The design of the receiving water monitoring program should follow the guidance on structured question-driven monitoring outlined in the SWAMP Assessment Framework. In addition, the design should be comparable with, to the extent practicable, regional scale monitoring designs and approaches being developed for the San Diego River watershed and coastal estuaries in the San Diego Region.</u> Any available monitoring …"
D.1.a.2.a.	32	Jurisdictional Monitoring Requirements	Add an emphasis on improving comparability of data and coordination of sampling.	If Provision D is not replaced, the following language should be revised: "…may be utilized as a dry weather ambient receiving water monitoring station<u>, with an emphasis on improving coordination among sampling efforts and the comparability of monitoring data.</u>"
D.1.a.2.a.ii and iii	32	Jurisdictional Monitoring Requirements	It is not clear what question(s) this requirement is meant to address and it seems arbitrary. Recommend deleting unless question(s) can be stated explicitly.	If Provision D is not replaced, Delete or modify to clarify monitoring question(s).
D.1.b	34-38	Jurisdictional Monitoring Requirements	Proposed monitoring of five MS4 outfalls in every jurisdiction is greatly in excess of the monitoring needed to characterize similar land uses and drainages. Monitoring of representative sites for homogeneous land uses or mixed-use land uses can be coordinated and the results shared among jurisdictions. *See the Wet Weather Outfall Monitoring section of the Alternative Provision D Supporting Documentation for additional details.*	*If Provision D is not replaced, modify language to allow greater flexibility and coordination of monitoring (i.e., site selection, frequency, and parameters) to achieve program objectives while focusing resources on receiving water priorities and supporting development and implementation of management actions.*

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
D.1.b.1.a.iii	35	Jurisdictional Monitoring Requirements	It is not clear if the total number of stations is 5 or if 5 stations in each of the three land use types is required, for a total of 15 stations	If Provision D is not replaced, Add clarification that only 5 stations are required.
D.2	38-42	Watershed Monitoring Requirements	Section D.2 of the Tentative Order requires more reference watershed monitoring stations (one for each WMA) than are needed to assess receiving water conditions and establish reference conditions for the region. The Copermittees propose to use the results of the San Diego Region Stream Reference Study in lieu of this requirement. Regional reference sites that are based on similar geology and watershed size will provide an appropriate measure of the expected receiving water conditions achievable in Copermittees' jurisdictions as a result of the future implementation of their WQIPs. *See the Receiving Water Monitoring Section of the Alternative Provision D Supporting Documentation for additional details.*	*If Provision D is not replaced, modify language to allow for the use of the San Diego Region Stream Reference Study results to meet the reference watershed requirements.*
D.2	38-42	Watershed Monitoring Requirements	Monitoring proposed for MLS sites is more frequent than required to answer relevant management questions about trends in receiving water conditions. Wet weather monitoring at MLS sites can be reduced to once every five years, based on the statistical simulations conducted for development of the ROWD (2011 and included in Attachment 2-1). *See the Receiving Water Monitoring Section of the Alternative Provision D Supporting Documentation for additional details.*	*If Provision D is not replaced, reduce wet weather monitoring frequency at MLS sites to once every five years.*

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
D.2.a	38	Watershed Monitoring Requirements	There is no additional value to continuing the TWAS monitoring in its current form because the constituent concentrations and patterns are generally similar at the TWAS and MLS (and especially within a watershed), (See Attachment 2-1 from the ROWD (2011)). Additional focused receiving water monitoring to address information needs should be evaluated and addressed by Copermittee Program Managers in the WQIP Monitoring and Assessment Plans. *See the Receiving Water Monitoring Section of the Alternative Provision D Supporting Documentation for additional details.*	*If Provision D is not replaced, modify language to allow greater flexibility and coordination of monitoring to achieve program objectives consistent with the determination of receiving water priorities through the WQIP development process.*
D.2.a	38	Watershed Monitoring Requirements	The distinction between these stations and those called for in D.1.a.2 is not clear, partly because the channel types have not been more completely defined but also because no monitoring questions have been stated. There could be overlap between these two types of stations, especially because the receiving water stations are to be located in natural or undisturbed areas.	If Provision D is not replaced, Clarify the distinction between receiving water and watershed stations. Define management / monitoring questions that follow the SWAMP Assessment Framework guidance.
D.2.a.1	38	Watershed Monitoring Requirements	It is not clear how the data from the mass loading stations will be used; as there is no monitoring question or link to a management issue or decision.	If Provision D is not replaced, Define management / monitoring questions that follow the SWAMP Assessment Framework guidance. Show how the mass loading data will be used. Delete these stations if the value of the data cannot be demonstrated.
D.2.a.4	38	Watershed Monitoring Requirements	A single reference station is not very useful and has all sorts of statistical problems if used in isolation. It would be better to use regional reference data, where available.	If Provision D is not replaced, use the San Diego Stream Reference Study for Reference Stations.
D.2.a.5	38	Watershed	The rationale for this station is not clear.	If Provision D is not replaced,

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Monitoring Requirements	There is no management / monitoring question or link to a management issue or decisions. In addition, there is no readily obvious scientific reason why a midpoint station would be useful.	Delete this requirement.
D.2.e and D.3	45-46	WMA Special Studies and Regional Special Studies	Reduce the number of Special Studies from 3 to 2 per WMA in consideration of the planning period required to develop the Monitoring and Assessment Plan required as part of the WQIP. *See the Source/Stressor ID and Special Studies section of the Alternative Provision D Supporting Documentation for additional details.*	Reduce the number of Special Studies from 3 to 2 per WMA.
D.4.b and D.4.c	51-52	Assessment Requirements	See comment A.4. Language should be added to limit Copermittees responsibilities to within their jurisdiction.	*If Provision D is not replaced, the following language should be revised:* "The Copermittees, within <u>their respective jurisdictions of</u> ~~in~~ each Watershed Management Area, must…"
E. Jurisdictional Runoff Management Programs				
E	53-89	Jurisdictional Runoff Management Programs	Minor grammatical correction in the first sentence.	"The purpose of this provision is for each Copermittee to implement a program to control the contribution of pollutants to and the discharges from the MS4 with<u>in</u> its jurisdiction."
E	53-89	Jurisdictional Runoff Management Programs	As stated in the second introductory paragraph in Provision E "The jurisdictional runoff management programs implemented by each Copermittee must be consistent with the Water Quality Improvement Plan for the applicable Watershed Management Area required by Provision B." Additionally, as stated in the introduction to the WQIP (Provision B) "The purpose of this provision is to develop Water Quality Improvement Plans that guide the Copermittees' jurisdictional runoff	Include language into the introductory paragraph that clearly indicates that the JRMP requirements contained in Provision E may be modified to allow for implementation of the JRMP consistent with the WQIP if appropriate justification is provided. In addition, add the following: "<u>**Modification of Jurisdictional Runoff Management Program Requirements**</u> <u>Modifications shall be considered and where selected, proposed according to the process in Provision B.5. Proposed modifications may increase, decrease, and/or replace minimum requirements</u>

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			management program implementation efforts…" However, the provisions do not clearly allow for the appropriate modification of the JRMP requirements (increases, decreases, and/or replacement of activities) contained in the permit.	identified in Provision E."
E and Attachment C	Throughout	Jurisdictional Runoff Management Programs	Clarification.	Refer to Permanent BMPs as Structural BMPs and add a definition for structural BMPs into Attachment C.
E	Throughout	Jurisdictional Runoff Management Programs	Clarification for consistency.	Change "~~Permanent BMP Sizing Criteria Design Manual~~" to "BMP Design Manual" and make reference to the current design requirements under R9-2007-0001.
E.1.a.2	53	Legal Authority Establishment and Enforcement	Sites regulated under the Construction and Industrial General Permits are regulated elsewhere and through alternative means. Clarification is necessary for sites that are not regulated under the respective General Permits.	"Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity to its MS4 and control the quality of runoff from industrial and construction sites that do not~~, including industrial and construction sites which~~ have coverage under the statewide General Permit for Discharges of Storm Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit)~~, as well as to those sites which do not~~; "
E.1.a.4 and E.1.a.5	53-54	Legal Authority Establishment and Enforcement	The Copermittees do not have jurisdiction to control MS4 discharges outside of their respective MS4s and the Regional Board does not have the authority to require interagency agreements to grant such jurisdiction, particularly for those agencies not subject to the Order (Caltrans, Native American Tribes, Military installations, etc.)	Remove, reword, and/or combine the two subsections as follows : ~~"Control through interagency agreements among Copermittees the contribution of pollutants from one portion MS4 to another portion of the MS4;"~~ and ~~"Control through interagency agreements with other owners of the MS4 such as Caltrans, the U.S. federal government, or sovereign Native American Tribes, where possible, the contribution of pollutants from one portion of the MS4 to another portion of the MS4;"~~ "Coordinate, as possible, with other agencies to minimize the contribution of pollutant discharges from the Copermittee's

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				portion of the MS4 to portions of the MS4 under another agency's jurisdiction and from other agency's portions of the MS4 to the portion of the MS4 under the Copermittee's jurisdiction"
E.2.a	54-57	Illicit Discharge Detection and Elimination	The addition of "to the extent allowable by law", as referenced from the Phase II Regulations, limits Copermittees responsibility to those that they have the legal authority to implement. Copermittees cannot implement programs outside of what they have legal authority to do. In addition, some non-storm water discharges are authorized under the permit unless the Copermittee or San Diego Water Board determines they are a source of pollutants in receiving waters. Language should be provided to account for subsection E.2.a.(3).	"To the extent allowable by law, ~~E~~each Copermittee must address all non-storm water discharges as illicit discharges, where the likelihood exists that they are a source of pollutants to waters of the U.S."
E.2.a.1	55	Illicit Discharge Detection and Elimination	Uncontaminated pumped groundwater is the only category under this section that is required to be permitted under an NPDES Permit. It should be added to the initial paragraph and the remainder of the bullets should be added to E.2.a.(3), as they are impractical to be permitted and are currently not required to be permitted.	"Discharges of non-storm water to the MS4 from uncontaminated pumped groundwater ~~the following categories~~ must be addressed as illicit discharges where there is evidence that suggests that they are the source of pollutants to waters of the U.S., unless the discharge has coverage under NPDES Permit No. CAG919001 (Order No. R9-2007-0034, or subsequent order) for discharges to San Diego Bay, or NPDES Permit No. CAG919002 (Order No. R9-2008-0002, or subsequent order) for discharges to surface waters other than San Diego Bay: ~~(a) Uncontaminated pumped ground water;~~ ~~(b) Discharges from foundation drains;~~ ~~(c) Water from crawl space pumps; and~~ ~~(d) Water from footing drains."~~
E.2.a.2	55	Illicit Discharge Detection and	Limit to within the Copermittee's jurisdiction per prior comments and reword	Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Elimination	the applicable permitting portion to allow flexibility for any subsequent NPDES permits that may be issued.	unless the discharge has coverage under a valid NPDES Permit, ~~No. CAG 679001 (~~Order No. R9-2010-0003, or a subsequent order~~)~~. This includes water line flushing and water main break discharges from water purveyors under the Copermittee's jurisdiction that has been issued a water supply permit by the California Department of Public Health or federal military installations.
E.2.a.3	55	Illicit Discharge Detection and Elimination	Non-storm water sources should be limited to anthropogenic sources within the Copermittees jurisdiction to enable to Copermittees to address those sources in which they have control over. Also, see comment E.2.a.1.	Limit the source of pollutants in receiving waters to anthropogenic sources identified as an illicit discharge within the Copermittees jurisdiction and add discharges from foundation drains, water from crawl space pumps, and water from footing drains.
E.2.a.4	56	Illicit Discharge Detection and Elimination	See comment E.2.a.	Add "or similar means where there is evidence that those discharges are a source of pollutants to waters of the U.S."
E.2.a.4.a	56	Illicit Discharge Detection and Elimination	Individual buildings may require substantial structural modifications to redirect air conditioning condensation to landscaped areas. Redirection should be encouraged instead of required.	"The discharge of air conditioning condensation ~~must~~ should be directed to landscaped areas or other pervious surfaces where feasible;"
E.2.a.4.b	56	Illicit Discharge Detection and Elimination	Complete removal of residential car washing activities is unrealistic and resources would be better used to educate the public. Public outreach has proven to be also effective in minimizing water and detergent use and encouraging the use of commercial facilities.	"~~(i)~~ The discharge of wash water must be encouraged through public outreach and education (i) to be directed to landscaped areas or other pervious surfaces where feasible, and (ii) to m~~M~~inimize the use of water for vehicle washing, use as little washing detergent and other vehicle wash products as possible, wash vehicles at commercial wash facilities, and implement other practices or behaviors that will prevent the discharge of pollutants associated with individual residential vehicle washing from entering the MS4; and"
E.2.a.4.c.ii	56	Illicit Discharge Detection and Elimination	Clarify. Discharges of saline water to the MS4 cannot be directed out of the MS4 once the discharge has occurred. Allow saline discharges to salt water receiving waters.	"The discharge of saline swimming pool water ~~to the MS4~~ must be directed to the sanitary sewer, landscaped areas, or other pervious surfaces that can accommodate the volume of water or to the MS4 if the MS4 discharges to a saltwater receiving water."

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
E.2.a.5.a.1	56	Illicit Discharge Detection and Elimination	Building fire suppression system maintenance discharges should not be considered an illicit discharge if BMPs are implemented to prevent discharge of pollutants to the MS4.	Add "where BMPs are implemented."
E.2.a.5.b	57	Illicit Discharge Detection and Elimination	Emergency firefighting discharges are exempted in the Clean Water Act. BMPs should be encouraged, not required to be implemented, particularly in emergency situations that may result in the destruction of life and property.	"Each Copermittee ~~must~~ should develop"
E.2.b.1.d	57	Illicit Discharge Detection and Elimination	MS4 and Private Outfalls should be clearly defined. The Clean Water Act definition of MS4 Outfalls limits outfalls to "major outfalls", limiting the responsibility of Copermittees' mapping of outfalls to "major outfalls" and clarifying the definition of what constitutes a "private outfall".	"All known locations of MS4 outfalls as defined by 40 CFR §122.26(b)(5-6) and private outfalls, as defined by 40 CFR 122.26(b)(9), that discharge runoff collected from areas within the Copermittee's jurisdiction,"
E.2.b.1.e	58	Illicit Discharge Detection and Elimination	Clause is redundant and confusing.	~~(i.e., receiving water segments that are both a receiving water and part of the MS4),~~
E.2.b.2	58	Illicit Discharge Detection and Elimination	Clarification is necessary to limit employee responsibilities to within the terms of their employment.	"Each Copermittee must use Copermittee personnel and contractors to assist in identifying and reporting illicit discharges and connections, if observed during the course of their daily employment activities;"
E.2.b.4	58	Illicit Discharge Detection and Elimination	The addition of language is necessary to limit Copermittees responsibility to standards that may reasonably be met.	"Each Copermittee must implement practices and procedures (including a notification mechanism) to prevent, respond to, contain, and clean up any spills that may discharge into the MS4 within their jurisdiction from any source. The Copermittee must coordinate with spill response teams to prevent to the extent possible entry of spills into the MS4, and prevent contamination of waters of the U.S. ~~surface water, ground water, and soil~~."
E.2.b.5	58	Illicit Discharge Detection and	Clarification is needed for circumstances where the source of an illicit connection	Add language to clarify responsibility: (5) Copermittees are responsible for control of discharges to their

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Elimination: Prevent and Detect	and/or discharge is from another MS4. Add language to E.2.b(5) and move current E.2.b(5) to E.2.b(6).	MS4. In the event that the source of an illicit discharge or connection is from another MS4, the Copermittee shall notify and, if necessary coordinate, with the upstream MS4 to implement and/or enforce corrective actions. Move current E.2.b(5) to E.2.b(6).
E.2.c	58	Illicit Discharge Detection and Elimination: Field Screening and Monitoring	Visual observations should be acknowledged as a way to detect non-storm water and illicit discharges and connections.	Add "Visual Observations" to the provision header and acknowledge within the text.
E.2.d	58-61	Investigate and Eliminate Illicit Discharges and Connections	See the comments above for C.1. NALs should guide JRMP implementation and management actions through the iterative process set forth in the WQIP and may trigger follow up investigations, but may trigger other alternative actions. Actions taken based on NAL exceedances should be defined in the WQIP and/or JRMP based on the most effective actions to reach their watershed-based goals.	Clarify language to state that NAL exceedances during IDDE monitoring/investigations may trigger action levels, including but not limited to follow-up investigations based on the highest watershed priorities set forth and the iterative process provided in the WQIP. In addition, limit E.2.d.1.d to exclude identified natural sources.
E.2.d.2 and E.2.d.3	59 – 61	Illicit Discharge Detection and Elimination: Investigate and Eliminate	Sections 2 and 3 outline the procedures that Copermittees must have in place. Not all language under these headers speak to procedures. Additionally, some overlap exists between these two sections.	Edits were made to ensure that requirements addressed the development of procedures. Additional edits made for clarity and to reduce overlap between sections. See the strikeout document of the admin draft for specifics.
E.2.d.2	59	Illicit Discharge Detection and Elimination	TCBMPs may be part of the MS4 and specifically designed to receive and contain pollutants. The language, as written, is inconsistent with the TCBMP requirements prescribed in Provision E.3.a of the proposed permit. Limiting language should also be added for discharges to receiving waters within the jurisdiction of the Copermittee.	"Each Copermittee must implement procedures to investigate and inspect portions of its MS4 that, based on reports or notifications, field screening and monitoring, or other appropriate information, indicate a reasonable potential of ~~receiving, containing, or~~ discharging pollutants to receiving waters within the Copermittees jurisdiction due to illicit discharges, illicit connections, or other sources of non-storm water."
E.2.d.4	61	Illicit Discharge Detection and	Language used in the current Orange County Permit (Provision R9-2009-0002)	Use Orange County permit language instead: If the Copermittee suspects the source of the non-storm water

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Elimination	provides clearer language regarding follow through.	discharge as natural in origin (i.e. non-anthropogenically influenced) and in conveyance into the MS4, then the Copermittee must ~~collect the data and evidence necessary to demonstrate to the San Diego Water Board that it is natural in origin; and~~ document the rationale for why the discharge does not need further investigation. This documentation shall be included in the Annual Report.
E.3	61	Permanent BMP Requirements for All Development Projects	No jurisdictional limitations are provided in this section. As a result, language in the subsections may be interpreted as expanding Copermittee requirements outside their MS4 jurisdiction. In addition how the Copermittees implement their program should be a decision left to the Copermittees.	Reword to "Each Copermittee, within their respective jurisdictions, must ~~use their land use/planning authorities to~~ implement a development planning program…"
E.3.a	61	Permanent BMP Requirements for All Development Projects	Added language to clarify that not all the prescribed BMPs in Section E.3.a. are applied to every project. These BMPs are applied as practical and feasible and as applicable based on the sites condition and nature of development.	"Each Copermittee, as practical and feasible, must prescribe the following BMP requirements during the planning process (i.e. prior to project approval and issuance of grading or building permits) for all development projects (regardless of project type or size), where local permits are issued, including unpaved roads and flood management projects, except emergency projects implemented for the protection of persons and property:
E.3.a.2	62	Permanent BMP Requirements for All Development Projects	Source control BMP requirements apply to all projects and should be located in one place in the Provision. Language regarding source control BMPs from E.3.c should be moved here. A definition of "properly designed" should also be provided in Attachment C.	Add "Each Copermittee must require each Priority Development Project to implement applicable source control BMPs." A definition of properly designed has been added to Attachment C.
E.3.a.5.a.vi	64	Permanent BMP Requirements for All Development Projects	Treatment for infiltration BMPs should only be required if significant pollutant levels are present.	"Infiltration treatment control BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee, unless runoff does not exceed Basin Plan water quality standards or runoff is first treated or filtered to remove pollutants prior to infiltration; and"

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
E.3.b.1.b and E.3.b.1.c	64-65	Definition of Priority Development Project	Since SUSMP requirements have been in effect since 2001, will start seeing some redevelopment projects that were subject to previous SUSMPS. Therefore, the 50% rule for redevelopment projects should apply only to projects that were not subject to any previous SUSMP requirements.	Where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development and was not subject to previous Priority Project Development requirements, the performance and sizing requirements apply to the entire development. Add the following: (c) Projects where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development *was* subject to previous Priority Project Development Requirements, only the altered portion of development is subject to the new Priority Development Project requirements.
E.3.b.2	65-66	Priority Development Project Categories	The definition of a direct discharge has been established to mean that the project is releasing flows directly into the receiving water. If the project drains into an MS4 connection which serves existing developed areas before discharging to receiving water, this is not a direct discharge. Added language for clarification	Add language to E.3.b.2.e to clarify that applicable discharges to an ESA are "not commingled with flows"
E.3.b.2.g	66	Priority Development Project	This requirement was present in the prior permit; however, the residential driveways clause was added under the proposed permit. Including residential driveways as a PDP will require unnecessary, burdensome PDP process without proportional water quality benefits. Residential driveways experience low daily traffic trips compared to highways and roads.	"Streets, roads, highways, and freeways, ~~and residential driveways~~. This category is defined as any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles."
E.3.b.3.c and E.3.b.3.d	66	Priority Development Project	An exemption for Priority Development Projects should be provided for driveways constructed with permeable surfaces.	Add driveways to (c) and (d). Add parking lots to (d).
E.3.b.3.e	66	Priority	This exemption allows small individual	Add language as follows:

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Development Project Categories	residential projects to apply minimum BMPs that meet a minimum performance standards without going through the burdensome PDP review and approval process including; preparation of a full PDP study, and maintenance, verifications, and inspection of permanent treatment control BMPs. Under the current proposed language, single family residence as small as 5,000sf may be subject to PDP requirements, and is lumped in with industrial and commercial development; The potential pollutants generated by small residential are not as significant as industrial or commercial and can be effectively reduced by effective source control and minimum permanent BMPs.	(e) Single-family residential projects that are not part of a larger development or proposed subdivision and implement BMPs that meet minimum performance standards, as outlined in the BMP Design Manual.
E.3.b.3.f	66	Priority Development Project Exemption	This exemption provides an alternative design standard for smaller roadway projects. Existing roads may provide a great retrofit opportunity, but have many challenges due to physical constraints. Existing roads are considered utility corridors, in addition to being adjacent to buildings and structures which makes it physically impossible to fit BMPs that meet PDP sizing criteria. Therefore, Green Street concept is a design alternative.	Add language as follows: (f) Any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles~~.~~ that follows the USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets[1] to the MEP. 1:http://water.epa.gov/infrastructure/greeninfrastructure/index.cfm
E.3.c.1	66	Source Control BMP Requirements	See comment E.3.a.2	Remove Section and move language to Provision E.3.a.2.
E.3.c.2	66-67	Retention and Treatment Control BMP Requirement	A second tier standard is proposed for sites where on site retention is not feasible due to adverse soils or other conditions. The proposed language allows projects to provide pollutant removal equal to the	See Redlines to Section E.3.c (1) , page 86 of City of SD version

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			retention standard by capturing and treating a larger volume. Since equal pollutant removal is to be achieved, offsite mitigation should not be required if the second tier standard is met. This also provides flexibility to achieve retention of the design capture volume utilizing different design alternatives such as bioretention or biofiltration.	
E.3.c.2.b	67	Priority Development Project	Proposed language requires retention of the differential runoff volume to mimic natural hydrology. The main principle of LID is to mimic natural hydrology.	"Each Priority Development Project must be required to implement LID BMPs that are sized and designed to retain the difference in volume ~~equivalent to~~ between the runoff volume produced in the post-project condition as compared to the pre-project condition resulting from a 24-hour 85th percentile storm event ("design capture volume"). A footnote should also be provided clarifying that the "Design capture volume is a single event based volume available after an extended dry period".
E.3.c.3	68	Hydromodification Management BMP Requirements	The Regional Board adopted the San Diego Hydromodification Management Plan (HMP) in July 2010. Significant work, technical analysis and input have gone into the development of the HMP and these requirements have been in effect for only 16 months. Rather than providing separate criteria, the permit should acknowledge implementation of the Regional Board approved HMP as a sufficient mechanism for meeting hydromodification requirements.	Add the following: "Each Copermittee must require each Priority Development Project disturbing greater than one acre to implement hydromodification management BMPs, as described in the Copermittees current HMP, as applicable."
E.3.c.3	68	Hydromodification Management BMP Requirements	The requirement to match naturally occurring pre-development runoff conditions holds redevelopment to a higher standard than new development and mandates redevelopment projects to mitigate beyond site's impact. Redevelopment is widely accepted as	Add the following: "Post-project runoff flow rates and durations do not exceed pre-development ~~(naturally occurring)~~ runoff flow rates and durations by more than 10 percent (for the range of flows that result in increased potential for erosion or degraded channel conditions downstream of Priority Development Projects)."

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			benefiting water quality along with providing other environmental benefits. Redevelopment should be incentivized to ensure an overall improvement of water quality by proposing HMP requirements that are reasonable and achievable on site.	
E.3.c.3	68	Hydromodification Management BMP Requirements	Flexibility is needed since available research and study has not determined the most appropriate methods for sediment supply compensation. Reworded the paragraph to allow assessment, preservation and compensation at a regional level rather than project level.	Add the following: "Projects shall preserve, where feasible, or provide compensation for significant losses of sediment supply anticipated as a result of development."
E.3.c.4	69	Alternative Compliance for Technical Infeasibility: Mitigation	The proposed language allows the alternative compliance program to be optional and gives copermittees the discretion to exercise the program if it is determined to be beneficial and practical for the municipality. The City wants to ensure that the offsite mitigation does not end up in the permit where it becomes expectation that the City manages offsite mitigation for private developments. There are many factors to be taking into consideration in administering a mitigation program including: overhead cost to manage such a program, availability of land, long term maintenance responsibilities & cost, variability and lack of accurate cost estimate of BMPs construction & maintenance cost.	Add "Alternative compliance is an optional program for the Copermittees to utilize if it is determined to provide an equal or greater benefit than onsite compliance. Where alternative compliance is allowed, it is the sole responsibility of the project applicant to execute the alternative compliance and comply with the following requirements: ~~subject to the following requirements:~~"
E.3.c.4.c	70	Alternative Compliance for Technical Infeasibility: Mitigation	This section was revised to reflect the proposed revisions to the Retention requirements.	Modify language as follows: and/or ~~increased pollutant loads~~ water quality equivalence expected to be discharged from the site. The Project applicant must perform offsite mitigation for: [a] The portion of the pollutant load in the design capture volume that is not retained or equally treated onsite,

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				and/or [b] The portion of the increased potential erosion of downstream receiving waters not fully controlled with hydromodification management BMPs onsite. ~~For the pollutant load in the volume of storm water not retained onsite with retention LID BMPs, or increased potential erosion of downstream receiving waters not fully controlled onsite with hydromodification management BMPs, the Copermittee must require the project applicant to either 1) implement an offsite mitigation project, and/or 2) provide sufficient funding for a public or private offsite mitigation project via a mitigation fund.~~
E.3.c.4.c.iii	71	Mitigation Project Timing	The requirement that offsite mitigation projects "be completed upon the granting of occupancy for the first project that contributes funds towards the offsite mitigation project…" is not feasible. Due to the length of time it takes to acquire all of the necessary permits, this timeline is not realistic for regional facilities and will serve as a deterrent to their construction as an alternative compliance mechanism. Additionally, it may take several years for a Copermittee to accumulate the funds necessary for the design, construction and permitting of a regional facility.	Modify as follows: Offsite mitigation funding ~~projects~~ must be secured by the applicant and verified by the Copermittee prior to granting construction permits or recording of maps,whichever comes first, for each ~~completed upon the granting of occupancy for the first project that contributed funds toward the offsite mitigation project, unless a longer period is authorized by the San Diego Water Board.~~
E.3.e.2.a	73	Priority Development Project BMP Implementation and Oversight	Removal of the term "continuously" is suggested so ensure Copermittees do not have to allocate resources for incessant updates to the database. Language should also be added to clarify that, although the database will be watershed-based, each	"Each Copermittee must develop and ~~continuously~~ regularly maintain a watershed-based database to track and inventory all Priority Development Projects and associated structural ~~permanent~~ BMPs within their jurisdiction. Inventories must be accurate and complete beginning from January 2002 for the San Diego County Copermittees, February 2003 for the Orange

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Copermittee is responsible only for inventory under their jurisdiction.	County Copermittees, and July 2005 for the Riverside County Copermittees. The database must include, at a minimum, the following information:"
E.4	75	Construction Management	Storm Water Pollution Prevention Plan (SWPPP) is a State General Construction Permit term, and should not be used within the MS4 permit so that there is no confusion. Replace with Pollution Control Plan.	Replaced SWPPP with Pollution Control Plan
E.4	75	Construction Management	The language has been updated so that the Copermittee can define which construction projects will be inventoried within its jurisdictional program. Not all jurisdictions apply permits the same way, therefore each needs the ability to address their processes in regards to construction projects. This will eliminate projects in the inventory that are issued local building or construction permits but have no ground disturbance, e.g. plumbing, electrical, mechanical, decks, patios, etc.	Add the following: a. "<u>Construction Program Management</u> <u>Each copermittee must define in the Jurisdictional Runoff Management Plan the following:</u> (1) <u>Define construction sites to be inventoried, such as sites that involve any ground disturbance or soil disturbing activities.</u> (2) <u>Define a process for ensuring adequate construction BMP implementation for non-inventoried sites. Non-inventoried sites involve minor construction activities that are not anticipated to create storm water pollution such as interior improvements, plumbing, electrical and mechanical work. "</u>
E.5	79-85	Existing Development Management	After years of implementation of existing development programs, the Copermittees have the knowledge and experience to implement programs consistent with the goals of the Order and the adaptive management process required under the Order. In order to accomplish this goal, the Copermittees have reorganized and provided a concise existing development section as an alternative to the current	Replace the current provision E.5 with the proposed Provison E.5 located in the strikeout version provided.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			provision E.	
E.5.a	79	Existing Development Management	Adding the term "reasonable potential to discharge" allows flexibility for the Copermittees to determine priorities. Practically all existing properties have the potential to generate pollutant loads and the inspection program will be ineffective and impractical to implement as written. The focus needs to be on significant pollutant load discharges so inspections and enforcement can actually succeed in receiving water pollutant load reductions versus spending an exhaustive amount of time and money inspecting sites that discharge no pollutant loads, but have the potential to generate minimal loads.	*If the current Provision E.5 is not replaced, modify as follows:* "Each Copermittee must maintain an updated watershed-based inventory of all its existing development that has the reasonable potential to ~~may potentially~~ ~~generate~~ discharge a pollutant load to and from the MS4".
E.5.a.1.c	79	Existing Development Management	The SIC Code system was replaced by the NAICS Code system in 1997. As a result, the use of the SIC Code system is being phased out.	*If the current Provision E.5 is not replaced, modify as follows:* c) SIC Code or NAICS Code, if applicable;
E.5.a.4, E.5.a.7	79	Existing Development Management	Mobile home parks are outside the jurisdiction of Copermittees. Also, minor grammatical corrections.	*If the current Provision E.5 is not replaced, modify as follows:* "(4) Identification ~~if a business is a~~ of mobile businesses; " "(7) ~~Identification if an area is a~~ Common Interest Areas (CIAs) / Home Owner Associations (HOAs)~~, or~~ and ~~mobile home parks~~; "
E.5.a.13	80	Existing Development Management	The continual requirement for map updating is excessive. Regularly updated maps should be sufficient for up-to-date information without requiring Copermittees to expend excessive resources.	*If the current Provision E.5 is not replaced, modify as follows:* "A ~~continually~~ regularly updated map showing the location of inventoried existing development, watershed boundaries, water bodies, and pollutants generated at the inventoried existing development."
E.5.b	80	Retrofitting and Channel	This is a new requirement, as compared to the prior permit, which only requires an	*If the current Provision E.5 is not replaced, modify as follows:*

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Rehabilitation in Areas of Existing Development	evaluation of channels that may be retrofitted. In many instances, channel rehabilitation may not be feasible and other options for improving discharge water quality would need to be considered. Language should be clarified to indicate retrofit and channel rehabilitation are options the Copermittees have at their disposal, but are not necessarily obligatory.	Remove this Provision entirely or include it as an option for compliance as stated below: "…and rehabilitate–channels and/or receiving waters to restore impaired beneficial uses of streams within its jurisdiction, as feasible."
E.5.b.3	80	Existing Development Management	The proposed permit requires the Copermittees to "encourage" landowner retrofit to private property through the "Copermittee's use of subsidies, penalties, or other incentives." Copermittees will face serious enforcement (and possibly legal) issues if they attempt to penalize private landowners for failing to expend their own time, effort, and money retrofitting properties that landowners had no intention of altering in the first place. In addition, water quality, feasibility, cost effectiveness, and community acceptance should be considered when a strategy is developed for retrofit and/or channel rehabilitation.	*If the current Provision E.5 is not replaced, modify as follows:* Each Copermittee must implement retrofit and channel rehabilitation projects, as feasible, that address the highest water quality priorities identified in the Water Quality Improvement Plan pursuant to Provision B.3.a. Ranking may also take into account water quality, project feasibility cost effectiveness, and community acceptance. The Copermittee ~~must~~ should encourage private landowners to implement retrofit designs, at minimum, through the use of public education and outreach. ~~and channel rehabilitation projects whenever practical. Private landowners should be encouraged through the Copermittee's use of subsidies, penalties, or other incentives.~~
E.5.b.5	81	Existing Development Management	See comments for Provision E.5.b.	*If the current Provision E.5 is not replaced, modify as follows:* "Where retrofitting and channel rehabilitation within specific areas of existing development under the Copermittees jurisdiction are determined to be infeasible to restore and protect receiving waters from the highest water quality priorities identified in the Water Quality Improvement Plan, each Copermittee ~~must~~ may identify, develop, and implement regional retrofitting and channel rehabilitation projects..."
E.5.b.7	81	Existing	Resource re-allocation will assist in	*If the current Provision E.5 is not replaced, modify as follows:*

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Development Management	neutralizing costs for any channel rehabilitation/retrofit projects undertaken by the Copermittees and will have a more significant likelihood of improving water quality than monitoring. Add.	<u>(7) Upon Regional Board approval and in lieu of monitoring during any given year, the Copermittees may reallocate resources originally authorized for water quality monitoring for retrofit and/or rehabilitation project(s), for a maximum of two nonconsecutive years during the permit term.</u>
E.5.c.1	81	Existing Development Management	Required use of pollution prevention methods will be extremely difficult to enforce, particularly if residential land uses are included.	*If the current Provision E.5 is not replaced, modify as follows:* Each Copermittee must ~~require~~ <u>promote</u> the use of pollution prevention methods by the inventoried existing development <u>through public outreach</u>.
E.5.c.2	81	Existing Development Management	See comment E.5.a.	*If the current Provision E.5 is not replaced, modify as follows:* "Each Copermittee must designate a minimum set of BMPs required for all inventoried existing development <u>with the reasonable potential to discharge pollutant loads to their MS4</u>, including special event venues ~~that have the potential to generate pollutants~~."
E.5.c.3	81	Existing Development Management	See comment E.5.a.	*If the current Provision E.5 is not replaced, modify as follows:* Each Copermittee must implement, or require the implementation of, designated BMPs at inventoried existing development that have the <u>reasonable</u> potential to ~~generate~~ <u>discharge</u> pollutant~~s~~ <u>loads</u> <u>from their MS4</u>.
E.5.c.4	82	Existing Development Management	See comment E.5.a.	*If the current Provision E.5 is not replaced, modify as follows:* Each Copermittee must operate and maintain, or require the operation and maintenance of designated BMPs at all inventoried existing development <u>that have been identified by the Copermittee as having the reasonable potential to discharge pollutant loads to their MS4</u>.
E.5.c.4.b	82	Existing Development Management	Clarification is necessary that Copermittees are only responsible for the work conducted within their jurisdiction and under their	*If the current Provision E.5 is not replaced, modify as follows:* "Each Copermittee must implement procedures during the

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			authority.	operation and maintenance of public streets, unpaved roads, paved roads, and paved highways and freeways, conducted under their authority and within their jurisdiction, that will reduce the contribution of storm water pollutants to the MEP and effectively prohibit the discharge of non-storm water pollutants from the MS4 to receiving water bodies. During maintenance of unpaved roads, each Copermittee must examine the feasibility of replacing existing culverts or designing new culverts/bridge crossings to maintain natural stream geomorphology.
E.5.c.5	82	Existing Development Management	See comment E.5.a.	*If the current Provision E.5 is not replaced, modify as follows:* "Each Copermittee must implement procedures, or require the implementation of procedures, to reduce the contribution of pollutants in storm water to the MEP and effectively prohibit non-storm water discharges associated with the application, storage, and disposal of pesticides, herbicides and fertilizers from inventoried existing development ~~into and from the MS4s.~~ identified by the Copermittee as having the reasonable potential to discharge pollutant loads into or from their MS4."
E.5.d	83	Existing Development Management	See comment E.5.a.	*If the current Provision E.5 is not replaced, modify as follows:* "Each Copermittee must conduct inspections of inventoried existing development that have been identified by the Copermittee as having the reasonable potential to discharge pollutant loads from their MS4 to ensure compliance with applicable local ordinances and permits, and the requirements of this Order."
E.5.d.1	83	Existing Development Management	See comment E.5.a.	*If the current Provision E.5 is not replaced, modify as follows:* "Each Copermittee must establish appropriate inspection frequencies for inventoried existing development based on the priorities set forth in the Water Quality Improvement Plan, and the potential for discharging pollutants via storm water and non-storm water runoff. At a minimum, inventoried existing development that has been identified by the Copermittee as having the reasonable potential to discharge pollutant loads to and from their MS4 must be inspected once ~~every five years~~ during

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				<ins>the permit term</ins>. Inventoried existing development must also be inspected within six months of any change in property ownership or ~~change~~ <ins>increase</ins> in pollutant generating activity..”
E.5.d.2.d through E.5.d.2.f	83-84	Existing Development Management	The addition of “if present” is necessary for clarification.	*If the current Provision E.5 is not replaced, modify as follows:* “(d)Visual observations of actual non-storm water discharges<ins>, if present</ins>; (e)Visual observations of actual or potential discharge of pollutants<ins>, if present</ins>; (f)Visual observations of actual or potential illicit connections<ins>, if present</ins>; and…”
E.5.e	85	Existing Development Management	Limiting language should be included for the Copermittee’s jurisdiction. The existing development inventory and enforcement should be limited to development with the reasonable potential to discharge pollutants.	*If the current Provision E.5 is not replaced, modify as follows:* “Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried existing development <ins>identified by the Copermittee as having the reasonable potential to discharge pollutant loads from the MS4 within their jurisdiction</ins>, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.”
E.6	85	Enforcement Response Plans	Enforcement response plans are already codified in Copermittees’ municipal codes. This section increases requirements for enforcement response and should be made more concise.	Recommend replacement of Enforcement Response Plan Provision with Copermittee streamlined provision, contained in the strikeout provided.
E.6.b.5	87	Enforcement Response Plans	Two weeks compliance is an extremely short time period for maintenance of TCBMPs and reasonable only if the next rain event is within that two week period. One month is much more reasonable and realistic for confirmation of TCBMP maintenance and is consistent with Copermittee implementation experience and	*If the current Provision E.6 is not replaced, modify as follows:* “For violations of permanent BMP maintenance requirements, all violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than than ~~10 business~~ <ins>30 calendar</ins> days after the violations are discovered. If more than ~~10 business~~ <ins>30 calendar</ins> days are required for compliance, a rationale must be recorded in the electronic

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			existing ordinances.	database or equivalent tabular system used to track permanent BMP inspections. "
E.6.c.2	87-88	Enforcement Response Plans	Criminal penalties should be limited to intentional or criminally negligent acts.	*If the current Provision E.6 is not replaced, modify as follows:* The enforcement process must include, at a minimum, appropriate sanctions to compel compliance, such as: (a) Verbal and written notices of violation; (b) Cleanup requirements; (c) Fines; (d) Bonding requirements; (e) Administrative and criminal <u>(if intentional or criminally negligent)</u> penalties; (f) Liens; (g) Stop work orders; and (h) Permit and occupancy denials.
E.6.c.4	88	Enforcement Response Plans	See comment E.6.b.5.	*If the current Provision E.6 is not replaced, modify as follows:* Change 10 business days to 30 calendar days.
E.6.d.1	88	Enforcement Response Plans	San Diego Water Board notice should be consistent with 40 CFR §122.41(l)(6) and the State of California Construction General Permit. Generally, the requirements should be 24 hour verbal notice and five day written notification. Also, email should suffice as written notice.	"Each Copermittee must notify the San Diego Water Board in writing within ~~48 hours~~ <u>5 calendar days</u> of issuing ~~high level~~ <u>escalated</u> enforcement (as defined in the Copermittee's Enforcement Response Plan) to a construction site that poses a significant threat to water quality as a result of violations or other non-compliance with its permits and applicable local ordinances, and the requirements of this Order. <u>Written notification may be provided electronically in email form."</u>
E.7.b.	89	Public Education and Participation	Public participation activities are more closely related to education and outreach, and are inherently different from intergovernmental coordination. Therefore public participation should be included with outreach activities. Move from E.7.b. to E.7.a.	"Each Copermittee must implement a public education <u>and participation program</u>, as appropriate, to promote and encourage <u>the development of programs</u>, management practices, control techniques and systems, design and engineering methods, and behaviors that reduce the discharge of pollutants in storm water to the MEP, prevent controllable non-storm water discharges from entering the MS4, and protect water quality standards in receiving

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				waters. The public education program must include~~, at minimum,~~ the following:”
E.7.a.(1)	89	Public Education and Participation	There is specific emphasis on pesticides, herbicides and fertilizers. The rationale for the specificity of these topics is unclear. Given the emphasis on showing changes in water quality, education efforts should be focused on activities that address the pollutants of concern and behaviors that are tied to water quality issues. Therefore, each Copermittee, by jurisdiction and watershed, should identify, determine and prioritize the activities that address priorities consistent with Provision B.	Educational activities, public information activities, and other appropriate outreach activities intended to reduce pollutants ~~associated with the application of pesticides, herbicides and fertilizer in storm water discharges~~ of concern from the MS4 to the MEP. Activities shall be determined and prioritized by Copermittees by jurisdiction and/or watershed (Section 5.c.(5) to address the highest threats to water quality, such as pesticides, herbicides and fertilizers, used oil, toxic waste, etc.;
E.7.a (2)	89	Public Education and Participation	There is specific emphasis on used oil and toxic material disposal. The rationale for the specificity in education topics is unclear. As stated above, Copermittees should be able to target education efforts on the pollutants and behaviors most commonly linked to the water quality issues within their respective jurisdictions and watersheds. Thus, this section is incorporated in the changes proposed above and would become part of E.7.a.1.	Move section E.7.a(2) into E.7.a(1).
E.7.a(3)	89	Public Education and Participation	There is specific emphasis on construction site operators as a target audience, with “other target audiences as determined by the Copermittee(s)”. The rationale for this is unclear. Per the justification above, each Copermittee should be able to determine target audiences in accordance with high risk activities and high priority pollutants within their jurisdiction and watershed(s). Once re-worded, this paragraph then becomes E.7.a (2), because the first two	“Appropriate education and training measures ~~for construction site operators and other~~ specific target audiences, as determined and prioritized by the Copermittees by jurisdiction and watershed, based on high risk behaviors and pollutants of concern, such as construction site operators, residents, underserved target audiences and school-aged children.”

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			paragraphs have been combined per the comments above. .	
E.7.b	89	Public Education and Participation	Inclusion of evaluation and assessment for education and outreach activities is a critical tool for adaptive management and should be addressed. Use of assessment is heavily cited in the development of the overall Water Quality Improvement Plan strategy. In addition, the purpose of intergovernmental coordination on respective JRMPs is unclear. Append to allow for watershed and regional collaboration of education and outreach activities based on effectiveness as determined by the Copermittees. Remove requirement for intergovernmental collaboration on jurisdictional runoff management programs. Add E.7.b as evaluation and assessment and move the current E.7.b to E.7.c.	Include the following language as E.7.a(3): b. "<u>Each Copermittee shall incorporate a mechanism for evaluation and assessment of educational and other outreach activities, as needed, to identify progress and incorporate modifications necessary to increase the effectiveness of the public education program.</u>" c. "Each Copermittee<u> may determine, where appropriate and effective, mechanisms for intergovernmental coordination on education and outreach activities</u>. ~~must incorporate a mechanism for public participation and where necessary intergovernmental coordination in updating, developing, and implementing its jurisdictional runoff management program.~~
F. Reporting				
F.1 and F.2	90	Reporting	Changes for consistency with Provision B.6.	Change timeframe from 12 to 18 months.
F.1	90	Reporting	Minor changes incorporated for consistency with Provision B.	Incorporate timeline consistent with Provision B.
F.2.a	90	Reporting	Additional language is necessary to clarify that modification of program elements of the jurisdictional runoff management program will include rationale for any changes to program elements prescribed in Provision E.	Add "Jurisdictional Runoff Management Program document updates that modify program elements from the requirements of Provision E must provide rationale for the modifications within the update documents." Add similar language for the BMP design manual and the Water Quality Improvement updates.
F.2.b	90	Reporting	See F.2.a.	See F.2.a.
F.2.c	91	Reporting	See F.2.a.	See F.2.a.
F.3.b	91	Reporting	Clarification.	"…The first Annual Report must be prepared for the reporting period beginning <u>July 1 after adoption of the permit, and upon</u>

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				San Diego Water Board determination that ~~the date the San Diego Water Board determines that~~…"
F.3.b.	91-92	Reporting	The San Diego Water Board should provide flexibility to allow updates to the Jurisdictional Runoff Management Program Annual Report Form (Attachment D).	Clarify "(Attachment D or approved revision" throughout the Provision.
F.3.b.1 (a through c)	91	Reporting	Monitoring data should be discussed under proposed modifications of the WQIP.	Move a through c under (iii) in original document (now iv).
F.3.b.1.d	92	Reporting	See F.2.a.	Add: (iii) "Proposed modifications to water quality improvement or jurisdictional strategies with associated rationale for such modifications,"
F.3.b.2	92	Reporting	Each Copermittee must submit the report form for each WMA in which they have jurisdiction. Language has been clarified.	Add: "Each Copermittee's Annual Report form must summarize the jurisdictional activities in the WMAs in which the Copermittee has jurisdiction."
F.4	93	Reporting	The Copermittees require language clarification that the regional clearinghouse may be maintained by another agency.	Add a footnote: "The Copermittee may elect to develop and maintain the clearinghouse(s) provided by other Copermittees or agencies."
F.5	93	Reporting	See F.4.	Add similar language from F.4.
G. Principal Watershed Copermittee Responsibilities				
G	96	Principal Watershed Copermittee Responsibilities	Coordinating and developing, with the other Copermittees, the requirements of Provisions F.3.c, F.4, and F.5.b of this Order.	Remove requirement that Principal Copermittee can only be Principal Copermittee for 2 watersheds. Clarify that all Copermittees have some level of commitment, not just the Principal Watershed Copermittee.
H. Modification of Programs				
H	97	Modification of Programs	Modifications of programs are allowed under the WQIP as part of the iterative process and adaptive management. Language should be added to that effect or there may be annual amendments to the Order.	"Proposed modifications outside of the WQIP process that are not minor require amendment of this Order in accordance with this Order's rules, policies, and procedures."
I. Standard Permit Provisions and General Provisions				
			N/A	None.
Attachment A. Discharge Prohibitions				
Attachment A,	A-1	Attachment B to	The Resolution has been adopted as 2012-	Reference adopted SWRCB Resolution 2012-0012.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
2		State Water Board Resolution 2012-001X	0012 and should be updated accordingly throughout the document. Order should be incorporated by reference instead duplication.	
Attachment B. Standard Permit Provisions and General Provisions				
Attachment B	B1-B5	Standard Permit Provisions and General Provisions	This attachment incorporates the standard NPDES permit provisions as identified in 40 CFR 122.41. Although correctly transposed from the regulations the provisions are obviously developed for a traditional point source permit (i.e. wastewater permit). As such there are a number of standard provision that pose challenges to the Copermittees to comply with. Clarification is requested on a number of the provisions.	See specific changes noted below.
Attachment B, 1.m	B-7	Bypass	This provision requires the Copermittees to notify the Regional Board whenever an anticipated or unanticipated bypass will occur. Given the nature of storm events and the fact that stormwater treatment BMPs include bypass provisions to protect the BMP integrity it would appear that the Copermittees should notify the Regional Board anytime a storm is predicted to ensure compliance with the provision (whether anticipated or unanticipated). This provision was crafted for typical wastewater discharges and has little relevance to stormwater.	Delete this provision.
Attachment C. Acronyms, Abbreviations and Definitions				
Attachment C	C1-C10	Definitions	Definitions need to be added for: properly designed, BMP Design Manual, Public Education, Outreach, and Participation channel rehabilitation and improvement, and retrofit. As currently written, the permit authorizes subjective broad authority and	Suggested definitions are provided in the strikeout.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			deference to the Regional Board in interpretation of the definitions, if not included. Minor clarifications and grammatical corrections are also included.	
Attachment C	C-6	Definitions – MS4	The addition of CWA language to the definition of MS4 limits Copermittees' responsibilities to within their jurisdiction and strengthens support that Copermittees are not responsible for discharges in MS4s that they do not operate.	Add "Copermittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators." 40 CFR §122.21(a)(vi).
Attachment C	C-7	Definitions – Pre-Development Runoff Conditions	The definition for Pre-Development Runoff Conditions should be the exact language codified in the Federal Register at 64 FR §68761.	**Replace the definition as follows:** **Pre-Development Runoff Conditions** – "Runoff conditions that exist onsite immediately before the planned development activities occur. Pre-development is not intended to be interpreted as that period before any human-induced land disturbance activity has occurred." 64 FR §68761.
Attachment C	C-7	Definitions – Public Education, Outreach, and Participation	Neither Public Education and Outreach, nor Public Participation are mentioned in the definitions section of Attachment C. Please add definitions for these non-structural BMPs.	**Add "Public Education, Outreach and Participation –** Programs to educate residents, businesses and visitors about the importance of water quality and water quality programs so that they will support local efforts and understand their role in protecting receiving waters. The Education and Outreach Program will increase knowledge and awareness, improve attitudes toward storm pollution prevention, and provide a foundation for changing behaviors that contribute to storm water pollution."
Attachment C	C-10	Definitions – Waters of the state	Current permit language, citing the California Water Code, presupposes that all portions of the MS4 are considered waters covered by the definition of waters of the state, "Any water, surface or underground, including saline waters within the boundaries of the State [CWC Provision 13050 (e)]." This language should be	**"Waters of the State** - Any water, surface or underground, including saline waters within the boundaries of the State [CWC Provision 13050 (e)]. The definition of the Waters of the State is broader than that for the Waters of the United States in that all water in the State is considered to be a Waters of the State ~~regardless of circumstance or condition~~. Under this definition, portions of a MS4 may be ~~is always~~ considered to be a Waters of the State. However, man-made portions of the MS4 constructed

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			limited based on the intent of the definition (natural water sources) and should not include dry man-made structures that collect runoff for the sole purpose of flow volume/velocity and/or pollutant reduction.	<u>for the sole purpose of flow and/or pollutant reduction will not be considered Waters of the State.</u>"
Attachment D. Jurisdictional Runoff Management Program Annual Report Form				
			N/A	None.
Attachment E. Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011				
Attachment E	E-1 to E-30	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011	Most requirements are outlined already in the TMDLs and the redundancy of this Attachment is unnecessary. In fact, Attachment E *adds* many TMDL requirements not provided in the TMDL Resolutions, circumventing the TMDL public process. Implementation will be inconsistent with previously adopted resolutions and CLRPs and MPs already drafted, submitted, approved, and/or implemented. A summary of inconsistencies between the TMDLs and Attachment E, where the City of San Diego is listed as a responsible party, are provided as an attachment to this table.	On page E-1, reword to clarify that TMDL implementation must be incorporated into the WQIP and Monitoring sections by the Copermittees and reference the Resolution Numbers in the TMDL list and add recommended compliance language per comments below. Address all inconsistencies with the TMDL Resolutions (provided as attachment).
Attachment E	E-1	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011	The Rainbow Creek TMDL for Total Nitrogen and Phosphorous does not include Wasteload Allocations for the County of San Diego Copermittees. The TMDL only contains Load Allocations. Load allocations should not be implemented through an NPDES permit. It is inappropriate to simply "re-name" the Load Allocations as Wasteload Allocations.	Strike the following TMDL from Attachment E in its entirety: Total Maximum Daily Loads for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed
Attachment E	E-1 to E-30	Specific Provisions for	State and federal law do not require the use	See recommended changes in the attached revised Permit to the

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Total Maximum Daily Loads Applicable to Order No. R9-2012-0011	of numeric effluent limitations for MS4 permittees, but rather encourage flexible implementation of best management practices through an iterative process. Specifically, the choice to include either management practices or numeric limitations in MS4 permits is within the regulatory agency's discretion, and on the question of whether MS4 permits must contain numeric effluent limitations, the court upheld EPA's use of iterative BMPs in place of numeric effluent limitations for storm water discharges. (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)[1] Given the challenges with meeting the numeric WQBELs (even with the implementation of a comprehensive suite of BMPs) and the flexibility allowed by State and federal regulations and guidance, a BMP-based WQBEL approach should be allowed for complying with TMDLs. Removing the numeric WQBELs is not proposed. Rather, inclusion of a WQIP-based "compliance path" is recommended. The WQIPs can and should be used as the basis for establishing WQBELs expressed as BMPs. The WQIPs can satisfy the necessary elements of BMP-based WQBELs. For example, the WQIPs would meet the requirements described in the 2010 EPA memo (which updated key aspects of	following: • Provision A.4.c • Provision A.4.d • Provision B (first paragraph) • Provision B.3 Additionally, within the requirements for each individual TMDL in Attachment E, include language similar to the following,: Compliance may be demonstrated via any one of the following methods: 1. There is no discharge from the MS4, or 2. Applicable effluent limitations are met, or 3. Receiving waters meet the applicable receiving water limitations or water quality objective, or 4. Loading from the MS4 is such that it does not cause water quality objective exceedances, or 5. For Copermittee(s) that are implementing a Regional Board-approved WQIP, WQBELs will be implemented as BMPs and compliance will be based upon implementing all provisions of the WQIP in accordance with the approved milestones and schedule.

[1] See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			the 2002 memorandum) regarding federal expectations for incorporation of TMDLs WLAs into NPDES stormwater permits as BMP-based WQBELs.	
Attachment E	E-1 to E-30	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011	The findings of California's Stormwater Blue Ribbon Panel, which was convened specifically to examine the feasibility of incorporating numeric effluent limits in stormwater permits, ultimately concluded that numeric limits were generally infeasible across all three stormwater activities (municipal, industrial, and construction), with a few exceptions (*The Feasibility of Numeric Effluent Limits Applicable to Discharges of Stormwater Associated with Municipal, Industrial and Construction Activities, June 19, 2006*). Additionally, state law and policy does not require the use of numeric effluent limitations in MS4 permits. In 2009, the State Water Board affirmed this approach in a precedential order, stating: [i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California's NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether a future municipal storm water permit requirement appropriately implements a storm water wasteload	See recommended changes in the attached revised Permit to the following: • Provision A.4.c • Provision A.4.d • Provision B (first paragraph) • Provision B.3 Additionally, within the requirements for each individual TMDL in Attachment E, include language similar to the following,: Compliance may be demonstrated via any one of the following methods: 1. There is no discharge from the MS4, or 2. Applicable effluent limitations are met, or 3. Receiving waters meet the applicable receiving water limitations or water quality objective, or 4. Loading from the MS4 is such that it does not cause water quality objective exceedances, or 5. For Copermittee(s) that are implementing a Regional Board-approved WQIP, WQBELs will be implemented as BMPs and compliance will be based upon implementing all provisions of the WQIP in accordance with the approved milestones and schedule.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			allocation will need to be decided on the regional water quality control board's findings *supporting either the numeric or non-numeric* effluent limitations contained in the permit. (Order WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)	
Attachment E. Part 1.b, 2.b, 3.b, 4.b, 5.b, and 6.b	E-2, E-4, E-6, E-9, E-13, and E-19	Water Quality Based Effluent Limitations	Federal regulations (40 CFR 122.44(d)(1)(vii)(B)) require inclusion of effluent limits that are "consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA." Attachment E outlines the requirements of effective TMDLs and appears to incorporate numeric receiving water limitations (RWL) <u>and</u> effluent limitations, where the effluent limitations are set equal to the TMDL Waste Load Allocations (WLAs) and the RWLs are set equal to the TMDL numeric targets. This approach results in a situation where the Copermittees are in double jeopardy. Copermittees should not be put in double jeopardy by being required to meet both RWLs and effluent limitations. Rather, attainment of either RWLs <u>**or**</u> effluent limitations should represent compliance with the permit and the requirements of the TMDL.	See recommended changes in the attached revised Permit. Additional language should be added to the WQBELs sections for all TMDLs in Attachment E to clearly define compliance with WQBELs via any of the following methods: - There is no discharge from the MS4, **OR** - Applicable effluent limitations are met, **OR** - Receiving waters meet the applicable receiving water limitations or water quality objective, **OR** - Loading from the MS4 is such that it does not cause water quality objective exceedances, **OR** - For Copermittee(s) that are implementing a Regional Board-approved WQIP, WQBELs will be implemented as BMPs and compliance will be based upon implementing all provisions of the WQIP in accordance with the approved milestones and schedule.
Attachment E	E-1 to E-30	Multiple	Attachment E specifies outfall monitoring	Modify the Specific Monitoring and Assessment Requirements

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			requirements for several TMDLs, "in accordance with the requirements of Provisions D.1, D.4.a.(1)(b), and D.4.a.(3)(b) of this Order." Adding outfall monitoring to the TMDL provisions is inappropriate and unnecessary. Attachment E should focus on integrating the monitoring requirements *specified in the TMDL Basin Plan Amendments.* The monitoring requirements for TMDLs were developed through a public comment process and adopted by the Regional Board, and are the only monitoring requirements that should be specified in Attachment E. Furthermore, there is no reason to re-state the requirements from Provision D, which makes it likely that Attachment E and Provision D will have inconsistencies. Provision D requirements should only be listed in Provision D.	for the following TMDLs: 1. Total Maximum Daily Load for Diazinon in Chollas Creek Watershed 2. Total Maximum Daily Loads for Dissolved Copper in Shelter Island Yacht Basin 3. Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek 4. Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay Specifically, for each of these TMDLs, the sub-bullet under section (d) regarding effluent monitoring should be stricken and replaced with the following: "The Responsible Copermittees must implement the monitoring and assessment requirements issued under Order No. XXXX. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.", where "XXXX" reflects the order numbers for each TMDL, shown in the attached revised Permit on Page E-1. For the Chollas Creek Metals and Diazinon TMDLs, the XXX refers to the order number for the issued Investigation Orders. For the Project I Bacteria TMDL, specific changes to the monitoring requirements are requested to reflect those specified in the TMDL Basin Plan Amendment, as described below.
Attachment E. Part 4.b.	E-10	Water Quality Based Effluent Limitations	The TMDL for Dissolved Copper, Lead, and Zinc in Chollas Creek states that "If all copper, lead, and zinc concentrations in urban runoff to Chollas Creek meet their respective TMDL concentrations, the	If WQBELs are to be expressed as numeric effluent limits consistent with the WLAs, then mass-based WQBELs should be included as a mechanism for demonstrating compliance to allow for options to demonstrate load-based pollutant reductions. As described above, the mass-based WQBELs should only be included with an "or" statement (not an "and" statement).

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			loading capacity of the creek should not be exceeded" (Section 8). The TMDL further states that "because this WLA is concentration-based it will apply to each land use and each sub-watershed at all times and will not be specific to any land use or sub-watershed (Section 8.1)." Requiring all land uses and sub-watersheds to meet effluent limits consistent with RWLs is not a cost-effective or practicable approach to BMP strategy development. Volume reduction strategies such as Low Impact Development and Green Infrastructure should be a viable compliance path for the San Diego region. The WQBELs should include the mass-load based WLAs to consider the pollutant loads reduced, which will be impacted by both pollutant concentration reductions *and* stormwater volume reductions. Alternatives for load-based approaches should be included as effluent limitations, which will correspond to targets for meaningful CLRP and WQIP development.	The recommended Compliance Determination language in the attached revised Permit addresses this issue.
Attachment E. Part 6.a	E-19	Applicability	Since adoption of the Project I Bacteria TMDL, the Copermittees have submitted data analysis to the Regional Board to demonstrate that 303(d) listings for San Marcos HA, San Dieguito River HA, and Los Penasquitos HA were incorrectly applied to REC beneficial uses. The Regional Board has concurred with the findings for each HA and stated that these HAs are "not subject to further action under Resolution No. R9-2010-0001." Similar	In Table 6.0, the San Dieguito River WMA and Carlsbad WMAs should be deleted. The Los Penasquitos WMA should be re-named to the Mission Bay WMA and Torrey Pines State Beach at Del Mar should be removed. The recommended language in the attached revised Permit addresses this issue by also adding the following to Specific Provision 6.a.(5): "Subsequent to TMDL adoption, it has been established by the Regional Board that the following water bodies are not subject

<table>
<tr><th>Permit Section</th><th>Permit Page (Original)</th><th>Section Title</th><th>Reason for Proposed Changes/Comments</th><th>Proposed Changes</th></tr>
<tr><td></td><td></td><td></td><td>responses are expected for the other HAs.</td><td>to further action under Resolution No. R9-2010-001, and therefore are not subject to Bacteria TMDL requirements described herein and are not included in Table 6.0:
<table><tr><th>Watershed Management Area</th><th>Water Body</th><th>Segment or Area</th></tr><tr><td>Carlsbad</td><td>Pacific Ocean Shoreline</td><td>at Moonlight State Beach</td></tr><tr><td>San Dieguito River</td><td>Pacific Ocean Shoreline</td><td>at San Dieguito Lagoon mouth</td></tr><tr><td>Peñasquitos</td><td>Pacific Ocean Shoreline</td><td>Torrey Pines State Beach at Del Mar (Anderson Canyon)</td></tr></table></td></tr>
<tr><td>Attachment E. Part 6.b</td><td>E-19</td><td>Receiving Water Limitations</td><td>The Basin Plan Amendment for the Project I Bacteria TMDL contains Receiving Water Limitations. These Receiving Water Limitations should be incorporated directly into the Permit. However, Attachment E contains Receiving Water Limitations that do <u>not</u> match those from the TMDL. The Regional Board should not revise or translate the RWLs from the TMDL, they should be incorporated directly. The RWLs incorporated into Attachment E have several discrepancies with the RWLs in the TMDL, including application of single sample targets to the dry weather RWLs and application of total coliform RWLs for inland waters.</td><td>Replace entirely the RWLs in the Permit with those from the TMDL.

The attached revised Permit incorporates RWLs for beaches (Table 6.1) and RWLs for Creeks (Table 6.2). Note these RWLs were pasted directly from the Basin Plan Amendment (Attachment A, page 52).</td></tr>
<tr><td>Attachment E. Part 6.b</td><td>E-19 and E-20</td><td>Water Quality Based Effluent</td><td>Attachment E specifies WQBELs for dry weather flows as both receiving water and</td><td>It is recommended that the single sample maximum not be used for dry weather WQBELs. </table>

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Limitations	effluent limitations for the Project I Bacteria TMDL, in terms of zero allowable exceedances of the single sample maximum and the 30-day geometric mean. However, the dry weather component of the TMDL only considered the 30-day geometric mean, and did not consider the single sample maximum within its calculation. Incorporating single sample effluent limitations into the Permit goes beyond the TMDL requirements. In addition, if the TMDL had included single sample limits, there would have been a corresponding allowable exceedance frequency, just as for wet weather. The 22% allowable exceedance rate for wet weather was based on a reference beach within the Los Angeles Region, and although not used in the technical approach for the San Diego Beaches and Creeks TMDL, the reference beach also exhibits exceedances during dry weather, which is incorporated into beach TMDLs in the Los Angeles region.	weather exceedance frequency should be assumed and applied. Specific Provision 6.b.(2) of the attached revised Permit addresses this issue by (1) incorporating the RWLs directly from the TMDL, and (2) linking the receiving water limitations and effluent limitations.
Attachment E. Part 6.b	E-20	Water Quality Based Effluent Limitations	The Project I Bacteria TMDL applies mass-load based TMDLs to point sources. Many of the BMPs used for achieving pollutant reductions, such as structural BMPs and green infrastructure, emphasize infiltration and associated volume reduction as the primary mechanism for reducing urban runoff. A significant investment could be made to implement structural BMPs to reduce urban runoff to meet the mass-load based WLAs assigned in the TMDL. These reductions could result in meeting the mass-	If WQBELs are to be expressed as numeric effluent limits consistent with the WLAs, the mass based WLAs for both dry and wet weather presented in the TMDL should be included as a mechanism for demonstrating compliance to 1) be consistent with the assumptions of the WLAs and 2) allow for options to demonstrate load based pollutant reductions. The attached revised Permit addresses this issue by incorporating the mass-based wasteload allocations into Section 6.b.(2).

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			based WLA and have a positive impact on receiving waters by significantly reducing urban loads to receiving waters. However, even the small amount of flows remaining could exceed the numeric effluent limitations currently in the Permit, but not cause or contribute to WQO exceedances. In this manner, a violation of the numeric WQBELs would result in zero credit for the millions invested and penalty for discharges that did not negatively impact attainment of WQ standards. Volume reduction strategies such as Low Impact Development and Green Infrastructure should be a viable compliance path for the San Diego region. The WQBELs should include the mass-load based WLAs to consider the pollutant loads reduced, which will be impacted by both pollutant concentration reductions *and* stormwater volume reductions.	
Attachment E. Part 6.b	E-20	Water Quality Based Effluent Limitations	The reference conditions and associated allowable exceedance frequencies for WQBELs addressing Project I Bacteria TMDL were based on a marine reference beach within Los Angeles, and are not necessarily applicable to fresh water flows in the San Diego Region. The Los Angeles reference beach was influenced by salt water (increasing bacterial die-off) and mixing/dilution from wave action that likely resulted in lower exceedances of REC-1 objectives than would be found in a freshwater stream. Freshwater TMDLs in the Los Angeles region now incorporate	The permit should include language that allows for update of the allowable exceedance frequencies as these results become available. The attached revised Permit addresses this issue by added the following paragraph to Specific Provision 6.b.(1).(a): "The allowable exceedance frequencies in Table 6.1 and Table 6.2 can be updated by the Regional Board Executive Officer if sufficient data is provided regarding reference systems in the San Diego Region."

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			freshwater reference systems (instead of a marine reference system), and the marine beach exceedance rates have been updated through a recent TMDL reopener for Santa Monica Bay. In addition, a reference study is currently underway for the San Diego Region.	
Attachment E. Part 6.c	E-21	Compliance Schedule	Total coliform WQOs do not apply to inland waters.	As shown in the attached revised Permit, add a footnote to Table 6.3 as follows: "Total coliform receiving water limitations apply only to segments of areas of Pacific Ocean Shoreline listed in Table 6.0."
Attachment E. Part 6.c	E-21	Compliance Schedule	The CLRPs to be submitted by Copermittees will propose interim compliance dates, as allowed by the Project I Bacteria TMDL, generally 7 and 10 years, respectively, to meet the 50% reduction milestone for dry and wet weather. The CLRPs submitted by Copermittees may not all propose the same interim compliance dates and the Permit should acknowledge the flexibility allowed by the TMDL (see page 68 of Attachment A of the Basin Plan Amendment). In fact, this scheduling flexibility was a primary "incentive" for Copermittees to develop CLRPs instead of BLRPs.	The interim compliance dates should not be specified in the Permit. Instead, the Permit should reference the submitted and Regional Board-approved CLRPs. This approach will avoid conflict between the TMDL, Permit, and CLRPs. The attached revised Permit addresses this issue by revising the opening of Section 6.c.(2): "The Responsible Copermittees must comply with the following interim WQBELs by the interim compliance dates <u>submitted in the Regional Board-approved CLRPs and supported by Order No. R9-2010-0001</u>:" Table 6.5 should be deleted from Attachment E to allow the CLRPs the scheduling flexibility provided in the TMDL adopted by the Regional Board.
Attachment E. Part 6.c	E-21 thru E-27	Compliance Schedule	Similar to the flexibility allowed for scheduling, the TMDL allows CLRPs flexibility in expressing and achieving TMDL milestones/interim requirements. Furthermore, the wet weather interim compliance dates are well-beyond the term of this Permit, and should be not included in	Delete Table 6.4 because (1) the CLRPs have flexibility to express interim milestones and (2) the wet weather interim requirements do not apply until 2022, well beyond the term of this Permit.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Attachment E.	
Attachment E. Part 6.c	E-27	Compliance Schedule	The Copermittees request an acknowledgement of the TMDL reopener scheduled for April 2016 which falls within the term of this Permit.	Add a part (3) to Specific Provision 6.c: "(3) Submittals to Support TMDL Basin Plan Amendment The Responsible Copermittees are encouraged to submit data to support the TMDL reopener scheduled for April 2016 including but not limited to data related to reference watershed monitoring and beneficial use usage frequency."
Attachment E. Part 6.d (new section added to revised)	E-27	Compliance Determination	The BPA for the Project I Bacteria TMDL contains specific language regarding MS4 compliance determination in the case that receiving water limitations are not attained. This language should be added directly to the Permit.	As shown in the attached revised Permit, add the following language to Section 6 of Attachment E, which is *pasted directly* from the BPA: "The municipal MS4s may demonstrate that their discharges are not causing the exceedances in the receiving waters by providing data from their discharge points to the receiving waters, by providing data collected at jurisdictional boundaries, and/or by using other methods accepted by the San Diego Water Board. Otherwise, at the end of the wet weather TMDL compliance schedule, the municipal Phase I MS4s will be held responsible and considered out of compliance unless other information or evidence indicates another controllable or uncontrollable source is responsible for the exceedances in the receiving waters. If controllable sources other than discharges from the municipal Phase I MS4s are identified before or after the end of the wet weather TMDL Compliance Schedules as causing the exceedances, those controllable sources will be responsible for reducing their bacteria loads and/or demonstrating that discharges from those sources are not causing the exceedances. If controllable sources other than the Phase I MS4s are identified as causing the exceedances, and the Phase I MS4s have demonstrated they are not causing or contributing to the exceedances, the Phase I MS4s will not be considered out of compliance. The San Diego Water Board shall implement additional actions (e.g., issue enforcement actions, amend existing NPDES requirements or conditional waivers), as needed, to bring all those controllable sources into

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				compliance with the wet weather TMDLs."
Attachment E. Part 6.d	E-27	Specific Monitoring and Assessment Requirements	As described above, the CLRPs envisioned in the Project I Bacteria TMDL include flexibility to develop certain components based on watershed-specific issues and conditions. Each CLRP submitted by the Copermittees will include a monitoring and assessment component. It is important to allow the CLRP process to drive the monitoring programs.	As shown in the attached revised Permit, include the following at the beginning of the Monitoring and Assessment section: "The BLRPs and CLRPs to be submitted by the Copermittees and approved by the Regional Board Executive Officer contain monitoring programs. Implementation of those Regional Board-approved monitoring programs constitutes compliance with the Monitoring Station and Monitoring Procedure requirements, described below."
Attachment E. Part 6.d	E-27	Specific Monitoring and Assessment Requirements	The Project I Bacteria TMDL included specific beach monitoring requirements, which were subject to a public comment process and adopted by the Regional Board. Attachment E adds many additional components to these requirements, which undermines the TMDL adoption and public commenting process. Instead of re-interpreting and adding onto the TMDL monitoring requirements in the Basin Plan Amendment, the Permit should adopt those requirements directly (BPA Attachment A, page 50-51).	As shown in the attached revised Permit, the beach monitoring requirement should be incorporated directly from the TMDL. The following language/requirement for beaches is *pasted directly* from the TMDL: "(1) Monitoring and Assessment Requirements for Beaches (a) Monitoring Stations For beaches addressed by these TMDLs, monitoring locations should consist of, at a minimum, the same locations used to collect data required under MS4 NPDES monitoring requirements and beach monitoring for Health and Safety Code section 115880.75 If exceedances of the receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations and/or other source identification methods must also be used to demonstrate that the bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters. (b) Monitoring Procedures (i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations at least monthly.

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				(ii) The Responsible Copermittees must collect wet weather monitoring samples from the receiving water monitoring stations at least once within the first 24 hours of the end of a storm event that occurs during the rainy season (i.e., October 1 through April 30). (iii) Samples must be analyzed for total coliform, fecal coliform, and *Enterococcus* indicator bacteria."
Attachment E. Part 6.d	E-27	Specific Monitoring and Assessment Requirements	Similarly, the creek monitoring requirements should reflect the TMDL that was approved and subject to public comment (BPA Attachment A, page 50-51). Note that total coliform should not be a requirement for creek monitoring, as creeks are not subject to total coliform WQOs, RWLs, or WLAs.	As shown in the attached revised Permit, the creek monitoring requirement should be incorporated directly from the TMDL. The following language/requirement for creeks is *pasted directly* from the TMDL: "Monitoring and Assessment Requirements for Creeks and Creek Mouths (a) Monitoring Stations For creeks addressed by these TMDLs, monitoring locations should consist of, at a minimum, a location at or near the mouth of the creek (e.g., Mass Loading Station or Mass Emission Station) and one or more locations upstream of the mouth (e.g., Watershed Assessment Stations). If exceedances of the receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations and/or other source identification methods must also be used to demonstrate that the bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters. (b) Monitoring Procedures (i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations at least monthly. (ii) The Responsible Copermittees must collect wet weather

Permit Section	Permit Page (Original)	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				monitoring samples from the receiving water monitoring stations within the first 24 hours of the end of a storm event that occurs during the rainy season (i.e., October 1 through April 30) (iii) Samples collected from receiving water monitoring stations must be analyzed for fecal coliform and *Enterococcus* indicator bacteria.”

ADMINISTRATIVE DRAFT MS4 PERMIT INCONSISTENCIES WITH TMDL REQUIREMENTS

Section (Att. E)	Sub-Section	Admin. Draft MS4 Permit Summary	Inconsistency/Issue
1	B(3)(a) Best Management Practices	The Responsible Copermittees must implement BMPs capable of achieving the WQBELs under Specific Provision 1.b	Issue with “must implement BMPs” BMPs are not mentioned in Resolution R9-2002-0123. Copermittees are required to: 1.Enforce existing local ordinances and adopt new legal authority as needed. 2) implement a “Diazinon Toxicity Control Plan”, and 3) conduct a focused Public Outreach/Education Program. However, the TMDL technical report suggests but does not require the use of BMPs. “Proposed implementation measures to meet the TMDL include implementation of best management practices (BMPs) and public outreach by the dischargers. Dischargers are responsible for taking measures, such as implementing BMPs, to reduce and manage their input of diazinon.”, per the San Diego Water Board Basin Plan Amendment and Technical Report for Resolution No. R9-2002-0123. Additionally, the Regional Water Board cannot dictate the method of implementation.
1	D(b).	“The responsible Copermittees must monitor the effluent of the MS4 outfalls for diazinon within the Chollas Creek Watershed, and calculate or estimate the monthly and annual diazinon loads”	Monitoring requirements are incorrect. Compliance monitoring includes flow-weighted composite sampling at the receiving water. Also, the TMDL is a concentration based TMDL; therefore, load calculations are not required and inappropriate. The Numeric Targets and WLAs are all defined in terms of concentrations.
2	B(3). Best Management Practices	“The responsible copermittee must implement BMPs…”	In resolution R9-2005-0019 there is no mention of BMPs. In the technical TMDL report there is also no requirement of BMP implementation, though pollution prevention practices and source control BMPs “can be developed and implemented”. Additionally, the Regional Water Board cannot dictate the method of implementation. Discharger strategies to reduce copper leading to SIYB are discussed, however, they are more applicable to boating. MS4 discharger mitigation is not discussed.
2	c. Compliance Schedule	The Responsible Copermittee was required to achieve its WLA upon the effective date of the TMDL, December 2, 2005.	Compliance schedule is incorrect. The compliance deadline is 2022. Attachment A to resolution No. R9-2005-0019 states that “copper load and wasteload reductions are required over a 17-year staged compliance schedule period.”

Section (Att. E)	Sub-Section	Admin. Draft MS4 Permit Summary	Inconsistency/Issue
2	d. Specific Monitoring and Assessment Requirements	The Responsible Copermittee must monitor the effluent of its MS4 outfalls for dissolved copper, and calculate the monthly and annual dissolved copper loads"	There are no specific monitoring requirements other than to monitor SIYB waters (receiving waters).
4	b. (3)a.	The Responsible Copermittee must implement BMPs capable of achieving the WQBELs under Specific Provision 4.b for Chollas Creek.	Issue with must implement BMPs. Mitigation and consideration of alternative projects (i.e. CEQA requirements) "should" be incorporated; however, BMPs are not specifically called out in the TMDL beyond any relevance to restoration projects that would fall under CEQA. Additionally, the Regional Water Board cannot dictate the method of implementation. (Order No. R9-2007-0043).
4	d. Specific Monitoring and Assessment Requirements.	RPs "must monitor the effluent of the MS4 outfalls discharging to Chollas Creek for dissolved copper, lead, and zinc or estimate the monthly and annual dissolved copper, lead, and zinc loads"	Outfall monitoring is not required in the TMDL. Flow-weighted composite sampling for 3 storms at the receiving water is required. No monthly or annual loads are required in the concentration based TMDL which is based on the hardness-dependent CTR water quality criteria for dissolved metals. However, "Storm water samples shall be collected using a flow-weighted composite sampling strategy during the wet-weather season in a manner identical to the current municipal storm water-monitoring program" so what the "current permit" says is what is required. (Order No. R9-2007-0043, Order No. R9-2004-0277.
6	Table 6.0	South Orange County Watershed Management Area (WMA) – Pacific Shoreline related to Laguna Beach includes 5 of 6 segments are listed	Segment Laguna Beach @ Laguna Avenue is not listed in the MS4 Permit (and is included in the TMDL on the List of Impaired Segments).
6	Table 6.0	South Orange County WMA – Pacific Shoreline related to San Clemente	Responsible Party Dana Point is not listed in MS4 Permit (as listed in the TMDL)
6	Table 6.0	Carlsbad WMA RPs include Cities of Oceanside, Solana Beach, and Vista.	These 3 cities are not located within the Moonlight HA. RPs <u>did not</u> include Cities of Oceanside, Solana Beach, and Vista in the TMDL.
6	Table 6.0	Peñasquitos WMA (Miramar Reservoir HA) includes Los Peñasquitos Watershed, Scripps, and Tecolote.	The City of San Diego would not agree with merging all three listings into one WMA. Peñasquitos WMA is appropriate for the Pacific Shoreline Listing at Torrey Pines State Beach; however, not for Scripps and Tecolote. Mission WMA is appropriate for both the Scripps and Tecolote listings. In the TMDL: Miramar HA is listed for the Pacific Shoreline Listing at Torrey Pines State Beach. Scripps HA is listed for Pacific Shoreline Listing at La Jolla and PB segments. Tecolote HA is listed for Tecolote Creek.

Section (Att. E)	Sub-Section	Admin. Draft MS4 Permit Summary	Inconsistency/Issue
6	Table 6.0	San Diego River WMA for Forrester Creek Responsible Parties include City of La Mesa	The TMDL does not list the City of La Mesa as a RP.
6	B. (1) Receiving Water Limitations (RWL) Table 6.1	Note 1: Only the single sample maximum (SSM) is required to be achieved during wet weather.	To focus on the SSM and not be required to address the 30-day geomean for wet weather. Note C of both Tables on p. A52 of the TMDL "Receiving Water Limitations for Beaches and Creeks" states that the 30-day geomean must also be met.
6	Limitations (RWL) Table 6.1	Note 2: Both the SSM and Geomeans are required to be achieved during dry weather.	Adding SSM to the required WQBELs goes beyond the TMDL. The SSM should not be used for a dry weather WQBEL. Note E of both Tables on p. A52 of the TMDL "Receiving Water Limitations for Beaches and Creeks" states that the 30-day geomean must be met. The SSM is not a dry weather numeric target.
6	B. (2) Effluent Limitations	The Permit assigned RWLs to the MS4 discharges. Is not conditional upon causing or contributing to an exceedance in the RW.	Beyond the TMDL requirements, which requires compliance based on the receiving water and follow up based on exceedances in the receiving water. The TMDL allows the RPs the flexibility to design their follow-up program, which is also consistent with the WQIP.
6	B. (3) BMPs	This section does not acknowledge the timeline discrepancy between the WQIP and CLRP and the exhaustive resources that have been expended to date.	The CLRPs are in progress – resources and funding have been committed by the RPs to develop CLRPs. The City will incorporate the CLRPs into the WQIPs. The CLRPs address 3 (b) and (c) (Appendix P of Technical Report), and include a Monitoring Plan and QAPP designed to meet the compliance requirements of the TMDL.
6	C. Compliance Schedule (2) Interim Compliance dates	(2) Interim Compliance dates are provided based on the priorities listed in the TMDL for each listed segment. These do not reflect the CLRP process and remove the flexibility meant to encourage a CLRP approach.	Interim Dry Weather WQBELs provided for City WMAs San Dieguito, Peñasquitos/Miramar, Scripps, and Tecolote are set at year 5, rather than year 7. It should be year 7 to allow for the CLRP process per the TMDL. TMDL allows RPs to propose an alternative compliance schedule when developing a CLRP (pA68-69). The schedule is to be included in the CLRP due October 2012. If the Regional Board doesn't accept the proposed schedule a default CLRP schedule was provided on p A68 (pA69). This allows 7 years to comply with an interim 50% reduction for Dry Weather.
6	C. (1) and (2)	Interim and Final Compliance Dates	Permit is inconsistent in selecting/applying them per the TMDL. (See prior two comments)

Section (Att. E)	Sub-Section	Admin. Draft MS4 Permit Summary	Inconsistency/Issue
6	D. Monitoring and Assessment Requirements (1) Beaches (a) Monitoring Stations	Does not specify AB411 monitoring locations for beach listings.	Inconsistent with the TMDL. AB411 locations provide a possible cost-savings by overlapping with the existing program and a benefit to assessment since there is a historical data set. The TMDL states monitoring locations "…should consist of, at a minimum, the same locations used to collect data required under the MS4 NPDES monitoring requirements and beach monitoring for AB411 monitoring." (pA50). CLRP monitoring has already been designed to monitor at the AB411 locations. Stakeholders agreed to monitor AB411 locations for regional consistency and allow for comparison between watersheds.
6	D. (1) (a) Monitoring Stations	Requires coastal outfall monitoring during wet and dry weather simultaneous to receiving water monitoring. Requires analysis of all 3 analytes regardless of exceedances in the receiving water.	(1) Beyond the requirements of the TMDL. While the TMDL is ambiguous as to whether outfall monitoring is required prior to the end of the compliance period, it states "If at the end of the wet TMDL Compliance schedule the receiving waters exceed the SSM more than the allowable exceedance frequency, all controllable sources are responsible for demonstrating their discharges into the RW are not causing the exceedances or they will be considered out of compliance. (p. A54)." (3) Requires costly, routine monitoring on an annual basis, instead of follow up/source identification based on receiving water monitoring. (4) Follow up monitoring should be based on the exceedance frequency of the receiving water numeric targets. The CLRP monitoring plans design follow up monitoring to address receiving water exceedance frequency of the numeric targets after interim milestone of 50% reduction. This approach allows the RPs to implement BMPs and assess water quality improvements prior to the interim milestones. Focus on BMP implementation and compliance monitoring. Limit the cost of follow up monitoring and source tracking.
6	D. (1) (b) Monitoring Procedures	Must monitor each storm event.	This is a costly requirement and not feasible to execute. The TMDL, as written, has contradictory language regarding the number of wet events. The CLRP monitoring approach identifies a set number of monitoring events to be sampled that should be sufficient to characterize the quality of wet weather discharges. The CLRP monitoring approach should be followed, when submitted.

Section (Att. E)	Sub-Section	Admin. Draft MS4 Permit Summary	Inconsistency/Issue
	D. (1) (b) Monitoring Procedures	Does not specify minimum frequency for dry weather monitoring.	Not consistent with TMDL. Doesn't include a reference to the TMDL. Provides inconsistent guidance to the RPs regarding when to monitor per the Permit versus TMDL requirements. "The method and number of samples needed for calculating the 30-day geomean should be consistent with the number of samples required by the Ocean Plan for beaches and Basin Plan for Creeks (TMDL pA53)." Beaches will utilize data collected under the AB411 program, as specified in the CLRP.
6	D. Monitoring and Assessment Requirements (2) Creeks and Creek Mouths (a) Monitoring Stations	Additional outfall stations and jurisdictional monitoring stations. Two Jurisdictional monitoring sites per City.	Increase monitoring requirements. Removes flexibility for RPs to develop follow up monitoring and special studies based on watershed priorities and available resources. The TMDL, as written, requires monitoring one receiving monitoring location at the mouth and one upstream. It does not require outfall or jurisdictional monitoring, giving RPs the flexibility to design their follow up monitoring and source id studies.
6	D. (2) (b) Monitoring Procedures	Must monitor each storm event.	This is a costly requirement and not feasible to execute although the TMDL has contradictory language regarding the number of wet events. The CLRP monitoring approach identifies a set number of monitoring events to be sampled that should be sufficient to characterize the quality of wet weather discharges.
6	D. (2) (b) Monitoring Procedures	Inconsistent in the level of details provided for outfall and jurisdictional monitoring than provided in D. Monitoring and Assessment Requirements (1) Beaches (a) Monitoring Stations.	Monitoring procedures only apply to receiving water monitoring locations. Does not provide analytes or event frequency requirements for outfall or jurisdictional monitoring.
	D.(2) (c) Assessment and Reporting	Assess interim and final receiving whether WQBELs have been achieved. Requires additional outfall monitoring if the receiving water WQBELs have not been achieved.	This is overly prescriptive monitoring requirements to try and identify sources each year of compliance monitoring. Need to add language to clarify that this assessment is not required until after the interim and final compliance dates. Follow up monitoring and source id studies should not be required until after the interim and final compliance dates. The TMDL requires the Copermittees to "demonstrate progress until the exceedance frequencies ultimately are achieved at the end of the TMDL Compliance Schedule (pA55)." Follow up and Source Id approach should be flexible and adaptive to allow the RPs to implement BMPs and assess water quality improvements prior to the interim milestones, as specified in the CLRP. Focus on BMP implementation and compliance monitoring. Limit the cost of follow up monitoring and source tracking. CLRPs will provide an annual summary of monitoring data and findings.

Section (Att. E)	Sub-Section	Admin. Draft MS4 Permit Summary	Inconsistency/Issue
6	D.(1) and (2) (c) Assessment and Reporting	Inconsistent requirements between the two permit sections.	Section D.(1)c does not require reporting of outfall data or additional sites to address RW exceedances as required in Section D(2)c.

ADMINISTRATIVE DRAFT

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD SAN DIEGO REGION

TENTATIVE
ORDER NO. R9-2012-0011
NPDES NO. CAS0109266

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT AND WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS WITHIN THE SAN DIEGO REGION

The San Diego County Copermittees in Table 1a are subject to waste discharge requirements within their respective jurisdictions set forth in this Order.

Table 1a. San Diego County Copermittees

City of Carlsbad	City of Oceanside
City of Chula Vista	City of Poway
City of Coronado	City of San Diego
City of Del Mar	City of San Marcos
City of El Cajon	City of Santee
City of Encinitas	City of Solana Beach
City of Escondido	City of Vista
City of Imperial Beach	County of San Diego
City of La Mesa	San Diego County Regional Airport Authority
City of Lemon Grove	Unified Port District of San Diego
City of National City	

The Orange County Copermittees in Table 1b are subject to waste discharge requirements within their respective jurisdictions set forth in this Order upon expiration of Order No. R9-2009-0002, NPDES No. CAS0108740 on December 16, 2014.

Table 1b. Orange County Copermittees

City of Aliso Viejo	City of Ranch Santa Margarita
City of Dana Point	City of San Clemente
City of Laguna Beach	City of San Juan Capistrano
City of Laguna Hills	City of Laguna Woods
City of Laguna Niguel	County of Orange
City of Lake Forest	Orange County Flood Control District
City of Mission Viejo	

The Riverside County Copermittees in Table 1c are subject to waste discharge requirements within their respective jurisdictions set forth in this Order upon expiration of Order No. R9-2010-0016, NPDES No. CAS0108766 on November 10, 2015.

Table 1c. Riverside County Copermittees

City of Murrieta	County of Riverside
City of Temecula	Riverside County Flood Control and Water Conservation District
City of Wildomar	

The Orange County Copermittees and Riverside County Copermittees may enroll under this Order at a date earlier than the expiration date of their current Orders subject to the conditions described in Provision F.6 of this Order and the Copermittees in the respective county receive a Notice of Enrollment (NOE) from the San Diego Water Board.

The term Copermittee in this Order refers to any San Diego County, Orange County, or Riverside County Copermittee enrolled under this Order, unless specified otherwise.

This Order provides permit coverage for the Copermittee discharges described in Table 2. "Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators." 40 CFR §122.26(a)(3)(vi).

Table 2. Discharge Locations and Receiving Waters

Discharge Points	Locations throughout San Diego Region
Discharge Description	Municipal Separate Storm Sewer System (MS4) Discharges
Receiving Waters	Waters of the U.S.: Inland Surface Waters, Enclosed Bays and Estuaries, and Coastal Ocean Waters of the San Diego Region

Table 3. Administrative Information

This Order was adopted by the San Diego Water Board on:	**Month Day, 2012**
This Order will become effective on:	**Month Day, 2012**
This Order will expire on:	**Month Day, 2017**
The Copermittees must file a Report of Waste Discharge (ROWD) in accordance with Title 23, California Code of Regulations, as application for issuance of new waste discharge requirements no later than 180 days in advance of the Order expiration date.	

I, David W. Gibson, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on Month Day, 2012.

TENTATIVE

David W. Gibson
Executive Officer

ADMINISTRATIVE DRAFT

TABLE OF CONTENTS
(Cont'd)

I. FINDINGS

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board), finds that:

JURISDICTION

1. **MS4 Ownership or Operation.** Each of the Copermittees owns or operates an MS4, through which it discharges storm water and non-storm water into waters of the U.S. within the San Diego Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is "interrelated" to a medium or large MS4; or (3) an MS4 which contributes to a violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the U.S.

2. **Legal and Regulatory Authority.** This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations (Code of Federal Regulations [CFR] Title 40, Part 122 [40 CFR 122]) adopted by the United States Environmental Protection Agency (USEPA), and chapter 5.5, division 7 of the California Water Code (CWC) (commencing with section 13370). This Order serves as an NPDES permit for discharges from MS4s to surface waters. This Order also serves as waste discharge requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the CWC (commencing with section 13260).

3. **CWA Technology Based Standards and Prohibitions.** Pursuant to CWA section 402(p)(3)(B), NPDES permits for storm water discharges from MS4s must include requirements to effectively prohibit non-storm water discharges into MS4s, and require controls to reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP).

4. **CWA NPDES Permit Conditions.** Pursuant to CWA section 402(a)(2), NPDES permits must prescribe conditions to assure compliance with CWA section 402(p)(3)(B) and 40 CFR 122.26(d)(2)(iv)(B). This Order prescribes conditions to assure compliance with the CWA requirements for owners and operators of MS4s to effectively prohibit non-storm water discharges in to the MS4s, and require controls to reduce the discharge of pollutants in storm water from the MS4s to the MEP.

5. **CWA and CWC Monitoring Requirements.** Pursuant to 40 CFR 122.48, NPDES permits must specify requirements for recording and reporting monitoring results. In addition, CWC sections 13267 and 13383 authorize the San Diego Water Board to require technical and monitoring reports. This Order establishes monitoring and reporting requirements to implement federal and State requirements.

6. **Total Maximum Daily Loads.** CWA section 303(d)(1)(A) requires that "[e]ach state shall identify those waters within its boundaries for which the effluent limitations…are not stringent enough to implement any water quality standard applicable to such waters." The CWA also requires states to establish a priority ranking of impaired water bodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired water bodies is called the Clean Water Act Section 303(d) List of Water Quality Limited Segments, commonly referred to as the 303(d) List. The CWA requires the 303(d) List to be updated every two years. Requirements of this Order implement the TMDLs adopted by the San Diego Water Board and approved by USEPA.

7. **Non-Storm Water Discharges.** Pursuant to CWA section 402(p)(3)(B)(ii), this Order requires each Copermittee to effectively prohibit discharges of non-storm water into its MS4. Nevertheless, non-storm water discharges into and from the MS4s continue to be reported to the San Diego Water Board by the Copermittees and other persons. Monitoring conducted by the Copermittees, as well as the 303(d) List, have identified dry weather, non-storm water discharges from the MS4s as a source of pollutants causing or contributing to receiving water quality impairments in the San Diego Region. The federal regulations [40 CFR 122.26(d)(2)(iv)(B)] require the Copermittees to have a program to prevent all types of non-storm water discharges, or illicit discharges, from entering the MS4. The federal regulations, however, allow for specific categories of non-storm water discharges or flows to be addressed as illicit discharges only where such discharges are identified as sources of pollutants to waters of the U.S.

8. **In-Stream Treatment Systems.** Pursuant to federal regulations [40 CFR 131.10(a)], in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Authorizing the construction of a runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Runoff treatment must occur prior to the discharge of runoff into receiving waters. Treatment control best management practices (BMPs) must not be constructed in waters of the U.S. ~~or state.~~ Construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body.

DISCHARGE CHARACTERISTICS AND RUNOFF MANAGEMENT

9. **Point Source Discharges of Pollutants.** Discharges from the MS4s may contain waste, as defined in the CWC, and pollutants that adversely affect the quality of the waters of the state. A discharge from an MS4 is a "discharge of pollutants from a point source" into waters of the U.S. as defined in the CWA. Storm water and non-storm water discharges from the MS4s may contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the Basin Plan. Storm water and non-storm water discharges from the MS4s are subject to the

conditions and requirements established in the Basin Plan for point source discharges.

10. **Potential Beneficial Use Impairment.** The discharge of pollutants and/or increased flows from MS4s may cause or threaten to cause the concentration of pollutants to exceed applicable receiving water quality objectives and impair or threaten to impair designated beneficial uses resulting in a condition of pollution, contamination, or nuisance.

11. **Pollutants Generated by Land Development.** Land development has created and continues to create new sources of non-storm water discharges and pollutants in storm water discharges as human population density increases. This brings higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, and trash. Pollutants from these sources are dumped or washed off the surface by non-storm water or storm water flows into and from the MS4s. When development converts natural vegetated pervious ground cover to impervious surfaces such as paved highways, streets, rooftops, and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving a developed area not subject to SUSMP or HMP requirements contains greater pollutant loads and is significantly greater in runoff volume, velocity, and peak flow rate than pre-development runoff from the same area.

12. **Runoff Discharges to Receiving Waters.** The MS4s discharge runoff into lakes, drinking water reservoirs, rivers, streams, creeks, bays, estuaries, coastal lagoons, the Pacific Ocean, and tributaries thereto within the eleven hydrologic units comprising the San Diego Region. Numerous receiving water bodies and water body segments have been designated as impaired by the San Diego Water Board pursuant to CWA section 303(d).

13. **Pollutants in Runoff.** The most common pollutants in runoff discharged from the MS4s include total suspended solids, sediment, pathogens (e.g., bacteria, viruses, protozoa), heavy metals (e.g., cadmium, copper, lead, and zinc), petroleum products and polynuclear aromatic hydrocarbons, synthetic organics (e.g., pesticides, herbicides, and PCBs), nutrients (e.g., nitrogen and phosphorus), oxygen-demanding substances (decaying vegetation, animal waste), detergents, and trash.

14. **Human Health and Aquatic Life Impairment.** Pollutants in runoff discharges from the MS4s can threaten and adversely affect human health and aquatic organisms. Adverse responses of organisms to chemicals or physical agents in runoff range from physiological responses such as impaired reproduction or growth anomalies to mortality. Increased volume, velocity, rate, and duration of storm water runoff greatly accelerate the erosion of downstream natural channels. This alters stream channels and habitats and can adversely affect aquatic and terrestrial organisms.

15. **Water Quality Effects.** The Copermittees' water quality monitoring data submitted to date documents persistent exceedances of Basin Plan water quality objectives for runoff-related pollutants at various watershed monitoring stations. Persistent toxicity

has also been observed at several watershed monitoring stations. In addition, bioassessment data indicate that the majority of the monitored receiving waters have Poor to Very Poor Index of Biotic Integrity (IBI) ratings. These findings indicate that runoff discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in the San Diego Region. Non-storm water discharges from the MS4s have been shown to contribute significant levels of pollutants and flow in arid, developed Southern California watersheds, and contribute significantly to exceedances of applicable receiving water quality objectives.

16. **Non-Storm Water Discharges.** ~~Non-storm water discharges from the MS4s are not considered storm water discharges and therefore are not subject to the MEP standard from CWA 402(p)(3)(B)(iii), which is explicitly for "Municipal … *Stormwater Discharges* (emphasis added)" from the MS4s.~~ Pursuant to CWA 402(p)(3)(B)(ii), non-storm water discharges into the MS4s must be effectively prohibited.

17. **Best Management Practices.** Pollutants can be effectively reduced in runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Pollution prevention is the reduction or elimination of pollutant generation at its source and is the best "first line of defense". Source control BMPs (both structural and non-structural) minimize the contact between pollutants and runoff, therefore keeping pollutants onsite and out of receiving waters. Treatment control BMPs remove pollutants that have been mobilized by storm water or non-storm water flows.

18. **BMP Implementation.** Runoff needs to be addressed during the three major phases of development (planning, construction, and use) in order to reduce the discharge of storm water pollutants to the MEP, effectively prohibit non-storm water discharges, and protect receiving waters. Development which is not guided by water quality planning policies and principles can result in increased pollutant load discharges, flow rates, and flow durations which can negatively affect receiving water beneficial uses. Construction sites without adequate BMP implementation result in sediment runoff rates which greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. Existing development can generate substantial pollutant loads which are discharged in runoff to receiving waters.

19. **Long Term Planning and Implementation.** Federal regulations require municipal storm water permits to expire 5 years from adoption, after which the permit must be renewed and reissued. The San Diego Water Board recognizes that the degradation of water quality and impacts to beneficial uses of the waters in the San Diego Region occurred over several decades. The San Diego Water Board further recognizes that a decade or more may be necessary to realize demonstrable improvement to the quality of waters in the Region. This Order includes a long term planning and implementation approach that will require more than a single permit term to complete.

WATER QUALITY STANDARDS

20. **Basin Plan.** The San Diego Water Board adopted a Water Quality Control Plan for the San Diego Basin (Basin Plan) on September 8, 1994 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for receiving waters addressed through the plan. The Basin Plan was subsequently approved by the State Water Resources Control Board (State Water Board) on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the San Diego Water Board and approved by the State Water Board. Requirements of this Order implement the Basin Plan.

    The Basin Plan identifies the following existing and potential beneficial uses for inland surface waters in the San Diego Region: Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1), Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), Rare, Threatened, or Endangered Species (RARE), Freshwater Replenishment (FRSH), Hydropower Generation (POW), and Preservation of Biological Habitats of Special Significance (BIOL). The following additional existing and potential beneficial uses are identified for coastal waters of the San Diego Region: Navigation (NAV), Commercial and Sport Fishing (COMM), Estuarine Habitat (EST), Marine Habitat (MAR), Aquaculture (AQUA), Migration of Aquatic Organisms (MIGR), Spawning, Reproduction, and/or Early Development (SPWN), and Shellfish Harvesting (SHELL).

21. **Ocean Plan.** The State Water Board adopted the Water Quality Control Plan for Ocean Waters of California, California Ocean Plan (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005 and it became effective on February 14, 2006. The Ocean Plan is applicable, in its entirety, to point source discharges to the ocean. Requirements of this Order implement the Ocean Plan.

    The Ocean Plan identifies the following beneficial uses of ocean waters of the state to be protected: Industrial water supply; water contact and non-contact recreation, including aesthetic enjoyment; navigation; commercial and sport fishing; mariculture; preservation and enhancement of designated Areas of Special Biological Significance; rare and endangered species; marine habitat; fish spawning and shellfish harvesting

22. **Sediment Quality Control Plan**. On September 16, 2008, the State Water Board adopted the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality (Sediment Quality Control Plan). The Sediment Quality Control Plan became effective on August 25, 2009. The Sediment Quality Control Plan establishes 1) narrative sediment quality objectives for benthic community protection from exposure to contaminants in sediment and to protect human health, and 2) a program of implementation using a multiple lines of evidence approach to interpret

the narrative sediment quality objectives. Requirements of this Order implement the Sediment Quality Control Plan.

23. **National Toxics Rule and California Toxics Rule.** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the National toxics Rule (NTR) applied in California. On May 18, 2000, USEPA adopted the California Toxics Rule (CTR). The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants

24. **Antidegradation Policy.** This Order is in conformance with the federal Antidegradation Policy described in 40 CFR 131.12, and State Water Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality Waters in California*. Federal regulations at 40 CFR 131.12 require that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The San Diego Water Board's Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies.

CONSIDERATIONS UNDER FEDERAL LAW

25. **Coastal Zone Act Reauthorization Amendments.** Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA addresses five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This Order addresses the management measures required for the urban category, with the exception of septic systems. The runoff management programs developed pursuant to this Order fulfill the need for coastal cities to develop a runoff non-point source plan identified in the Non-Point Source Program Strategy and Implementation Plan. The San Diego Water Board addresses septic systems through the administration of other programs.

26. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the Federal Endangered Species Act (16 USCA sections 1531 to 1544). This Order requires compliance with receiving water limits, and other requirements to protect the beneficial uses of waters of the State. The Copermittees are responsible for meeting all requirements of the applicable Endangered Species Act.

CONSIDERATIONS UNDER STATE LAW

27. **Unfunded Mandates.** This Order does not constitute an unfunded local government mandate subject to subvention under Article XIIIB, Section (6) of the California Constitution for several reasons, including, but not limited to, the following:

    a. This Order implements federally mandated requirements under CWA section 402. (33 USC 1342(p)(3)(B).)

    b. The local agency Copermittees' obligations under this Order are similar to, and in many respects less stringent than, the obligations of non-governmental and new dischargers who are issued NPDES permits for storm water and non-storm water discharges.

    c. The local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order.

    d. The Copermittees have requested permit coverage in lieu of compliance with the complete prohibition against the discharge of pollutants contained in CWA section 301(a) (33 USC 1311(a)) and in lieu of numeric restrictions on their MS4 discharges (i.e. effluent limitations).

    e. The local agencies' responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under State law predates the enactment of Article XIIIB, Section (6) of the California Constitution.

    f. The provisions of this Order to implement TMDLs are federal mandates. The CWA requires TMDLs to be developed for water bodies that do not meet federal water quality standards. (33 USC 1313(d).) Once the USEPA or a state develops a TMDL, federal law requires that permits must contain effluent limitations consistent with the assumptions and requirements of any applicable wasteload allocation. (40 CFR 122.44(d)(1)(vii)(B).)

28. **California Environmental Quality Act.** The issuance of WDRs and an NPDES permit for the discharge of runoff from MS4s to waters of the U.S. is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (CEQA) (Public Resources Code, Division 13, Chapter 3, section 21000 et seq.) in accordance with CWC section 13389.

STATE WATER BOARD DECISIONS

29. **Compliance with Prohibitions and Limitations.** The receiving water limitation language specified in this Order is consistent with language recommended by the USEPA and established in State Water Board Order WQ-99-05, *Own Motion Review of the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03, NPDES Permit No. CAS0108740*, adopted by the State Water Board on June 17, 1999. The receiving water limitation language in this Order requires compliance with water quality standards, which for storm water discharges is to be achieved through an iterative approach requiring the

implementation of improved and better-tailored BMPs over time. Implementation of the iterative approach to comply with receiving water limitations based on applicable water quality standards is necessary to ensure that storm water discharges from the MS4 ultimately will not cause or contribute to violations of water quality standards and the creation of conditions of pollution, contamination, or nuisance.

30. **Special Conditions for Areas of Special Biological Significance.** On March 20, 2012, the State Water Board approved Resolution No. 2012-0012~~X~~ approving an exception to the Ocean Plan prohibition against discharges to Areas of Special Biological Significance (ASBS) for certain nonpoint source discharges and NPDES permitted municipal storm water discharges. The Resolution requires monitoring and testing of marine aquatic life and water quality in several ASBS to protect California's coastline during storms when rain water overflows into coastal waters. Specific terms, prohibitions, and special conditions were adopted to provide special protections for marine aquatic life and natural water quality in ASBSs. The City of San Diego's municipal storm water discharges to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's municipal storm water discharges to the Heisler Park ASBS are subject terms and conditions of the Resolution. The Special Protections contained in Attachment B to the Resolution applicable to these discharges are hereby incorporated in this Order as if fully set forth herein.

ADMINISTRATIVE FINDINGS

31. **Executive Officer Delegation of Authority.** The San Diego Water Board by prior resolution has delegated all matters that may legally be delegated to its Executive Officer to act on its behalf pursuant to CWC section 13223. Therefore, the Executive Officer is authorized to act on the San Diego Water Board's behalf on any matter within this Order unless such delegation is unlawful under CWC section 13223 or this Order explicitly states otherwise.

32. **Standard Provisions.** Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR 122.42, are provided in Attachment B to this Order.

33. **Fact Sheet.** The Fact Sheet for this Order contains background information, regulatory and legal citations, references and additional explanatory information and data in support of the requirements of this Order. The Fact Sheet is hereby incorporated into this Order and constitutes part of the Findings of this Order.

34. **Public Notice.** The San Diego Water Board notified the Copermittees, and interested agencies and persons of its intent to prescribe WDRs for MS4 discharges of pollutants to waters of the U.S. and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet.

35. **Public Hearing.** The San Diego Water Board held a public hearing on Month Day, 2012 and heard and considered all comments pertaining to the terms and conditions of this Order. Details of the public hearing are provided in the Fact Sheet.

II. PROVISIONS

THEREFORE, IT IS HEREBY ORDERED that the Copermittees, in order to meet the provisions contained in division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA and regulations adopted thereunder, must each comply with the following:

A. PROHIBITIONS AND LIMITATIONS

The purpose of this provision is to describe the conditions under which storm water and non-storm water discharges into and from MS4s are prohibited or limited. The goal of this provision is to ~~protect, preserve, enhance, and restore~~ address the impacts of MS4 discharges so that such discharges do not impair water quality and designated beneficial uses of waters of the U.S. This goal will be accomplished through implementation of control measures that effectively prohibit non-storm water discharges into and from the Copermittees' MS4s, and reduce pollutants in storm water discharges from the Copermittees' MS4s to the MEP. The process for determination of compliance with the Discharge Prohibitions (A.1), Receiving Water Limitations (A.2), and Effluent Limitations (A.3) is defined in Provision A.4.

1. Discharge Prohibitions

a. Discharges ~~into and~~ from MS4s owned and operated by a Copermittee in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance in receiving waters of the ~~state~~ U.S. are effectively prohibited, unless the Copermittee is addressing the discharges through Provision A.1.e or A.4 through the process set forth in Provision A.4.

b. Non-storm water discharges into ~~and from~~ MS4s are effectively prohibited, unless such discharges are either authorized by a separate NPDES permit, or the discharge is a category of non-storm water discharges or flows that must be addressed pursuant to Provisions E.2.a.(1)-(5) of this Order.

c. Discharges from MS4s are subject to all waste discharge prohibitions in the Basin Plan, included in Attachment A to this Order, unless the Copermittee is addressing the discharges through Provision A.1.e or A.4 through the process set forth in Provision A.4.

d. ~~Discharges from MS4s to ASBS are prohibited.~~ Storm water discharges from the City of San Diego's MS4 to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's MS4 to the Heisler Park ASBS are authorized under this Order subject to the Special Protections contained in Attachment B to State Water Board Resolution No. 2012-0012~~X~~ applicable to these discharges, included in Attachment A to this Order. All other discharges from MS4s to ASBS are prohibited, unless authorized by a subsequent order.

e. For discharges associated with water body pollutant combinations addressed in a TMDL in Attachment E of this Order, the affected Copermittees shall achieve compliance as outlined in Attachment E (Total Maximum Daily Load Provisions).

2. Receiving Water Limitations

a. Discharges from MS4s owned and operated by a Copermittee must not cause or contribute to the violation of water quality standards in any receiving waters, including ~~but not limited to~~ all applicable provisions contained in the list below including any modifications, unless the Copermittee is addressing the discharges through Provision A.2.b or A.4 through the process set forth in Provision A.4:

(1) The San Diego Water Board's Basin Plan, including beneficial uses, water quality objectives, and implementation plans;

(2) State Water Board plans for water quality control including the following:

(a) Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries (Thermal Plan), and

(b) The Ocean Plan, including beneficial uses, water quality objectives, and implementation plans;

(3) State Water Board policies for water and sediment quality control including the following:

(a) Water Quality Control Policy for the Enclosed Bays and Estuaries of California,

(b) Sediment Quality Control Plan which includes the following narrative objectives for bays and estuaries:

(i) Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities, and

(ii) Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health,

(c) The Statement of Policy with Respect to Maintaining High Quality of Waters in California (State Water Board Resolution No. 68-16).:

(4) Priority pollutant criteria promulgated by the USEPA through the following:

ADMINISTRATIVE DRAFT

(a) National Toxics Rule (NTR)[1] (promulgated on December 22, 1992 and amended on May 4, 1995), and

(b) California Toxics Rule (CTR)[2,3]

~~a. Discharges from MS4s composed of storm water runoff must not alter natural ocean water quality in an ASBS.~~

~~b. Discharges from MS4s must not cause or contribute to the violation of any receiving water limitations expressed as water quality based effluent limitations (WQBELs) required to meet the WLAs established for the TMDLs in to this Order, pursuant to the applicable TMDL compliance schedules.~~

b. For receiving water limitations associated with a water body pollutant combination addressed in a TMDL in Attachment E of this Order, the Copermittees shall achieve compliance as outlined in Attachment E (Total Maximum Daily Load Provisions).

3. Effluent Limitations

a. Technology Based Effluent Limits

Pollutants in storm water discharges from MS4s must be reduced to the MEP~~.~~[4], through timely implementation of control measures and other actions as specified in Provisions B and E as described in Provision A.4.

b. Water Quality Based Effluent Limits

For a water body-pollutant combination addressed in a TMDL in Attachment E of this Order, ~~P~~pollutants in discharges from MS4s must be reduced to comply with ~~any~~ effluent limitations expressed as WQBELs required to meet the WLAs established for those TMDLs as described in Provision A.4 and Attachment E to this Order, pursuant to the applicable TMDL compliance schedules.

4. Compliance with Discharge Prohibitions, ~~and~~ Receiving Water Limitations, and Effluent Limitations

Each Copermittee must comply with the discharge prohibitions (A.1), ~~and~~ receiving water limitations (A.2), and effluent limitations (A.3) of this Order through timely

---

[1] 40 CFR 131.36
[2] 65 Federal Register 31682-31719 (May 18, 2000), adding Section 131.38 to 40 CFR
[3] If a water quality objective and a CTR criterion are in effect for the same priority pollutant, the more stringent of the two applies, unless a previous regulatory action (i.e., TMDL) has specified otherwise.
[4] This does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants in storm water discharges to the MEP prior to entering receiving waters (e.g., low flow diversions to the sanitary sewer). Runoff treatment must occur prior to the discharge of runoff into receiving waters per Finding 8.

implementation of strategies, control measures, and other actions as specified in Provisions B and E of this Order, including any modifications. The Water Quality Improvement Plans described in Provision B shall be designed to achieve compliance with the discharge prohibitions, receiving water limitations, and effluent limitations. Copermittees shall be considered in compliance with A.1, A.2, and A.3 unless the Regional Board has denied approval of a Water Quality Improvement Plan or subsequent update as described in Provisions B and F.1.

a. If exceedance(s) of water quality standards persist in receiving waters notwithstanding implementation of this Order, the Copermittees must comply with the following procedures:

(1) For pollutants that are not in the process of being addressed via specific scheduled actions in a Water Quality Improvement Plan, ~~U~~upon a determination by either the Copermittees or the San Diego Water Board that discharges from the MS4 are causing or contributing to an exceedance of an applicable water quality standard, the Copermittees must submit the following updates to the Water Quality Improvement Plan required under Provision B as part of the Annual Report required under Provision F.3.b~~,~~ or Water Quality Improvement Plan update Provision B.5.a, unless the San Diego Water Board either: 1) directs an earlier submittal; or 2) allows for the adoption of a forthcoming TMDL to establish wasteload allocations that will form the basis of revisions to the Water Quality Improvement Plan:

(a) The water quality improvement strategies being implemented that are effective and will continue to be implemented;

(b) ~~Additional w~~Water quality improvement strategies (~~i.~~e.g. BMPs, retrofitting projects, stream and/or habitat rehabilitation, ~~or~~ restoration projects, etc.) that will be implemented to reduce or eliminate any pollutants or conditions that are causing or contributing to the exceedance of water quality standards;

(c) Updates to the schedule for implementation of the existing and additional water quality improvement strategies; and

(d) Updates, when necessary, to the schedule for achieving compliance with the discharge prohibitions and receiving water limitations of this Order;

(e) As described in Provision B.6, Copermittees must submit requested modifications to the Water Quality Improvement Plan either in the Annual Report required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision F.5.b~~The San Diego Water Board may require the incorporation of additional modifications to the Water Quality Improvement Plan required under Provision B. The applicable Copermittees must submit any modifications~~

~~to the update to the Water Quality Improvement Plan within 30 days of notification that additional modifications are required by the San Diego Water Board, or as otherwise directed~~;

(f) As described in Provision B.6, upon ~~Within 30 days of the~~ San Diego Water Board determination that the update to the Water Quality Improvement Plan meets the requirements of this Order, the Copermittees must submit requested modifications to the jurisdictional runoff management programs either in the Annual Report required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision F.5.b.~~revise the jurisdictional runoff management program documents to incorporate the updated water quality improvement strategies that have been and will be implemented, the implementation schedule, and any additional monitoring required~~; and

(g) The Copermittees must implement the revised jurisdictional runoff management programs and updated jurisdictional monitoring and assessment component of the Water Quality Improvement Plan.

(2) For pollutants in the process of being addressed via a specific, scheduled program in a Water Quality Improvement Plan, the Copermittee(s) shall continue to implement that program as described in the Water Quality Improvement Plan approved by the Regional Board;

b. So long as the Copermittees have complied with the procedures set forth above and are implementing the Water Quality Improvement Plan(s) approved by the Regional Board, the Copermittees ~~must~~ do not have to repeat the same procedure ~~set forth above to comply with~~ for continuing or recurring exceedances of the same discharge prohibitions, effluent limitations, and receiving water limitations ~~of this Order for continuing or recurring exceedances of the same water quality standard(s) following implementation of scheduled actions~~ unless directed to ~~do otherwise~~ by the San Diego Water Board.

~~**a.** Nothing in Provisions A.4. and A.4. prevents the San Diego Water Board from enforcing any provision of this Order while the applicable Copermittees prepare and implement the above update to the Water Quality Improvement Plan and jurisdictional runoff management programs.~~

ADMINISTRATIVE DRAFT

B. WATER QUALITY IMPROVEMENT PLANS

The purpose of this provision is to develop Water Quality Improvement Plans that guide the Copermittees' jurisdictional runoff management program implementation efforts towards achieving the outcome of improved water quality in MS4 discharges and receiving waters. The goal of the Water Quality Improvement Plan is to 1) effectively prohibit non-storm water discharges into the MS4s, 2) reduce pollutants in storm water discharges from the MS4s to the MEP, and 3) support attainment and ~~the~~ reasonable protection, preservation~~,~~, and enhancement~~, and restoration~~ of water quality and designated beneficial uses of waters of the state. Therefore, implementation of the WQIPs also provides the basis for complying with Provisions A.1 and A.3, as described in Provision A.4. This goal will be accomplished through an adaptive planning and management process that identifies the highest water quality priorities within a watershed and implements strategies, control measures, and BMPs to achieve improvements in the quality of discharges from the MS4s and receiving waters.

The Copermittees must develop Water Quality Improvement Plans for each Watershed Management Area that 1) prioritize water quality ~~issues~~conditions resulting from the Copermittee's MS4 discharges ~~to and from the MS4s with~~in each Watershed Management Area, 2) identify MS4 pollutant sources ~~and other stressors~~ associated with ~~those~~the water quality priorities, 3) define numeric ~~targets~~goals and schedules to ~~achieve improvement of~~address water quality priorities, 4) describe water quality improvement strategies to achieve numeric ~~targets~~goals, and 5) develop and execute a coordinated monitoring and assessment program to facilitate adaptive management of the Water Quality Improvement Plans and determine progress towards achieving improved water quality in MS4 discharges and receiving waters ~~improved water quality.~~

The Copermittees must ~~implement all~~submit Water Quality Improvement Plans for public review and Regional Board Executive Officer review and approval per the ~~requirements of~~ schedule outline in Provision ~~no later than 12 months after the adoption of this Order, or in accordance with Provision F.5~~B.~~6 of this Order.~~

1.
Watershed Management Areas

The Copermittees must develop Water Quality Improvement Plans for each of the Watershed Management Areas in Table B-1. A total of ~~nine~~ten Water Quality Improvement Plans must be developed for the San Diego Region.

ADMINISTRATIVE DRAFT

Table B-1. Watershed Management Areas (continued)

Watershed Management Area	Hydrologic Unit(s)	Major Surface Water Bodies	Responsible Copermittees
San Diego Bay	Pueblo San Diego (908.00) Sweetwater (909.00) Otay (910.00)	Sweetwater River Otay River San Diego Bay Pacific Ocean	- City of Chula Vista - City of Coronado - City of Imperial Beach - City of La Mesa - City of Lemon Grove - City of National City - City of San Diego - County of San Diego - San Diego County Regional Airport Authority - Unified Port of San Diego
Tijuana River	Tijuana (911.00)	Tijuana River Tijuana Estuary Pacific Ocean	- City of Imperial Beach - City of San Diego - County of San Diego

Notes:
1. The Orange County Copermittees will be enrolled under this Order upon expiration of Order No. R9-2009-0002, or earlier if the Orange County Copermittees meet the conditions in Provision F.6.
2. The Riverside County Copermittees will be enrolled under this Order upon expiration of Order No. R9-2010-0016, or earlier if the Riverside County Copermittees meet the conditions in Provision F.6.
3. The County of San Diego will not be required to implement the requirements of Provision B for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees are enrolled under this Order. Until then, the County of San Diego is responsible for implementing and complying with the requirements of Provisions D.1, D.4.a.(1)&(3), E, F.2.a-b, F.3.b, and F.4 for the areas of the Santa Margarita River Watershed Management Area within its jurisdiction.

2. Identification of Water Quality Priorities

The Copermittees must identify the water quality priorities within each Watershed Management Area that will be addressed by the Water Quality Improvement Plan. Where appropriate, Watershed Management Areas may be separated into subwatersheds to focus water quality prioritization and jurisdictional ~~runoff management program~~ implementation efforts by receiving water.

a. Assessment of Receiving Water Conditions

The Copermittees must ~~review pollutant sources, discharges, and receiving water conditions and assess~~consider the following, at a minimum, to ~~determine~~support the ~~degree~~identification of ~~adverse~~water quality priorities based on the impacts ~~to~~of MS4 discharges on receiving water beneficial uses:

(1) Receiving waters listed as impaired on the CWA Section 303(d) List of Water Quality Limited Segments (303(d) List);

(2) TMDLs adopted and under development by the San Diego Water Board;

(3) The requirements of Provision A.2;

~~(3)~~(4) Receiving waters recognized as sensitive or highly valued by the Copermittees, including estuaries designated under the National Estuary Program under CWA section 320, wetlands defined by the State or U.S. Fish and Wildlife Service's National Wetlands Inventory as wetlands, and receiving waters identified as ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012~~X~~ (Attachment A);

~~(4)~~(5) Water quality standards established in the Basin Plan;

~~(5)~~(6) Known historical versus current physical, chemical, and biological water quality conditions;

~~(6)~~(7) ~~All available~~ Available, relevant, and appropriately collected physical, chemical, and biological receiving water monitoring data meeting appropriate QA/QC standards, including~~, but not limited to,~~ data describing:

(a) Chemical constituents;

(b) Water quality parameters (i.e. pH, temperature, conductivity, etc.);

(c) Toxicity Identification Evaluations for both receiving water column and sediment;

(d) Trash impacts;

(e) Bioassessments; and

(f) Physical habitat.

~~(7)~~(8) Available evidence of erosional impacts in receiving waters due to accelerated flows (i.e. hydromodification); ~~and~~

~~(8)~~(9) Available evidence of adverse impacts to the chemical, physical, and biological integrity of receiving waters~~.~~; and

(10) The potential for long-term achievement and maintenance of beneficial use attainment in the Watershed Management Area.

b. ASSESSMENT OF MS4 DISCHARGE QUALITY AND IMPACTS

To support the identification of priorities based on the impacts of MS4 discharges on receiving water beneficial uses, the Copermittees must review appropriately collected MS4 discharge quality data and consider the extent to which MS4s cause or contribute to the adverse impacts to receiving water beneficial uses identified in B.2.a. Considerations include:

(1) Locations of the Copermittees' MS4 discharges with respect to receiving waters;

(2) MS4 discharge quality results relevant to impacts in receiving waters and action levels, including the temporal and geographic variation of the results;

(3) The requirements of Provisions A.1 and A.3.; and

(4) Whether MS4 discharge quality is sufficiently well known or other information is available to assess whether MS4 discharges are causing or contributing to specific receiving water conditions, or whether additional data need to be collected through the Monitoring and Assessment Program developed as part of the Water Quality Improvement Plan.

c. IDENTIFICATION OF ~~IDENTIFY~~PRIORITY ~~POLLUTANTS AND~~ RECEIVING WATER CONDITIONS

The Copermittees must use the information gathered in Provision B.2.a~~.~~ and B.2.b. to develop a list of water quality priorities as pollutants and/or receiving water conditions that are the highest threat to receiving water quality or that most adversely affect the physical, chemical, and biological integrity of receiving waters. The Copermittees must identify the highest water quality priorities to be addressed by the Water Quality Improvement Plan, and describe the reasoning for selecting a subset of receiving water conditions as the highest priority(ies)~~.~~ The Water Quality Improvement Plans shall describe the following for the highest priority receiving water condition:

(1) The beneficial use(s) and pollutant(s) associated with the priority receiving water condition(s);

(2) The geographic extent of the priority receiving water condition(s)within the WMA, if known;

(3) The Copermittees with MS4s that contribute discharges to the priority water receiving condition(s);

(4) The temporal extent of the priority receiving condition(s) (i.e., dry weather and/or wet weather); and

(5) Whether receiving waters have been monitored sufficiently to adequately characterize the priority receiving condition(s), including a consideration of spatial and temporal variation.

d. MS4 POLLUTANT SOURCE ~~AND/OR STRESSOR~~ IDENTIFICATION

The Copermittees must identify and prioritize known and suspected storm water and non-storm water pollutant sources ~~and any other stressors causing or contributing to~~within the MS4 associated with the highest priority receiving water conditions identified under B.2.c~~quality priorities.~~ . The identification of known and suspected sources of the highest water quality priorities as identified for Provision B.2.c ~~must~~ shall consider the following :

(1) Land uses and their potential contribution to the highest priority receiving water conditions;

(2) Pollutant generating facilities ~~or~~, areas, and/or activities within the Watershed Management Area~~, including:~~;

~~Each Copermittee's inventory of construction, municipal, commercial, industrial, and residential facilities, areas, and/or activities,~~

~~Publicly owned parks and/or recreational areas,~~

~~Open space areas,~~

~~All currently operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, and~~

~~Areas not within the Copermittees' jurisdictions (e.g., tribal lands, state lands, federal lands) that may be pollutant sources related to the highest water quality priorities within the Watershed Management Area;~~

Locations of the Copermittees' MS4s~~, including the following:~~

(3) ~~All MS4~~ outfalls ~~that discharge to receiving waters, and~~ .

~~Locations of major structural controls for storm water and non-storm water (e.g., retention basins, detention basins, major infiltration devices, etc.);~~

~~Other known and suspected sources of non-storm water or pollutants in storm water discharges to receiving waters within the Watershed Management Area, including the following:~~

~~Other MS4 outfalls (e.g., Phase II Municipal and Caltrans),~~

~~Other NPDES permitted discharges,~~

~~Any other discharges that may be considered point sources (e.g., private outfalls), and~~

~~Any other discharges that may be considered non-point sources (e.g., agriculture, wildlife or other natural sources);~~

(4) Review of available data, including ~~but not limited to~~:

(i) Findings from the Copermittees' illicit discharge detection and elimination programs,

(ii) Findings from the Copermittees' MS4 outfall monitoring,

~~(iii) Findings from the Copermittees' receiving water monitoring,~~
~~(iv)~~
~~(v) Findings from the Copermittees' MS4 discharges and receiving water assessments, and~~
~~(vi)~~
~~(vii)~~(iii) ~~Any other~~Other available, relevant, and appropriately-collected data, information, or studies related to pollutant sources and ~~conditions~~ pollutant-generating activities that contribute to the highest priority receiving water ~~quality priorities as~~conditions identified ~~for~~ in Provision B.2.c~~ce~~.

(5) Whether MS4 sources are sufficiently well known to design an effective, efficient[5], directed control strategy, or whether additional source/stressor identification needs to be conducted through the Monitoring and Assessment Program developed as part of the Water Quality Improvement Plan to identify and prioritize sources/stressors within the watershed.

e. NUMERIC ~~TARGETS AND SCHEDULES~~GOALS

The Copermittees must develop and incorporate interim and final numeric ~~targets[6] and schedules~~ goals[67] into the Water Quality Improvement Plans. Numeric ~~targets~~goals and schedules ~~must be used~~are intended to support Water Quality Improvement Plan development and to measure progress towards addressing the highest priority receiving water conditions identified under B.2.c~~water quality priorities and an ultimate outcome of protections, preservation, enhancement, and restoration of~~. Numeric goals are not enforceable compliance standards, effluent limitations, or receiving water ~~beneficial uses.~~ limitations. When ~~developing~~establishing numeric ~~targets~~goals and corresponding schedules, the Copermittees must consider the following:

---

[5] Copermittees are encouraged to use a sustainability analysis, or Triple Bottom Line analysis, that considers environmental, social and economic factors when estimating the potential efficiency of control strategies.

~~[6] Interim and final numeric targets may take a variety of forms such as pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric targets are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators.~~

[6] Interim and final numeric goals may take a variety of forms such as TMDL targets, TMDL wasteload allocations, TMDL based WQBELs incorporated in Attachment E of this Order, action levels, pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric goals are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators. To the extent that a goal is not based on an enforceable regulatory mechanism (i.e., TMDL, WLA), WQIP goals and schedules may be revised through the iterative process. Numeric goals are not subject to enforcement or non-compliance actions under this Order.

ADMINISTRATIVE DRAFT

PROVISION B: WATER QUALITY IMPROVEMENT PLANS

(1) Final numeric ~~targets~~goals must be based on measureable criteria or indicators, to be achieved in the receiving waters and/or MS4 discharges for the highest priority receiving water ~~quality priorities~~conditions which will ~~result in~~be capable of demonstrating progress toward the achievement of the restoration and/or protection of water quality standards in receiving waters; and

(2) Interim numeric ~~targets~~goals must be based on measureable criteria or indicators that can demonstrate incremental progress toward achieving the final numeric ~~targets~~goals in the receiving waters and/or MS4 discharges~~;~~. ~~and~~

(3) Schedules must be adequate for measuring progress toward achieving the interim and final numeric ~~targets~~ goals required for Provisions B.2.d. ~~and B.2.d..~~ Schedules must incorporate the following:

(i) Interim dates for achieving the interim numeric goals~~targets~~,

(ii) Compliance schedules for any applicable TMDLs in Attachment E to this Order,

(iii) Compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012~~X~~ (see Attachment A),

(iv) Achievement of the final numeric goals ~~targets~~ in the receiving waters and/or MS4 discharges for the highest water quality priorities must be as soon as possible, and

~~(iv)~~(v) Final dates for achieving the final numeric goals ~~targets~~ must not extend more than 10 years beyond the date this Order is adopted, unless the schedule includes an applicable TMDL in Attachment E to this Order[7][8].

3. Water Quality Improvement Strategies and Schedules

The Copermittees must develop specific water quality improvement strategies to address the highest ~~water quality~~ priority~~ies~~ receiving water conditions identified within a Watershed Management Area. The water quality improvement strategies must address the highest water quality priorities by preventing or eliminating non-storm water discharges to and from the MS4, reducing pollutants in storm water discharges from the MS4 to the MEP, and restoring and/or

[7] Achievement of final numeric goals within 10 years represents progress towards attainment of water quality standards, but is not a requirement to fully attain all applicable water quality standards or all priority receiving water conditions within 10 years.

protecting the water quality standards of receiving waters.

a. Water Quality Improvement Strategies

The Copermittees must prioritize water quality improvement strategies, ~~must prioritize~~based on their likely effectiveness and efficiency, and implement ~~the following~~ measures, as appropriate, to effectively prohibit non-storm water discharges into its MS4, reduce pollutants in storm water discharges from its MS4 to the MEP, and achieve the interim and final numeric ~~targets~~goals in accordance with the schedules ~~required for~~in Provision B.2~~.:~~.e. Measures include:

(1) Copermittee-selected activities identified in Provision E ,either as described in the jurisdictional runoff management programs or as modified with justification, that will address priority receiving water conditions; and

~~(2)~~ Additional ~~S~~structural and/or non-structural BMPs (to include public outreach and participation programs), as selected by the Copermittee, that are designed to achieve the interim and final numeric goals identified in Provision B.2.e.~~targets in the receiving waters and/or MS4 discharges;~~

~~Retrofitting projects for areas of existing development known or suspected to contribute to the highest water quality priorities, and where retrofitting will contribute to reducing or eliminating non-storm water discharges to the MS4 and/or reducing pollutants in storm water discharges from the MS4 to the MEP;~~

~~(3)~~(2) ~~Stream and/or habitat rehabilitation or restoration projects where stream and/or habitat rehabilitation or restoration are necessary for, or will contribute to demonstrable improvements in the physical, chemical, and biological receiving water conditions and restoration and/or protection of water quality standards in receiving waters; and~~

~~Other water quality improvement strategies that will result in preventing or eliminating non-storm water discharges to and from the MS4, reducing pollutants in storm water discharges from the MS4 to the MEP, and restoring and/or protecting the water quality standards of receiving waters.~~

b. Implementation Schedules

~~(1)~~ The Copermittees must develop schedules for implementing the water quality improvement strategies identified under Provision B.3.aa~~a~~ to achieve the interim and final numeric ~~targets~~goals identified in ~~the receiving waters and/or MS4 discharges for the highest water quality priorities~~B.2.e in the Watershed Management Area. Schedules must be developed for both the water quality improvement strategies implemented by each Copermittee within its jurisdiction and for strategies that ~~will be implemented by multiple Copermittees~~ Copermittees' choose to implement on a collaborative basis~~.~~

~~(2)~~(1) .

Formatte

~~(3)~~(2) The Copermittees must incorporate the implementation compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-001~~X~~2 (see Attachment A).

4. Water Quality Improvement Monitoring and Assessment

The Copermittees in each Watershed Management Area must develop an integrated ~~program to assess the~~Water Quality Improvement Plan Monitoring and Assessment Program that assesses: 1) progress toward achieving the numeric ~~targets~~goals and schedules, ~~and~~2) ~~the~~ progress toward addressing the highest priority receiving water ~~quality priorities~~conditions for each Watershed Management Area, and 3) each Copermittee's overall efforts implementing the requirements of Provision B. The water quality improvement monitoring and assessment program must include the monitoring and assessment requirements of Provision D~~.~~, which may be modified for consistency with the priority receiving water conditions of each Watershed Management Area and associated Copermittees. For Watershed Management Areas with applicable TMDLs, the water quality monitoring and assessment program must incorporate the specific monitoring and assessment requirements of Attachment E. For Watershed Management Areas with any ASBS, the water quality monitoring and assessment program must also incorporate the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012~~X~~ (see Attachment A).

5. Iterative and Adaptive Management Process

~~a. Water Quality Improvement Plan Adaptive Management Process~~

The Copermittees in each Watershed Management Area must implement the iterative process, ~~at least once every 3 years,~~ adapting the Water Quality Improvement Plan, jurisdictional runoff management programs and monitoring and assessment programs, as necessary, to become more effective~~, based on, but not limited to~~ and meet the requirements of Provisions A, and shall consider the following~~ considerations~~:

a. Priority Receiving Water Conditions and Numeric Goals

The priority receiving water conditions and numeric goals, developed pursuant to B.2.c. and B.2.e respectively, shall guide jurisdictional implementation efforts for the duration of this Order. Recommendations for changes to priority receiving water conditions and numeric goals shall be provided in the Report of Waste Discharge and shall consider the following:

(1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan;

(2) Progress toward achieving interim and final numeric ~~targets~~goals in receiving waters and/or MS4 discharges for the highest water quality priorities in the Watershed Management Area~~,~~

~~Appropriateness of the highest water quality priorities identified for the Watershed Management Area;~~

~~Progress toward achieving outcomes according to established schedules;~~

(3) New scientific information or new or updated policies or regulations that affect identified numeric goals including revised water quality objectives or TMDLs;

~~(3)~~(4) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality problems and implementation measures to address the highest priority receiving water ~~quality problems~~conditions;

~~(4)~~(5) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees;

(6) The factors listed in Provision B.2.a.(1)-(10);

~~(5)~~(7) San Diego Water Board recommendations; and

~~(6)~~(8) Recommendations for modifications ~~to the Water Quality Improvement Plan~~ solicited through a public participation process.

b. ~~BASED ON THE RESULTS OF THE ITERATIVE PROCESS~~ WATER QUALITY IMPROVEMENT STRATEGIES AND SCHEDULES

~~(1)~~ The water quality improvement strategies and schedules required pursuant to ~~Provision B.5.a., the~~Provisions B.3 and B.4 shall be adapted as new information becomes available to inform more effective and efficient means of achieving the numeric goals established in Provision B.2.e. Copermittees ~~must report any modifications necessary~~shall consider adaptation to ~~improve the effectiveness of the Water Quality Improvement Plan in the Annual Report required pursuant to Provision , or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision F.5..~~

~~(2) The Copermittees must implement any modifications to the Water Quality Improvement Plan in accordance with the schedules developed pursuant to Provisions B.2. and B.3., unless directed otherwise by the San Diego Water Board.~~

~~**b. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM ADAPTIVE MANAGEMENT PROCESS**~~

~~Each Copermittee in the Watershed Management Area must implement the iterative process,~~jurisdictional runoff management programs and monitoring and assessment strategies and schedules at least annually~~, adapting its jurisdictional runoff management program to become more effective, based on, but not limited to~~ considering the following:

(1) Changes to priority receiving water conditions and numeric goals based on recommendations from B.5.a.;

(2) Measurable or demonstrable reductions of non-storm water discharges to ~~and from~~ each Copermittee's MS4;

(3) Measurable or demonstrable reductions of pollutants in storm water discharges from each Copermittee's MS4 to the MEP;

(4) Information on the MS4 sources and/or pollutant-generating activities determined to be most significantly contributing to priority receiving water conditions;

~~(4)~~(5) Efficiency in implementing the Water Quality Improvement Plan;

~~(5)~~(6) San Diego Water Board recommendations; and

~~(6)~~(7) Recommendations for modifications ~~to each Copermittee's jurisdictional runoff management program~~ solicited through a public participation process~~.~~.

6. Water Quality Improvement Plan Submittal, Implementation, and Modifications

Requirements for Water Quality Improvement Plan submittals and modifications are described in Provision F. Requirements for corresponding modifications to the jurisdictional runoff management programs and monitoring and assessment program are also described in Provision F.

~~The~~ Copermittees must commence with implementation of the Water Quality Improvement Plan no later than ~~180 days after submission, unless otherwise directed in writing by the San Diego Water Board.~~ the fiscal year (July 1) following San Diego Water Board approval of the Water Quality Improvement Plan.

~~(1) modifications necessary to improve the effectiveness its jurisdictional runoff management program document in the Annual Report required pursuant to Provision , or as part of the ROWD required pursuant to Provision F.5..~~

~~Each Copermittee must implement any modifications to its jurisdictional runoff management program in accordance with the schedules developed pursuant to~~

~~Provisions B.2. and B.3., unless directed otherwise by the San Diego Water Board.~~

~~5. Water Quality Improvement Plan Implementation~~

~~Copermittees must commence with implementation of the Water Quality Improvement Plan no later than 180 days after submission, unless otherwise directed in writing by the San Diego Water Board.~~

ADMINISTRATIVE DRAFT

C. ACTION LEVELS

The purpose of this provision is for the Copermittees to incorporate numeric non-storm water and storm water action levels in the Water Quality Improvement Plans. The action levels ~~will~~shall be used to guide the following program planning efforts and measure progress towards attaining the reasonable protection, preservation, and enhancement~~, and restoration~~ of water quality and designated beneficial uses of waters of the state~~. This goal will be accomplished through monitoring and assessing the quality of the MS4 discharges during the implementation of the Water Quality Improvement Plans.~~:

1. ~~The Copermittees must incorporate numeric action levels in the~~ Support development and prioritization of water quality improvement strategies through the Water Quality Improvement Plans ~~to direct and focus~~. Discharge data above action levels can be evaluated using a statistical approach considering the ~~Copermittees' jurisdictional runoff management program implementation efforts for addressing MS4~~ frequency, magnitude, and loading of discharges to the receiving waters~~. The numeric action levels will be used as part of the MS4~~ to support development of actions and prioritization of their implementation.

2. Assist in the effective prohibition of non-stormwater discharges ~~assessments required under~~ from the MS4 pursuant to Provision ~~, and each Copermittee's program to detect and eliminate non-storm water~~ E.2.

3. Support the detection and elimination of illicit discharges to the MS4 ~~required under~~pursuant to Provision ~~. Numeric~~E.2.

These goals will be accomplished through monitoring and assessing the quality of the MS4 discharges prior to and during the implementation of the Water Quality Improvement Plans. Exceedances of action levels are not subject to enforcement or non-compliance actions under this Order.

Action levels will be developed and incorporated into the Water Quality Improvement Plans (Provision B) including the Illicit Discharge Detection and Elimination (IDDE) Program (Provision E.2). Depending upon the goals/objectives for the use of the action levels ~~must be developed~~ and the priority receiving water conditions, the constituents and values at which they are set may differ between watersheds. Copermittees may develop Watershed Management Area specific numeric action levels for non-storm water and storm water MS4 discharges~~,~~ using an approach approved by the Regional Board or use the default non-stormwater and stormwater action levels prescribed within C.1 and C.2 below, respectively. The Copermittees will submit action levels as part of their Water Quality Improvement Plan(s). The action levels established as ~~follows:~~part of R9-2007-0001 will serve as the interim action levels until the Water Quality Improvement Plans are completed and approved.

PROVISION C: ACTION LEVELS

ADMINISTRATIVE DRAFT

1. Non-Storm Water Action Levels

a. The following non-storm water action levels (NALs) must be incorporated ~~in the Water Quality Improvement Plan~~:

(1) Non-Storm Water Discharges from MS4s to Ocean Surf Zone

Table C-1. Non-Storm Water Action Levels for Discharges from MS4s to Ocean Surf Zone

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100 ml	1,000	-	10,000/1,000[1]	OP
Fecal Coliform	MPN/100 ml	200[2]	-	400	OP
Enterococci	MPN/100 ml	35	-	104[3]	OP

Abbreviations/Acronyms
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
MPN/100 ml – most probable number per 100 milliliters

Notes:
1. Total coliform density ~~shall not exceed~~NAL is 1,000 MPN/100 ml when the fecal/total coliform ratio exceeds 0.1
2. Fecal coliform density ~~may not exceed~~ NAL is 200 MPN per 100 ml during any 30 day period
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas"

~~(3)~~
~~(4)~~(2) Non-Storm Water Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Table C-2. Non-Storm Water Action Levels for Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Turbidity	NTU	75	-	225	OP
pH	Units	Within limit of 6.0 to 9.0 at all times			OP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	35	-	104[3]	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
OP – Ocean Plan water quality objective
NTU – Nephelometric Turbidity Units
ug/L – micrograms per liter
MDAL – maximum daily action level
BP – Basin Plan water quality objective
MPN/100 ml – most probable number per 100 milliliters

Notes:
1. Based on a minimum of not less than five samples for any 30-day period
2. ~~No~~NAL is reached if more than 10 percent of total samples ~~may~~ exceed 400 MPN per 100 ml during any 30 day period
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas" and is not applicable to waterbodies that are not designated REC-1.

ADMINISTRATIVE DRAFT

Table C-3. Non-Storm Water Action Levels for Priority Pollutants

Parameter	Units	Freshwater (CTR)		Saltwater (CTR)	
		MDAL	AMAL	MDAL	AMAL
Cadmium	ug/L	**	**	16	8
Copper	ug/L	*	*	5.8	2.9
Chromium III	ug/L	**	**	-	-
Chromium VI	ug/L	16	8.1	83	41
Lead	ug/L	*	*	14	2.9
Nickel	ug/L	**	**	14	6.8
Silver	ug/L	*	*	2.2	1.1
Zinc	ug/L	*	*	95	47

Abbreviations/Acronyms:

CTR – California Toxic Rule
ug/L – micrograms per liter
AMAL – average monthly action level
MDAL – maximum daily action level

Notes:

* Action levels developed on a case-by-case basis (see below)

** Action levels developed on a case-by-case basis (see below), but calculated criteria are not to exceed Maximum Contaminant Levels (MCLs) under the California Code of Regulations, Title 22, Division 4, Chapter 15, Article 4, Section 64431

The Cadmium, Copper, Chromium (III), Lead, Nickel, Silver and Zinc NALs for MS4 discharges to freshwater receiving waters will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data (receiving water hardness). For these priority pollutants, the following equations (40 CFR 131.38.b.2) will be required:

Cadmium (Total Recoverable) = exp(0.7852[ln(hardness)] -2.715)
Chromium III (Total Recoverable) = exp(0.8190[ln(hardness)] + .6848)
Copper (Total Recoverable) = exp(0.8545[ln(hardness)] - 1.702)
Lead (Total Recoverable) = exp(1.273[ln(hardness)] - 4.705)
Nickel (Total Recoverable) = exp(.8460[ln(hardness)] + 0.0584)
Silver (Total Recoverable) = exp(1.72[ln(hardness)] - 6.52)
Zinc (Total Recoverable) = exp(0.8473[ln(hardness)] + 0.884)

~~(5)~~(3) Non-Storm Water Discharges from MS4s to Inland Surface Waters

Table C-4. Non-Storm Water Action Levels for Discharges from MS4s to Inland Surface Waters

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Dissolved Oxygen	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters			BP
Turbidity	NTU	-	20	See MDAL	BP
pH	Units	Within limit of 6.5 to 8.5 at all times			BP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	33	-	61[3]	BP
Total Nitrogen	mg/L	-	1.0	See MDAL	BP
Total Phosphorus	mg/L	-	0.1	See MDAL	BP
MBAS	mg/L	-	0.5	See MDAL	BP
Iron	mg/L	-	0.3	See MDAL	BP
Manganese	mg/L	-	0.05	See MDAL	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
BP – Basin Plan water quality objective
COLD – cold freshwater habitat beneficial use
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
MDAL – maximum daily action level
WARM – warm freshwater habitat beneficial use
MBAS – Methylene Blue Active Substances
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period
2. ~~No~~NAL is reached if more than 10 percent of total samples ~~may~~ exceed 400 MPN per 100 ml during any 30 day period
3. This value has been set to the Basin Plan water quality objective for freshwater "designated beach areas" and is not applicable to waterbodies that are not designated REC-1.

b. If not identified in Provision C.1.a, NALs must be identified and incorporated in the Water Quality Improvement Plan for any pollutants or waste constituents causing or contributing, or threatening to cause or contribute to a condition of pollution or nuisance in waters of the ~~state~~ U.S. associated with the highest water quality priorities related to non-storm water discharges from the MS4s. NALs must be based on:

(1) Applicable water quality standards which may be dependent upon site-specific or receiving water-specific conditions or assumptions to be identified by the Copermittees; or

(2) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. Dry weather monitoring and assessment data from MS4 outfalls collected in accordance with Provision D.1 may be used to develop or revise NALs based upon watershed-specific data. Revision of NALs is subject to Regional Board EO approval.

~~3.~~

~~4.~~2. Storm Water Action Levels

a. The following storm water action levels (SALs) for discharges of storm water from the MS4 must be incorporated ~~in the Water Quality Improvement Plan:~~:

Table C-5. Storm Water Action Levels for Discharges from MS4s to Receiving Waters

Parameter	Units	Action Level
Turbidity	NTU	126
Nitrate & Nitrite (Total)	mg/L	2.6
Phosphorus (Total P)	mg/L	1.46
Cadmium (Total Cd)*	µg/L	3.0
Copper (Total Cu)*	µg/L	127
Lead (Total Pb)*	µg/L	250
Zinc (Total Zn)*	µg/L	976

Abbreviations/Acronyms:
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
ug/L – micrograms per liter

Notes:
* The sampling must include a measure of receiving water hardness at each MS4 outfall. If a total metal concentration exceeds the corresponding metals SAL in Table C-5, that concentration must be compared to the California Toxics Rule criteria and the USEPA 1-hour maximum concentration for the detected level of receiving water hardness associated with that sample. If it is determined that the sample's total metal concentration for that specific metal exceeds that SAL, but does not exceed the applicable USEPA 1-hour maximum concentration criterion for the measured level of hardness, then the sample result will not be considered ~~as an excursion~~ above the SAL for that measurement.

b. If not identified in Provision C.2.a, SALs must be identified and incorporated in the Water Quality Improvement Plan for pollutants or waste constituents causing or contributing, or threatening to cause or contribute to a condition of pollution or nuisance in waters of the state associated with the highest water quality priorities related to storm water discharges from the MS4s. SALs must be based on:

(1) Federal and State water quality guidance and/or water quality standards; ~~and~~or

(2) Site-specific or receiving water-specific conditions; or

(3) One of the approaches recommended by the California Water Board's Storm Water Panel in its report, "The Feasibility of Numerical Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities" (June 2006).

~~(3)~~(4) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. Wet weather monitoring and assessment data from MS4 outfalls collected in accordance with Provision D.1.b may be used to develop or revise SALs based upon watershed-specific data. Revision of SALs is subject to San Diego Water Board approval.

PROVISION C: ACTION LEVELS

D. MONITORING AND ASSESSMENT REQUIREMENTS

[*Note: This entire section has been replaced with a proposed alternative version of provision D.*]

Water quality monitoring and assessment shall be question-driven and designed to support adaptive storm water management and the iterative process outlined in Provision B. The monitoring and assessment activities shall be based on a logical hierarchy in which overall management goals help define clear management questions, which are addressed by specific monitoring activities designed to produce data targeted to defined assessment needs. The monitoring and assessment activities shall follow relevant and applicable guidance provided in the SWAMP Assessment Framework (Bernstein, 2010[8]), A Framework for Monitoring and Assessment in the San Diego Region (SDRWQCB, 2011[9]), and the Southern California Stormwater Monitoring Coalition's (SMC) Model Monitoring Program (SMC, 2004[10]).

The monitoring and assessment shall be designed in two phases. A transitional program shall be implemented beginning the first day of October in the year following permit adoption, and continue until the first day of October following commencement of Water Quality Improvement Plan implementation, pursuant to Provision B. The transitional ("pre-WQIP") program shall build on the experience gained implementing water quality monitoring programs under previous Orders and shall address the SMC questions as described below. The second ("post-WQIP") phase of the Monitoring and Assessment Program shall address the watershed priorities identified in the Water Quality Improvement Plans as developed for each watershed pursuant to Provision B. This phase of monitoring shall begin with implementation of the approved WQIPs. The transitional (pre-WQIP) phase of monitoring and assessment applies only to the San Diego County Copermittees; the Orange County and Riverside County permittees affected by this regional permit are expected to participate during the post-WQIP phase, after officially enrolling under the regional permit.

As a starting point, the Monitoring and Assessment Program shall be designed to address the overarching management questions developed by the SMC:

Prepared by Lilian Busse and Bruce Posthumus. http://www.waterboards.ca.gov/sandiego/board_info/agendas/2012/Jun/item9/eosr0612MonitoringFramework.SD1.pdf

[10] SMC, 2004. "Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California." A report from the Stormwater Monitoring Coalition's Model Monitoring Technical Committee. August 2004. Technical Report #419. http://www.lmtf.org/FoLM/Poliact/EColi/419_smc_mm.pdf

1. Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? This question will be addressed by comparing indicator values to the relevant benchmarks or objectives and/or to background conditions.

2. What is the extent and magnitude of the current or potential receiving water problems? This question will be addressed by mapping the spatial extent and/or temporal persistence of problems, the severity of impacts, and/or the degree to which benchmarks are exceeded.
3. What is the relative urban runoff contribution to the receiving water problem(s)? This question will be addressed by comparing concentrations and loads of priority constituents to those from other sources, including background.

4. What are the sources of urban runoff that contribute to receiving water problem(s)? This question will be addressed by characterizing and prioritizing discharges and using targeted source identification protocols to track the origin of specific constituents.

5. Are conditions in receiving waters getting better or worse? This question will be addressed by time series analyses of individual indicators and/or of aggregate or cumulative indices of condition.

Given that substantial work has already been accomplished and other work is ongoing to address the questions related to receiving water condition assessment (questions 1, 2, 5), the Copermittees shall focus their efforts principally on questions 3 and 4. All five questions need not be addressed simultaneously to the same degree. As watershed problems are identified, effort should shift to diagnosis (questions 4 and 5) until the problems have been addressed, at which point effort may shift back to broader assessment (questions 1 and 2) in search of other problems to address.

During the transitional (pre-WQIP) period, where feasible the Copermittees shall develop more specific monitoring questions to guide the design of specific monitoring activities and address specific assessment needs. The information so generated will be used to guide management actions, based on the results of the monitoring data assessments.

As part of each WQIP, the Copermittees shall develop a water quality Monitoring and Assessment Program (Monitoring and Assessment Program) for each Watershed Management Area (WMA), as provided in Table B-1. Using the overarching SMC management questions as guidance, each Monitoring and Assessment Program shall include specific monitoring questions appropriate to address the assessment needs of each specific WMA. The monitoring activities shall be designed to generate data needed to address priority issues identified in the WQIPs, and the resulting monitoring data and assessments shall be supplied to program planners to help inform management actions. If a WMA has an approved Comprehensive Load Reduction Plan (CLRP), the CLRP shall be incorporated into the WQIP.

Each Copermittee covered by this permit shall participate in development and implementation of the Monitoring and Assessment Program for each WMA in which they have jurisdiction. The Copermittees shall consider the needs of regional monitoring and assessment activities in the development of each Monitoring and Assessment Program and make allowances as needed for regional coordination.

1. Receiving Waters Monitoring

Until approval and implementation of the WQIPs, the Copermittees shall perform receiving water monitoring to address management questions and specific questions, as specified in Provisions D.1.a-D.1.g below:

a. SMC Regional Monitoring

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems?

The Copermittees shall participate in the SMC Regional Monitoring Program through its planned completion. The SMC monitoring program seeks to coordinate and leverage existing monitoring efforts to produce regional estimates of condition, improve data comparability and quality assurance, and maximize data availability, while conserving monitoring expenditures. The primary goal of this program is to implement an ongoing, large scale regional monitoring program for southern California's coastal streams and rivers. A comprehensive program was designed by the SMC, in which each participating group assesses its local watersheds and then contributes their portion to the overall regional assessment. The SMC Regional Monitoring Program involves a probabilistic design for characterization of coastal watersheds using bioassessment metrics and related analyses, including, but may not be limited to: physical habitat characterization, Southern California Index of Biological Integrity scoring, macroinvertebrate and algal taxonomy, algal biomass, water chemistry, and toxicity. The study incorporates both reference and non-reference streams and may identify additional biological and/or chemical stressors affecting stream health, such as channel alteration and presence of invasive species.

b. Southern California Bight Regional Monitoring

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems?

The Copermittees shall participate in the Southern California Bight Regional Monitoring program as a trade-off with other routine monitoring requirements. The Bight program involves detailed characterization of coastal and offshore receiving waters, as well as targeted special studies. The Bight regional monitoring effort is designed to build upon the data collected during the previous Bight regional programs, to assess the extent of contamination in the Southern California Bight. Receiving water samples are collected in or near coastal areas, bays, estuaries, offshore islands, and open water/deep ocean within the Bight. Water quality and sediment samples may be collected to provide data for model input, to assess long-term trends, and to answer management questions developed by the diverse group of stakeholders in the Southern California Bight Region as part of the program. In addition, special studies such as potential new technology implementation (i.e. bioanalytical screening and/or genetic coding) may be conducted as part of the Bight Regional Monitoring.

c. SEDIMENT QUALITY MONITORING

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems?

Specific Question: What is the condition of sediments in enclosed bays and estuaries with respect to the statewide sediment quality objectives?

Copermittees shall perform monitoring of bay and lagoon sediments, as applicable, under the Copermittees' responsibility to conform to the requirements of the Statewide Sediment Quality Objectives regulatory program, per State Water Resources Control Board Resolution No. 2008-0070 – Adoption of a Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality.

d. HYDROMODIFICATION MANAGEMENT PLAN (HMP) MONITORING

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems?

The Copermittees shall perform receiving water monitoring as required per their Hydromodification Management Plan Monitoring Plans, as approved by the California Regional Water Quality Control Board, San Diego Region.

e. TMDL MONITORING

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? Are conditions in receiving waters getting better or worse?

Specific question: What is the progress in achieving and complying with adopted TMDL targets?

The Copermittees shall conduct receiving water monitoring to address monitoring requirements associated with TMDLs as specified below.

(1) The Copermittees shall perform water quality monitoring as required per the Implementation Plans or approved CLRPs of effective TMDLs, including compliance monitoring for the following TMDLs:

(a) TMDL for Diazinon in Chollas Creek Watershed Resolution No. R9-2002-0123; Effective as of September 11, 2003.

(b) TMDLs for Dissolved Copper in Shelter Island Yacht Basin Resolution No. R9-2005-0019; Effective as of December 2, 2005.

(c) TMDLs for Dissolved Copper, Lead, and Zinc in Chollas Creek Resolution No. R9-2007-0043; Effective as of October 22, 2008.

(d) TMDLs for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay Resolution No. R9-2008-0027; Effective as of September 15, 2009.

(e) Revised TMDLs for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek) Resolution No. R9-2010-0001; Effective as of April 4, 2011.

(2) TMDL monitoring shall be coordinated and/or integrated with monitoring specified in an approved CLRP or equivalent implementation plan.

f. ASBS SPECIAL PROTECTIONS MONITORING

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? Are conditions in receiving waters getting better or worse?

The Copermittees responsible for discharges to Areas of Special Biological Significance (ASBS) as regulated per the Special Protections for Areas of Special Biological Significance, Governing Point Source Discharges of Storm Water and Nonpoint Source Waste Discharges, State Water Resources Control Board Resolution No. 2012-0012, shall perform receiving water monitoring as required, per the adopted ASBS Special Protections.

g. SAN DIEGO REGIONAL REFERENCE STREAM STUDY

Management Question: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems?

Specific Question: What are the concentrations/loads of bacteria, nutrients, and metals in reference streams in Southern California?

The Copermittees shall participate in reference stream receiving water monitoring and data analysis under the San Diego Regional Reference Stream Study as a Regional Study. The San Diego Regional Reference Stream Study is intended to characterize background concentrations of bacteria, nutrients, and metals in natural streams within the jurisdiction of the San Diego Water Board (Region 9). Samples shall be collected during wet and dry weather at sites considered representative of natural conditions (a contributing drainage area at least 95 percent undeveloped) and that vary in regards to hydrology, catchment size, and geology. The results of the study may be used to assist determination of scientifically-based reference stream numeric goals for indicator bacteria, nutrients, and metals.

h. Long-Term Receiving Water Monitoring, Post-WQIP Adoption

(1) Management Question: Are conditions in receiving waters getting better or worse?

(2) Following adoption of the WQIPs, the Copermittees shall conduct long-term receiving water monitoring to be performed in each WMA during WQIP implementation, for assessment of long-term trends, as specified below:

(3) The Copermittees in each Watershed Management Area shall select one long-term receiving water station from among the existing mass loading stations (MLS) and temporary watershed assessment stations (TWAS) to be representative of receiving water quality within the WMA.

(4) During the permit term, the Copermittees shall perform monitoring during three wet weather events and three dry weather events at each of the long-term stations selected by the Copermittees and approved by the San Diego Water Board.

(5) Dry Weather Receiving Water Monitoring

During the permit term, the Copermittees shall perform monitoring during three dry weather events, at minimum, at each of the long-term stations. One event must be conducted during the dry season (May 1-September 30) and one event must be conducted during a dry weather period during the wet season (October 1 –April 30), after the first wet weather event of the season, with an antecedent dry period of at least 72 hours following any storm event producing measurable rainfall of greater than 0.1 inch.

(a) For each dry weather receiving water monitoring event, the Copermittees must record field observations consistent with Table D-1 at each monitoring station.

Table D-1. Field Observations for Dry Weather Ambient Receiving Water Monitoring Stations

Field Observations
• Station identification and location. • Presence of flow, or pooled or ponded water. • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate), - Flow characteristics (i.e. presence of floatables, surface scum, or sheens, odor, color), • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, or sheens, odor, color). • Station description (i.e. deposits or stains, vegetation condition, structural condition, observable biology). • Presence and assessment of trash in and around station.

(b) If flow is present during the dry weather watershed monitoring event, and conditions allow the collection of the data, the Copermittee must monitor and record the parameters in Table D-2.

Table D-2. Field Monitoring Parameters for Receiving Water and Persistent MS4 Monitoring Stations

Parameters
• pH • Temperature • Specific conductivity • Dissolved oxygen • Turbidity

(c) Samples must be collected and analyzed as follows:

(i) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, indicator bacteria, and toxicity. Analytes that are field measured do not need to be analyzed by a laboratory.

(ii) For all other constituents, composite samples shall be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques: time-weighted composites composed of 24 discrete hourly samples, or flow-weighted composites collected over a typical 24 hour period. Only one analysis of the composite of aliquots is required.

(d) Samples shall be collected for analysis of the following parameters: TMDL or CLRP constituents in watersheds where the Copermittees are responsible parties in an adopted TMDL Implementation Plan, constituents listed as a cause of impairment on a CWA Section 303(d) listing for the receiving water body reach to which the outfall discharges, applicable NAL constituents, and constituents identified by the Copermittees as the watershed priorities in their respective WQIPs, as well as the constituents listed in Table D-3.

Table D-3. Analytical Monitoring Constituents for Receiving Water Monitoring Stations

Conventionals, Nutrients, Hydrocarbons	Metals (Total and Dissolved)	Pesticides	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity[1] • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus[1] • Orthophosphate • Nitrite[1,2] • Nitrate[1,2] • Total Kjeldahl Nitrogen • Ammonia	• Arsenic • Cadmium[1] • Chromium • Copper[1] • Iron • Lead[1] • Mercury • Nickel • Selenium • Thallium • Zinc[1]	• Organo-phosphate pesticides • Pyrethroid pesticides	•Total Coliform • Fecal Coliform[3] •*Enterococcus*

Notes:
1. Constituent with a storm water action level (SAL) specified under Provision C.2.
2. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
3. *E. Coli* may be substituted for Fecal Coliform.

(e) Dry Weather Receiving Water Toxicity Monitoring:

For each dry weather monitoring event, grab or composite samples from each monitoring station must be collected and analyzed for toxicity in accordance with Table D-4.

Table D-4. Toxicity Testing for Receiving Water Monitoring Stations

Freshwater Organism	Test Approach per Event	EPA Protocol[1]
Pimephales promelas (fathead minnow)	Wet: 1 acute Dry: 1 acute and chronic	EPA-821-R-02-012
Hyalella azteca	Wet: 1 acute Dry: 1 acute and chronic	EPA-821-R-02-012
Psuedokirchneriella subcapitata (formerly *Selenastrum capricornutum*, unicellular algae)	Wet: 1 acute Dry: 1 acute and chronic	EPA-821-R-02-013

Notes:
1. EPA protocols shall be utilized for toxicity testing unless alternate toxicity testing protocols have been approved by the San Diego Regional Water Quality Control Board. Chronic toxicity testing will also be conducted at dry weather mass loading stations unless the channel flows are diverted year-round during dry weather conditions to the sanitary sewer for treatment

(f) Receiving Water Bioassessment Monitoring:

Copermittees shall perform Bioassessment monitoring once during the permit term in accordance with the SMC Model Monitoring Program “Triad” assessment approach (SMC, 2004). Copermittees shall conduct sampling, analysis, and reporting of specified in-stream biological and habitat data according to the protocols specified in the SCCWRP Tech Report No. 539, or subsequent protocols, if developed, that have been widely-accepted as an appropriate alternative for Southern California receiving waters. Bioassessment monitoring may be conducted in conjunction with SMC Regional Monitoring and/or other dry weather receiving water monitoring. A physical assessment shall be conducted that will include details of the channel condition including channel dimensions, hydrologic and geomorphic conditions, and presence and condition of vegetation and habitat.

(6) Wet Weather Receiving Water Monitoring

During the permit term, Copermittees shall perform monitoring during three wet weather events at each of the long-term receiving water monitoring stations. Each monitoring station must be monitored during the wet season beginning October 1 and ending April 30.

(a) For each wet weather monitoring event, the following narrative descriptions and observations must be recorded at each monitoring station:

(i) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(ii) The flow rates and volumes measured or estimated. Data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board;

(iii) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and

(iv) Presence and assessment of trash in and around station.

(b) For each wet weather receiving water monitoring event, the parameters in Table D-2 must be monitored and recorded in the field.

(c) Samples must be collected and analyzed as follows:

(i) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, indicator bacteria, and toxicity. Analytes that are field measured do not need to be analyzed by a laboratory.

(ii) For all other constituents, composite samples shall be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques: time-weighted composites composed of 24 discrete hourly samples, or flow-weighted composites collected over the length of the storm event or a typical 24 hour period, whichever is shorter. Only one analysis of the composite of aliquots is required.

(iii) Copermittees should implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods.

(d) Samples shall be collected for analysis of the following parameters: TMDL or CLRP constituents in watersheds where the Copermittees are responsible parties in an adopted TMDL Implementation Plan, constituents listed as a cause of impairment on a CWA Section 303(d) listing for the receiving water body reach to which the outfall discharges,

applicable SAL constituents, and constituents identified by the Copermittees as the watershed priorities in their respective WQIPs, as well as the constituents listed in Table D-3.

(e) Wet Weather Receiving Water Toxicity Monitoring

Grab samples or composites from each monitoring station must be collected and analyzed for toxicity in accordance with Table D-4.

i. OTHER RECEIVING WATER MONITORING, POST-WQIP ADOPTION

After adoption of the WQIPs, the Copermittees shall conduct monitoring based on the approved WQIPs, in addition to long-term receiving water monitoring as described in Provision D.1.h, to include constituents identified by the Copermittees as the watershed priorities in their respective WQIPs. Nothing in this Provision is intended to prevent Copermittee collection of additional receiving water data, as necessary, to support and implement respective WQIPs. This monitoring shall include, at minimum, integration of the following receiving water requirements within the WQIPs, as appropriate for specific watersheds:

(1) Participation in SMC Regional Monitoring Program, where applicable

(2) Sediment Quality Monitoring in applicable estuaries

(3) Hydromodification Management Plan (HMP) Monitoring as applicable

(4) TMDL Monitoring where implementation plans have been approved and are under implementation, and

(5) ASBS Special Protections Monitoring, where applicable.

j. RECEIVING WATER MONITORING REPORTING

The Copermittees shall report on the progress of the receiving water monitoring and the results or findings of such monitoring, when completed, in the Annual Report pursuant to Provision F.3.b.

2. MS4 Outfall Discharge Monitoring

Discharge monitoring shall involve both Non-Storm Water (Dry Weather) and Storm Water (Wet Weather) components. The Copermittees shall perform monitoring, as necessary, to identify non-storm water discharges and illegal connections/illicit discharges (IC/IDs) pursuant to Provision E.2 of this Order. To accomplish this, the monitoring may include a variety of water quality and other monitoring techniques, including visual and other observations. Copermittees shall investigate dry weather flows and prioritize outfalls with observed flows for follow-up action as detailed below.

a. STORM WATER OUTFALL INVENTORY

Management Questions: What is the relative urban runoff contribution to receiving water problem(s)? What are the sources of urban runoff that contribute to receiving water problem(s)?

(1) Each Copermittee shall identify all major outfalls, as defined by 40 CFR §122.26(b)(5-6), that discharge directly to named receiving waters within its jurisdiction, and geo-locate those outfalls on a map of the MS4 pursuant to Provision E.2.b of this Order. This information shall be compiled in a storm water outfall inventory, which also shall include applicable information including HSA, jurisdiction, outlet size, and approximate drainage area. Only MS4 outfalls with safe access and for which access is gained without disturbing critical habitat will be considered in the number of eligible major MS4 outfalls.

b. NON-STORM WATER TRANSIENT FLOW (DRY WEATHER) MONITORING, IDDE INVESTIGATION

Management Questions: What is the relative urban runoff contribution to receiving water problem(s)? What are the sources of urban runoff that contribute to receiving water problem(s)?

Specific Questions: Which non-storm water discharges are transient and which are persistent? Which discharges should be investigated as potential IDDEs? Which outfalls exhibit persistent dry weather flows?

The Copermittees shall perform non-storm transient flow discharge monitoring to address the above management and specific questions as follows:

(1) Each Copermittee shall prioritize the major MS4 outfalls within its jurisdiction from the list of major outfalls developed pursuant to Provision D.a., based on criteria and rationale that include potential threat to water quality.

(2) Copermittees with less than 125 major MS4 outfalls that discharge to a

receiving water shall visually inspect 80% of the outfalls twice per year during dry weather.

(3) Copermittees with 125 or more but less than 250 major MS4 outfalls that discharge to a receiving water shall visually inspect a prioritized list of major MS4 outfalls that discharge to a receiving water annually. The total number of inspections per Copermittees with 125 or more but less than 250 major MS4s will be a minimum of the total number of all major MS4 outfalls locations once with annual visual inspections Where possible, inspections will be conducted year round. Major MS4 outfalls shall be prioritized based on threat to water quality and will consider factors such as:

(a) Assessment of connectivity of the discharge to a flowing receiving water

(b) Reported exceedances in water quality data

(c) Surrounding land use

(d) Presence of watershed priority constituents, TMDLs & CWA 303(d) list of impaired water bodies

(e) Flow rate

(4) Copermittees with 250 or more major MS4 outfalls that discharge to a receiving water shall visually inspect a prioritized list of major MS4 outfalls that discharge to a receiving water annually. The total number of inspections per Copermittees with 250 or greater major MS4s will be a minimum of 250 to a maximum of 500 locations with annual visual inspections. Where possible, inspections will be conducted year round. Major MS4 outfalls shall be prioritized based on threat to water quality and will consider factors such as:

(a) Assessment of connectivity of the discharge to a flowing receiving water

(b) Reported exceedances in water quality data

(c) Surrounding land use

(d) Presence of watershed priority constituents, TMDLs & CWA 303(d) list of impaired water bodies

(e) Flow rate

(5) Obvious illicit discharges (i.e., unusual color, unusual odor, or high flow) shall be investigated immediately pursuant to Provision E.2.

(6) An antecedent dry period of at least 72 hours following any storm event producing measurable rainfall of greater than 0.1 inch is required prior to conducting dry weather visual inspections.

(7) During a visual inspection, field personnel shall note visual and other observations, including those provided in Table D-5 of this Order.

(a) During a visual inspection, an inspection form will be filled out documenting observations in conformance with table D-5.

(b) Inspections of major outfalls conducted pursuant to Provision E of this order, including but not limited to complaint follow-ups, may be accounted for as the visual inspection for the major outfall under this Provision.

Table D-5. Field Observations for Non-Storm Water MS4 Monitoring Stations

Field Observations
• Station identification and location. • Presence of flow, or pooled or ponded water from the outfall. • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate), - Flow characteristics (i.e. presence of floatables, surface scum, or sheens, odor, color), - Flow source(s) suspected or identified from non-storm water source investigation, and - Flow source(s) eliminated during non-storm water source identification. • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, or sheens, odor, color), and - Known or suspected source(s) of pooled or ponded water. • Station description (i.e. deposits or stains, vegetation condition, structural condition, observable biology). • Presence and assessment of trash in and around station. • Evidence or signs of illicit connections or illegal dumping.

(8) Evidence of obvious illegal discharges, such as obvious odor, discoloration, or floating foam or scum, shall be followed up immediately.

~~(7)~~(9) The field observations shall be evaluated together with existing information available from prior inspections and prior monitoring results to determine whether the non-storm water (dry weather) discharge flow is likely to be transient or persistent[11].

[11] Persistent flow, as modified from the SMC Model Monitoring Program definition of persistent WQO exceedance, is defined as “the presence of flow, pooled, or ponded water more than 72 hours after a measureable rainfall event of

(a) If the flow is deemed to be transient, observations shall be used to conduct IDDE investigations where warranted pursuant to Provision E.2.

(b) If the nature and source of the observed flow is already known, this shall be noted on the field log, including whether the observed flow results from a non-storm water discharge conditionally allowed per Provision E.2.a.

(10) Where the non-storm water (dry weather) discharge flow is deemed to be persistent in Provision D.2.a.(8), the outfall shall be referred to the characterization and prioritization process described in Provision D.2.c. .

(11) The framework developed in the transitional monitoring program shall be used as a basis to design a continuing IDDE monitoring program as part of the Monitoring and Assessment Program in each WQIP.

c. NON-STORM WATER PERSISTENT FLOW (DRY WEATHER) OUTFALL MONITORING

Management Questions: What is the relative urban runoff contribution to receiving water problem(s)? What are the sources of urban runoff that contribute to receiving water problem(s)?

Specific Questions: Which outfalls exhibit persistent dry weather flows? Do discharge concentrations at MS4 outfalls meet applicable permit action levels? Which MS4 outfalls impact receiving water quality during dry weather?

The Copermittees shall perform non-storm water persistent flow discharge monitoring to address the above-listed management and specific questions as follows:

(1) Based upon the results of the investigation conducted pursuant to Provision D.2.b., each Copermittee shall add to the storm water outfall inventory compiled pursuant to Provision D.2.a., a classification of whether the outfall produces persistent discharge flow, transient flow, or no dry weather flow. The inventory shall provide notations on the basis for that classification; the classification may be based on historical data and/or contemporary observations, including information generated per Provision D.2.b..

0.1 inch of precipitation during three consecutive monitoring and/or inspection events". All other flow is considered transient.

(2) The Copermittees shall prioritize the outfalls identified as having persistent dry weather in the stormwater outfall inventory, pursuant to Provision D.2.c.(1). Historical data may be used to assist prioritization, where available. The prioritization shall be prepared based on criteria to be developed by the Copermittees, and a brief rationale for the prioritization shall be provided to accompany the map.

(3) Based on the prioritization of major outfalls developed under Provision D.2.c.(2), the Copermittees shall identify, at minimum, a number of major outfalls to monitor within each watershed management area equivalent to the number of urbanized HSAs within the WMA. The selected outfalls shall be listed by urbanized HSA and indicated on the map prepared pursuant to Provision D.2.a.

(4) The Copermittees shall monitor each major outfall identified in Provision D.2.c.(3) two times annually under dry weather conditions until one of the following occurs, at which point the outfall may be removed from the list:

(a) Flows are reduced to near-zero for three consecutive visits, or

(b) The source(s) of flows are determined to be derived from a non-storm water discharge source conditionally allowed per Provision E.2.a, or

(c) The source of the discharge is determined to be covered by a separate NPDES permit.

(d) The Copermittees shall document any such removal of sites from the outfall monitoring list in their annual report. Outfalls so removed must be replaced with then next highest prioritized MS4 outfall in the WMA per Provision D.2.c.(3), unless there are no remaining qualifying outfalls within the urbanized HSAs of the WMA.

(e) Where these criteria are not met but the threat to water quality is reduced, the outfall may be prioritized accordingly for continued follow up activity.

(5) During each semi-annual visit, the Copermittee must record field observations consistent with Table D-5 at each non-storm water MS4 monitoring station within its jurisdiction.

(6) Prior to WQIP approval, each semi-annual visit in which measurable flow is present from an outfall listed under Provision D.2.c.(3) must include the following:

(a) Grab samples shall be collected for analysis for the constituents listed in Table D-6, unless the Copermittee has historical data that can demonstrate or provide justification that the analysis of the constituent is not necessary.

Table D-6. Analytical Monitoring Constituents for Non-Storm Water MS4 Monitoring Stations

Conventionals, Nutrients, Hydrocarbons	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Total Phosphorus • Ortho-phosphate • Nitrite[1] • Nitrate[1] • Total Kjeldahl Nitrogen • Ammonia as N • Chlorine	• Cadmium • Copper • Lead • Zinc	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

(b) Field measurements shall be collected for the parameters listed in Table D-2.

(c) If the Copermittee identifies and eliminates the source of non-storm water discharge, analysis of the sample is not required.

(7) As part of the WQIP, Copermittees must develop a program to characterize the persistent non-storm water discharges and pollutant loads from the Copermittee's major MS4 outfalls. As part of the development of the Monitoring and Assessment Program for each WMA, the number and selection of outfalls shall be re-evaluated and determined anew for each WMA, along with the appropriate monitoring frequency and methods.

(8) After WQIP approval, each visit in which measurable flow is present from an outfall listed under Provision D.2.c.(3), as modified by approved changes pursuant to Provision D.2.c.(7) must include the following:

a. Samples shall be collected for analysis of the following parameters:

(i) Constituents identified by the Copermittees as highest watershed priorities,

(ii) TMDL constituents in watersheds where the Copermittees are responsible parties in an effective TMDL Implementation Plan for the receiving water body reach to which the outfall discharges,

(iii) Constituents listed as a cause of impairment on a CWA Section 303(d) listing for the receiving water body reach to which the outfall discharges, and

(iv) Applicable NAL constituents.

b. Field measurements shall be collected for the parameters listed in Table D-2.

(9) Annually, the Copermittees shall evaluate the data produced by the persistent flow outfall monitoring and inspections, rank the outfalls according to potential threat to receiving water quality, and produce a prioritized list of major outfalls for follow-up action. The prioritized list shall be used to update the WQIP, with the goal of reducing flows and/or loads in order of the ranked priority list through targeted programmatic actions and source investigations.

d. Storm Water (Wet Weather) Outfall Monitoring

Management Questions: What is the relative urban runoff contribution to receiving water problem(s)? What are the sources of urban runoff that contribute to receiving water problem(s)?

Specific Questions: Which MS4 outfalls impact receiving water quality during wet weather? Do discharge concentrations at MS4 outfalls meet applicable permit action levels? How do representative MS4 outlet discharge concentrations, loads, and flows change over time?

The Copermittees shall perform storm water discharge monitoring to address the above-listed management and specific questions as follows:

(1) Prior to adoption of the WQIPs, the San Diego Copermittees shall continue the MS4 outfall monitoring program implemented under Order No. R9-2007-0001 per RWQCB approved plan through its planned completion to continue to obtain data from a representative cross-section of discharges.

(2) Prior to adoption of the WQIPs, the San Diego Copermittees shall perform storm water discharge monitoring based on representative outfalls to address the above-listed management questions as follows:

(a) The Copermittees shall select, at minimum, three monitoring stations at representative major MS4 outfalls with homogenous land use types and/or typical mixed-use drainage areas per WMA from the map developed pursuant to Provision D.2.a. Historical data may be used to assist site selection, where available. These outfalls shall be geo-located on a map showing the urban hydrologic sub-areas (HSAs), land use drainage areas, and jurisdictional boundaries within the permitted area.

(b) Each selected monitoring station must be monitored twice during the wet season, beginning October 1 and ending April 30.

(c) For each wet weather monitoring event, the following narrative descriptions and observations must be recorded at each monitoring station:

(i) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(ii) The flow rates and volumes measured or estimated. Data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board;

(d) For each wet weather monitoring event, the parameters in Table D-2 must be monitored and recorded in the field. Samples shall be collected for analysis of parameters listed in Table D-7, according to the following methods:

(i) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, and indicator bacteria. Analytes that are field measured do not need to be analyzed by a laboratory.

(ii) For all other constituents, composite samples shall be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

[a] Through use of automated equipment to collect time-weighted composites composed of 24 discrete hourly samples, or flow-weighted composites collected over the length of the storm event or a typical 24 hour period, whichever is shorter. Only one analysis of the composite of aliquots is required.

[b] If automated compositing is not feasible, a composite sample may be collected using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours. Only one analysis of the composite of aliquots is required.

(iii) Copermittees should implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods.

Table D-7. Analytical Monitoring Constituents for Wet Weather MS4 Outfall Monitoring Stations

Conventionals, Nutrients, Hydrocarbons	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity[1] • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus[1] • Orthophosphate • Nitrite[1,2] • Nitrate[1,2] • Total Kjeldahl Nitrogen • Ammonia	• Arsenic • Cadmium[1] • Chromium • Copper[1] • Iron • Lead[1] • • Nickel • Selenium • Thallium • Zinc[1]	•Total Coliform • Fecal Coliform[3] •*Enterococcus*

Notes:
1. Constituent with a storm water action level (SAL) specified under Provision C.2.
2. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
3. *E. Coli* may be substituted for Fecal Coliform.

(3) After adoption of the WQIPs, the Copermittees shall perform storm water discharge monitoring based on representative major MS4 outfalls to address the above-listed management questions, and according to the needs for outfall monitoring as defined in the monitoring and assessment sections of the WQIPs. Samples shall be collected for analysis of parameters identified by the Copermittees as watershed priorities in the WQIP. Copermittees shall consider constituents based on factors including, but not limited to:

(a) Constituents identified as the highest water quality priorities.

(b) TMDL constituents in watersheds where the Copermittees are responsible parties in an effective TMDL Implementation Plan for the receiving water body reach to which the outfall discharges,

(c) Constituents listed as a cause of impairment on a CWA Section 303(d) listing for the receiving water body reach to which the outfall discharges, and

(d) Applicable SAL constituents.

e. MS4 Outfall Discharge Monitoring Reporting

The Copermittees shall report on the progress of the MS4 outfall monitoring and the results or findings of such monitoring, when completed, in the Annual Report pursuant to Provision F.3.b.

3. Source/Stressor Identification

Management Question: What are the sources of urban runoff that contribute to receiving water problem(s)?

The Copermittees shall perform Source/Stressor Identification studies as needed to investigate sources of pollutants or stressors in cases where MS4 discharges are deemed to be causing or contributing to receiving water priorities, based on monitoring performed under Provisions D.1 and D.2. The results of the Stressor/Source Identification studies may be shared regionally among the Copermittees to provide information useful in improving adaptive management of urban runoff through implementation of the WQIPs.

The principal role of Source/Stressor Identification is to identify and prioritize pollutant generating activities and source categories. Identification of high-priority sources is an important step in support of the WQIP process, to help inform the development of effective pollutant reduction strategies for particular priority constituents on a watershed-specific basis.

Source identification shall be conducted on a constituent-specific basis. The source identification efforts shall focus on constituents identified as watershed priorities, and include prioritization of sources based on magnitude, controllability, and other factors. The constituent-specific source identification process shall include, at a minimum, the following steps:

- Step 1: Compile known information on the specific priority constituent. This information includes data on potential sources and movement of a particular constituent within the urban watershed. Data generated by the Copermittees and others, as well as information available from a literature research on the priority constituent shall be compiled and analyzed as appropriate.

- Step 2: Based on the compiled information generated on the priority constituent, identify data gaps, if any. Targeted studies may be planned where appropriate to fill identified data gaps; such studies would be performed as Special Studies per

Provision D.4. For example, targeted studies may be performed to quantify the relative loading of a priority constituent from a particular pollutant generating activity, or to improve understanding of the fate of a constituent in the environment.

- Step 3: Based on the information compiled, develop an inventory of sources and consider how to prioritize them within the watershed for potential follow-up action. Examples of prioritization criteria for sources include relative magnitude in discharges, geographical distribution (i.e., regional or localized), frequency of occurrence in discharges, human health risk, and controllability.

- Step 4: Develop a prioritized list of sources for the priority constituent and deliver to the Copermittee staff responsible for implementing WQIPs.

Prior to adoption of the WQIPs, the San Diego Copermittees shall continue source identification studies pertaining to compliance with TMDLs and the development of the CLRP implemented under Order No. R9-2007-0001.

Following adoption of the WQIPs, the Copermittees shall conduct source/stressor identification studies as necessary to support the WQIP watershed priorities and strategies. The plans for source/stressor ID studies must be submitted as part of the Monitoring and Assessment Programs included as part of the WQIPs required pursuant to Provision B of this Order.

The Copermittees shall report on the progress of the source/stressor ID studies and the results or findings of such studies, when completed, in the Annual Report pursuant to Provision F.3.b.

4. Special Studies

The Copermittees shall conduct Special Studies to address information needs as identified for receiving waters per monitoring performed pursuant to Provision D.1, for MS4 outfall discharges per monitoring performed pursuant to Provision D.2, and in Source/Stressor Identification studies per Provision D.3; to provide information on BMP effectiveness; and otherwise as needed to support implementation or evaluation of the WQIP strategies for the identified highest water quality priorities.

Within the permit term, two Special Studies shall be conducted within each Watershed Management Area, to address specific questions developed for each Watershed Management Area, and two regional special studies shall be conducted to answer regional questions.

a. The monitoring plans for the special studies must be submitted as part of the Monitoring and Assessment Programs included as part of the Water Quality Improvement Plans required pursuant to Provision B. The special studies must, at a minimum, be in conformance with the following criteria:

(1) The special studies must be related to water quality priorities identified by the Copermittees within the Watershed Management Area or San Diego Region, and the monitoring plans for the special studies must address specific watershed or regional questions;

(2) The special studies must be implemented within specific Watershed Management Areas or regionally within the San Diego Region;

(3) The special studies must include some form of participation by all Copermittees within the Watershed Management Area or San Diego Region, as applicable;

(4) One of the two required special studies within each Watershed Management Area may be replaced by a regional special study pursuant to D.4.a. (1) through D.4.a.(3); and

(5) A special study done pursuant to D.4.a. (1) through D.4.a.(4) that is started prior to the submittal of the WQIP, but is completed during the permit term, shall meet the requirements of a special study for a Watershed Management Area or San Diego Region, as applicable.

b. The Copermittees shall report on the progress of the special studies and the results or findings of such studies, when completed, in the Annual Report pursuant to Provision F.3.b.

Examples of special studies include:

- Enhance outreach & education by expanding residential BMP rebate programs (irrigation, rainwater harvesting and turf conversion) to multi-family housing
- Enhance outreach & education by increasing enforcement of over-irrigation regulation
- Conduct Catch Basin Inlet Cleaning Study assessment
- Implement Residential & Commercial Area Patrolling
- Implement Targeted Aggressive Street Sweeping Study
- Develop Watershed Urban Runoff Management Program Inspection Program (separate from commercial/industrial inspections, targets all businesses in specific areas)
- Conduct an investigation to improve the understanding of the linkage between groundwater and surface water hydrology and potential impacts to receiving water beneficial uses
- Conduct targeted field investigations to provide additional spatial or temporal information on the highest priority constituents or activities to inform or improve the efficiency of implementation efforts in the WMA.

The Regional Reference Stream Study is an example of a regional special study.

5. Assessment Requirements

The Copermittees must report the progress and findings of the following assessments, when available and as applicable to each WMA, as part of the Annual Report for each WMA, as required pursuant to Provision F. Assessments that occur only once per permit term, or are based on monitoring that occurs only once per permit term, shall be reported as part of the applicable Annual Report, or included within the Copermittees' Report of Waste Discharge, prior to commencement of the subsequent permit term.

a. Receiving Water Monitoring

The Copermittees shall perform analysis and assessments of data and information produced per Provision D.1, addressing for each Receiving Water Monitoring element the management and specific questions as shown in Provision D.1 and below. The analysis and assessments shall relate the monitoring data compiled for each component to the conditions of affected receiving waters and status of relevant receiving water beneficial uses.

(1) SMC Regional Monitoring

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems?

The Copermittees shall incorporate results of the SMC Regional Monitoring Program, when available, into the analysis and assessments conducted as part of WQIP planning and implementation. The SMC Program is designed to provide a representative sampling of receiving water quality in coastal rivers and streams in the region's watersheds, based on a probabilistic design for characterization of coastal watersheds, using bioassessment metrics and related analyses. The analysis and assessments of the data shall relate the SMC monitoring data to the condition of receiving waters and status of receiving water beneficial uses.

(2) Bight Regional Monitoring

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems?

The Copermittees shall incorporate results of the Bight Regional Monitoring Program, when available, into the analysis and assessments conducted as part of WQIP planning and implementation. The Bight regional monitoring effort involves detailed characterization of coastal and offshore receiving waters, as well as targeted special studies. The analysis and assessments of the data shall relate the Bight monitoring data to the condition of receiving waters and status of receiving water beneficial uses.

(3) Sediment Quality

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems?

Specific Question: What is the condition of sediments in enclosed bays and estuaries with respect to the statewide sediment quality objectives?

The Copermittees shall incorporate results of the sediment quality monitoring of bay and estuarine sediments, when available, into the analysis and assessments conducted as part of WQIP planning and implementation. The analysis and assessments of the data shall relate sediment quality data to the condition of receiving waters and status of receiving water beneficial uses.

The analysis of sediment quality data also shall conform to the requirements of the Statewide Sediment Quality Objectives regulatory program, per State Water Resources Control Board Resolution No. 2008-0070 – Adoption of a Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality. The Copermittees shall include the results of this analysis, when available and as applicable to each WMA, in the Annual Report pursuant to Provision F.3.b.

(4) Hydromodification Management Plan (HMP) Monitoring

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems?

The Copermittees shall incorporate results of the receiving water monitoring required per their Hydromodification Management Monitoring Plans, as approved by the California Regional Water Quality Control Board, San Diego Region, when available, into the analysis and assessments conducted as part of WQIP planning and implementation. The analysis and assessments of the data shall relate HMP monitoring data to the condition of receiving waters and status of receiving water beneficial uses. The Copermittees shall include the results of this analysis, when available and as applicable to each WMA, in the Annual Report pursuant to Provision F.3.b.

(5) TMDL Monitoring

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? Are conditions in receiving waters getting better or worse?

Specific question: What is the progress in achieving and complying with adopted TMDL targets?

The Copermittees shall incorporate results of TMDL monitoring, when available, into the analysis and assessments conducted as part of WQIP planning and implementation. The analysis and assessments of the TMDL monitoring data shall be integrated with other receiving water data in assessments of the condition of receiving waters and status of receiving water beneficial uses.

The Copermittees shall annually evaluate receiving water data produced per Provision D.1.e. to determine whether TMDL targets are being met, for applicable receiving waters as specified in adopted TMDLs and include the results of this evaluation, when available and as applicable to each WMA, in the Annual Report pursuant to Provision F.3.b.

The analysis of TMDL monitoring data also shall conform to the requirements of the adopted TMDLs and associated Implementation Plans, to demonstrate compliance with the applicable terms of adopted TMDLs and Implementation Plans.

(6) ASBS Special Protections Monitoring

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? Are conditions in receiving waters getting better or worse?

The Copermittees responsible for discharges to Areas of Special Biological Significance (ASBS) as regulated per the Special Protections for Areas of Special Biological Significance, Governing Point Source Discharges of Storm Water and Nonpoint Source Waste Discharges, State Water Resources Control Board Resolution No. 2012-0012, shall incorporate results of ASBS monitoring, when available, into the analysis and assessments conducted as part of WQIP planning and implementation. The analysis and assessments of the ASBS monitoring data shall be integrated with other receiving water data in assessments of the condition of receiving waters and status of receiving water beneficial uses.

The Copermittees for whom ASBS monitoring is required under the terms of the adopted ASBS Special Protections shall evaluate the data as required per State Water Resources Control Board Resolution No. 2012-0012, and include the results of this evaluation, when available and as applicable to each WMA, in the Annual Report pursuant to Provision F.3.b.

(7) Long-Term Receiving Water Monitoring

Management Question: Are conditions in receiving waters getting better or worse?

The Copermittees shall incorporate the results of the Long-Term Receiving Water Monitoring into the analysis and assessments conducted as part of the adaptive management process. The analysis and assessments of the Long-Term monitoring data shall be integrated with other receiving water data in assessments of the condition of receiving waters and status of receiving water beneficial uses.

The Copermittees shall evaluate the data produced by the receiving water monitoring pursuant to Provision D.1.g, and incorporate new receiving water data into time series plots for each long-term monitoring constituent, for each WMA. Once per permit term the Copermittee shall perform statistical trends analysis on the cumulative long-term receiving water data set.

(8) Integrated Receiving Water Assessment

Management Questions: Are conditions in receiving waters protective, or likely to be protective, of beneficial uses? What is the extent and magnitude of the current or potential receiving water problems? Are conditions in receiving waters getting better or worse?

Once during the permit term, for each watershed management area, the Copermittees shall integrate the analyses and assessments of the results of the SMC Regional Monitoring Program, Bight Regional Monitoring Program, Sediment Quality monitoring, HMP Monitoring, TMDL monitoring, ASBS monitoring, and Long-term receiving water monitoring, as performed per Provisions D.5.a.(1)-D.5.a.(7), as well as other data as available and applicable, to assess the condition of receiving waters and status of receiving water beneficial uses, and identify data or information gaps. The integrated assessment shall include, as appropriate to address any identified data gaps, recommendations for additional monitoring as may be required to adequately characterize conditions in receiving waters, or where special studies may be needed to address specific information needs.

b. MS4 OUTFALL DISCHARGE MONITORING

The Copermittees shall perform analysis and assessments of data and information produced per Provision D.2, addressing the management and specific questions as shown in Provision D.2 and below. The Copermittees shall include the results of this analysis, when available and as applicable to each WMA, in the Annual Report pursuant to Provision F.3.b.

(1) <u>Transient Non-Storm Water (Dry Weather) Monitoring, IC/ID Investigation</u>

Management Questions: What is the relative urban runoff contribution to receiving water problem(s)? What are the sources of urban runoff that contribute to receiving water problem(s)?

Specific Questions: Which non-storm water discharges are transient and which are persistent? Which discharges should be investigated as potential IC/IDs? Which outfalls exhibit persistent dry weather flows?

(a) Where the presence of non-storm water (dry weather) flow is noted from an outfall during a visual inspection, field personnel shall note visual and other observations (including approximate/estimated flow rate, changes in flow rate during inspection, changes in flow rate over previous inspections, color, presence of foam or sheen, and odor) on a field log. Inspectors also shall note where there is evidence of past flow and record pertinent observations at all sites visited.

(b) The field observations shall be evaluated together with existing information available from prior inspections and prior monitoring results to determine whether the non-storm water (dry weather) discharge flow is likely to be transient or persistent. If the flow is deemed to be transient as indicated by pooled or ponded water or other evidence of recent flow, and there is evidence of an illicit discharge such as obvious odor, discoloration, foam or scum, the observations shall be used to conduct IC/ID investigations pursuant to Provision E.2. If the nature and source of the observed flow is already known, this shall be noted on the field log, including whether the observed flow results from a non-storm water discharge conditionally allowed per Provision E.2.a.

(c) Where the non-storm water (dry weather) discharge flow is deemed to be persistent in Provision D.2.b.(9), the outfall shall be referred to the characterization and prioritization process described in Provision D.2.c.

(2) <u>Persistent Non-Storm Water (Dry Weather) Outfall Monitoring</u>

Management Questions: What is the relative urban runoff contribution to receiving water problem(s)? What are the sources of urban runoff that contribute to receiving water problem(s)?

Specific Questions: Which outfalls exhibit persistent dry weather flows? Do discharge concentrations at MS4 outfalls meet applicable permit action levels? Which MS4 outfalls impact receiving water quality during dry weather?

(a) Identification and Prioritization of Outfalls with Persistent Flow

Annually, the Copermittees shall evaluate the data produced by the dry weather outfall monitoring pursuant to Provision D.2.c., rank the outfalls according to potential threat to receiving water quality, and produce a prioritized list of outfalls for follow-up action. The Copermittees must analyze the non-storm water monitoring data collected pursuant to Provision D.2.c.

and consider NAL exceedances in prioritizing outfalls. The prioritized list shall be provided in the Annual Report for each WMA pursuant to Provision F.3.b. The prioritized list shall be used to update the WQIPs with the goal of reducing flows/ loads in order of the ranked priority list, through targeted programmatic actions and source investigations.

(b) Evaluate Potential Impacts to Receiving Waters from Persistent Non-Storm Water Outfall Flows

Annually, the Copermittees shall evaluate the data produced by the dry weather outfall monitoring pursuant to Provision D.2.c., and compare the outfall monitoring data to relevant receiving water quality data, to identify outfalls that may cause or contribute to receiving water quality problems.

(c) Calculate Loadings to Receiving Waters from Persistent Non-Storm Water Outfall Flows

Annually, the Copermittees shall estimate discharge loadings from the data produced by the dry weather outfall monitoring pursuant to Provision D.2.c., and rank the monitored outfalls in order from highest to lowest loading, to identify outfalls that may cause or contribute to receiving water quality problems. As part of this annual estimation, the Copermittees shall identify areas where program implementation is thought to have resulted in reductions or elimination of loads from MS4 outfalls.

(d) The Copermittees in each Watershed Management Area must review the non-storm water flow and pollutant load analyses required pursuant to Provision D.4.b.(2)(d) on an annual basis to:

(i) Identify the pollutant load reductions that are thought to be attributable to water quality management actions within the high priority outfall drainage areas

(ii) Assess the effectiveness of the water quality improvement strategies being implemented within the Watershed Management Area toward reducing or eliminating non-storm water discharges and pollutant loads discharging from the MS4 to receiving waters; and

(iii) Identify modifications necessary to increase the effectiveness of the water quality improvement strategies toward reducing or eliminating non-storm water discharges and pollutant loads discharging from the MS4 to receiving waters.

(3) Storm Water (Wet Weather) Outfall Monitoring

Management Questions: What is the relative urban runoff contribution to receiving water problem(s)? What are the sources of urban runoff that contribute to receiving water problem(s)?

Specific Questions: Do discharge concentrations at MS4 outfalls meet applicable permit action levels? Which MS4 outfalls impact receiving water quality during wet weather? How do representative MS4 outlet discharge concentrations, loads, and flows change over time?

(a) Comparisons of Wet Weather Outfall Quality to Storm Water Action Levels

The Copermittees shall analyze the storm water monitoring data collected pursuant to Provision D.2.c and consider SAL exceedances in prioritizing outfalls for further investigation, and assessing progress towards addressing WQIP priorities.

(b) Evaluate Potential Impacts to Receiving Waters

Annually, the Copermittees shall evaluate the data produced by the wet weather outfall monitoring pursuant to Provision D.2.c, and compare the outfall monitoring data to relevant receiving water quality data, to identify outfalls that may cause or contribute to receiving water quality problems. As part of this annual estimation, the Copermittees shall identify areas where program implementation is thought to have resulted in reductions or elimination of loads from MS4 outfalls.

(c) Calculate Loadings to Receiving Waters from Storm Water Outfall Flows

Annually, the Copermittees shall estimate discharge loadings from the data produced by the wet weather outfall monitoring pursuant to Provision D.2.c.

(d) The Copermittees in each Watershed Management Area must review the storm water flow and pollutant load analyses required pursuant to Provision D.4.b.(3)(e) on an annual basis to:

  (i) Identify the pollutant load reductions that are thought to be attributable to water quality management actions within the monitored outfall drainage areas

  (ii) Assess the effectiveness of the water quality improvement strategies being implemented within the Watershed Management Area toward reducing storm water pollutant loads discharging from the MS4 to receiving waters; and

  (iii) Identify modifications necessary to increase the effectiveness of the water quality improvement strategies toward reducing storm water pollutant loads discharging from the MS4 to receiving waters.

(e) Characterization of Trends Over Time

The Copermittees shall evaluate the data produced by the wet weather outfall monitoring pursuant to Provision D.2.c, and incorporate new outfall monitoring data into time series plots for each long-term monitoring constituent, for each WMA. Once per permit term the Copermittee shall perform statistical trends analysis on the cumulative long-term MS4 outfall water quality data set.

c. SOURCE IDENTIFICATION

Management Question: What are the sources of urban runoff that contribute to receiving water problem(s)?

The principal role of Source/Stressor Identification is to identify and prioritize pollutant generating activities and source categories. Identification of high-priority sources is an important step in support of the WQIP process, to help inform the development of effective pollutant reduction strategies for particular priority constituents on a watershed-specific basis.

Source identification shall be conducted on a constituent-specific basis. The source identification efforts shall focus on constituents identified as watershed priorities, and include prioritization of sources based on magnitude, controllability, and other factors.

Following WQIP approval and implementation, source identification studies shall be used to improve WQIP effectiveness. For each Watershed Management Area, the Copermittees shall perform the investigation pursuant to Provision D.3, as necessary to address identified watershed priorities, including production of a prioritized list of sources or potential sources that warrant additional investigation and/or development of control strategies through the WQIPs.

Annually, the Copermittees shall evaluate the results and findings produced by the source/stressor identification studies conducted pursuant to Provision D.3, and inform Copermittee staff responsible for WQIP implementation of the relative magnitudes and/or priority rankings of identified sources. The Copermittees shall include the results of this analysis, when available and as applicable to each WMA, in the Annual Report pursuant to Provision F.3.b.

d. Special Studies

Following WQIP approval and implementation, special studies shall be identified to fill data gaps and provide targeted information to improve WQIP effectiveness. Upon completion of each Special Study conducted pursuant to Provision D.4, the Copermittees shall evaluate the study results and apply the results to the implementation of WQIPs within each Watershed Management Area as applicable.

Annually, the Copermittees shall evaluate the results and findings produced by the special studies conducted pursuant to Provision D.4, and assess their relevance to the Copermittees' efforts to better characterize WMAs and receiving water conditions, to understand urban runoff pollutant sources, and to control and limit the discharges of pollutants from MS4 outfalls to the maximum extent practicable. The Copermittees shall include the results of this analysis, when available and as applicable to each WMA, in the Annual Report pursuant to Provision F.3.b.

e. Integrated Evaluation of Water Quality Improvement Strategies

Once during the permit term, for each watershed management area, the Copermittees shall integrate the analyses and results of the monitoring performed pursuant to Provisions D.1-D.4, and the results of the assessments performed pursuant to Provision D.5.a.-D.5.d, as well as other data as available and applicable, to assess: 1) progress towards achieving the numeric goals and schedules established per the approved WQIPs, 2) progress toward addressing the highest priority receiving water conditions established for each Watershed Management Area, and 3) water quality improvements that are thought to be attributable to the Copermittees' implementation of the requirements of Provision B. For Watershed Management Areas with applicable TMDLs, the integrated evaluation must incorporate the specific monitoring and assessment requirements of Attachment E. For Watershed Management Areas with any ASBS, the water quality monitoring and assessment program must also incorporate the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012. The integrated evaluation shall include the following:

(1) The conditions of receiving waters and status of receiving water beneficial uses,

(2) The extent to which MS4 discharges cause or contribute to receiving water problems during both dry weather and wet weather,

(3) The estimated reductions in loadings from MS4 discharges attributable to the Copermittees' stormwater management activities, for both dry and wet weather,

(4) The principal identified sources of pollutants that are responsible for constituents in MS4 discharges that cause or contribute to receiving water problems,

(5) The results of the cumulative special studies and their application to improvement of the WQIPs for the Watershed Management Areas,

(6) Progress toward achieving the interim and final numeric targets for restoring impacted beneficial uses in receiving waters with adopted TMDL Implementation Plans;

(7) Any identified data or information gaps, along with recommendations for additional monitoring, special studies, or other investigations to address the data and information needs.

E. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS

The purpose of this provision is for each Copermittee to implement a program to control the ~~contribution~~discharge of pollutants to and ~~the discharges~~ from ~~the MS4 with~~ its respective MS4 to receiving waters within its jurisdiction. The goals of this ~~provision~~ program ~~is~~ are to: 1) effectively prohibit non-storm water discharges into the MS4s, 2) reduce pollutants in storm water discharges from the MS4s to the MEP, and 3) ~~to reduce the discharge of pollutants in storm water to the MEP and effectively prohibit non-storm water discharges to provide~~ support the attainment and the reasonable protection, preservation,~~,~~ and enhancement~~, and restoration of~~ water quality and designated beneficial uses of waters of the ~~state~~U.S. The~~i~~se goals will be accomplished through compliance with the jurisdictional runoff management program requirements of this Provision, and as modified or supplemented per Provision B (Water Quality Improvement Plans).

Each Copermittee must implement all the requirements of Provision E no later than ~~12~~ 18 months after the adoption of this Order, or in accordance with Provision F.5.a. Each Copermittee must update its jurisdictional runoff management program document, in accordance with Provision F.2.a, to include all the requirements of Provision E. The jurisdictional runoff management programs implemented by each Copermittee must be consistent with the Water Quality Improvement Plan for the applicable Watershed Management Area required by Provision B. Until the Copermittee has updated its jurisdictional runoff management program document with the requirements of Provision E, the Copermittee must continue implementing its current jurisdictional runoff management program.

Modification of Jurisdictional Runoff Management Program Requirements

Modifications shall be considered and where selected, proposed according to the process in Provision B.5. Proposed modifications may increase, decrease, and/or replace minimum requirements identified in Provision E.

1. Legal Authority Establishment and Enforcement

a. Each Copermittee must establish, maintain, and enforce adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 through statute, ordinance, permit, contract, order, or similar means to the extent allowable by law. This legal authority must~~, at a minimum,~~ authorize the Copermittee to:

(1) Effectively ~~P~~prohibit and eliminate all illicit discharges and illicit connections to its MS4;

(2) Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity to its MS4 and control the quality of runoff from industrial and construction sites, including industrial and construction

sites ~~which~~that do not have coverage under the statewide General Permit for Discharges of Storm Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit~~), as well as to those sites which do not;~~);

(3) Control the discharge of spills, dumping, or disposal of materials other than storm water into its MS4;

~~(4) Control through interagency agreements among Copermittees~~Coordinate, as possible, with other agencies to minimize the contribution of ~~pollutants~~pollutant discharges from ~~one portion MS4 to another portion of~~ the ~~MS4;~~
~~(5)~~
~~(6)~~(4) ~~Control through interagency agreements with other owners of the MS4 such as Caltrans, the U.S. federal government, or sovereign Native American Tribes, where possible, the contribution of pollutants from one~~Copermittee's portion of the MS4 to ~~another portion of~~ portions of the MS4 under another agency's jurisdiction and from the other agency's portions of the MS4 to the ~~MS4~~portion of the MS4 under the Copermittee's jurisdiction;

~~(7)~~(5) Require compliance with conditions in its statutes, ordinances, permits, contracts, orders, or similar means to hold dischargers to its MS4 accountable for their contributions of pollutants and flows;

~~(8)~~(6) Require the use of BMPs to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;

~~(9)~~(7) Require documentation on the effectiveness of BMPs implemented to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;

~~(10)~~(8) Utilize enforcement mechanisms to require compliance with its statutes, ordinances, permits, contracts, orders, or similar means; and

~~(11)~~(9) Carry out all inspections, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with its statutes, ordinances, permits, contracts, orders, or similar means and with the requirements of this Order, including the prohibition of illicit discharges and connections to its MS4; the Copermittee must also have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from industrial facilities, including construction sites, discharging into its MS4.

b. With the first Annual Report required by Provision F.3.b, each Copermittee must submit a statement certified by its Principal Executive Officer, Ranking Elected

Official, or Duly Authorized Representative that the Copermittee has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in this Order.

2. Illicit Discharge Detection and Elimination

Each Copermittee must implement a program to actively detect and eliminate illicit discharges and improper disposal into the MS4, or otherwise require the discharger to apply for and obtain a separate NPDES permit. The illicit discharge detection and elimination program must include, at a minimum, the following requirements:

a. Non-Storm Water Discharges

To the extent allowable by law, ~~E~~each Copermittee must address all non-storm water discharges as illicit discharges~~,~~ where the likelihood exists that they are a source of pollutants to waters of the U.S., unless a non-storm water discharge is either identified as a discharge authorized by a separate NPDES permit, or identified as a category of non-storm water discharges or flows that must be addressed pursuant to the following requirements:

(1) Discharges of non-storm water to the MS4 from uncontaminated pumped groundwater ~~the following categories~~ must be addressed as illicit discharges where there is evidence that suggests that they are the source of pollutants to waters of the U.S., unless the discharge has coverage under NPDES Permit No. CAG919001 (Order No. R9-2007-0034, or subsequent order) for discharges to San Diego Bay, or NPDES Permit No. CAG919002 (Order No. R9-2008-0002, or subsequent order) for discharges to surface waters other than San Diego Bay:

~~(a) Uncontaminated pumped ground water;~~

~~(b) Discharges from foundation drains;~~

~~(c) Water from crawl space pumps; and~~

~~(d) Water from footing drains.~~

(2) Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges unless the discharge has coverage under a valid NPDES Permit ~~No. CAG 679001 (~~, Order No. R9-2010-0003, or a subsequent order~~)~~. This includes water line flushing and water main break discharges from water purveyors under the Copermittee's jurisdiction that has been issued a water supply permit by the California Department of Public Health or federal military installations. Discharges from recycled or reclaimed water lines to the MS4 must be addressed as illicit discharges, unless the discharges have coverage under a separate NPDES permit.

ADMINISTRATIVE DRAFT

(3) Discharges of non-storm water to the MS4 from the following categories must be addressed by the Copermittee as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a anthropogenic source of pollutants to receiving waters within the Copermittee's jurisdiction:

(a) Discharges from foundation drains;

(b) Water from crawl space pumps;

(c) Water from footing drains.

(d) Diverted stream flows;

(e) Rising ground waters;

(f) Uncontaminated ground water infiltration to MS4s;

(g) Springs;

(h) Flows from riparian habitats and wetlands; and

(i) Discharges from potable water sources.

(4) Discharges of non-storm water to the MS4 from the following categories must be controlled by the requirements given below through statute, ordinance, permit, contract, order, or similar means where there is evidence that those discharges are a source of pollutants to waters of the~~.~~ U.S. Discharges of non-storm water to the MS4 from the following categories not controlled by the requirements given below through statute, ordinance, permit, contract, order, or similar means must be addressed by the Copermittee as illicit discharges.

(a) Air conditioning condensation

The discharge of air conditioning condensation ~~must~~ should be directed to landscaped areas or other pervious surfaces where feasible;

(b) Individual residential vehicle washing

The discharge of wash water must be ~~directed to landscaped areas or other pervious surfaces where feasible, and~~encouraged through public outreach and education:

(i) To be directed to landscaped areas or other pervious surfaces where feasible, and

(ii) To ~~M~~minimize the use of water for vehicle washing, use as little washing detergent and other vehicle wash products as possible, wash vehicles at commercial wash facilities, and implement other practices or behaviors that will prevent the discharge of pollutants associated with individual residential vehicle washing from entering the MS4; and

(c) Dechlorinated swimming pool discharges

(i) Eliminate residual chlorine, algaecide, filter backwash, or other pollutants from swimming pools prior to discharging to the MS4, and

(ii) The discharge of saline swimming pool water ~~to the MS4~~ must be directed to the sanitary sewer, landscaped areas, ~~or~~ other pervious surfaces that can accommodate the volume of water, or to the MS4 if the MS4 discharges to a saltwater receiving water.

~~(4)~~(5) Firefighting discharges to the MS4 must be addressed by the Copermittee as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a significant source of pollutants to receiving waters. Firefighting discharges to the MS4 not identified as a significant source of pollutants to receiving waters, must be addressed, at a minimum, as follows:

(a) Non-emergency firefighting discharges

(i) Building fire suppression system maintenance discharges (e.g. sprinkler line flushing) to the MS4 must be addressed as illicit discharges where BMPs are not implemented.

(ii) Non-emergency firefighting discharges (i.e., discharges from controlled or practice blazes, firefighting training, and maintenance activities not associated with building fire suppression systems) must be addressed by a program, to be developed and implemented by the Copermittee, to reduce or eliminate pollutants in such discharges from entering the MS4.

(b) Emergency firefighting discharges

Each Copermittee ~~must~~ should develop and encourage implementation of BMPs to reduce or eliminate pollutants in emergency firefighting discharges to the MS4s and receiving waters within its jurisdiction. During emergency situations, priority of efforts should be directed toward life, property, and the environment (in descending order). BMPs ~~should~~ shall not interfere with immediate emergency response operations or impact public health and safety.

~~(5)~~(6) If the Copermittee or San Diego Water Board identifies any category of non-storm water discharges listed under Provisions E.2.a.(1)-(4) as a source of pollutants to receiving waters, the category must be prohibited through ordinance, order, or similar means and addressed as an illicit discharge.

b. Prevent and Detect Illicit Discharges And Connections

Each Copermittee must include the following measures within its program to prevent and detect illicit discharges to the MS4:

(1) Each Copermittee must maintain an updated map of its entire MS4 and the corresponding drainage areas. The accuracy of the MS4 map must be confirmed during non-storm water MS4 monitoring events. The MS4 map must be included as part of the jurisdictional runoff management program document. Any geographic information system (GIS) layers or files used by the Copermittee to maintain the MS4 map must be made available to the San Diego Water Board upon request. The MS4 map must identify the following:

(a) All segments of the MS4 owned, operated, and maintained by the Copermittee,

(b) All known locations of inlets that discharge and/or collect runoff into the Copermittee's MS4,

(c) All known locations of connections with other MS4s not owned or operated by the Copermittee (e.g. Caltrans MS4s),

(d) All known locations of MS4 outfalls as defined by 40 CFR §122.26(B)(5-6) and private outfalls as defined by 40 CFR §122.26(B)(9) that discharge runoff collected from areas within the Copermittee's jurisdiction,

(e) All segments of receiving waters within the Copermittee's jurisdiction that receive and convey runoff discharged from the Copermittee's MS4 outfalls~~ (i.e., receiving water segments that are both a receiving water and part of the MS4)~~, and

(f) Locations of the non-storm water MS4 monitoring stations, identified pursuant to Provision D.1.a.(1)(a), within its jurisdiction;

(2) Each Copermittee must use Copermittee personnel and contractors to assist in identifying and reporting illicit discharges and connections, if observed, during the course of their daily employment activities;

(3) Each Copermittee must promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges to or from the MS4. Each Copermittee must facilitate public reporting through development and operation of a public hotline. Public hotlines can be Copermittee-specific or shared by the Copermittees. All public hotlines must be capable of receiving reports in both English and Spanish 24 hours per day and seven days per week;

(4) Each Copermittee must implement practices and procedures (including a notification mechanism) to prevent, respond to, contain, and clean up any spills that may discharge into the MS4 within their jurisdiction from any source. The Copermittee must coordinate with spill response teams to prevent to the extent possible entry of spills into the MS4, and prevent contamination ~~of surface water, ground water, and soil~~waters of the ~~.~~U.S. The Copermittee must coordinate spill prevention, containment, and response activities throughout all appropriate Copermittee departments, programs, and agencies;~~ and~~

~~(4)~~(5) Copermittees are responsible for control of discharges to their MS4. In the event that the source of an illicit discharge or connection is from another MS4, the Copermittee shall notify and, if necessary coordinate, with the upstream MS4 to implement and/or enforce corrective actions; and

~~(5)~~(6) Each Copermittee must implement practices and procedures to prevent and limit infiltration of seepage from sanitary sewers (including private laterals and failing septic systems) to the MS4.

c. Visual Observations, Field Screening, And/or Monitoring

Each Copermittee must conduct visual observations, field screening and/or monitoring of MS4 outfalls and other portions of its MS4 within its jurisdiction to detect non-storm water and illicit discharges and connections to the MS4 in accordance with the jurisdictional non-storm water MS4 monitoring program requirements in Provision D.1.a.(1).

d. Investigate and Eliminate Illicit Discharges And Connections

Each Copermittee must include the following measures within its program to investigate and eliminate illicit discharges to the MS4:

ADMINISTRATIVE DRAFT

(1) Each Copermittee must prioritize and determine when follow-up investigations will be performed in response to visual observations and/or water quality monitoring data collected during an investigation of a detected non-storm water or illicit discharge to or from the MS4. The criteria for follow-up investigations must include the following:

(a) Pollutants identified as causing or contributing to the highest water quality priorities identified in the Water Quality Improvement Plan;

(b) Pollutants identified as causing or contributing, or threatening to cause or contribute to impairments in water bodies on the 303(d) List and/or in environmentally sensitive areas (ESAs), located within its jurisdiction;

(c) Pollutants identified from sources or land uses known to exist within the area, drainage basin, or watershed that discharges to the portion of the MS4 within its jurisdiction included in the investigation; and

(d) Pollutants identified as causing or contributing to and exceedance of an NAL[12][13] where the source has not been identified as natural described in Provision C.1; and

(e) Pollutants identified as a threat to human health or the environment.

(2) Each Copermittee must implement procedures to investigate and inspect portions of its MS4 that~~,~~ based on reports or notifications, visual observations, field screening~~ and~~, monitoring, or other appropriate information, indicate a reasonable potential of ~~receiving, containing, or~~ discharging pollutants to receiving waters within the Copermittees jurisdiction due to illicit discharges, illicit connections, or other sources of non-storm water. ~~The procedures must include the following:~~

(a) The Copermittee may develop criteria to assess the validity of, and prioritize the response to, each report or notification received. Each Copermittee must respond to each report or notification (e.g., public hotline reports, staff or contractor reports and notifications, etc.) of an incident in a timely manner. ~~The Copermittee may develop criteria to assess the validity of, and prioritize the response to, each report or notification received;~~

(b) ~~Each Copermittee must immediately investigate and seek~~Procedures should address field investigations to identify sources or potential sources for the discharge, unless the source or potential source has

[12] NAL exceedances discovered during the course of IDDE monitoring and/or investigations may trigger action levels, including but not limited to, follow-up investigations based on the highest watershed priorities set forth and the iterative process provided in the WQIP.

already been identified during previous investigations. The criteria established in Provision E.d.(2)(a) shall be used to prioritize response based on highest watershed priorities as established for the iterative process and determined in the Water Quality Improvement Plan, including:

(i) Obvious illicit discharges must be immediately investigated to identify the source(s) of discharges of non-storm water where flows are observed in and from the MS4 during the field screening and monitoring required pursuant to Provision D.1.a.(1);~~.~~

(i) The investigation must include field investigations to identify sources or potential sources for the discharge, unless the source or potential source has already been identified during previous investigations;

(ii) The investigation may include field investigations, reviewing Copermittee inventories, and other land use data to identify potential sources of the discharge; and

Procedures should address tracking of illicit discharges and connections.

~~(i)~~

~~(b) Each Copermittee must investigate and seek to identify the source(s) of non-storm water discharges from the MS4 where there is evidence of non-storm water having been discharged into or from the MS4 (e.g., pooled water). The investigation may include field investigations, reviewing Copermittee inventories, and other land use data to identify potential sources of the discharge; and~~

(3) Each Copermittee must maintain records and a database of the investigations, including the following information:

(a) Location of incident, including hydrologic subarea, portion of MS4 receiving the non-storm water or illicit discharge, and point of discharge or potential discharge from MS4 to receiving water,

(b) Source of information initiating the investigation (e.g., public hotline reports, staff or contractor reports and notifications, monitoring data, etc.),

(c) Date the information used to initiate the investigation was received,

(d) Date the investigation was initiated,

(e) Dates of follow-up investigations,

(i) Identified or suspected source of the illicit discharge or connection, if determined,

(f) Known or suspected related incidents, if any,

(g) Result of the investigation, and

(h) If a source cannot be identified and the investigation is not continued, a rationale for why a discharge does not pose a threat to water quality and/or does not require additional investigation.

(4) Each Copermittee must initiate the implementation of procedures, in a timely manner, to eliminate all detected and identified illicit discharges and connections within its jurisdiction. The procedures must include the following:

~~Each Copermittee must enforce its~~

(a) Procedures outlined by the Copermittee should address legal authority, as required under Provision E.1, to ~~eliminate~~enforce the elimination of illicit discharges and connections to ~~its~~the MS4. If the Copermittee identifies the source as a controllable source of non-storm water or illicit discharge or connection, the Copermittee must implement its Enforcement Response Plan pursuant to Provision E.6 and enforce its legal authority ~~to prohibit~~to effectively prohibit and eliminate illicit discharges and connections to its MS4~~;~~. Responses to discharges may include:

(i) If the Copermittee identifies the source of the discharge as a category of non-storm water discharges in Provision E.2.a, and the discharge ~~to or from the MS4 is~~ in exceedance of NALs developed ~~under Provision ,~~in the Water Quality Implementation Plan, then the Copermittees must determine if this is an isolated incident or set of circumstances, or if the category of discharge must be addressed through the prohibition of that category of discharge as an illicit discharge pursuant to Provision E.2.a.(6);

(ii) If the Copermittee suspects the source of the non-storm water discharge as natural in origin (i.e. non-anthropogenically influenced) and in conveyance into the MS4, then the Copermittee must ~~collect the data and evidence necessary to demonstrate to the San Diego Water Board that it is natural in origin; and~~document the rationale for why the discharge does not need further investigation. This documentation shall be included in the Annual Report.

(iii) If the Copermittee is unable to identify and document the source of a recurring non-storm water discharge to or from the MS4, then the Copermittee must address the discharge as an illicit discharge and update its jurisdictional runoff management program to address the common and suspected sources of the non-storm water discharge within its jurisdiction in accordance with the Copermittee's priorities.

(5) Each Copermittee must submit a summary of the non-storm water discharges and illicit discharges and connections investigated and eliminated within its jurisdiction with each Annual Report required under Provision F.3.b of this Order.

3. Development Planning

Each Copermittee ~~must use~~, within ~~their land use/planning authorities to~~ its respective jurisdiction, must implement a development planning program that includes, at a minimum, the following requirements.

a. Permanent BMP Requirements for All Development Projects

Each Copermittee~~,~~, as practical and feasible, must prescribe ~~the following~~ BMP requirements during the planning process (i.e. prior to project approval and issuance of grading or building permits) for all development projects ~~(regardless of project type or size),~~ where local permits are issued, including unpaved roads and flood management projects, except emergency projects implemented for the protection of persons and property:

(1) General Requirements

(a) All BMPs must be located so as to remove pollutants from runoff prior to its discharge to any receiving waters, and as close to the source as possible;

(b) Multiple development projects may use shared permanent BMPs as long as construction of any shared BMP is completed prior to the use or occupation of any development project from which the BMP will receive runoff; and

(c) Permanent BMPs must not be constructed within ~~a~~ waters of the U.S. ~~or waters of the state.~~

(2) Source Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement applicable source control BMPs. The following source control BMPs must be implemented at all development projects where applicable and feasible:

(a) Prevention of illicit discharges into the MS4;

(b) Storm drain system stenciling or signage;

(c) Properly designed outdoor material storage areas;

(d) Properly designed outdoor work areas;

(e) Properly designed trash storage areas; and

(f) Any additional BMPs necessary to minimize pollutant generation at each project.

(3) Low Impact Development (LID) BMP Requirements

The following LID BMPs must be implemented at all development projects where applicable and feasible:

(a) Maintenance or restoration of natural storage reservoirs and drainage corridors (including topographic depressions, areas of permeable soils, natural swales, and ephemeral and intermittent streams),[13]

(b) Buffer zones for natural water bodies (where buffer zones are technically infeasible, require project applicant to include other buffers such as trees, access restrictions, etc.);

(c) Conservation of natural areas within the project footprint including existing trees, other vegetation, and soils;

(d) Construction of streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided public safety is not compromised;

(e) Minimization of the impervious footprint of the project;

(f) Minimization of soil compaction to landscaped areas;

(g) Disconnection of impervious surfaces through distributed pervious areas;

(h) Landscaped or other pervious areas designed and constructed to effectively receive and infiltrate, retain and/or treat runoff from impervious areas, prior to discharge to the MS4;

(i) Small collection strategies located at, or as close as possible to, the source (i.e. the point where storm water initially meets the ground) to minimize the transport of runoff and pollutants to receiving waters;

[13] Development projects proposing to dredge or fill materials in waters of the U.S. must obtain a CWA Section 401 Water Quality Certification. Projects proposing to dredge or fill waters of the State must obtain Waste Discharge Requirements.

ADMINISTRATIVE DRAFT

(j) Use of permeable materials for projects with low traffic areas and appropriate soil conditions;

(k) Landscaping with native or drought tolerant species; and

(l) Harvesting and using precipitation.

~~Long-Term Permanent BMP Maintenance~~

~~Each Copermittee must require the project applicant to submit proof of the mechanism under which ongoing long-term maintenance of all permanent BMPs will be conducted.~~

~~Infiltration and Groundwater Protection~~

~~(a) Infiltration and treatment control BMPs designed to primarily function as large, centralized infiltration devices (such as large infiltration trenches and infiltration basins) must not cause or contribute to an exceedance of an applicable groundwater quality objective. At a minimum, such infiltration and treatment control BMPs must be in conformance with the design criteria listed below, unless the development project applicant demonstrates to the Copermittee that one or more of the specific design criteria listed below are not necessary to protect groundwater quality. The design criteria listed below do not apply to small infiltration systems dispersed throughout a development project.~~

~~(i) Runoff must undergo pretreatment such as sedimentation or filtration prior to infiltration;~~

~~(ii) Pollution prevention and source control BMPs must be implemented at a level appropriate to protect groundwater quality at sites where infiltration treatment control BMPs are to be used;~~

~~(iii) Infiltration treatment control BMPs must be adequately maintained to remove pollutants in storm water to the MEP;~~

~~(iv) The vertical distance from the base of any infiltration treatment control BMP to the seasonal high groundwater mark must be at least 10 feet. Where groundwater basins do not support beneficial uses, this vertical distance criteria may be reduced, provided groundwater quality is maintained;~~

~~(v) The soil through which infiltration is to occur must have physical and chemical characteristics (e.g., appropriate cation exchange capacity, organic content, clay content, and infiltration rate) which are adequate for proper infiltration durations and treatment of runoff for the protection of groundwater beneficial uses;~~

~~(vi) Infiltration treatment control BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee,~~

~~unless first treated or filtered to remove pollutants prior to infiltration; and~~

~~(vii) Infiltration treatment control BMPs must be located a minimum of 100 feet horizontally from any water supply wells.~~

~~(b) The Copermittees may collectively or individually develop alternative mandatory design criteria to that listed above for infiltration and treatment control BMPs which are designed to primarily function as centralized infiltration devices. Before implementing the alternative design criteria in the development planning process the Copermitee(s) must:~~

~~(i) Notify the San Diego Water Board of the intent to implement the alternative design criteria submitted; and~~

~~(ii) Comply with any conditions set by the San Diego Water Board.~~

b. Priority Development Projects

(1) Definition of Priority Development Project

Priority Development Projects include the following:

(a) All new development projects that fall under the Priority Development Project categories listed under Provision E.3.b.(2). Where a new development project feature, such as a parking lot, falls into a Priority Development Project category, the entire project footprint is subject to Priority Development Project requirements; and

(b) Those redevelopment projects that create, add, or replace at least 5,000 square feet of impervious surfaces on an already developed site, ~~or~~ and the redevelopment project is a Priority Development Project category listed under Provision E.3.b.(2). Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to Priority Development Project requirements, the performance and sizing requirements discussed in Provisions E.3.c.(2) and E.3.c.(3) apply only to the addition or replacement, and not to the entire development. Where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development and was not subject to previous Priority Project Development requirements, the performance and sizing requirements apply to the entire development.

(c) Projects where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development was subject to previous Priority Project

Development requirements, only the altered portion of development is subject to the Priority Development Project requirements in this Order.

(2) Priority Development Project Categories

(a) New development projects that create 10,000 square feet or more of impervious surfaces (collectively over the entire project site). This category includes commercial, industrial, residential, mixed-use, and public development projects on public or private land which fall under the planning and building authority of the Copermittee.

(b) Automotive repair shops. This category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

(c) Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812), where the land area for development is 5,000 square feet or more~~.~~ of impervious surface.

(d) Hillside development projects. This category includes any development which creates 5,000 square feet or more of impervious surface which is located in an area with known erosive soil conditions, where the development will grade on any natural slope that is twenty-five percent or greater.

(e) Environmentally sensitive areas (ESAs). This category includes any development located within, directly adjacent to, or discharging directly to an ESA, which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. “Directly adjacent to” means situated within 200 feet of the ESA. “Discharging directly to” means outflow from a drainage conveyance system that collects runoff from the subject development or redevelopment site ~~and~~ which terminates at or in receiving waters within the ESA and is not comingled with flows from adjacent lands.

(f) Parking lots. This category is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce that has 5,000 square feet or more of impervious surface.

(g) Streets, roads, highways, and freeways~~, and residential driveways~~. This category is defined as any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles.

(h) Retail gasoline outlets (RGOs). This category includes RGOs that meet the following criteria: (a) 5,000 square feet or more of impervious surface or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day.

(i) Large development projects. This category includes any post-construction pollutant-generating new development projects that result in the disturbance of one acre or more of land.

(3) Priority Development Project Exemptions

Each Copermittee has the discretion to exempt the following projects from being defined as Priority Development Projects:

(a) Sidewalks constructed as part of new streets or roads and designed to direct storm water runoff to adjacent vegetated areas;

(b) Bicycle lanes that are constructed as part of new streets or roads but are not hydraulically connected to the new streets or roads and designed to direct storm water runoff to adjacent vegetated areas;

(c) Impervious trails and driveways constructed and designed to direct storm water runoff to adjacent vegetated areas, or other non-erodible permeable areas;

(d) Sidewalks, bicycle lanes, driveways, parking lots, or trails constructed with permeable surfaces.

(e) Single-family residential projects that are not part of a larger development or proposed subdivision and implement BMPs that meet minimum performance standards, as outlined in the BMP Design Manual.[15]

(f) Any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles that follows the USEPA guidance regarding Management Wet Weather with Green Infrastructure: Green Streets[16] to the MEP.

---

[15] The BMP Design Manual was formerly known as the Standard Urban Storm Water Mitigation Plan under Order Nos. R9-2007-0001, R9-2009-0002, and R9-2010-0016.

c. Priority Development Project ~~Permanent~~ Structural BMP Performance and Sizing Requirements

In addition to the BMP requirements listed for all development projects under Provision E.3.a, Priority Development Projects must also implement ~~permanent~~ structural BMPs that conform to performance and sizing requirements.
~~(1) Source Control BMP Requirements~~

~~Each Copermittee must require each Priority Development Project to implement applicable source control BMPs listed under Provision E.3.a.(2).~~

(1) Retention and Treatment Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement BMPs to retain and treat pollutants onsite in the following order:

(a) Each Priority Development Project must be required to implement LID BMPs as described in Provision E.3.a.(3); and~~.~~

(b) Each Priority Development Project must be required to implement LID BMPs that are sized and designed to retain the difference in volume ~~equivalent to~~between the runoff volume produced in the post-development condition as compared to the pre-development runoff condition resulting from a 24-hour 85th percentile storm event[17] ("design capture volume"[18]), or

(c) If onsite retention of the design capture volume using LID BMPs is technically infeasible per Provision E.3.c.(4), flow-thru LID and/or conventional treatment control BMPs must be implemented to provide equal pollutant removal for ~~treat~~ the portion of the design capture volume that is not retained onsite. Flow-thru LID treatment control BMPs must be designed for an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP; or~~.~~

~~(c)~~(d) If retention and/or equivalent pollutant removal of the design capture volume to meet E.3.c.(2)(a) or E.3.c.(2)(b) are infeasible

[17] This volume is not a single volume to be applied to all areas covered by this Order. The size of the 85th percentile storm event is different for various parts of the San Diego Region. The Copermittees are encouraged to calculate the 85th percentile storm event for each of its jurisdictions using local rain data pertinent to its particular jurisdiction. In addition, isopluvial maps may be used to extrapolate rainfall data to areas where insufficient data exists in order to determine the volume of the local 85th percentile storm event in such areas. Where the Copermittees will use isopluvial maps to determine the 85th percentile storm event in areas lacking rain data, the Copermittees must describe their method for using isopluvial maps in its BMP Design Manuals.
[18] Design capture volume is a single event based volume occurring after an extended dry period.

onsite~~Additionally~~, project applicants must perform mitigation for the portion of the pollutant load in the design capture volume that is not retained or equally treated onsite, as described in Provision E.3.c.(~~5~~4)c.

~~(d)~~(e) All onsite treatment control BMPs must:

(i) Be correctly sized and designed so as to remove pollutants from storm water to the MEP;

(ii) Be sized to comply with the following numeric sizing criteria:

[a] Volume-based treatment control BMPs must be designed to mitigate (infiltrate, filter, or treat) the remaining portion of the design capture volume that was not retained onsite; or

[b] Flow-based treatment control BMPs must be designed to mitigate (filter or treat) either: 1) the maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour, for each hour of a storm event; or 2) the maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity (for each hour of a storm event), as determined from the local historical rainfall record, multiplied by a factor of two.

(iii) Be ranked with high or medium pollutant removal efficiency for the project's most significant pollutants of concern. Treatment control BMPs with a low removal efficiency ranking must only be approved by a Copermittee when a feasibility analysis has been conducted which exhibits that implementation of treatment control BMPs with high or medium removal efficiency rankings are infeasible for a Priority Development Project or portion of a Priority Development Project.

(2) Hydromodification Management BMP Requirements

Each Copermittee must require each Priority Development ~~Project~~Project disturbing greater than one acre to implement hydromodification management BMPs, ~~so that:~~as described in the Copermittees current HMP, as applicable.

(a) Post-project runoff flow rates and durations do not exceed pre-development ~~(naturally occurring)~~ runoff flow rates and durations by more than 10 percent (for the range of flows that result in increased potential for erosion or degraded channel conditions downstream of Priority Development Projects).

(i) In evaluating the range of flows that results in increased potential for erosion of natural (non-hardened) channels, the lower boundary must correspond with the critical channel flow that

ADMINISTRATIVE DRAFT

produces the critical shear stress that initiates channel bed movement or that erodes the toe of channel banks.

(ii) For artificially hardened channels, analysis to identify the lower boundary must use characteristics of a natural stream segment similar to that found in the watershed. The lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or erodes the toe of the channel banks.

~~(i)~~(iii) The Copermittees may use monitoring results pursuant to Provision D.5.a.(4) to re-define the range of flows resulting in increased potential for erosion or degraded channel conditions, as warranted by the data.

(b) Projects shall preserve (where feasible) or provide compensation for significant losses of sediment supply anticipated as a result of development. ~~Post-project runoff flow rates and durations must compensate for the loss of sediment supply due to the development project, should loss of sediment supply occur as a result of the development project.~~

(c) If hydromodification management BMPs are technically infeasible per Provision E.3.c.(~~5~~4), project applicants must perform mitigation for the portion of the runoff volume that is not controlled and will cause or contribute to increased potential for erosion of receiving waters downstream of the Priority Development Project, as described in Provision E.3.c.(~~5~~4)c.

(d) Exemptions

Each Copermittee has the discretion to exempt a Priority Development Project from the hydromodification management BMP requirements where the project:

(i) Discharges storm water runoff into underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean;

(ii) Discharges storm water runoff into conveyance channels whose bed and bank are stabilized (e.g. concrete lined, an engineered interlocking paver, gabion system etc…) all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean; or

(iii) Discharges storm water runoff into other areas identified by the San Diego Water Board as exempt from the requirements of Provisions E.3.c.(3) .

(3) Long-Term Structural BMP Maintenance

Each Copermittee must require the project applicant to submit proof of the mechanism under which ongoing long-term maintenance of all structural BMPs will be conducted.

(4) Infiltration and Groundwater Protection

(a) Infiltration and treatment control BMPs designed to primarily function as large, centralized infiltration devices (such as large infiltration trenches and infiltration basins) must not cause or contribute to an exceedance of an applicable groundwater quality objective. At a minimum, such infiltration and treatment control BMPs must be in conformance with the design criteria listed below, unless the development project applicant demonstrates to the Copermittee that one or more of the specific design criteria listed below are not necessary to protect groundwater quality. The design criteria listed below do not apply to small infiltration systems dispersed throughout a development project.

(i) Runoff must undergo pretreatment such as sedimentation or filtration prior to infiltration;

(ii) Pollution prevention and source control BMPs must be implemented at a level appropriate to protect groundwater quality at sites where infiltration treatment control BMPs are to be used;

(iii) Infiltration treatment control BMPs must be adequately maintained to remove pollutants in storm water to the MEP;

(iv) The vertical distance from the base of any infiltration treatment control BMP to the seasonal high groundwater mark must be at least 10 feet. Where groundwater basins do not support beneficial uses, this vertical distance criteria may be reduced, provided groundwater quality is maintained;

(v) The soil through which infiltration is to occur must have physical and chemical characteristics (e.g., appropriate cation exchange capacity, organic content, clay content, and infiltration rate) which are adequate for proper infiltration durations and treatment of runoff for the protection of groundwater beneficial uses;

(vi) Infiltration treatment control BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee, unless runoff does not exceed Basin Plan water quality standards or runoff is first treated or filtered to remove pollutants prior to infiltration; and

(vii) Infiltration treatment control BMPs must be located a minimum of 100 feet horizontally from any water supply wells.

(b) The Copermittees may collectively or individually develop alternative mandatory design criteria to that listed above for infiltration and treatment control BMPs which are designed to primarily function as centralized infiltration devices. Before implementing the alternative design criteria in the development planning process the Copermittee(s) must:

(i) Notify the San Diego Water Board of the intent to implement the alternative design criteria submitted; and

(ii) Comply with any conditions set by the San Diego Water Board.

(5) Alternative Compliance for Technical Infeasibility

At the discretion of each Copermittee, alternative compliance may be allowed for certain Priority Development Projects to comply with Provisions E.3.c.(~~2~~1) and E.3.c.(2~~3~~)~~,~~. Alternative compliance is an optional program for the Copermittees to utilize if it is determined to provide an equal or greater benefit than onsite compliance. Where alternative compliance is allowed, it is the sole responsibility of the project applicant to execute the alternative compliance and comply with the following requirements:
~~subject to the following requirements:~~

a. Applicability

Priority Development Projects may be allowed alternative compliance if:

(i) The Copermittee reviews and ~~approves~~ accepts site-specific hydrologic and/or design analysis performed by a registered professional engineer, geologist, architect, or landscape architect;

(ii) The project applicant demonstrates, and the Copermittee determines and documents, that ~~retention LID and/or hydromodification management~~ BMPs per Provisions E.3.c.(1~~2~~) and E.3.c.(2~~3~~) were incorporated into the project design to the maximum extent technically feasible given the project site conditions;

(iii) The project applicant is required to perform mitigation described in Provision E.3.c.(5~~4~~)~~ccc~~ with a net result of at least the same level of water quality protection as would have been achieved if the Priority Development Project had fully implemented the ~~retention LID and hydromodification management~~ BMP requirements under Provisions E.3.c.(1~~2~~) and E.3.c.(2~~3~~) onsite.

b. Criteria For Technical Infeasibility

Each Copermittee must develop, or develop in collaboration with the other Copermittees, criteria to determine technical infeasibility for fully implementing the ~~retention LID and hydromodification management~~ BMP requirements under Provisions E.3.c.(1~~2~~) and E.3.c.(2~~3~~) and include these requirements in the ~~Permanent~~ BMP ~~Sizing Criteria~~ Design Manual pursuant to Provision E.3.d. Technical infeasibility may result from conditions including, but not limited to:

(i) Locations that cannot meet the infiltration and groundwater protection requirements in Provision E.3.c~~a~~.(4~~5~~) due to the presence of shallow bedrock, contaminated soils, near surface groundwater, underground facilities, or utilities;

(ii) Brownfield development sites or other locations where pollutant mobilization is a documented concern;

(iii) The design of the site precludes the use of soil amendments, plantings of vegetation, or other designs that can be used to infiltrate and evapotranspirate runoff;

(iv) Soils cannot be sufficiently amended to provide for the requisite infiltration rates;

(v) Locations with geotechnical hazards;

(vi) Insufficient onsite and/or offsite demand for storm water use;

(vii) Modifications to an existing building to manage storm water are not feasible due to structural or plumbing constraints;

~~(vii)~~(viii) HMP flow rate requirements that result in BMP orifice sizes too small for efficient maintenance; and

~~(viii)~~(ix) Smart growth and infill or redevelopment locations where the density and/or nature of the project would create significant difficulty for compliance with Provisions E.3.c.(2) and E.3.c.(3) onsite.

c. Mitigation

Priority Development Projects that meet the Copermittee's technical infeasibility criteria developed pursuant to Provision E.3.c.(~~5~~4)b must be required to mitigate for the increased flow rates, increased flow durations, and/or ~~increased pollutant loads~~water quality equivalence expected to be discharged from the site.

(i) The Project applicant must perform offsite mitigation for:

[a] The portion of the pollutant load in the design capture volume that is not retained or equally treated onsite, and/or

[b] The portion of the increased potential erosion of downstream receiving waters not fully controlled with hydromodification management BMPs onsite.

~~For the pollutant load in the volume of storm water not retained onsite with retention LID BMPs, or increased potential erosion of downstream receiving waters not fully controlled onsite with hydromodification management BMPs, the Copermittee must require the project applicant to either 1) implement an offsite mitigation project, and/or 2) provide sufficient funding for a public or private offsite mitigation project via a mitigation fund.~~

~~(i)~~(ii) Mitigation Project Locations

Offsite mitigation projects must be implemented within the same ~~hydrologic unit~~Watershed Management Area as the Priority Development Project, and preferably within the same hydrologic subarea. Mitigation projects outside of the hydrologic subarea but within the same ~~hydrologic unit~~Watershed Management Area may be approved provided that the project applicant demonstrates that mitigation projects within the same hydrologic subarea are infeasible and that the mitigation project will address similar potential impacts expected from the Priority Development Project.

~~(ii)~~(iii) Mitigation Project Types

Offsite mitigation projects ~~must~~ may include, where applicable and feasible, retrofitting opportunities and stream and/or habitat rehabilitation or restoration opportunities identified in the Water Quality Improvement Plans, identified pursuant to Provision B.3.. Other offsite mitigation projects may include green streets or infrastructure projects, groundwater recharge projects, or regional BMPs upstream of receiving waters. Mitigation credit will not be given to portions of in stream mitigation projects using impervious~~In-stream rehabilitation or restoration measures to protect or prevent adverse physical changes to creek bed and banks must not include the use of non-naturally occurring~~ hardscape materials such as concrete~~, riprap, or gabions~~. Project applicants seeking to utilize these alternative compliance provisions may propose other offsite mitigation projects, which the Copermittees may approve if they meet the requirements of Provision E.3.c.(4).

~~(iii)~~(iv) Mitigation Project Timing

The Copermittee and/or project applicant must develop a schedule for the completion of offsite mitigation projects, including milestone dates to identify, fund, design, and construct the projects. Offsite mitigation funding ~~projects~~ must be secured by the applicant and verified by the Copermittee prior to granting construction permits or recording of maps,whichever comes first. ~~completed upon the granting of occupancy for the first project that contributed funds toward the offsite mitigation project, unless a longer period is authorized by the San Diego Water Board.~~.

~~(iv)~~(v) Mitigation Fund

A Copermittee may choose to implement additional mitigation programs (e.g., pollutant credit system, mitigation fund) as a means for developing and implementing offsite mitigation projects, provided the projects conform to the requirements for project locations, types, and timing described above.

d. Update ~~Permanent~~ BMP ~~Sizing Criteria~~ Design Manual

Each Copermittee must update its ~~Permanent BMP Sizing Criteria Design Manual (~~BMP Design Manual~~)~~~~[19]~~ pursuant to Provision F.2.b or Provision F.5.a. Until the Copermittee has updated its BMP Design Manual with the requirements of Provision E.3.c, the Copermittee must continue implementing its current BMP Design Manual. Unless directed otherwise by the San Diego Water Board, the Copermittee must implement the BMP Design Manual within 180 days of completing the update. The update of the BMP Design Manual must include the following:

(1) Updated procedures to determine the nature and extent of storm water requirements applicable to a potential development or redevelopment project. These procedures must inform project applicants of the storm water management requirements applicable to their project including, but not limited to, general requirements for all development projects, LID and conventional BMP design procedures and requirements, hydromodification management requirements, requirements specific to phased projects, and procedures specific to private developments and public improvement projects;

(2) Updated procedures to identify pollutants and conditions of concern for selecting the most appropriate ~~permanent~~ structural BMPs that consider, at a minimum, the following:

(a) Receiving water quality (including pollutants for which receiving waters are listed as impaired under CWA section 303(d));

(b) Priority pollutants or receiving water conditions contributing to the highest water quality priorities identified in the Water Quality Improvement Plan;

(c) Land use type of the project and pollutants associated with that land use type; and

(d) Pollutants expected to be present onsite.

(3) Updated procedures for designing ~~permanent~~ structural BMPs, including any updated performance and sizing requirements to be consistent with the requirements of Provision E.3.c for all BMPs listed in the BMP Design Manual;

(4) Long-term maintenance criteria for each BMP listed in the BMP Design Manual; and

~~[19] The Permanent BMP Sizing Criteria Design Manual was formerly known as the Standard Storm Water Mitigation Plan under Order Nos. R9-2007-0001, R9-2009-0002, and R9-2010-0016.~~

(5) Criteria and mitigation requirements, in accordance with the requirements under Provision E.3.c.(4), if the Copermittee elects to allow alternative compliance for technical infeasibility within its jurisdiction.

e. Priority Development Project BMP Implementation and Oversight

Each Copermittee must implement a program to ensure structural ~~permanent~~ BMPs on all Priority Development Projects are designed, constructed, and maintained to remove pollutants in storm water to the MEP.

(1) Structural~~Permanent~~ BMP Approval and Verification Process

(a) Each Copermittee must ensure that for all Priority Development Project applications that have not received prior lawful approval by the Copermittee by 18~~2~~ months after the adoption of this Order, or pursuant to Provision F.5.a~~aa~~, the requirements of Provision E.3 are implemented. For project applications that have received prior lawful approval by 18~~2~~ months after the adoption of this Order, or pursuant to Provision F.5.a~~aa~~, the Copermittee may allow previous land development requirements to apply.

(b) Each Copermittee must identify the roles and responsibilities of various municipal departments in implementing the structural~~permanent~~ BMP requirements, including each stage of a project from application review and approval through BMP maintenance and inspections.

(c) Each Copermittee must ensure that appropriate easements and ownerships are properly recorded in public records and the information is conveyed to all appropriate parties when there is a change in project or site ownership.

(d) Each Copermittee must ensure that prior to occupancy and/or intended use of any portion of the Priority Development Project, each ~~permanent~~ structural BMP must be inspected to verify that they have been constructed and are operating in compliance with all of its specifications, plans, permits, ordinances, and the requirements of this Order.

(2) Priority Development Project Inventory and Prioritization

(a) Each Copermittee must develop and ~~continuously~~regularly maintain a watershed-based database to track and inventory all Priority Development Projects and associated structural~~permanent~~ BMPs within their jurisdiction. Inventories must be accurate and complete beginning from January 2002 for the San Diego County Copermittees, February 2003 for the Orange County Copermittees, and July 2005 for the Riverside County

Copermittees, where data is available. The database must include, at a minimum, the following information:

(i) Priority Development Project location (address and hydrologic subarea);

(ii) Descriptions of structural BMP type(s);

(iii) Date(s) of construction;

(iv) Party responsible for ~~permanent~~ structural BMP maintenance;

(v) Dates and findings of ~~permanent~~ structural BMP maintenance verifications; and

(vi) Corrective actions and/or resolutions.

(b) Each Copermittee must prioritize the Priority Development Projects with ~~permanent~~ structural BMPs within its jurisdiction. The designation of Priority Development Projects as high priority must consider the following:

(i) The highest water quality priorities identified in the Water Quality Improvement Plan;

(ii) Receiving water quality;

(iii) Number and sizes of ~~permanent~~ structural BMPs;

(iv) Recommended maintenance frequency of ~~permanent~~ structural BMPs;

(v) Likelihood of operation and maintenance issues of structural ~~permanent~~ BMPs;

(vi) Land use and expected pollutants generated; and

(vii) Compliance record.

(3) Structural ~~Permanent~~ BMP Maintenance Verifications and Inspections

Each Copermittee is required to verify that structural ~~permanent~~ BMPs on each Priority Development Project are adequately maintained, and continue to operate effectively to remove pollutants in storm water to the MEP through inspections, self-certifications, surveys, or other equally effective approaches.

(a) All (100 percent) of the structural ~~permanent~~ BMPs at Priority Development Projects that are designated as high priority must be inspected directly by the Copermittee annually prior to each rainy season;

(b) For verifications performed through a means other than direct Copermittee inspection, adequate documentation must be required by the Copermittee to provide assurance that the required maintenance of structural ~~permanent~~ BMPs at each Priority Development Project has been completed; and

(c) Appropriate follow-up measures (including re-inspections, enforcement, etc.) must be conducted to ensure that structural ~~permanent~~ BMPs at each Priority Development Project continue to reduce pollutants in storm water to the MEP as originally designed.

f. Development Project Enforcement

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all development projects, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

4. Construction Management

Each Copermittee must implement a construction management program that includes~~, at a minimum,~~ the following requirements:

a. Construction Program Management

Each Copermittee must define in the Jurisdictional Runoff Management Plan the following:

(1) Define construction sites to be inventoried, such as sites that involve any ground disturbance or soil disturbing activities; and

(2) Define a process for ensuring adequate construction BMP implementation for non-inventoried sites. Non-inventoried sites involve minor construction activities that are not anticipated to create storm water pollution such as interior improvements, plumbing, electrical, and mechanical work.

~~a.~~**b.** Project Approval Process

Prior to ~~approval and~~ issuance of any local permit that allows commencement of construction~~, grading, or building permits~~ activities for any inventoried construction site, ~~a project~~ each Copermittee must:

(1) Require a ~~project~~site-specific ~~storm water pollution prevention plan (SWPPP)~~Pollution Control Plan, or equivalent construction BMP or erosion control plan, to be submitted by the project applicant ~~for~~ to the Copermittee~~'s approval~~;

(2) ~~Ensure~~ Confirm the Pollution Control Plan~~SWPPP~~, or equivalent construction BMP or erosion control plan, complies with the local grading ordinance, other applicable local ordinances, and the requirements of this Order; and

(3) ~~Ensure~~ Confirm the Pollution Control Plan~~SWPPP~~, or equivalent construction BMP or erosion control plan, includes seasonally appropriate and effective BMPs and management measures described in Provision E.4.c, as applicable to the project.

~~(1) Verify that the project applicant has obtained coverage under applicable permits, including, but not limited to the Construction General Permit, Clean Water Act Section 401 Water Quality Certification and Section 404 Permit, and California Department of Fish and Game Streambed Alteration Agreement.~~

c. Construction Site Inventory and Tracking

(1) Each Copermittee must maintain, and update at least monthly, a watershed-based inventory of all applicable construction sites ~~requiring construction, grading, or building permits~~ within its jurisdiction. The inventory must include:

(a) Relevant contact information for each site (e.g., name, address, phone, and email for the owner and contractor);

(b) The basic site information including location (address and hydrologic subarea), Waste Discharge Identification (WDID) number (if applicable), size of the site, and approximate area of disturbance;

(c) Whether or not the site is considered a high threat to water quality, as defined in Provision E.4.b.(2) below;

~~(a) The project start and anticipated completion dates;~~

(d) Current construction phase;

(e) The required inspection frequency, as defined in the Copermittee's jurisdictional runoff management program document;

(f) The date the Copermittee ~~approved~~ accepted the project-specific Pollution Control Plan~~SWPPP~~, or equivalent construction BMP or erosion control plan; and

(g) Whether or not there are ongoing enforcement actions administered to the site.

(2) Each Copermittee must identify all construction sites within its jurisdiction that represent a high threat to downstream surface water quality. At a minimum, high threat to water quality sites must include:

(a) Sites located within a hydrologic subarea where sediment is known o suspected to contribute to the highest water quality priorities identified in the Water Quality Improvement Plan;

(b) Sites located within the same hydrologic subarea and tributary to a CWA section 303(d) water body segment impaired for sediment;

(c) Sites located within, directly adjacent to, or discharging directly to a receiving water within an ESA; and

(d) Other sites determined by the Copermittees or the San Diego Water Board as a high threat to water quality.

d. Construction Site BMP and Management Measure Implementation

Each Copermittee must implement, or require the implementation of effective BMPs to reduce discharges of pollutants in storm water from construction sites to the MEP, and prevent non-storm water discharges into the MS4. These BMPs must be site specific, seasonally appropriate, and construction phase appropriate. BMPs and management measures must be implemented at each construction site year round. Dry season BMP implementation must plan for and address unseasonal rain events that may occur during the dry season (May 1 through September 30). Copermittees must implement, or require the implementation of, BMPs and management measures in the following categories:

(1) Project Planning;

(2) Good Site Management “Housekeeping”, including waste management;

(3) Non-storm Water Management;

(4) Erosion Control;

(5) Sediment Control;

(6) Run-on and Run-off Control; and

(7) Active/Passive Sediment Treatment Systems, where applicable.

e. Construction Site Inspections

Each Copermittee must conduct construction site inspections to ~~ensure~~ confirm compliance with its permits and applicable local ordinances, and the requirements of this Order. Priority for site inspections must consider threat to water quality pursuant to Provision E.4.b as well as the nature of the construction activity, topography, and the characteristics of soils and receiving water quality.

(1) Inspection Frequency

(a) Each Copermittee must conduct inspections at all inventoried sites, including high threat to water quality sites, at an appropriate frequency for each phase of construction to ~~ensure~~ confirm the site reduces the discharge of pollutants in storm water from construction sites to the MEP, and prevents non-storm water discharges from entering the MS4.

(b) Each Copermittee must establish appropriate inspection frequencies for high threat to water quality sites, and all other sites, for each phase of construction. Inspection frequencies appropriate for addressing the highest water quality priorities identified in the Water Quality Improvement Plan, and for complying with the requirements of this Order must be identified in each Copermittee’s jurisdictional runoff management program document.

ADMINISTRATIVE DRAFT

(c) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e., re-inspection, enforcement) necessary to ~~ensure~~ confirm site compliance with its permits and applicable local ordinances, and the requirements of this Order.

(2) Inspection Content

Inspections of construction sites by the Copermittee must include, at a minimum:

(a) Verification of coverage under the Construction General Permit (Notice of Intent (NOI) and/or WDID number) during initial inspections, when applicable;

(b) Assessment of compliance with its permits and applicable local ordinances related to pollution prevention, including the implementation and maintenance of applicable BMPs;

(c) Assessment of BMP adequacy and effectiveness;

(d) Visual observations of actual non-storm water discharges;

(e) Visual observations of actual or potential discharge of sediment and/or construction related materials from the site;

(f) Visual observations of actual or potential illicit connections; and

(g) If any violations are found and BMP enhancements are needed, inspectors must take and document appropriate actions in accordance with the Enforcement Response Plan pursuant to Provision E.6.

(3) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried construction sites. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must include, at a minimum:

(a) Site name, location (address and hydrologic subarea), and WDID number (if applicable);

(b) Inspection date;

(c) Weather conditions during inspection;

~~(a) Approximate amount of rainfall since last inspection;~~

(d) Description and photo documentation of problems observed with BMPs and indication of need for BMP addition/repair/replacement and any scheduled re-inspection, and date of re-inspection;

(e) Descriptions of any other specific inspection comments which must, at a minimum, include rationales for longer compliance time~~.~~;

(f) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6; and

(g) Resolution of problems noted and date problems fixed.

f. Construction Site Enforcement

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried construction sites, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

5. Existing Development Management
[Note: This section is provided as an alternative to the original language. As such, line-out strike-out is not provided.]
Each Copermittee must implement an existing development management program that includes the following requirements:

a. Industrial, Commercial, and Municipal Sources

(1) Source Identification and Prioritization

Each Copermittee must identify sources and maintain an updated watershed-based inventory of its existing industrial, commercial, and municipal development that has the reasonable potential to discharge a pollutant load to and from the MS4. The use of an automated database system, such as GIS, is highly recommended. The inventory must, at a minimum, include:

(a) Name, location (address and hydrological subarea) of each source;

(b) A designation of the source as municipal, commercial, or industrial;

(c) SIC Code or NAICS Code, if applicable;

(d) Industrial General Permit NOI and/or WDID number, if applicable;

(e) Identification of pollutants generated or potentially generated by the source;

(f) Whether the source is adjacent to an ESA;

(g) Whether the source is tributary to and within the same hydrologic subarea as a CWA section 303(d) water body segment and generates or potentially generates pollutants for which the water body segment is impaired; and

(h) Whether the source contributes or potentially contributes to the highest water quality priorities identified in the Water Quality Improvement Plan;

(2) BMP Implementation and Maintenance

Each Copermittee must designate a minimum set of BMPs required for all inventoried existing development with the reasonable potential to discharge pollutant loads from their MS4, including special event venues. The designated minimum BMPs must be specific to facility types and pollutant-generating activities, as appropriate.

(a) Pollution Prevention

Each Copermittee must promote the use of pollution prevention methods, where appropriate.

(b) BMP Operation and Maintenance

(i) Each Copermittee must properly operate and maintain, or require the proper operation and maintenance of designated BMPs at sources within its jurisdiction.

Each Copermittee must implement a schedule of operation and maintenance activities for its MS4 and related structures (including but not limited to catch basins, storm drain inlets, detention basins, etc.), and verify proper operation of all its municipal structural treatment controls. Operations and maintenance activities may include:

[a] Inspections of MS4 and related structures;

[b] Cleaning of MS4 and related structures; and

[c] Proper disposal of materials removed from cleaning of MS4 and related structures.

(ii) Each Copermittee must implement a schedule of operation and maintenance activities for public: streets, unpaved roads, paved roads, and paved highways and freeways within its jurisdiction.

(iii) Each Copermittee must implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers. Copermittees that operate both a municipal sanitary sewer system and a MS4 must implement controls and measures to prevent and eliminate seeping sewage from infiltrating the MS4. Copermittees that do not operate both a municipal sanitary sewer system and a MS4 are encouraged to coordinate with sewering agencies to keep themselves informed of relevant and appropriate maintenance activities and capital projects in their jurisdiction.

(c) Pesticides, Herbicides, and Fertilizers BMPs

Each Copermittee must implement procedures, or require the implementation of procedures, as appropriate, to reduce discharges of pollutants associated with the application, storage, and disposal of pesticides, herbicides and fertilizers at sources within its jurisdiction.

(3) Measures to Address Highest Water Quality Priorities

Each Copermittee must conduct or require measures as necessary to address sources or areas that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan. These measures must be identified as applicable in each WQIP strategy, and may include any of the following:

(a) Copermittee Program Activities

Each Copermittee may make modifications to its program activities (e.g. increased or focused education, inspections, etc.) to address sources that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan.

(b) Additional Control Measures

Each Copermittee may require additional pollution prevention measures and control measures at sources that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan, including consideration of retrofit and channel rehabilitation and improvement opportunities, as identified in Provision 5.a.2.(c)

(c) Retrofit

Each Copermittee must develop a strategy to facilitate the implementation of retrofit projects. Existing development in high priority areas should be assessed for inclusion in the retrofit plan. Retrofit plans should focus on pollutants and areas identified as high priority within the Water Quality Improvement Plans, with the highest priority projects included in the Water Quality Improvement Plans.

(i) Retrofit projects may be prioritized based on their relative benefit to water quality, feasibility, cost effectiveness, and community acceptance.
(ii) Retrofit projects in the highest priority areas should be included in the review for the Water Quality Improvement Plan to provide additional pollutant removal from storm water discharges.

(d) Channel Rehabilitation and Improvement

Each Copermittee must develop a strategy to facilitate the implementation of channel rehabilitation and improvement projects. Existing channels in high priority areas should be assessed for inclusion in the channel rehabilitation and improvement plan. Channel rehabilitation and improvement plans should focus on pollutants and areas identified as high priority within the Water Quality Improvement Plans.

(i) Channel rehabilitation and improvement projects may be selected to address hydromodification, restore wetland and riparian habitat, or to address other water quality issues prioritized in the Water Quality Improvement Plan.

(ii) Channel rehabilitation and improvement projects may be prioritized based on their relative benefit to water quality, feasibility, cost effectiveness, and community acceptance.

(iii) Channel rehabilitation and improvement projects in the highest priority areas should be included in the review for the Water Quality Improvement Plan to provide additional pollutant removal from storm water discharges.

(4) Inspection Requirements:

(a) Inspection Frequency

(i) Each Copermittee must establish appropriate inspection frequencies for inventoried industrial, commercial, and municipal sources based on the potential for discharging pollutants via storm water and non-storm water discharges, and should reflect the priorities set forth in the Water Quality Improvement Plan.

(ii) Each Copermittee must conduct inspections annually with a level of effort equivalent to 20% of their industrial, commercial, and municipal inventory combined[18]. If facilities require multiple inspections during any given year, those additional inspections may count towards this total.

(iii) Inventoried existing development must be inspected, as needed, in response to valid public complaints and findings from the Copermittee's municipal and contract staff inspections.

(iv) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e. education and outreach, re-inspection, enforcement) as necessary to confirm compliance in accordance with its enforcement response plan pursuant to Provision E.6.

(b) Inspection Content

Inspections of industrial, commercial, and municipal facilities by the Copermittee may include the following:

(i) Industrial, commercial, and municipal facilities name and location (address and hydrologic subarea);

(ii) Inspection and re-inspection date(s);

(iii) Assessment of compliance with its applicable local ordinances and permits related to non-storm water and storm water discharges and runoff;

(iv) Assessment of BMPs implementation;

(v) Verification of coverage under the Industrial General Permit (NOI and/or WDID number), when applicable;

(vi) Visual observations of actual non-storm water discharges, if present;

(vii) Visual observations of actual or potential discharge of pollutants, if present; and

(viii) Visual observations of actual or potential illicit connections, if present.

[18] Excludes linear facilities (MS4 and roads).

(c) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried industrial, commercial, and municipal facilities. The Copermittee must maintain all inspection records in an electronic database or tabular format, either in paper or electronic inspection records files, which must be made available to the San Diego Water Board upon request.

Inspection records must include the information necessary to effectively manage and implement the industrial, commercial, and municipal facilities inspection program, as described in each Copermittee's jurisdictional runoff management plan

b. Residential Sources

(1) Source Identification and Prioritization:

An inventory of residential sources within each Copermittees jurisdiction must be developed as follows:

(a) Designation of Residential Management Areas

Each Copermittee must divide areas of residential development into Residential Management Areas. Residential Management Areas may be designated by one or more of the following: Hydrologic Sub Area, land use (e.g. single family, multi family, rural, Common Interest Areas, ~~or~~ Home Owner Associations), and/or residential target audiences, and/or other accepted methods to be included in each Copermittee-approved jurisdictional runoff management plan.

(b) Prioritization of Residential Management Areas

Copermittees must prioritize Residential Management Areas for the purposes of ~~prioritizing and~~ directing their residential programs. Prioritization must consider whether the Residential Management Area contributes or potentially contributes to the highest water quality priorities identified in the Water Quality Improvement Plan, and consideration of other program information or information from other relevant programs:

(c) A regularly updated map must be developed showing the locations of the highest priority inventoried Residential Management Areas, watershed boundaries, and water bodies at or near them.

(2) BMP Implementation and Maintenance

(a) Designate BMPs

Each Copermittee must designate and ~~require~~ encourage the implementation of a minimum set of BMPs for all residential sources or residential target audiences with the reasonable potential to discharge significant pollutant loads from their MS4.The designated minimum BMPs must be source-specific, and must address each of the following as appropriate.

(i) Pollution Prevention

Each Copermittee must promote the use of pollution prevention methods, where appropriate.

(ii) BMP Operation and Maintenance

Each Copermittee must designate ~~operate~~ and ~~maintain, or~~ require the operation and maintenance of designated BMPs for residential sources within its jurisdiction.

(iii) Pesticides, Herbicides, and Fertilizers BMPs

Each Copermittee must designate ~~require~~ and encourage, as appropriate, the implementation of practices to reduce discharges of pollutants associated with the application, storage, and disposal of pesticides, herbicides and fertilizers at residential sources within its jurisdiction.

(3) Measures to Address Highest Water Quality Priorities

Each Copermittee must designate ~~conduct~~ or require measures as necessary to address residential sources or residential target audiences ~~areas~~ that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan. These measures must be identified as applicable in each WQIP strategy, and may include any of the following:

(a) Copermittee Program Activities

Each Copermittee may make modifications to its program activities (e.g. increased or focused education, inspections, etc.) to address residential sources that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan.

(b) Additional Control Measures

Each Copermittee may require additional pollution prevention and control measures at sources that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan.

(c) Retrofit

Each Copermittee must encourage through education or other means the implementation of retrofit projects at residential sources or areas.

(4) Residential Management Area Oversight:

(a) Residential Area Assessment

Each Copermittee must conduct representative evaluations (e.g. visual observations, water use analysis, and other historical data) of its high priority ~~prioritized~~ Residential Management Areas as defined in the Water Quality Improvement Plan to update implementation strategies. Each Copermittee must develop a program to facilitate oversight and assessment in residential areas. Oversight may include complaint investigation, IDDE Activities, follow-up on monitoring obdervations, visual observations, outreach and education, water use analysis, or other methods deemed necessary to facilitate BMP implementation. Each Copermittee should conduct assessment of its oversight activities in prioritized residential areas to inform any updates to the WQIP.

~~Residential Program Update~~

~~Within two years, each Copermittee must develop and submit for Regional Board approval an updated residential program strategy based on assessment findings. Until Copermittees implement an updated residential program, they must continue performing their existing programs.~~

(b) Follow up Actions

Each Copermittee must prioritize ~~and implement~~ its follow up actions and enforcement (e.g. education and outreach, re-assessment~~, enforcement~~) in accordance with its Enforcement Response Plan pursuant to Provision E.6.

(c) ~~Assessment Tracking and~~ Record~~-keeping~~s

~~Assessment r~~Records must be ~~tracked and~~ sufficiently detailed in order to determine compliance with the requirements of this Order and any progress made toward the modification of residential management strategies, or addressing the highest water quality priorities identified in the Water Quality Improvement Plan.

~~1) The following municipal facilities:~~

~~(a) Flood management and flood control devices and structures,~~

~~(b) Operating or closed municipal landfills,~~

~~(c) Publicly owned treatment works (including water and wastewater treatment plants) and sanitary sewer collection systems,~~

~~(d) Corporate yards, including maintenance and storage yards for materials, waste, equipment, and vehicles,~~

~~(e) Hazardous waste collection facilities, and~~

~~(f) Other treatment, storage or disposal facilities for municipal waste;~~

~~2) Identification if a business is a mobile business;~~

~~3) SIC Code, if applicable;~~

~~4) Industrial General Permit NOI and/or WDID number, if applicable;~~

~~5) Identification if an area is a Common Interest Area (CIA) / Home Owner Association (HOA), or mobile home park;~~

~~6) Identification of pollutants generated and potentially generated by the facility, area, and/or activity;~~

~~7) Status of facility, area, and/or activity as active or inactive;~~

~~8) Whether the facility, area, and/or activity is adjacent to an ESA;~~

~~9) Whether the facility, area, and/or activity is tributary to and within the same hydrologic subarea as a CWA section 303(d) water body segment and generates pollutants for which the water body segment is impaired;~~

~~10) Whether the facility, area, and/or activity contributes or potentially contributes to the highest water quality priorities identified in the Water Quality Improvement Plan; and~~

~~11) A continually updated map showing the location of inventoried existing development, watershed boundaries, water bodies, and pollutants generated at the inventoried existing development.~~
~~Retrofitting and Channel Rehabilitation in Areas of Existing Development~~

~~Each Copermittee must develop and implement a program to retrofit areas of existing development to reduce the discharge of pollutants in storm water from the MS4 to the MEP and effectively prohibit non-storm water discharges into its MS4, and rehabilitate channels to restore impaired beneficial uses of streams within its jurisdiction.~~

~~(1) Each Copermittee must identify areas of existing development as candidates for retrofitting, and channels in areas of existing development as candidates for rehabilitation within its jurisdiction. Areas of existing development must be selected based on a likelihood that retrofitting and channel rehabilitation will address the highest water quality priorities identified in the Water Quality Improvement Plan prepared pursuant to Provision B.~~

~~(2) Each Copermittee must evaluate and rank the areas of existing development identified pursuant to Provisions E.5.a and E.5.b.(1) for retrofitting and channel rehabilitation. The evaluation must include an assessment of those areas where pollutant removal from storm water and effective prohibition of non-storm water discharges through retrofitting existing development will provide the most benefit to water quality. The evaluation must also include an assessment of the channels within its jurisdiction where channel rehabilitation will improve beneficial uses of streams within the Copermittee's jurisdiction. Data collected during the implementation of the Water Quality Improvement Plan must be used to inform each area assessment and rank determination.~~

~~(3) Each Copermittee must implement retrofit and channel rehabilitation projects that address the highest water quality priorities identified in the Water Quality Improvement Plan pursuant to Provision B.3.a. The Copermittee must encourage private landowners to implement retrofit and channel rehabilitation projects whenever practical. Private landowners should be~~

~~encouraged through the Copermittee's use of subsidies, penalties, or other incentives.~~

~~(4) Each Copermittee must evaluate the flood management and flood control devices and structures in its inventory to determine if it is feasible to retrofit the device or structure, to provide additional pollutant removal from storm water. A Copermittee must consider the highest water quality priorities identified in their Water Quality Improvement Plan as part of each assessment.~~

~~(5) Where retrofitting and channel rehabilitation within specific areas of existing development are determined to be infeasible to restore and protect receiving waters from the highest water quality priorities identified in the Water Quality Improvement Plan, each Copermittee must identify, develop, and implement regional retrofitting and channel rehabilitation projects (i.e. projects that can receive and/or treat storm water from one or more areas of existing development and will result in a net benefit to water quality and the environment) adjacent to and/or downstream of the areas of existing development. The Copermittees may collaborate and cooperate with each other to develop regional retrofitting and channel rehabilitation projects. The Copermittees are also encouraged to partner with existing efforts in other Watershed Management Areas, and the Integrated Regional Water Management (IRWM) Groups in San Diego County, South Orange County, and Southwest Riverside County.~~

~~Existing Development BMP Implementation and Maintenance~~

~~**1)** Pollution Prevention~~

~~Each Copermittee must require the use of pollution prevention methods by the inventoried existing development.~~

~~**2)** Designate BMPs~~

~~Each Copermittee must designate a minimum set of BMPs required for all inventoried existing development, including special event venues, that have the potential to generate pollutants. The designated minimum BMPs must be specific to facility types and pollutant-generating activities, as appropriate.~~

~~**3)** BMP Implementation~~

~~Each Copermittee must implement, or require the implementation of, designated BMPs at inventoried existing development that have the potential to generate pollutants. A Copermittee must require additional pollution prevention measures and enhanced BMPs at inventoried existing development that discharges pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan.~~

~~**4)** BMP Operation and Maintenance~~

~~Each Copermittee must operate and maintain, or require the operation and maintenance of designated BMPs at all inventoried existing development.~~

~~(b) Each Copermittee must implement a schedule of operation and maintenance activities for its MS4 and related structures (including but not limited to catch basins, storm drain inlets, detention basins, etc.), and verify proper operation of all its municipal structural treatment controls designed to reduce pollutants (including floatables) in storm water discharges to or from its MS4s and related drainage structures.~~

~~(c) Each Copermittee must implement procedures during the operation and maintenance of public streets, unpaved roads, paved roads, and paved highways and freeways that will reduce the contribution of storm water pollutants to the MEP and effectively prohibit non-storm water pollutants from the MS4 to receiving water bodies. During maintenance of unpaved roads, each Copermittee must examine the feasibility of replacing existing culverts or designing new culverts/bridge crossings to maintain natural stream geomorphology.~~

~~(d) Each Copermittee must implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers. Copermittees that operate both a municipal sanitary sewer system and a MS4 must implement controls and measures to prevent and eliminate seeping sewage from infiltrating the MS4. Copermittees that do not operate both a municipal sanitary sewer system and a MS4 must keep themselves informed of relevant and appropriate maintenance activities and sanitary sewage projects in their jurisdiction that may cause or contribute to seepage of sewage into the MS4.~~

~~**5)** Pesticides, Herbicides, and Fertilizers BMPs~~

~~Each Copermittee must implement procedures, or require the implementation of procedures, to reduce the contribution of pollutants in storm water to the MEP and effectively prohibit non-storm water discharges associated with the application, storage, and disposal of pesticides, herbicides and fertilizers from inventoried existing development into and from the MS4s. The Copermittee must require additional pollution prevention measures and enhanced BMPs at inventoried existing development that discharges pesticides, herbicides, or fertilizers identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan. Such BMPs must include, as appropriate educational activities, permits, certifications and other measures for applicators and distributors.~~

ADMINISTRATIVE DRAFT

~~Existing Development Inspections~~

~~Each Copermittee must conduct inspections of inventoried existing development to ensure compliance with applicable local ordinances and permits, and the requirements of this Order.~~

~~(1) Inspection Frequency~~

~~(a) Each Copermittee must establish appropriate inspection frequencies for inventoried existing development based on the priorities set forth in the Water Quality Improvement Plan, and the potential for discharging pollutants via storm water and non-storm water runoff. At a minimum, inventoried existing development must be inspected once every five years. Inventoried existing development must also be inspected within six months of any change in property ownership or change in pollutant generating activity. The frequency of inspection at inventoried existing development must be appropriate to ensure that applied BMPs are sufficient to reduce the discharge of pollutants in storm water from the MS4 to the MEP and effectively prohibit non-storm water discharges to the MS4.~~

~~(b) Inventoried existing development must be inspected, as needed, in response to valid public complaints and findings from the Copermittee's municipal and contract staff inspections.~~

~~(c) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e. re-inspection, enforcement) necessary to ensure compliance with its applicable local ordinances and permits, the most current jurisdictional runoff management program document, the Water Quality Improvement Plan, and the requirements of this Order.~~

~~(2) Inspection Content~~

~~Inspections of existing development by the Copermittee must include, at a minimum:~~

~~(a) Assessment of compliance with its applicable local ordinances and permits related to non-storm water and storm water discharges and runoff;~~

~~(b) Assessment of the implementation, maintenance and effectiveness of the designated minimum and/or enhanced BMPs;~~

~~(c) Verification of coverage under the Industrial General Permit (NOI and/or WDID number), when applicable;~~

~~(d) Visual observations of actual non-storm water discharges;~~

~~(e) Visual observations of actual or potential discharge of pollutants;~~

~~(f) Visual observations of actual or potential illicit connections; and~~

~~(g) If any violations are found and BMP enhancements are needed, inspectors must take and document appropriate actions in accordance with the Enforcement Response Plan pursuant to Provision E.6.~~

~~(3) Inspection Tracking and Records~~

~~Each Copermittee must track all inspections and re-inspections at all inventoried existing development. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must be sufficiently detailed in order to determine compliance with the~~

~~requirements of this Order and any progress made towards addressing the highest water quality priorities identified in the Water Quality Improvement Plan. Inspection records must include, at a minimum:~~

~~(a) Existing development name and location (address and hydrologic subarea);~~

~~(b) Inspection and re-inspection date(s);~~

~~(c) Weather conditions during inspection;~~

~~(d) Description and photo documentation of problems observed with BMPs and indication of need for BMP addition/repair/replacement and any scheduled re-inspection, and date of re-inspection;~~

~~(e) Description of actions to reduce pollutants in storm water runoff to the MEP and actions to effectively prohibit non-storm discharges into the MS4 at the inventoried existing development;~~

~~(f) Photo documentation of observed actions or BMPs to reduce pollutants in storm water runoff to the MEP and actions to effectively prohibit non-storm discharges into the storm drain;~~

~~(g) If the facility, area, and/or activity has been designated or identified as a contributor to the highest water quality priorities identified in the Water Quality Improvement Plan, then the inspection report must include a description of any specific or additional actions taken to reduce or eliminate the contribution of the facility, area, and/or activity to the highest water quality priorities;~~

~~(h) Descriptions of any other specific inspection comments which must, at a minimum, include rationales for longer compliance time;~~

~~(i) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6; and~~

~~(j) Resolution of problems noted and date problems fixed.~~

c. Existing Development Enforcement

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried existing development identified by the Copermittee as having the reasonable potential to discharge pollutant loads from the MS4 within their jurisdiction, ~~as necessary, to achieve compliance with the requirements of this Order,~~ in accordance with its Enforcement Response Plan pursuant to Provision E.6.

6. Enforcement Response Plans

Each Copermittee must develop and implement an Enforcement Response Plan as part of its jurisdictional runoff management program document. The Enforcement Response Plan must ~~include the protocols for progressively stricter responses, including timeframes allowed for corrections of problems, and for~~

~~various field violation scenarios~~describe the applicable protocols and options for enforcing compliance with the provisions of this Order. The Enforcement Response Plan must include~~, at a minimum,~~ the following~~ requirements~~:

a. Enforcement Response Plan Components

The Enforcement Response Plans shall include the following individual components:

(1) The Illicit Discharge Detection and Elimination Enforcement Components provided in Provision E.2;

(2) The Development Planning Enforcement Component provided in Provision E.3;

(3) The Construction Management Enforcement Component provided in Provision E.4; and

(4) The Existing Development Management Enforcement Component provided in Provision E.5.

Existing enforcement plans or procedures may be used to partially or wholly satisfy the requirements of any Enforcement Response Plan component.

b. Enforcement Approaches and Options

Each Enforcement Response Plan component must describe the Copermittee's approach to correcting noncompliance with its permits, applicable local ordinances, and this Order. It must describe protocols for progressively stricter responses, including, as applicable, timeframes allowed to bring areas or facilities into compliance. The enforcement process must include appropriate sanctions to compel compliance, such as:

(1) Verbal and written notices of violation;

(2) Cleanup requirements;

(3) Fines

(4) Bonding requirements;

(5) Administrative and criminal (if intentional or criminally negligent) penalties;

(6) Liens;

(7) Stop work orders; and

(8) Permit and occupancy denials.

c. Correction of Violations

(1) Violations must be corrected in a timely manner with the goal of correcting them within 30 calendar days after the violations are discovered, and prior to the next predicted rain event, when possible.

(2) If more than 30 calendar days are required for compliance, then a rationale must be recorded in the applicable electronic database or tabular system used to track compliance.

d. ESCALATED ENFORCEMENT PRIORITIES

(1) Each Enforcement Response Plan must include a definition of "escalated enforcement priorities". Escalated enforcement priorities shall be defined to include any enforcement scenario where a violation or other non-compliance is determined to constitute a significant contribution to any of the highest water quality priorities identified in the Water Quality Improvement Plan. Escalated enforcement priorities may be defined differently for development planning; construction sites; commercial, industrial, and municipal sources; and residential management areas.

(2) Where a violation involving a pollutant or stressor that has been identified as a highest water quality priority is not determined to represent an escalated enforcement priority, a rationale must be recorded in the applicable electronic database or tabular system used to track compliance.

(3) Escalated enforcement actions must continue to increase in severity, as necessary, to compel compliance as soon as possible.

~~a. Illicit Discharge Detection and Elimination Enforcement Component~~

~~The Enforcement Response Plan must describe required enforcement actions to eliminate non-storm water discharges and illicit discharges or connections to the Copermittee's MS4.~~

~~(1) The Enforcement Response Plan must include a definition of "high level enforcement" for non-storm water discharges and illicit discharges or connections. "High level enforcement" for non-storm water discharges and illicit discharges or connections may be defined differently for construction sites, municipal, commercial, industrial, and residential areas of existing development.~~

~~(2) Non-storm water discharges and illicit discharges or connections must be addressed with an escalating series of enforcement actions as follows:~~

~~(a) If the non-storm water discharge and illicit discharge or connection is a source of pollutants contributing to the highest water quality priorities identified in the Water Quality Improvement Plan, then high level enforcement actions must be immediately issued, and subsequent high~~

~~level enforcement actions must continue to escalate, as necessary, to compel the elimination of the discharge or connection as soon as possible; or~~

~~(b) If the non-storm water discharge and illicit discharge or connection is not a source of pollutants contributing to the highest water quality priorities identified in the Water Quality Improvement Plan, then escalating enforcement actions must be issued, and enforcement actions must result in the elimination of the discharge or connection as quickly as the Copermittee's available resources allow.~~

~~(3) If the Copermittee identifies the source, and the source is a controllable non-storm water discharge (i.e. anthropogenically influenced) or a controllable illicit discharge or connection, then the Copermittee must implement the following:~~

~~(a) Immediately enforce its legal authority to eliminate controllable sources of non-storm water and illicit discharges or connections upon identifying the source; and~~

~~(b) For controllable sources of non-storm water discharges and illicit discharges or connections that cannot be eliminated immediately upon identification, the discharge or connection must be eliminated in a timely manner with the goal of eliminating the discharge or connection within 10 business days after the source is identified. If more than 10 business days are required to eliminate the discharge or connection, a rationale must be recorded in the electronic database or equivalent tabular system used to track the investigations of non-storm water and illicit discharges and connections.~~

~~(4) If the Copermittee identifies the source as a non-storm water discharge to or from the MS4 that is in exceedance of NALs developed pursuant to Provision C.1, and in violation or threatened violation of an existing separate NPDES permit (e.g. the groundwater dewatering NPDES permit), then the Copermittee must report, within three business days, the findings to the San Diego Water Board including all pertinent information regarding the discharger and discharge characteristics.~~

~~**b.** Development Projects Enforcement Component~~

~~The Enforcement Response Plan must describe required enforcement actions to compel compliance with the Copermittee's BMP Design Manual requirements for development projects.~~

~~(1) The Enforcement Response Plan must include a definition of "high level enforcement" for development projects.~~

~~(2) The enforcement process must include appropriate sanctions to compel compliance with requirements of the Copermittee's BMP Design Manual or this Order. Sanctions must include, at a minimum, the following tools or their equivalent:~~

~~(a) Non-monetary penalties;~~

~~(b) Fines;~~

~~(c) Bonding requirements;~~

~~(d) Administrative and criminal penalties;~~

~~(e) Liens; and~~

~~(f) Permit or occupancy denials.~~

~~(3) Occupancy must be denied until a development project is in full compliance with the Copermittee's BMP Design Manual requirements. Documentation of full compliance with the Copermittee's BMP Design Manual requirements must be recorded in the electronic database or equivalent tabular system used to track development projects.~~

~~(4) Violations or other non-compliance that contribute or potentially contribute to the highest water quality priorities identified in the Water Quality Improvement Plan must be issued high level enforcement actions. High level enforcement actions must continue to escalate, as necessary, to compel compliance as soon as possible.~~

~~(5) For violations of permanent BMP maintenance requirements, all violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 10 business days after the violations are discovered. If more than 10 business days are required for compliance, a rationale must be recorded in the electronic database or equivalent tabular system used to track permanent BMP inspections.~~

~~**a.** Construction / Existing Development Enforcement Component~~

~~The Enforcement Response Plan must describe required enforcement actions to compel compliance with its permits and applicable local ordinances, and the requirements of this Order, at construction sites and areas of existing development.~~

~~(1) The Enforcement Response Plan must include a definition of "high level enforcement" for construction sites and areas of existing development. "High level enforcement" may be defined differently for construction sites, municipal,~~

~~commercial, industrial, and residential areas of existing development.~~

~~(2) The enforcement process must include, at a minimum, appropriate sanctions to compel compliance, such as:~~

~~(a) Verbal and written notices of violation;~~

~~(b) Cleanup requirements;~~

~~(c) Fines;~~

~~(d) Bonding requirements;~~

~~(e) Administrative and criminal penalties;~~

~~(f) Liens;~~

~~(g) Stop work orders; and~~

~~(h) Permit and occupancy denials.~~

~~(3) Violations or other non-compliance that contribute or potentially contribute to the highest water quality priorities identified in the Water Quality Improvement Plan must be issued high level enforcement actions. High level enforcement actions must continue to escalate, as necessary, to compel compliance as soon as possible.~~

~~(4) All violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 10 business days after the violations are discovered. If more than 10 business days are required for compliance, then a rationale must be recorded in the electronic database or equivalent tabular system used to track construction site and existing development inspections.~~

e. REPORTING OF NON-COMPLIANT SITES

(1) Each Copermittee must notify the San Diego Water Board verbally within 24 hours and in writing within ~~48 hours~~ 5 calendar days of issuing ~~high level~~escalated enforcement (as defined in the Copermittee's Enforcement Response Plan) to a construction site that poses a significant threat to water quality as a result of violations or other non-compliance with its permits and applicable local ordinances, and the requirements of this Order. Written notification may be provided electronically in email form.

(2) Each Copermittee must notify the San Diego Water Board of non-filers under the Industrial General Permit and Construction General Permit by email to Nonfilers_R9@waterboards.ca.gov.

~~6.~~7. Public Education and Participation

a. Each Copermittee must implement a public education and participation program, as appropriate, to promote and encourage the development of programs, management practices, control techniques and systems, design and engineering methods, and behaviors that reduce the discharge of pollutants in storm water to the MEP, prevent controllable non-storm water discharges from entering the MS4, and protect water quality standards in receiving waters. The public education program must include~~, at a minimum,~~ the following:

(1) Educational activities, public information activities, and other appropriate outreach activities intended to reduce pollutants ~~associated with the application of pesticides, herbicides and fertilizer in storm water discharges to and~~of concern from its MS4 to the MEP. Activities shall be determined and prioritized by Copermittees by jurisdiction and/or watershed (Section 5.c.(5) to address the highest threats to water quality (e.g. pesticides, herbicides and fertilizers, used oil, toxic waste, etc.);

~~(1) Educational activities, public information activities, and other appropriate outreach activities to facilitate the proper management and disposal of used oil and toxic materials; and~~

(2) Appropriate education and training measures for ~~construction site operators and other~~ specific target audiences, as determined and prioritized by the Copermittee(s) by jurisdiction and watershed, based on high risk behaviors and pollutants of concern, such as construction site operators, residents, underserved target audiences and school-aged children.

b. ~~.~~Each Copermittee shall incorporate a mechanism for evaluation and assessment of educational and other outreach activities, as needed, to identify progress and incorporate modifications necessary to increase the effectiveness of the public education program.

c. Each Copermittee may determine, where appropriate and effective, mechanisms for intergovernmental coordination on education and outreach activities.~~must incorporate a mechanism for public participation and where necessary intergovernmental coordination in updating, developing, and implementing its jurisdictional runoff management program.~~

~~7.~~8. Fiscal Analysis

a. Each Copermittee must secure the resources necessary to meet all the requirements of this Order.

b. Each Copermittee must conduct an annual fiscal analysis of their jurisdictional runoff management programs in their entirety. The fiscal analysis must include the following:

ADMINISTRATIVE DRAFT

(1) Identification of the various categories of expenditures necessary to implement the requirements of this Order, including a description of the specific items to be accounted for in each category of expenditures;
~~(1) The capital and operation and maintenance expenditures necessary to implement the requirements of this Order;~~

(2) The staff resources needed and allocated to meet the requirements of this Order, including any development, implementation, and enforcement activities required;

(3) The fiscal analysis must provide estimated expenditures for Provisions E.8.b.(1) and E.8.b.(2) for each Copermittee's jurisdictional runoff management program budget for the current reporting period.~~during the reporting period, the preceding reporting period, and the next reporting period; and~~

(4) The source(s) of funds that are proposed to meet the necessary expenditures described in Provisions E.8.b.(1) and E.8.b.(2), including legal restrictions on the use of such funds.

c. Each Copermittee must submit a summary of the annual fiscal analysis with each Annual Report required pursuant to Provision F.3.b.

d. Each Copermittee must provide the documentation used to develop the summary of the annual fiscal analysis upon request by the San Diego Water Board.

F. REPORTING

The purpose of this provision is to determine and document compliance with the requirements set forth in this Order. The goal of this provision is to communicate to the San Diego Water Board and the people of the State of California the implementation status of each jurisdictional runoff management program and compliance with the requirements of this Order. This goal is to be accomplished through the submittal of specific deliverables to the San Diego Water Board by the Copermittees.

1. Water Quality Improvement Plans

The Copermittees for each Watershed Management Area must develop and submit a complete Water Quality Improvement Plan in accordance with the requirements of Provision B, no later than ~~12~~ 18 months after the adoption of this Order for a 30 day public review and comment period. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 30 days. Based on the comments received, the San Diego Water Board will determine whether to hold a public hearing or to limit public input to submittal of written comments. If no hearing is held the San Diego Water Board will notify the Copermittees that the Water Quality Improvement Plan has been accepted as complete following its review and determination that the Water Quality Improvement Plan meets the requirements of this Order Water Quality Improvement Plans are deemed approved if no response is provided to the Copermittees within 2 months of the submittal date. Water Quality Improvement Plans must be made available on the Regional Clearinghouse required pursuant to Provision F.4.

a. WATER QUALITY IMPROVEMENT PLAN SUBMITTAL AND IMPLEMENTATION

Copermittees must submit requested modifications to the Water Quality Improvement Plan either in the Annual Report required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision F.5.b. Once approved by the San Diego Water Board Executive Officer, the Copermittees must implement any modifications to the Water Quality Improvement Plan in accordance with the schedules developed pursuant to Provisions B.2 and B.3.b. Requests for modification are deemed approved if no response is provided to the requesting Copermittee(s) within 2 months of the request date.

b. CORRESPONDING MODIFICATIONS TO JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS AND MONITORING AND ASSESSMENT PROGRAMS

Copermittees must submit requested modifications to the jurisdictional runoff management programs and monitoring and assessment programs either in the Annual Report required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision F.5.b. Once approved by the San Diego Water Board Executive Officer, the Copermittees must implement any modifications to the Water Quality Improvement Plan in

accordance with the schedules developed pursuant to Provisions B.3.b. Requests for modification are deemed approved if no response is provided to the requesting Copermittee(s) within 2 months of the request date.

2. Updates

a. Jurisdictional Runoff Management Program Document Updates

Each Copermittee must update its jurisdictional runoff management program document to incorporate the requirements of Provision E. The update must be completed no later than ~~12~~18 months after the adoption of this Order. Updated jurisdictional runoff management program documents must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Subsequent updates may be submitted as part of the Annual Reports, and updated jurisdictional runoff management program documents must be made available on the Regional Clearinghouse.

Jurisdictional Runoff Management Program document updates that modify program elements from the requirements of Provision E must provide rationale for the modifications within the update documents.

b. ~~Permanent~~ BMP ~~Sizing Criteria~~ Design Manual Updates

Each Copermittee must update its BMP Design Manual to incorporate the requirements of Provision E.3.d. The update must be completed no later than 18~~12~~ months after the adoption of this Order. Updated BMP Design Manuals must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Subsequent updates may be submitted as part of the Annual Reports. Updated BMP Design Manuals must be made available on the Regional Clearinghouse.

BMP Design Manual updates that modify program elements from the requirements of Provision E must provide rationale for the modifications within the update documents.

c. Water Quality Improvement Plan Updates

The Copermittees for each Watershed Management Area must submit updates to the Water Quality Improvement Plan as part of the Annual Reports. Updated Water Quality Improvement Plans must be made available on the Regional Clearinghouse required pursuant to Provision F.4.

Water Quality Improvement Plan updates that modify program elements from the requirements of Provision E must provide rationale for the modifications within the update documents.

~~5.~~3. Progress Reporting

a. PROGRESS REPORT PRESENTATIONS

The Copermittees for each Watershed Management Area must appear before the San Diego Water Board, as requested by the San Diego Water Board, to provide progress reports on the implementation of the Water Quality Improvement Plan and jurisdictional runoff management programs.

b. ANNUAL REPORTS

(1) The Copermittees for each Watershed Management Area must submit an Annual Report for each reporting period, which begins July 1 and ends June ~~-~~30 in the following year, no later than ~~October~~ January 31 of the following year~~the end of the reporting period~~. This is to accommodate the monitoring year from October 1, to September 30 of the subsequent year. The first Annual Report must be prepared for the reporting period beginning ~~from~~July 1 after adoption of the ~~date the~~permit, and upon San Diego Water Board ~~determines~~determination that the Water Quality Improvement Plan meets the requirements of this Order to June 30 in the following year. Annual Reports must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Each Annual Report must include the following:

(a) The progress of implementing the Water Quality Improvement Plan including, but not limited to:

:

(i) The progress toward achieving the interim and final numeric ~~targets~~goals for the highest water quality priorities for the Watershed Management Area,

(ii) The water quality improvement strategies that were implemented and/or no longer implemented by each of the Copermittees during the reporting period and previous reporting periods, and are planned to be implemented during the next reporting period,

(iii) Proposed modifications to water quality improvement or jurisdictional strategies with associated rationale for such modifications,

(iv) Previously proposed modifications or updates incorporated into the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document and implemented by the Copermittees in the Watershed Management Area,

[a] The monitoring data collected pursuant to Provision D,

summarized and presented in tabular and graphical form;

[b] Progress of the special studies required pursuant to Provision D, and the results or findings when a special study, or each phase of a special study, is completed;

[c] The findings from the assessments required pursuant to Provision D; and

~~[a] and~~

(v) Proposed modifications or updates to the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document;

(b) A completed Jurisdictional Runoff Management Program Annual Report Form (Attachment D or approved revision) for each Copermittee in the Watershed Management Area, certified by a Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative.

(2) Each Copermittee must complete and submit a Jurisdictional Runoff Management Program Annual Report Form (Attachment D or approved revision) no later than October 31 of each year until the first Annual Report is required to be submitted. Each Copermittee's Annual Report form must summarize the jurisdictional activities in the WMAs in which the Copermittee has jurisdiction.

(3) Each Copermittee must provide any data or documentation utilized in developing the Annual Report upon request by the San Diego Water Board. Any monitoring data utilized in developing the Annual Report must be uploaded to the California Environmental Data Exchange Network (CEDEN).[19] Any monitoring and assessment data utilized in developing the Annual Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.

c. REGIONAL MONITORING AND ASSESSMENT REPORT

(1) The Copermittees must submit a Regional Monitoring and Assessment Report no later than 180 days in advance of the expiration date of this Order. The Regional Monitoring and Assessment Report may be submitted as part of the ROWD required pursuant to Provision F.5.b. The Copermittees must review the jurisdictional and watershed monitoring data, data analyses, and assessments required pursuant to Provision D.4, to assess the following:

[19] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

(a) The beneficial uses of the receiving waters within the San Diego Region that are protected or must be restored;

(b) The progress toward restoring impacted beneficial uses in the receiving waters within the San Diego Region; and

~~(c)~~ The Copermittees for each Watershed Management Area must submit an Annual ~~The jurisdictional and watershed monitoring data collected pursuant to Provisions D.1 and D.2, summarized and presented in tabular and graphical form;~~

~~(d)~~

~~(e) Progress of the special studies required pursuant to Provisions D.2 and D.3, and the results or findings when a special study, or each phase of a special study, is completed;~~

~~(f)~~

~~(g) The findings from the assessments required pursuant to Provision D.4;~~

~~(h)~~

~~(i)~~(c) The progress of implementing the Water Quality Improvement Plan, including, but not limited to, the following

(d) Pollutants or conditions of emerging concern that may impact beneficial uses in the receiving waters within the San Diego Region.

(2) The Regional Monitoring and Assessment Report must include recommendations for improving the implementation and assessment of the Water Quality Improvement Plans and jurisdictional runoff management programs.

(3) Each Copermittee must provide any data or documentation utilized in developing the Regional Monitoring and Assessment Report upon request by the San Diego Water Board. Any monitoring and assessment data utilized in developing the Regional Monitoring and Assessment Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.

4. Regional Clearinghouse

The Copermittees[20][23] must develop, update, and maintain an internet-based Regional Clearinghouse that can be used to store, disseminate, and share the Copermittees' Water Quality Improvement Plans, Annual Reports, jurisdictional runoff management program documents, monitoring data, special studies, and any other data or information generated by the Copermittees during the implementation

[20] The Copermittee may elect to develop and maintain the clearinghouse(s) provided by other Copermittees or agencies.

of this Order. Monitoring data collected pursuant to Provision D must be uploaded to CEDEN,[21] with links to the uploaded data available on the Regional Clearinghouse. The Regional Clearinghouse may be linked to other internet-based data portals and databases where the original documents and data are stored. The Regional Clearinghouse must be available and accessible to members of the public. The Regional Clearinghouse must be developed and made available to the public no later than 18~~2~~ months after the adoption of this Order.

5. Report of Waste Discharge

a. The Orange County Copermittees and the Riverside County Copermittees, are required to submit a complete ROWD pursuant to the requirements of their current Orders and are enrolled under this Order upon expiration of their current Orders. Upon expiration of their current Orders, the Copermittees in each county must comply with the requirements of this Order by July 1 after enrollment under this Order, unless early enrollment is granted pursuant to Provision F.6 of this Order. The current Orders for the Orange County Copermittees and Riverside County Copermittees are rescinded upon their expiration date except for enforcement purposes.

b. The Copermittees must submit to the San Diego Water Board a complete ROWD as an application for the re-issuance of this NPDES permit. The ROWD must be submitted no later than 180 days in advance of the expiration date of this Order. The Copermittee may elect to develop and submit the in conjunction with or provided by another Copermittee. The ROWD must contain the following minimum information:

[21] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

(1) Names and addresses of the Copermittees;

(2) Names and titles of the primary contacts of the Copermittees;

(3) Proposed changes to the Copermittees' Water Quality Improvement Plans and the supporting justification;

(4) Proposed changes to the Copermittees' jurisdictional runoff management programs and the supporting justification;

(5) Any other information necessary for the re-issuance of this Order; and

(6) Any other information required by federal regulations for NPDES permit reissuance.

6. Application for Early Enrollment

a. The Orange County Copermittees, collectively, or Riverside County Copermittees, collectively, may apply for early enrollment under this Order by submitting a Report of Waste Discharge Form 200 for each individual Copermittee in the respective county, with a written request for early enrollment under this Order that certifies the following conditions have been met:

(1) A Water Quality Improvement Plan has been developed in accordance with the requirements of Provision B, which can and will be implemented immediately upon enrollment under this Order;

(2) Each Copermittee in the county has updated its jurisdictional runoff management program document to incorporate the requirements of Provision E, which can and will be implemented immediately upon enrollment under this Order; and

(3) Each Copermittee in the county has updated its BMP Design Manual to incorporate the requirements of Provision E.3.d, which can and will be implemented immediately upon enrollment under this Order.

b. The San Diego Water Board will review the application for early enrollment and associated documents for completeness. A Notice of Enrollment (NOE) under this Order will be issued to the Copermittees in the respective county by the San Diego Water Board upon completion of the early enrollment application requirements. The effective enrollment date will be specified in the NOE and the Copermittees in the respective county are authorized to have MS4 discharges pursuant to the requirements of this Order starting on the date specified in the NOE. The existing Order for that county is rescinded upon the effective enrollment date specified in the NOE except for enforcement purposes.

7. Reporting Provisions

Each Copermittee must comply with all the reporting and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

G. PRINCIPAL WATERSHED COPERMITTEE RESPONSIBILITIES

1. The Copermittees within each Watershed Management Area must designate a Principal Watershed Copermittee and notify the San Diego Water Board of the name of the Principal Watershed Copermittee. ~~An individual Copermittee should not be designated a Principal Watershed Copermittee for more than two Watershed Management Areas.~~ The notification may be submitted with the Water Quality Improvement Plan required pursuant to Provision F.1 of this Order.

2. The Principal Watershed Copermittee is responsible for, at a minimum, the following:

   a. Serving as liaison between the Copermittees in the Watershed Management Area and the San Diego Water Board on general permit issues, and when necessary and appropriate, representing the Copermittees in the Watershed Management Area before the San Diego Water Board.

   b. Facilitating the development of the Water Quality Improvement Plan in accordance with the requirements of Provision B of this Order

   c. Coordinating the submittal of the deliverables required by Provisions F.1, F.2, F.3.a, and F.3.b of this Order.

   d. Coordinating and developing, with the other ~~Principal Watershed~~ Copermittees, the requirements of Provisions F.3.c, F.4, and F.5,~~bbb~~ of this Order.

Formatte

ADMINISTRATIVE DRAFT

H. MODIFICATION OF PROGRAMS

1. Modifications of the Order may be initiated by the San Diego Water Board or by the Copermittees. Requests by Copermittees must be made to the San Diego Water Board.

2. Minor modifications to the Order may be made by the San Diego Water Board where the proposed modification complies with all the prohibitions and limitations, and other requirements of this Order.

3. Proposed modifications outside of the WQIP process that are not minor require amendment of this Order in accordance with this Order's rules, policies, and procedures.

I. STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

Each Copermittee must comply with all the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

ATTACHMENT A

DISCHARGE PROHIBITIONS

1. Basin Plan Waste Discharge Prohibitions

California Water Code Section 13243 provides that a Regional Water Board, in a water quality control plan, may specify certain conditions or areas where the discharge of waste or certain types of waste is not permitted. The following waste discharge prohibitions in the Water Quality Control Plan for the San Diego Basin (Basin Plan) are applicable to any person, as defined by Section 13050(c) of the California Water Code, who is a citizen, domiciliary, or political agency or entity of California whose activities in California could affect the quality of waters of the state within the boundaries of the San Diego Region.

1. The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination or nuisance as defined in California Water Code Section 13050, is prohibited.

2. The discharge of waste to land, except as authorized by waste discharge requirements or the terms described in California Water Code Section 13264 is prohibited.

3. The discharge of pollutants or dredged or fill material to waters of the United States except as authorized by a National Pollutant Discharge Elimination System (NPDES) permit or a dredged or fill material permit (subject to the exemption described in California Water Code Section 13376) is prohibited.

4. Discharges of recycled water to lakes or reservoirs used for municipal water supply or to inland surface water tributaries thereto are prohibited, unless this San Diego Water Board issues a NPDES permit authorizing such a discharge; the proposed discharge has been approved by the State Department of Health Services (DHS) and the operating agency of the impacted reservoir; and the discharger has an approved fail-safe long-term disposal alternative.

5. The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited. Allowances for dilution may be made at the discretion of the San Diego Water Board. Consideration would include streamflow data, the degree of treatment provided and safety measures to ensure reliability of facility performance. As an example, discharge of secondary effluent would probably be permitted if streamflow provided 100:1 dilution capability.

6. The discharge of waste in a manner causing flow, ponding, or surfacing on lands not owned or under the control of the discharger is prohibited, unless the discharge is authorized by the San Diego Water Board.

ADMINISTRATIVE DRAFT

7. The dumping, deposition, or discharge of waste directly into waters of the state, or adjacent to such waters in any manner which may permit its being transported into the waters, is prohibited unless authorized by the San Diego Water Board.

8. Any discharge to a storm water conveyance system that is not composed entirely of "*storm water*" is prohibited unless authorized by the San Diego Water Board. [The federal regulations, 40 CFR 122.26(b)(13), define storm water as storm water runoff, snow melt runoff, and surface runoff and drainage. 40 CFR 122.26(b)(2) defines an illicit discharge as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities.] [§122.26 amended at 56 FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992].

9. The unauthorized discharge of treated or untreated sewage to waters of the state or to a storm water conveyance system is prohibited.

10. The discharge of industrial wastes to conventional septic tank/subsurface disposal systems, except as authorized by the terms described in California Water Code Section 13264, is prohibited.

11. The discharge of radioactive wastes amenable to alternative methods of disposal into the waters of the state is prohibited.

12. The discharge of any radiological, chemical, or biological warfare agent into waters of the state is prohibited.

13. The discharge of waste into a natural or excavated site below historic water levels is prohibited unless the discharge is authorized by the San Diego Water Board.

14. The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in waters of the state or which unreasonably affect, or threaten to affect, beneficial uses of such waters is prohibited.

15. The discharge of treated or untreated sewage from vessels to Mission Bay, Oceanside Harbor, Dana Point Harbor, or other small boat harbors is prohibited.

16. The discharge of untreated sewage from vessels to San Diego Bay is prohibited.

17. The discharge of treated sewage from vessels to portions of San Diego Bay that are less than 30 feet deep at mean lower low water (MLLW) is prohibited.

18. The discharge of treated sewage from vessels, which do not have a properly functioning ~~US~~ U.S.Coast Guard certified Type I or Type II marine sanitation device, to portions of San Diego Bay that are greater than 30 feet deep at mean lower low water (MLLW) is prohibited.

ADMINISTRATIVE DRAFT

2. Attachment B to State Water Board Resolution 2012-0012~~X~~

Copermittees that discharge into Areas of Special Biological Significance must comply with State Water Board Resolution No. 2012-0012.

~~**Special Protections for Areas of Special Biological Significance, Governing Point Source Discharges of Storm Water and Nonpoint Source Waste Discharges**~~

~~I. PROVISIONS FOR POINT SOURCE DISCHARGES OF STORM WATER AND NONPOINT SOURCE WASTE DISCHARGES~~

~~The following terms, prohibitions, and special conditions (hereafter collectively referred to as special conditions) are established as limitations on point source storm water and nonpoint source discharges. These special conditions provide Special Protections for marine aquatic life and natural water quality in Areas of Special Biological Significance (ASBS), as required for State Water Quality Protection Areas pursuant to California Public Resources Code Sections 36700(f) and 36710(f). These Special Protections are adopted by the State Water Board as part of the California Ocean Plan (Ocean Plan) General Exception.~~

~~The special conditions are organized by category of discharge. The State Water Resources Control Board (State Water Board) and Regional Water Quality Control Boards (Regional Water Boards) will determine categories and the means of regulation for those categories [e.g., Point Source Storm Water National Pollutant Discharge Elimination System (NPDES) or Nonpoint Source].~~

~~**A. PERMITTED POINT SOURCE DISCHARGES OF STORM WATER**~~

~~1. General Provisions for Permitted Point Source Discharges of Storm Water~~

~~a. Existing storm water discharges into an ASBS are allowed only under the following conditions:~~

~~(1) The discharges are authorized by an NPDES permit issued by the State Water Board or Regional Water Board;~~

~~(2) The discharges comply with all of the applicable terms, prohibitions, and special conditions contained in these Special Protections; and~~

~~(3) The discharges:~~

~~(i) Are essential for flood control or slope stability, including roof, landscape, road, and parking lot drainage;~~

~~(ii) Are designed to prevent soil erosion;~~

~~(iii) Occur only during wet weather;~~

~~(iv) Are composed of only storm water runoff.~~

~~b. Discharges composed of storm water runoff shall not alter natural ocean water quality in an ASBS.~~

ADMINISTRATIVE DRAFT

~~c. The discharge of trash is prohibited.~~

~~d. Only discharges from existing storm water outfalls are allowed. Any proposed or new storm water runoff discharge shall be routed to existing storm water discharge outfalls and shall not result in any new contribution of waste to an ASBS (i.e., no additional pollutant loading). "Existing storm water outfalls" are those that were constructed or under construction prior to January 1, 2005. "New contribution of waste" is defined as any addition of waste beyond what would have occurred as of January 1, 2005. A change to an existing storm water outfall, in terms of re-location or alteration, in order to comply with these special conditions, is allowed and does not constitute a new discharge.~~

~~e. Non-storm water discharges are prohibited except as provided below:~~

~~(1) The term "non-storm water discharges" means any waste discharges from a municipal separate storm sewer system (MS4) or other NPDES permitted storm drain system to an ASBS that are not composed entirely of storm water.~~

~~(2) The following non-storm water discharges are allowed, provided that the discharges are essential for emergency response purposes, structural stability, slope stability or occur naturally:~~

~~(i) Discharges associated with emergency fire fighting operations.~~

~~(ii) Foundation and footing drains.~~

~~(iii) Water from crawl space or basement pumps.~~

~~(iv) Hillside dewatering.~~

~~(v) Naturally occurring groundwater seepage via a storm drain.~~

~~(vi) Non-anthropogenic flows from a naturally occurring stream via a culvert or storm drain, as long as there are no contributions of anthropogenic runoff.~~

~~(3) Authorized non-storm water discharges shall not cause or contribute to a violation of the water quality objectives in Chapter II of the Ocean Plan nor alter natural ocean water quality in an ASBS.~~

~~2. Compliance Plans for Inclusion in Storm Water Management Plans (SWMP) and Storm Water Pollution Prevention Plans (SWPPP).~~

~~The discharger shall specifically address the prohibition of non-storm water runoff and the requirement to maintain natural water quality for storm water discharges to an ASBS in an ASBS Compliance Plan to be included in its SWMP or a SWPPP, as appropriate to permit type. If a statewide permit includes a SWMP, then the discharger shall prepare a stand-alone compliance plan for ASBS discharges . The ASBS Compliance Plan is subject to approval by the Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (for permits issued by Regional Water Boards).~~

~~a. The Compliance Plan shall include a map of surface drainage of storm water runoff, showing areas of sheet runoff, prioritize discharges, and describe any structural Best~~

ADMINISTRATIVE DRAFT

~~Management Practices (BMPs) already employed and/or BMPs to be employed in the future. Priority discharges are those that pose the greatest water quality threat and which are identified to require installation of structural BMPs. The map shall also show the storm water conveyances in relation to other features such as service areas, sewage conveyances and treatment facilities, landslides, areas prone to erosion, and waste and hazardous material storage areas, if applicable. The SWMP or SWPPP shall also include a procedure for updating the map and plan when changes are made to the storm water conveyance facilities.~~

~~b. The ASBS Compliance Plan shall describe the measures by which all non-authorized non-storm water runoff (e.g., dry weather flows) has been eliminated, how these measures will be maintained over time, and how these measures are monitored and documented.~~

~~c. For Municipal Separate Storm Sewer System (MS4s), the ASBS Compliance Plan shall require minimum inspection frequencies as follows:~~

~~(1) The minimum inspection frequency for construction sites shall be weekly during rainy season;~~

~~(2) The minimum inspection frequency for industrial facilities shall be monthly during the rainy season;~~

~~(3) The minimum inspection frequency for commercial facilities (e.g., restaurants) shall be twice during the rainy season; and~~

~~(4) Storm water outfall drains equal to or greater than 18 inches (457 mm) in diameter or width shall be inspected once prior to the beginning of the rainy season and once during the rainy season and maintained to remove trash and other anthropogenic debris.~~

~~d. The ASBS Compliance Plan shall address storm water discharges (wet weather flows) and, in particular, describe how pollutant reductions in storm water runoff, that are necessary to comply with these special conditions, will be achieved through BMPs. Structural BMPs need not be installed if the discharger can document to the satisfaction of the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that such installation would pose a threat to health or safety. BMPs to control storm water runoff discharges (at the end-of-pipe) during a design storm shall be designed to achieve on average the following target levels:~~

~~(1) Table B Instantaneous Maximum Water Quality Objectives in Chapter II of the Ocean Plan; or~~

~~(2) A 90% reduction in pollutant loading during storm events, for the applicant's total discharges. The baseline for the reduction is the effective date of the Exception. The baseline for these determinations is the effective date of the Exception, and the reductions must be achieved and documented within four (4) years of the effective date.~~

~~e. The ASBS Compliance Plan shall address erosion control and the prevention of anthropogenic sedimentation in ASBS. The natural habitat conditions in the ASBS shall not be altered as a result of anthropogenic sedimentation.~~

~~f. The ASBS Compliance Plan shall describe the non-structural BMPs currently employed and planned in the future (including those for construction activities), and include an implementation schedule. The ASBS Compliance Plan shall include non-structural BMPs that address public education and outreach. Education and outreach efforts must adequately inform the public that direct discharges of pollutants from private property not entering an MS4 are prohibited. The ASBS Compliance Plan shall also describe the structural BMPs, including any low impact development (LID) measures, currently employed and planned for higher threat discharges and include an implementation schedule. To control storm water runoff discharges (at the end-of-pipe) during a design storm, permittees must first consider using LID practices to infiltrate, use, or evapotranspirate storm water runoff on-site.~~

~~g. The BMPs and implementation schedule shall be designed to ensure that natural water quality conditions in the receiving water are achieved and maintained by either reducing flows from impervious surfaces or reducing pollutant loading, or some combination thereof.~~

~~h. If the results of the receiving water monitoring described in IV.B. of these special conditions indicate that the storm water runoff is causing or contributing to an alteration of natural ocean water quality in the ASBS, the discharger shall submit a report to the State Water Board and Regional Water Board within 30 days of receiving the results.~~

~~(1) The report shall identify the constituents in storm water runoff that alter natural ocean water quality and the sources of these constituents.~~

~~(2) The report shall describe BMPs that are currently being implemented, BMPs that are identified in the SWMP or SWPPP for future implementation, and any additional BMPs that may be added to the SWMP or SWPPP to address the alteration of natural water quality. The report shall include a new or modified implementation schedule for the BMPs.~~

~~(3) Within 30 days of the approval of the report by the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits), the discharger shall revise its ASBS Compliance Plan to incorporate any new or modified BMPs that have been or will be implemented, the implementation schedule, and any additional monitoring required.~~

~~(4) As long as the discharger has complied with the procedures described above and is implementing the revised SWMP or SWPPP, the discharger does not have to repeat the same procedure for continuing or recurring exceedances of natural ocean water quality conditions due to the same constituent.~~

~~(5) Compliance with this section does not excuse violations of any term, prohibition, or condition contained in these Special Protections.~~

~~3. Compliance Schedule~~

ADMINISTRATIVE DRAFT

~~a. On the effective date of the Exception, all non-authorized non-storm water discharges (e.g., dry weather flow) are effectively prohibited.~~

~~b. Within one year from the effective date of the Exception, the discharger shall submit a written ASBS Compliance Plan to the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that describes its strategy to comply with these special conditions, including the requirement to maintain natural water quality in the affected ASBS. The ASBS Compliance Plan shall include a time schedule to implement appropriate non-structural and structural controls (implementation schedule) to comply with these special conditions for inclusion in the discharger's SWMP or SWPPP, as appropriate to permit type.~~

~~c. Within 18 months of the effective date of the Exception, any non-structural controls that are necessary to comply with these special conditions shall be implemented.~~

~~d. Within four (4) years of the effective date of the Exception, any structural controls identified in the ASBS Compliance Plan that are necessary to comply with these special conditions shall be operational.~~

~~e. Within four (4) years of the effective date of the Exception, all dischargers must comply with the requirement that their discharges into the affected ASBS maintain natural ocean water quality. If the initial results of post-storm receiving water quality testing indicate levels higher than the 85th percentile threshold of reference water quality data and the pre-storm receiving water levels, then the discharger must re-sample the receiving water, pre- and post-storm. If after re-sampling the post-storm levels are still higher than the 85th percentile threshold of reference water quality data, and the pre-storm receiving water levels, for any constituent, then natural ocean water quality is exceeded. See attached Flowchart.~~

~~f. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may only authorize additional time to comply with the special conditions d. and e., above if good cause exists to do so. Good cause means a physical impossibility or lack of funding.~~

~~If a discharger claims physical impossibility, it shall notify the Board in writing within thirty (30) days of the date that the discharger first knew of the event or circumstance that caused or would cause it to fail to meet the deadline in d. or e. The notice shall describe the reason for the noncompliance or anticipated noncompliance and specifically refer to this Section of this Exception. It shall describe the anticipated length of time the delay in compliance may persist, the cause or causes of the delay as well as measures to minimize the impact of the delay on water quality, the measures taken or to be taken by the discharger to prevent or minimize the delay, the schedule by which the measures will be implemented, and the anticipated date of compliance. The discharger shall adopt all reasonable measures to avoid and minimize such delays and their impact on water quality.~~

~~The discharger may request an extension of time for compliance based on lack of funding. The request for an extension shall require:~~

~~(1) for municipalities, a demonstration of significant hardship to discharger ratepayers, by showing the relationship of storm water fees to annual household income for~~

~~residents within the discharger's jurisdictional area, and the discharger has made timely and complete applications for all available bond and grant funding, and either no bond or grant funding is available, or bond and/or grant funding is inadequate; or~~

~~(2) for other governmental agencies, a demonstration and documentation of a good faith effort to acquire funding through that agency's budgetary process.~~

~~B. NONPOINT SOURCE DISCHARGES~~

~~*[NOT INCLUDED]*~~
~~*[PROVISIONS FOR NONPOINT SOURCE DISCHARGES NOT APPLICABLE]*~~

~~II. ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES~~

~~*[NOT INCLUDED]*~~
~~*[ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES NOT APPLICABLE]*~~

~~III. ADDITIONAL REQUIREMENTS – WATERFRONT AND MARINE OPERATIONS~~

~~*[NOT INCLUDED]*~~
~~*[ADDITIONAL REQUIREMENTS FOR WATERFRONT AND MARINE OPERATIONS NOT APPLICABLE]*~~

~~IV. MONITORING REQUIREMENTS~~

~~Monitoring is mandatory for all dischargers to assure compliance with the Ocean Plan. Monitoring requirements include both: (A) core discharge monitoring, and (B) ocean receiving water monitoring. The State and Regional Water Boards must approve sampling site locations and any adjustments to the monitoring programs. All ocean receiving water and reference area monitoring must be comparable with the Water Boards' Surface Water Ambient Monitoring Program (SWAMP).~~

~~Safety concerns: Sample locations and sampling periods must be determined considering safety issues. Sampling may be postponed upon notification to the State and Regional Water Boards if hazardous conditions prevail.~~

~~Analytical Chemistry Methods: All constituents must be analyzed using the lowest minimum detection limits comparable to the Ocean Plan water quality objectives. For metal analysis, all samples, including storm water effluent, reference samples, and ocean receiving water samples, must be analyzed by the approved analytical method with the lowest minimum detection limits (currently Inductively Coupled Plasma/Mass Spectrometry) described in the Ocean Plan.~~

~~A. CORE DISCHARGE MONITORING PROGRAM~~

~~1. General sampling requirements for timing and storm size:~~

~~Runoff must be collected during a storm event that is greater than 0.1 inch and generates runoff, and at least 72 hours from the previously measurable storm event. Runoff samples shall be collected when post-storm receiving water is sampled, and analyzed for the same constituents as receiving water and reference site samples (see section IV B) as described below.~~

~~2. Runoff flow measurements~~

~~a. For municipal/industrial storm water outfalls in existence as of December 31, 2007, 18 inches (457mm) or greater in diameter/width (including multiple outfall pipes in combination having a width of 18 inches, runoff flows must be measured or calculated, using a method acceptable to and approved by the State and Regional Water Boards.~~
~~b. This will be reported annually for each precipitation season to the State and Regional Water Boards.~~

~~3. Runoff samples – storm events~~

~~a. For outfalls equal to or greater than 18 inches (0.46m) in diameter or width:~~

~~(1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and, within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination, ; and~~

~~(2) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS~~

~~(3) If an applicant has no outfall greater than 36 inches, then storm water runoff from the applicant's largest outfall shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates).~~

~~b. For outfalls equal to or greater than 36 inches (0.91m) in diameter or width:~~

~~(1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and, within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination; and~~

~~(2) samples of storm water runoff shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates) and~~

~~(3) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS.~~

~~c. For an applicant not participating in a regional monitoring program [see below in Section IV (B)] in addition to (a.) and (b.) above, a minimum of the two largest outfalls or 20 percent of the larger outfalls, whichever is greater, shall be sampled (flow weighted composite samples) at least three times annually during wet weather (storm event) and analyzed for all Ocean Plan Table A constituents, Table B constituents for marine aquatic life protection (except for toxicity, only chronic toxicity for three species shall be required), DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, and Ocean Plan indicator bacteria. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one (the largest) such discharge shall be sampled annually in each Region.~~

~~4. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may reduce or suspend core monitoring once the storm runoff is fully characterized. This determination may be made at any point after the discharge is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.~~

~~**B. OCEAN RECEIVING WATER AND REFERENCE AREA MONITORING PROGRAM**~~

~~In addition to performing the Core Discharge Monitoring Program in Section II.A above, all applicants having authorized discharges must perform ocean receiving water monitoring. In order to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS, dischargers may choose either (1) an individual monitoring program, or (2) participation in a regional integrated monitoring program.~~

~~1. Individual Monitoring Program: The requirements listed below are for those dischargers who elect to perform an individual monitoring program to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within the affected ASBS. In addition to Core Discharge Monitoring, the following additional monitoring requirements shall be met:~~

~~a. Three times annually, during wet weather (storm events), the receiving water at the point of discharge from the outfalls described in section (IV)(A)(3)(c) above shall be sampled and analyzed for Ocean Plan Table A constituents, Table B constituents for marine aquatic life, DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, salinity, chronic toxicity (three species), and Ocean Plan indicator bacteria.~~

~~The sample location for the ocean receiving water shall be in the surf zone at the point of discharges; this must be at the same location where storm water runoff is sampled. Receiving water shall be sampled at approximately the same time prior to (pre-storm) and during (or immediately after) the same storm (post storm). Reference water quality shall also be sampled and analyzed for the same constituents pre-storm and post-storm, during the same storms when receiving water is sampled. Reference stations will be determined by the State Water Board's Division of Water Quality and the applicable Regional Water Board(s).~~

~~b. Sediment sampling shall occur at least three times during every five (5) year period. The subtidal sediment (sand or finer, if present) at the discharge shall be sampled and analyzed for Ocean Plan Table B constituents for marine aquatic life, DDT, PCBs, PAHs,~~

~~pyrethroids, and OP pesticides. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed.~~

~~c. A quantitative survey of intertidal benthic marine life shall be performed at the discharge and at a reference site. The survey shall be performed at least once every five (5) year period. The survey design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The results of the survey shall be completed and submitted to the State Water Board and Regional Water Board at least six months prior to the end of the permit cycle.~~

~~d. Once during each five (5) year period, a bioaccumulation study shall be conducted to determine the concentrations of metals and synthetic organic pollutants at representative discharge sites and at representative reference sites. The study design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The bioaccumulation study may include California mussels (Mytilus californianus) and/or sand crabs (Emerita analoga or Blepharipoda occidentalis). Based on the study results, the Regional Water Board and the State Water Board's Division of Water Quality, may adjust the study design in subsequent permits, or add or modify additional test organisms (such as shore crabs or fish), or modify the study design appropriate for the area and best available sensitive measures of contaminant exposure.~~

~~e. Marine Debris: Representative quantitative observations for trash by type and source shall be performed along the coast of the ASBS within the influence of the discharger's outfalls. The design, including locations and frequency, of the marine debris observations is subject to approval by the Regional Water Board and State Water Board's Division of Water Quality.~~

~~f. The monitoring requirements of the Individual Monitoring Program in this section are minimum requirements. After a minimum of one (1) year of continuous water quality monitoring of the discharges and ocean receiving waters, the Executive Director of the State Water Board (statewide permits) or Executive officer of the Regional Water Board (Regional Water Board permits) may require additional monitoring, or adjust, reduce or suspend receiving water and reference station monitoring. This determination may be made at any point after the discharge and receiving water is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.~~

~~2. Regional Integrated Monitoring Program: Dischargers may elect to participate in a regional integrated monitoring program, in lieu of an individual monitoring program, to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS. This regional approach shall characterize natural water quality, pre- and post-storm, in ocean reference areas near the mouths of identified open space watersheds and the effects of the discharges on natural water quality (physical, chemical, and toxicity) in the ASBS receiving waters, and should include benthic marine aquatic life and bioaccumulation components. The design of the ASBS stratum of a regional integrated monitoring program may deviate from the otherwise prescribed individual monitoring approach (in Section IV.B.1) if approved by the State Water Board's Division of Water Quality and the Regional Water Boards.~~

~~a. Ocean reference areas shall be located at the drainages of flowing watersheds with minimal development (in no instance more than 10% development), and shall not be located in CWA Section 303(d) listed waterbodies or have tributaries that are 303(d)~~

~~listed. Reference areas shall be free of wastewater discharges and anthropogenic non-storm water runoff. A minimum of low threat storm runoff discharges (e.g. stream highway overpasses and campgrounds) may be allowed on a case-by-case basis. Reference areas shall be located in the same region as the ASBS receiving water monitoring occurs. The reference areas for each Region are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean reference water samples must be collected from each station, each from a separate storm. A minimum of one reference location shall be sampled for each ASBS receiving water site sampled per responsible party. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.~~

~~b. ASBS ocean receiving water must be sampled in the surf zone at the location where the runoff makes contact with ocean water (i.e. at "point zero"). Ocean receiving water stations must be representative of worst-case discharge conditions (i.e. co-located at a large drain greater than 36 inches, or if drains greater than 36 inches are not present in the ASBS then the largest drain greater than18 inches.) Ocean receiving water stations are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean receiving water samples must be collected during each storm season from each station, each from a separate storm. A minimum of one receiving water location shall be sampled in each ASBS per responsible party in that ASBS. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.~~

~~c. Reference and receiving water sampling shall commence during the first full storm season following the adoption of these special conditions, and post-storm samples shall be collected when annual storm water runoff is sampled. Sampling shall occur in a minimum of two storm seasons. For those ASBS dischargers that have already participated in the Southern California Bight 2008 ASBS regional monitoring effort, sampling may be limited to only one storm season.~~

~~d. Receiving water and reference samples shall be analyzed for the same constituents as storm water runoff samples. At a minimum, constituents to be sampled and analyzed in reference and discharge receiving waters must include oil and grease, total suspended solids, Ocean Plan Table B metals for protection of marine life, Ocean Plan PAHs, pyrethroids, OP pesticides, ammonia, nitrate, phosphates, and critical life stage chronic toxicity for three species. In addition, within the range of the southern sea otter, indicator bacteria or some other measure of fecal contamination shall be analyzed.~~

~~3. Waterfront and Marine Operations: In addition to the above requirements for ocean receiving water monitoring, additional monitoring must be performed for marinas and boat launch and pier facilities:~~

~~a. For all marina or mooring field operators, in mooring fields with 10 or more occupied moorings, the ocean receiving water must be sampled for Ocean Plan indicator bacteria, residual chlorine, copper, zinc, grease and oil, methylene blue active substances (MBAS), and ammonia nitrogen.~~

ADMINISTRATIVE DRAFT

~~(1) For mooring field operators opting for an individual monitoring program (Section IV.B.1 above), this sampling must occur weekly (on the weekend) from May through October.~~

~~(2) For mooring field operators opting to participate in a regional integrated monitoring program (Section IV.B.2 above), this sampling must occur monthly from May through October on a high use weekend in each month. The Water Boards may allow a reduction in the frequency of sampling, through the regional monitoring program, after the first year of monitoring.~~

~~b. For all mooring field operators, the subtidal sediment (sand or finer, if present) within mooring fields and below piers shall be sampled and analyzed for Ocean Plan Table B metals (for marine aquatic life beneficial use), acute toxicity, PAHs, and tributyltin. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed. This sampling shall occur at least three times during a five (5) year period. For mooring field operators opting to participate in a regional integrated monitoring program, the Water Boards may allow a reduction in the frequency of sampling after the first sampling effort's results are assessed.~~

ADMINISTRATIVE DRAFT

ATTACHMENT B

STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

1. Standard Permit Provisions

Code of Federal Regulations Title 40 Section 122.41 (40 CFR 122.41) includes conditions, or provisions, that apply to all National Pollutant Discharge Elimination System (NPDES) permits. Additional provisions applicable to NPDES permits are in 40 CFR 122.42. All applicable provisions in 40 CFR 122.41 and 40 CFR 122.42 must be incorporated into this Order and NPDES permit. The applicable 40 CFR 122.41 and 40 CFR 122.42 provisions are as follows:

a. Duty to Comply [40 CFR 122.41(a)]

The Copermittee must comply with all of the provisions of this permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application.

(1) The Copermittee must comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if the permit has not yet been modified to incorporate the requirement. [40 CFR 122.41(a)(1)]

(2) The CWA provides that any person who violates Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any such sections in a permit issued under Section 402, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to a civil penalty not to exceed $25,000 per day for each violation. The CWA provides that any person who *negligently* violates Section 301, 302, 306, 307, 308, 318, or 405 of the CWA, or any condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to criminal penalties of $2,500 to $25,000 per day of violation, or imprisonment of not more than 1 year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than $50,000 per day of violation, or by imprisonment of not more than 2 years, or both. Any person who *knowingly* violates such sections, or such conditions or limitations is subject to criminal penalties of $5,000 to $50,000 per day of violation, or imprisonment for not more than 3 years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than $100,000 per day of violation, or imprisonment of not more than 6 years, or both. Any person who knowingly violates Section 301, 302, 303, 306, 307, 308, 318 or 405 of the CWA, or any

permit condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than $250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than $500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in Section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than $1,000,000 and can be fined up to $2,000,000 for second or subsequent convictions.
[40 CFR 122.41(a)(2)]

(3) Any person may be assessed an administrative penalty by the San Diego Regional Water Quality Control Board (San Diego Water Board), State Water Resources Control Board (State Water Board), or United States Environmental Protection Agency (USEPA) for violating Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed $10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed $25,000. Penalties for Class II violations are not to exceed $10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed $125,000.
[40 CFR 122.41(a)(3)]

b. DUTY TO REAPPLY [40 CFR 122.41(B)]

If a Copermittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the Copermittee must apply for and obtain a new permit.

c. NEED TO HALT OR REDUCE ACTIVITY NOT A DEFENSE [40 CFR 122.41(C)]

It shall not be a defense for a Copermittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

d. DUTY TO MITIGATE [40 CFR 122.41(D)]

The Copermittee must take all reasonable steps to minimize or prevent any discharge or prevent any discharge or sludge use or disposal in violation of this permit that has a reasonable likelihood of adversely affecting human health or the environment.

e. PROPER OPERATION AND MAINTENANCE [40 CFR 122.41(E)]

The Copermittee must at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Copermittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems that are installed by a Copermittee only when the operation is necessary to achieve compliance with the conditions of this permit.

f. PERMIT ACTIONS [40 CFR 122.41(F)]

This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Copermittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

g. PROPERTY RIGHTS [40 CFR 122.41(G)]

This permit does not convey any property rights of any sort, or any exclusive privilege.

h. DUTY TO PROVIDE INFORMATION [40 CFR 122.41(H)]

The Copermittee must furnish to the San Diego Water Board, State Water Board, or USEPA within a reasonable time, any information which the San Diego Water Board, State Water Board, or USPEA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit or to determine compliance with this permit. The Copermittee must also furnish to the San Diego Water Board, State Water Board, or USPEA upon request, copies of records required to be kept by this permit.

i. INSPECTION AND ENTRY [40 CFR 122.41(I)]

The Copermittee must allow the San Diego Water Board, State Water Board, USEPA, and/or their authorized representative (including an authorized contractor acting as their representative), upon presentation of credentials and other documents as may be required by law, to:

(1) Enter upon the Copermittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit; [40 CFR 122.41(i)(1)]

(2) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit; [40 CFR 122.41(i)(2)]

(3) Inspect and photograph at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; [40 CFR 122.41(i)(3)] and

(4) Sample or monitor at reasonable times, for the purpose of assuring permit compliance or as otherwise authorized by the CWA, any substances or parameters at any location. [40 CFR 122.41(i)(4)]

j. MONITORING AND RECORDS [40 CFR 122.41(J)]

(1) Samples and measurements taken for the purpose of monitoring must be representative of the monitored activity. [40 CFR 122.41(j)(1)]

(2) Except for records of monitoring information required by this permit related to the Copermittee's sewage sludge use and disposal activities, which shall be retained for a period of at least five (5) years (or longer as required by 40 CFR Part 503), the Copermittee must retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board at any time. [40 CFR 122.41(j)(2)]

(3) Records for monitoring information must include: [40 CFR 122.41(j)(3)]

(a) The date, exact place, and time of sampling or measurements; [40 CFR 122.41(j)(3)(i)]
(b) The individual(s) who performed the sampling or measurements; [40 CFR 122.41(j)(3)(ii)]
(c) The date(s) analyses were performed; [40 CFR 122.41(j)(3)(iii)]
(d) The individual(s) who performed the analyses; [40 CFR 122.41(j)(3)(iv)]
(e) The analytical techniques or methods used; [40 CFR 122.41(j)(3)(v)] and
(f) The results of such analyses. [40 CFR 122.41(j)(3)(vi)]

(4) Monitoring must be conducted according to test procedures under 40 CFR Part 136 unless another method is required under 40 CFR Subchapters N or O.
[40 CFR 122.41(j)(4)]

In the case of pollutants for which there are no approved methods under 40 CFR Part 136 or otherwise required under 40 CFR Subchapters N and O, monitoring must be conducted according to a test procedure specified in the permit for such pollutants. [40 CFR 122.44(i)(1)(iv)]

(5) The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or both. [40 CFR 122.41(j)(5)]

k. **SIGNATORY REQUIREMENT [40 CFR 122.41(K)]**

(1) All applications, reports, or information submitted to the San Diego Water Board, State Water Board, or USEPA must be signed and certified. (See 40 CFR 122.22) [40 CFR 122.41(k)(1)]

(a) *For a municipality, State, Federal, or other public agency.* [All applications must be signed] [b]y either a principal executive officer or ranking elected official. [40 CFR 122.22(a)(3)]

(b) All reports required by permits, and other information requested by the San Diego Water Board, State Water Board, or USEPA must be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if: [40 CFR 122.22(b)]

(i) The authorization is made in writing by a person described in paragraph (a) of this section; [40 CFR 122.22(b)(1)]
(ii) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company, (A duly authorized representative may thus be either a named individual or any individual occupying a named position.)
[40 CFR 122.22(b)(2)] and,
(iii) The written authorization is submitted to the San Diego Water Board and State Water Board. [40 CFR 122.22(b)(3)]

(c) *Changes to authorization.* If an authorization under paragraph (b) of this section is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (b) of this section must be submitted to the San Diego Water Board prior to or together with any reports, information, or applications to be signed by an authorized representative. [40 CFR 122.22(c)]

(d) *Certification.* Any person signing a document under paragraph (a) or (b) of this section shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." [40 CFR 122.22(d)]

(2) The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than 6 months per violation, or by both. [40 CFR 122.41(k)(2)]

I. Reporting Requirements [40 CFR 122.41(l)]

(1) *Planned changes.* The Copermittee must give notice to the San Diego Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required only when: [40 CFR 122.41(l)(1)]

(a) The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR 122.29(b);
[40 CFR 122.41(l)(1)(i)] or

(b) The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in the permit, nor to notification requirements under 40 CFR 122.42(a)(1).
[40 CFR 122.41(l)(1)(ii)]

(c) The alteration or addition results in a significant change in the Copermittee's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. [40 CFR 122.41(l)(1)(iii)]

(2) Anticipated noncompliance. The Copermittee must give advance notice to the San Diego Water Board or State Water Board of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements.
[40 CFR 122.41(l)(2)]

(3) *Transfers*. This permit is not transferable to any person except after notice to the San Diego Water Board. The San Diego Water Board may require modification or revocation and reissuance of the permit to change the name of the Copermittee and incorporate such other requirements as may be necessary under the CWA.
[40 CFR 122.41(l)(3)]

ADMINISTRATIVE DRAFT

(4) Monitoring reports. Monitoring results must be reported at the intervals specified elsewhere in this permit. [40 CFR 122.41(l)(4)]

(a) Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the San Diego Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. [40 CFR 122.41(l)(4)(i)]

(b) If the Copermittee monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR Part 136 or another method required for an industry-specific waste stream under 40 CFR Subchapters N or O, the results of this monitoring must be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the San Diego Water Board or State Water Board. [40 CFR 122.41(l)(4)(ii)]

(c) Calculations for all limitations which require averaging of measurements must utilize an arithmetic mean unless otherwise specified in the permit. [40 CFR 122.41(l)(4)(iii)]

(5) *Compliance schedules*. Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit must be submitted no later than 14 days following each schedule date. [40 CFR 122.41(l)(5)]

(6) Twenty-four hour reporting.

(a) The Copermittee must report any noncompliance that may endanger health or the environment. Any information must be provided orally within 24 hours from the time the Copermittee becomes aware of the circumstances. A written submission must also be provided within five (5) days of the time the Copermittee becomes aware of the circumstances. The written submission must contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. [40 CFR 122.41(l)(6)(i)]

(b) The following must be included as information which must be reported within 24 hours under this paragraph: [40 CFR 122.41(l)(6)(ii)]

(i) Any unanticipated bypass that exceeds any effluent limitation in the permit (See 40 CFR 122.41(g)). [40 CFR 122.41(l)(6)(ii)(A)]
(ii) Any upset which exceeds any effluent limitation in the permit. [40 CFR 122.41(l)(6)(ii)(B)] and,
(iii) Violation of a maximum daily discharge limitation for any of the pollutants listed by the San Diego Water Board in the permit to be reported within 24

hours. (See 40 CFR 122.44(g))
[40 CFR 122.41(l)(6)(ii)(C)]

(c) The San Diego Water Board may waive the above-required written report on a case-by-case basis if the oral report has been received within 24 hours. [40 CFR 122.41(l)(6)(iii)]

(7) *Other noncompliance.* The Copermittee must report all instances of noncompliance not reported in accordance with the standard provisions required under 40 CFR 122.41(l)(4), (5), and (6), at the time monitoring reports are submitted. The reports must contain the information listed in the standard provisions required under 40 CFR 122.41(l)(6). [40 CFR 122.41(l)(7))]

(8) *Other information.* When the Copermittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the San Diego Water Board, State Water Board, or USEPA, the Copermittee must promptly submit such facts or information.
[40 CFR 122.41(l)(8)]

~~**a. BYPASS** [40 CFR 122.41(m)]~~

~~(1) *Definitions.*~~

~~(a) "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. [40 CFR 122.41(m)(1)(i)] or~~

~~(b) "Severe property damage" means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. [40 CFR 122.41(m)(1)(ii)]~~

~~(2) *Bypass not exceeding limitations*. The Copermittee may allow any bypass to occur which does not cause effluent limitations to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the standard provisions required under 40 CFR 122.41(m)(3) and (4). [40 CFR 122.41(m)(2)]~~

~~(3) *Notice.*~~

~~(a) *Anticipated bypass*. If the Copermittee knows in advance of the need for a bypass, it must submit a notice, if possible at least ten days before the date of the bypass. [40 CFR 122.41(m)(3)(i)] or~~

~~(b) *Unanticipated bypass*. The Copermittee must submit notice of an unanticipated bypass in accordance with the standard provisions required under 40 CFR 122.41(l)(6) (24-hour notice). [40 CFR 122.41(m)(3)(ii)]~~

ADMINISTRATIVE DRAFT

~~(4) *Prohibition of Bypass.*~~

~~(a) Bypass is prohibited, and the San Diego Water Board may take enforcement action against a Copermittee for bypass, unless: [40 CFR 122.41(m)(4)(i)]~~

~~(i) Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage; [40 CFR 122.41(m)(4)(i)(A)]~~

~~(ii) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; [40 CFR 122.41(m)(4)(i)(B)] and,~~

~~(iii) The Copermittee submitted notice in accordance with the standard provisions required under 40 CFR 122.41(m)(3). [40 CFR 122.41(m)(4)(i)(C)]~~

~~(b) The San Diego Water Board may approve an anticipated bypass, after considering its adverse effects, if the San Diego Water Board determines that it will meet the three conditions listed above. [40 CFR 122.41(m)(4)(ii)]~~

m. UPSET [40 CFR 122.41(N)]

(1) *Definition.* "Upset" means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Copermittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. [40 CFR 122.41(n)(1)]

(2) *Effect of an upset*. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the standard provisions required under 40 CFR 122.41(n)(3) are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. [40 CFR 122.41(n)(2)]

(3) *Conditions necessary for a demonstration of upset*. A Copermittee who wishes to establish the affirmative defense of upset must demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:
[40 CFR 122.41(n)(3)]

(a) An upset occurred and that the Copermittee can identify the cause(s) of the upset; [40 CFR 122.41(n)(3)(i)]
(b) The permitted facility was at the time being properly operated; [40 CFR 122.41(n)(3)(ii)] and
(c) The Copermittee submitted notice of the upset in accordance with the standard provisions required under 40 CFR 122.41(l)(6)(ii)(B) (24-hour notice).
[40 CFR 122.41(n)(3)(iii)]
(d) The Copermittee complied with any remedial measures pursuant to the standard provisions required under 40 CFR 122.41(d).
[40 CFR 122.41(n)(3)(iii)]

(4) *Burden of proof*. In any enforcement proceeding, the Copermittee seeking to establish the occurrence of an upset has the burden of proof.
[40 CFR 122.41(n)(4)]

n. STANDARD PERMIT PROVISIONS FOR MUNICIPAL SEPARATE STORM SEWER SYSTEMS [40 CFR 122.42(c)]

The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the San Diego Water Board or State Water Board under 40 CFR 122.26(a)(1)(v) must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report must include:

(1) The status of implementing the components of the storm water management program that are established as permit conditions; [40 CFR 122.42(c)(1)]

(2) Proposed changes to the storm water management programs that are established as permit conditions. Such proposed changes must be consistent with 40 CFR 122.26(d)(2)(iii); [40 CFR 122.42(c)(2)] and

(3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under 40 CFR 122.26(d)(2)(iv) and (v); [40 CFR 122.42(c)(3)]

(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year; [40 CFR 122.42(c)(4)]

(5) Annual expenditures and budget for year following each annual report; [40 CFR 122.42(c)(5)]

(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; [40 CFR 122.42(c)(6)]

(7) Identification of water quality improvements or degradation.
[40 CFR 122.42(c)(7)]

o. **STANDARD PERMIT PROVISIONS FOR STORM WATER DISCHARGES [40 CFR 122.42(D)]**

The initial permits for discharges composed entirely of storm water issued pursuant to 40 CFR 122.26(e)(7) must require compliance with the conditions of the permit as expeditiously as practicable, but in no event later than three years after the date of issuance of the permit.

2. General Provisions

In addition to the standard provisions required to be incorporated into the Order and NPDES permit pursuant to 40 CFR 122.41 and 40 CFR 122.42, several other general provisions apply to this Order. The general provisions applicable to this Order and NPDES permit are as follows:

a. **DISCHARGE OF WASTE IS A PRIVILEGE**

No discharge of waste into the waters of the State, whether or not such discharge is made pursuant to waste discharge requirements, shall create a vested right to continue such discharge. All discharges of waste into waters of the State are privileges, not rights. [CWC Section 13263(g)]

b. **DURATION OF ORDER AND NPDES PERMIT**

(1) *Effective date*. This Order and NPDES permit becomes effective on the date of its adoption provided the USEPA has no objection. If the USEPA objects to its issuance, this Order shall not become effective until such objection is withdrawn. This Order supersedes Order No. R9-2007-0001 upon the effective date of this Order, and supercedes Order Nos. R9-2009-0002 and R9-2010-0016 upon their expiration.

(2) *Expiration*. This Order and NPDES permit expires five years after adoption. [40 CFR 122.46(a)]

(3) *Continuation of expired order*. After this Order and NPDES permit expires, the terms and conditions of this Order and NPDES permit are automatically continued pending issuance of a new permit if all requirements of the federal NPDES regulations on the continuation of expired permits (40 CFR 122.6) are complied with.

c. **AVAILABILITY**

A copy of this Order must be kept at a readily accessible location and must be available to on-site personnel at all times.

d. CONFIDENTIALITY OF INFORMATION

Except as provided for in 40 CFR 122.7, no information or documents submitted in accordance with or in application for this Order will be considered confidential, and all such information and documents shall be available for review by the public at the San Diego Water Board office.

Claims of confidentiality for the following information will be denied: [40 CFR 122.7(b)]

(1) The name and address of any permit applicant or Copermittee; [40 CFR 122.7(b)(1)] and

(2) Permit applications and attachments, permits, and effluent data. [40 CFR 122.7(b)(2)]

e. EFFLUENT LIMITATIONS

(1) *Interim effluent limitations*. The Copermittee must comply with any interim effluent limitations as established by addendum, enforcement action, or revised waste discharge requirements which have been, or may be, adopted by the San Diego Water Board.

(2) *Other effluent limitations and standards*. If any applicable toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant and that standard or prohibition is more stringent than any limitation on the pollutant in the permit, the San Diego Water Board shall institute proceedings under these regulations to modify or revoke and reissue the permit to conform to the toxic effluent standard or prohibition. [40 CFR 122.44(b)(1)]

f. DUTY TO MINIMIZE OR CORRECT ADVERSE IMPACTS

The Copermittee must take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this Order, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncompliance.

g. PERMIT ACTIONS

The filing of a request by the Copermittee for modification, revocation and reissuance, or termination of this Order, or a notification of planned change in or anticipated noncompliance with this Order does not stay any condition of this Order. (See 40 CFR 122.41(f)) In addition, the following provisions apply to this Order:

(1) Upon application by any affected person, or on its own motion, the San Diego Water Board may review and revise the requirements in this Order. All requirements must be reviewed periodically. [CWC Section 13263(e)]

(2) This Order may be terminated or modified for cause, including, but not limited to, all of the following: [CWC Section 13381]

(a) Violation of any condition contained in the requirements of this Order. [CWC Section 13381(a)]

(b) Obtaining the requirements in this Order by misrepresentation, or failure to disclose fully all relevant facts. [CWC Section 13381(b)]

(c) A change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge. [CWC Section 13381(c)]

(3) When this Order is transferred to a new owner or operator, such requirements as may be necessary under the CWC may be incorporated into this Order.

h. NPDES Permitted Non-Storm Water Discharges

The San Diego Water Board has, in prior years, issued a limited number of individual NPDES permits for non-storm water discharges to MS4s. The San Diego Water Board or State Water Board may in the future, upon prior notice to the Copermittee(s), issue an NPDES permit for any non-storm water discharge (or class of non-storm water discharges) to an MS4.

i. Monitoring

In addition to the standard provisions required under 40 CFR 122.41(j) and (l)(4), the following general monitoring provisions apply to this Order:

(1) Where procedures are not otherwise specified in Order, sampling, analysis and quality assurance/quality control must be conducted in accordance with the Quality Assurance Management Plan (QAMP) for the State of California's Surface Water Ambient Monitoring Program (SWAMP), adopted by the State Water Resources Control Board (State Water Board).

(2) Pursuant to 40 CFR 122.41(j)(2) and CWC Section 13383(a), each Copermittee must retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least five (5) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board at any time.

(3) All chemical, bacteriological, and toxicity analyses must be conducted at a laboratory certified for such analyses by the California Department of Public Health or a laboratory approved by the San Diego Water Board.

(4) For priority toxic pollutants that are identified in the California Toxics Rule (CTR) (65 Fed. Reg. 31682), the Copermittees must instruct their laboratories to establish

calibration standards that are equivalent to or lower than the Minimum Levels (MLs) published in Appendix 4 of the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). If a Copermittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR Part 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Copermittee must submit documentation from the laboratory to the San Diego Water Board for approval prior to raising the ML for any priority toxic pollutant.

j. ENFORCEMENT

(1) The San Diego Water Board is authorized to enforce the terms of this Order under several provisions of the CWC, including, but not limited to, CWC Sections 13385, 13386, and 13387.

(2) Nothing in this Order shall be construed to protect the Copermittee from its liabilities under federal, state, or local laws.

(3) The CWC provides for civil and criminal penalties comparable to, and in some cases greater than, those provided for under the CWA.

(4) Except as provided in the standard conditions required under 40 CFR 122.41(m) and (n), nothing in this Order shall be construed to relieve the Copermittee from civil or criminal penalties for noncompliance.

(5) Nothing in this Order shall be construed to preclude the institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties to which the Copermittee is or may be subject to under Section 311 of the CWA.

(6) Nothing in this Order shall be construed to preclude institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties established pursuant to any applicable state law or regulation under authoring preserved by Section 510 of the CWA.

k. SEVERABILITY

The provisions of this Order are severable, and if any provision of this Order, or the application of any provisions of this Order to any circumstance, is held invalid, the application of such provision to other circumstances and the remainder of this Order shall not be affected thereby.

l. APPLICATIONS

Any application submitted by a Copermittee for reissuance or modification of this Order must satisfy all applicable requirements specified in federal regulations as well as any additional requirements for submittal of a Report of Waste Discharge specified in the CWC and the California Code of Regulations.

m. IMPLEMENTATION

All plans, reports and subsequent amendments submitted in compliance with this Order must be implemented immediately (or as otherwise specified). All submittals by Copermittees must be adequate to implement the requirements of this Order.

n. REPORT SUBMITTALS

(1) All report submittals must include an executive summary, introduction, conclusion, recommendations, and signed certified statement.

(2) Each Copermittee must submit a signed certified statement covering its responsibilities for each applicable submittal.

(3) The Principal Watershed Copermittee(s) must submit a signed certified statement covering its responsibilities for each applicable submittal and the sections of the submittals for which it is responsible.

(4) Unless otherwise directed, the Copermittees must submit one hard copy and one electronic copy of each report required under this Order to the San Diego Water Board, and one electronic copy to the USEPA.

(5) The Copermittees must submit reports and provide notifications as required by this Order to the following:

DEFINITIONS

2. Definitions

Active/Passive Sediment Treatment - Using mechanical, electrical or chemical means to flocculate or coagulate suspended sediment for removal from runoff from construction sites prior to discharge.

Anthropogenic Litter – Trash generated from human activities, not including sediment.

Average Monthly Action Level – The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month or the geometric mean for bacteria, as applicable.~~.~~

Beneficial Uses - The uses of water necessary for the survival or well being of man, plants, and wildlife. These uses of water serve to promote tangible and intangible economic, social, and environmental goals. "Beneficial Uses" of the waters of the State that may be protected include, but are not limited to, domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves. Existing beneficial uses are uses that were attained in the surface or ground water on or after November 28, 1975; and potential beneficial uses are uses that would probably develop in future years through the implementation of various control measures. "Beneficial Uses" are equivalent to "Designated Uses" under federal law. [California Water Code Section 13050(f)].

Best Management Practices (BMPs) - Defined in 40 CFR 122.2 as schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. ~~-~~In the case of municipal ~~storm water~~discharge permits, BMPs may be used in place of numeric effluent limits.

Bioassessment - The use of biological community information to evaluate the biological integrity of a water body and its watershed. With respect to aquatic ecosystems, bioassessment is the collection and analysis of samples of the benthic macroinvertebrate community together with physical/habitat quality measurements associated with the sampling site and the watershed to evaluate the biological condition (i.e. biotic integrity) of a water body.

Biocriteria - Under the CWA, numerical values or narrative expressions that define a desired biological condition for a water body that are legally enforceable. The USEPA defines biocriteria as: "numerical values or narrative expressions that describe the reference biological integrity of aquatic communities inhabiting waters of a given designated aquatic life use… (that)…describe the characteristics of water body segments least impaired by human activities."

Biofiltration - Practices that use vegetation and amended soils to detain and treat runoff from impervious areas. Treatment is through filtration, infiltration, adsorption, ion exchange, and biological uptake of pollutants.

Biological Integrity - Defined in Karr J.R. and D.R. Dudley. 1981. Ecological perspective on water quality goals. *Environmental Management* 5:55-68 as: "A balanced, integrated, adaptive community of organisms having a species composition, diversity, and functional organization comparable to that of natural habitat of the region." Also referred to as ecosystem health.

BMP Design Manual – A plan developed to eliminate, reduce, or mitigate the impacts of runoff from development projects, including Priority Development Projects.

Channel Rehabilitation and Improvement –Remedial measures or activities for the purpose of improving or restoring the environmental health of streams, channels or river systems. Techniques may vary from in-stream restoration techniques to off-line stormwater management practices installed in the system corridor or upland areas. Rehabilitation techniques may include, but are not limited to the following: riparian zone restoration, constructed wetlands, bank stabilization, channel modifications, and daylighting of drainage systems. Effectiveness may be measured in various manners, including: assessments of habitat, reduced streambank erosion, and restoration of water and sediment transport balance.

Clean Water Act Section 303(d) Water Body - An impaired water body in which water quality does not meet applicable water quality standards and/or is not expected to meet water quality standards, even after the application of technology based pollution controls required by the CWA. The discharge of runoff to these water bodies by the Copermittees is significant because these discharges can cause or contribute to violations of applicable water quality standards.

Construction Site – Any project, including projects requiring coverage under the Construction General Permit, that involves soil disturbing activities greater than 10,000 square feet including, but not limited to, clearing, grading, disturbances to ground such as stockpiling, and excavation. This does not include minor construction activities such as interior remodeling, plumbing, electrical, or mechanical work.

Contamination - As defined in the Porter-Cologne Water Quality Control Act, contamination is "an impairment of the quality of waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of disease. 'Contamination' includes any equivalent effect resulting from the disposal of waste whether or not waters of the State are affected."

Copermittee – An incorporated city within the County of Orange, County of Riverside, or County of San Diego in the San Diego Region (Region 9), the County of Orange, the County of Riverside, the County of San Diego, the Orange County Flood Control District, the Riverside County Water Conservation and Flood Control District, the San Diego Regional Airport Authority, or the Unified Port District of San Diego.

Copermittees – All of the individual Copermittees, collectively.

Critical Channel Flow (Qc) – The channel flow that produces the critical shear stress that initiates bed movement or that erodes the toe of channel banks. When measuring Qc, it should be based on the weakest boundary material – either bed or bank.

Daily Discharge – Defined as either: (1) the total mass of the constituent discharged over the calendar day or any 24 hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g. concentration.)

ADMINISTRATIVE DRAFT

The Daily Discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day, or other 24 hour period other than a day), or by the arithmetic mean of analytical results from one or more grab samples taken over the course of a day.

Development Projects - Construction, rehabilitation, redevelopment, or reconstruction of any public or private projects involving land disturbance activities. ~~residential project, industrial, commercial, or any other projects.~~

Dry Season – ~~The period of time from~~ May 1 to September 30. ~~when rainfall is not expected to occur the San Diego.~~

Dry Weather – Weather is considered dry if the preceding 72 hours has been without measurable precipitation (>0.1 inch).

Enclosed Bays – Enclosed bays are indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost bay works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays do not include inland surface waters or ocean waters.

Erosion – When land is diminished or worn away due to wind, water, or glacial ice. Often the eroded debris (silt or sediment) becomes a pollutant via storm water runoff. Erosion occurs naturally but can be intensified by land clearing activities such as farming, development, road building, and timber harvesting.

Environmentally Sensitive Areas (ESAs) - Areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Board and San Diego Water Board; State Water Quality Protected Areas; water bodies designated with the RARE beneficial use by the State Water Board and San Diego Water Board; areas designated as preserves or their equivalent under the Natural Communities Conservation Program within the Cities and County of Orange; and any other equivalent environmentally sensitive areas which have been identified by the Copermittees.

Estuaries – Waters, including coastal lagoons, located at the mouth of streams that serve as areas of mixing fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and ocean water. Estuaries do not include inland surface waters or ocean waters.

Existing Development – Any area that has been developed and exists for municipal, commercial, industrial, or residential purposes, uses, or activities. May include areas that are not actively used for its originally developed purpose, but may be re-purposed or redeveloped for another use or activity.

Flow Duration – The long-term period of time that flows occur above a threshold that causes significant sediment transport and may cause excessive erosion damage to creeks and streams (not a single storm event duration). The simplest way to visualize this is to consider a histogram of pre- and post-project flows using long-term records of hourly data. To maintain pre-

ADMINISTRATIVE DRAFT

development flow duration means that the total number of hours (counts) within each range of flows in a flow-duration histogram cannot increase between the pre- and post-development condition. Flow duration within the range of geomorphologically significant flows is important for managing erosion.

Grading - The cutting and/or filling of the land surface to a desired slope or elevation.

Hazardous Material – Any substance that poses a threat to human health or the environment due to its toxicity, corrosiveness, ignitability, explosive nature or chemical reactivity. These also include materials named by the USEPA in 40 CFR 116 to be reported if a designated quantity of the material is spilled into the waters of the U.S. or emitted into the environment.

Hazardous Waste - Hazardous waste is defined as "any waste which, under Section 600 of Title 22 of this code, is required to be managed according to Chapter 30 of Division 4.5 of Title 22 of this code" [CCR Title 22, Division 4.5, Chapter 11, Article 1].

Household Hazardous Waste – Paints, cleaning products, and other wastes generated during home improvement or maintenance activities.

Hydromodification – The change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, interflow and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport. In addition, alteration of stream and river channels, such as stream channelization, concrete lining, installation of dams and water impoundments, and excessive streambank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

Illicit Connection – Any connection to the MS4 that conveys an illicit discharge.

Illicit Discharge - Any discharge to the MS4 that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities [40 CFR 122.26(b)(2)].

Inactive Areas – Areas of construction activity that are not active and those that have been active and are not scheduled to be re-disturbed for at least 14 days.

Infiltration – Water other than wastewater that enters a sewer system (including sewer service connections and foundation drains) from the ground through such means as defective pipes, pipe joints, connections, or manholes. Infiltration does not include, and is distinguished from, inflow [40 CFR 35.2005(20)].

Inland Surface Waters – Includes all surface waters of the ~~State~~ U.S. that do not include the ocean, enclosed bays, or estuaries.

Jurisdictional Runoff Management Program Document – A written description of the specific jurisdictional runoff management measures and programs that each Copermittee will implement to comply with this Order and ensure that storm water pollutant discharges in runoff are reduced to the MEP and do not cause or contribute to a violation of water quality standards.

Low Impact Development (LID) – A storm water management and land development strategy that emphasizes conservation and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.

Low Impact Development Best Management Practices (LID BMPs) – LID BMPs include schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States through storm water management and land development strategies that emphasize conservation ~~s~~and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions. LID BMPs include retention practices that do not allow runoff, such as infiltration, rain water harvesting and reuse, and evapotranspiration. LID BMPs also include flow-through practices such as biofiltration that may have some discharge of storm water following pollutant reduction.

Major Outfall – As defined in the Code of Federal Regulations, a major outfall is a MS4 outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (i.e. discharge from a single conveyance other than a circular pipe which is associated with a drainage area of more than 50 acres); or, for MS4s that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or equivalent), a MS4 outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (i.e. discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

Maximum Daily Action Level (MDAL) –The highest allowable daily discharge of a pollutant, over a calendar day (or 24 hour period). For pollutants with action levels expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with action levels expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Maximum Extent Practicable (MEP) – The technology-based standard established by Congress in CWA section 402(p)(3)(B)(iii) for storm water that operators of MS4s must meet. Technology-based standards establish the level of pollutant reductions that dischargers must achieve, typically by treatment or by a combination of source control and treatment control BMPs. MEP generally emphasizes pollution prevention and source control BMPs primarily (as the first line of defense) in combination with treatment methods serving as a backup (additional line of defense). MEP considers economics and is generally, but not necessarily, less stringent than BAT. A definition for MEP is not provided either in the statute or in the regulations. Instead the definition of MEP is dynamic and will be defined by the following process over time: municipalities propose their definition of MEP by way of their runoff management programs. Their total collective and individual activities conducted pursuant to the runoff management programs becomes their proposal for MEP as it applies both to their overall effort, as well as to specific activities (e.g., MEP for street sweeping, or MEP for MS4 maintenance). In the absence of a proposal acceptable to the San Diego Water Board, the San Diego Water Board defines MEP.

In a memo dated February 11, 1993, entitled "Definition of Maximum Extent Practicable," Elizabeth Jennings, Senior Staff Counsel, SWRCB addressed the achievement of the MEP standard as follows:

> “*To achieve the MEP standard, municipalities must employ whatever Best Management Practices (BMPs) are technically feasible (i.e., are likely to be effective) and are not cost prohibitive. The major emphasis is on technical feasibility. Reducing pollutants to the MEP means choosing effective BMPs, and rejecting applicable BMPs only where other effective*

ADMINISTRATIVE DRAFT

BMPs will serve the same purpose, or the BMPs would not be technically feasible, or the cost would be prohibitive. In selecting BMPs to achieve the MEP standard, the following factors may be useful to consider:

a. Effectiveness: Will the BMPs address a pollutant (or pollutant source) of concern?
b. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?
c. Public Acceptance: Does the BMP have public support?
d. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?
e. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc.?

The final determination regarding whether a municipality has reduced pollutants to the maximum extent practicable can only be made by the Regional or State Water Boards, and not by the municipal discharger. If a municipality reviews a lengthy menu of BMPs and chooses to select only a few of the least expensive, it is likely that MEP has not been met. On the other hand, if a municipal discharger employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit derived, it would have met the standard. Where a choice may be made between two BMPs that should provide generally comparable effectiveness, the discharger may choose the least expensive alternative and exclude the more expensive BMP. However, it would not be acceptable either to reject all BMPs that would address a pollutant source, or to pick a BMP based solely on cost, which would be clearly less effective. In selecting BMPs the municipality must make a serious attempt to comply and practical solutions may not be lightly rejected. In any case, the burden would be on the municipal discharger to show compliance with its permit. After selecting a menu of BMPs, it is the responsibility of the discharger to ensure that all BMPs are implemented."

Monitoring Year – The monitoring year begins annually on October 1st and ends on September 30th.

Municipal Separate Storm Sewer System (MS4) – A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or designated and approved management agency under section 208 of the CWA that discharges to waters of the United States; (ii) Designated or used for collecting or conveying storm water; (iii) Which is not a combined sewer; (iv) Which is not part of the Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.26. "Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators." 40 CFR §122.26(a)(3)(vi).

National Pollutant Discharge Elimination System (NPDES) - The national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under Sections 307, 318, 402, and 405 of the CWA.

Non-Storm Water - All discharges to and from a MS4 that do not originate from precipitation events (i.e., all discharges from a MS4 other than storm water). Non-storm water includes illicit discharges and NPDES permitted discharges.

Nuisance - As defined in the Porter-Cologne Water Quality Control Act, a nuisance is "anything which meets all of the following requirements: 1) Is injurious to health, or is indecent, or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property. 2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal. 3) Occurs during~~,~~ or as a result of~~,~~ the treatment or disposal of wastes."

Ocean Waters – the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Board's California Ocean Plan.

Order – Unless otherwise specified, refers to this Order, Order No. R9-2012-0011 (NPDES No. CAS0109266).

~~**Permanent BMP Sizing Criteria Design Manual** – A plan developed to eliminate, reduce, or mitigate the impacts of runoff from development projects, including Priority Development Projects.~~

Person - A person is defined as an individual, association, partnership, corporation, municipality, State or Federal agency, or an agent or employee thereof [40 CFR 122.2].

Point Source - Any discernible, confined, and discrete conveyance, including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operations, landfill leachate collection systems, vessel, or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

Pollutant - Any agent that may cause or contribute to the degradation of water quality such that a condition of pollution or contamination is created or aggravated.

Pollution - As defined in the Porter-Cologne Water Quality Control Act, pollution is "the alteration of the quality of the waters of the State by waste, to a degree that unreasonably affects the either of the following: 1) The waters for beneficial uses; or 2) Facilities that serve these beneficial uses." Pollution may include contamination.

Pollution Prevention - Pollution prevention is defined as practices and processes that reduce or eliminate the generation of pollutants, in contrast to source control BMPs, treatment control BMPs, or disposal.

Permanent BMPs - A subset of BMPs including structural and non-structural controls which detain, retain, filter, remove, or educate to prevent the release of pollutants to surface waters from development projects in perpetuity, after construction of a project is completed.

Pre-Development Runoff Conditions ~~**(Discharge Rates, Durations, Etc.)**~~ – "Runoff conditions that exist~~ed~~ onsite immediately before the ~~existing development was constructed, or exists onsite before~~ planned development activities occur. Pre-development is not intended to be interpreted as that period before any human-induced land disturbance activity has occurred." 64 FR 68761.~~This definition includes natural watershed hydrology before any human induced~~

~~land alterations.~~

Priority Development Projects - New development and redevelopment projects defined under Provision E.3.b of Order No. R9-2012-0011.

Properly Designed – Designed in accordance with the Copermittee's BMP Design Manual and/or any appropriate design requirements set forth by the Copermittee and based on widely accepted design criteria.

Public Education, Outreach and Participation – Programs to educate residents, businesses and visitors about the importance of water quality and water quality programs so that they will support local efforts and understand their role in protecting receiving waters. The Education and Outreach Program will increase knowledge and awareness, improve attitudes toward storm pollution prevention, and provide a foundation for changing behaviors that contribute to storm water pollution.

Rainy Season (aka Wet Season) – ~~The period of time from~~ October 1 to April 30. ~~when the San Diego Region experiences the most rainfall.~~

Receiving Waters – Waters of the ~~United States~~U.S.

Receiving Water Limitations - Waste discharge requirements issued by the San Diego Water Board typically include both: (1) "Effluent Limitations" (or "Discharge Limitations") that specify the technology-based or water-quality-based effluent limitations; and (2) "Receiving Water Limitations" that specify the water quality objectives in the Basin Plan as well as any other limitations necessary to attain those objectives. In summary, the "Receiving Water Limitations" provision is the provision used to implement the requirement of CWA section 301(b)(1)(C) that NPDES permits must include any more stringent limitations necessary to meet water quality standards.

Redevelopment - The creation, addition, and or replacement of impervious surface on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces. Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include trenching and resurfacing associated with utility work; parking lots; resurfacing existing roadways; cutting and reconfiguring of surface parking lots; new sidewalk construction, pedestrian ramps, or bike lane on existing roads; and routine replacement of damaged pavement, such as pothole repair.

Retain –Keep or hold in a particular place, condition, or position without discharge to surface waters.

Retrofit – Retrofit is defined as a stormwater management practice (usually structural) put into place after development has occurred in watersheds where practices previously did not exist or are ineffective. The purpose of retrofits is to improve water quality, protect downstream channels, reduce flooding, or meet other specific objectives. Some examples of retrofits include, but are not limited to the following: green roofs, downspout and impervious cover disconnection, permeable pavement, bioretention, rain barrels, rain gardens, vacant lot stabilization, trash area enclosures, additional trash and waste disposal containers.

ADMINISTRATIVE DRAFT

Runoff - All flows in a storm water conveyance system that consists of the following components: (1) storm water (wet weather flows) and (2) non-storm water including dry weather flows.

San Diego Water Board – As used in this document the term "San Diego Water Board" is synonymous with the term "Regional Board" as defined in Water Code section 13050(b) and is intended to refer to the California Regional Water Quality Control Board for the San Diego Region as specified in Water Code Section 13200.

Sediment - Soil, sand, and minerals washed from land into water. Sediment resulting from anthropogenic sources (i.e. human induced land disturbance activities) is considered a pollutant. This Order regulates only the discharges of sediment from anthropogenic sources and does not regulate naturally occurring sources of sediment. Sediment can destroy fish-nesting areas, clog animal habitats, and cloud waters so that sunlight does not reach aquatic plants.

Shared Treatment Control BMP - BMPs used by multiple developments to infiltrate, filter, or treat the required volume or flow prior to discharge to a receiving water. This could include, for example, a treatment BMP at the end of an enclosed storm drain that collects runoff from several commercial developments.

Source Control BMP – Land use or site planning practices, or structural or nonstructural measures that aim to prevent runoff pollution by reducing the potential for contamination at the source of pollution. Source control BMPs minimize the contact between pollutants and runoff.

State Water Quality Protection Area – A nonterrestrial marine or estuarine area designated to protect marine species or biological communities from an undesirable alteration in natural water quality, including, but not limited to, areas of special biological significance that have been designated by the State Water Board through its water quality control planning process. Areas of special biological significance are a subset of State Water Quality Protection Areas, and require special protection as determined by the State Water Resources Control Board pursuant to the California Ocean Plan adopted and reviewed pursuant to Article 4 (commencing with Section 13160) of Chapter 3 of Division 7 of the California Water Code and pursuant to the Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California (California Thermal Plan) adopted by the State Water Board.

Storm Water – Per 40 CFR 122.26(b)(13), means storm water runoff, snowmelt runoff and surface runoff and drainage. ~~Surface runoff and drainage pertains to runoff and drainage resulting from precipitation events.~~

Structural BMP – Any structural control which detains, retains, or filters, to reduce the release of pollutants to surface waters from development projects (e.g. treatment control BMPs) which remains after construction.

Total Maximum Daily Load (TMDL) - The maximum amount of a pollutant that can be discharged into a water body from all sources (point and non-point) and still maintain water quality standards. Under CWA section 303(d), TMDLs must be developed for all water bodies that do not meet water quality standards after application of technology-based controls.

Toxicity - Adverse responses of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies). The water quality objectives for toxicity provided in the Basin Plan, state in part…"All waters shall be free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life….The survival of aquatic life in surface waters subjected to a waste discharge or other controllable water quality factors, shall not be less than that for the same water body in areas unaffected by the waste discharge".

Treatment Control BMP – Any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

Unpaved Road – Any long, narrow stretch without pavement used for traveling by motor passenger vehicles between two or more points. Unpaved roads are generally constructed of dirt, gravel, aggregate or macadam and may be improved or unimproved.

Waste - As defined in CWC Section 13050(d), "waste includes sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for purposes of, disposal."

Article 2 of CCR Title 23, Chapter 15 (Chapter 15) contains a waste classification system that applies to solid and semi-solid waste, which cannot be discharged directly or indirectly to water of the state and which therefore must be discharged to land for treatment, storage, or disposal in accordance with Chapter 15. There are four classifications of waste (listed in order of highest to lowest threat to water quality): hazardous waste, designated waste, non-hazardous solid waste, and inert waste.

Water Quality Objective - Numerical or narrative limits on constituents or characteristics of water designated to protect designated beneficial uses of the water. [California Water Code Section 13050 (h)]. California's water quality objectives are established by the State and Regional Water Boards in the Water Quality Control Plans. Numeric or narrative limits for pollutants or characteristics of water designed to protect the beneficial uses of the water. In other words, a water quality objective is the maximum concentration of a pollutant that can exist in a receiving water and still generally ensure that the beneficial uses of the receiving water remain protected (i.e., not impaired). Since water quality objectives are designed specifically to protect the beneficial uses, when the objectives are violated the beneficial uses are, by definition, no longer protected and become impaired. This is a fundamental concept under the Porter Cologne Act. Equally fundamental is Porter Cologne's definition of pollution. A condition of pollution exists when the water quality needed to support designated beneficial uses has become unreasonably affected or impaired; in other words, when the water quality objectives have been violated. These underlying definitions (regarding beneficial use protection) are the reason why all waste discharge requirements implementing the federal NPDES regulations require compliance with water quality objectives. (Water quality objectives are also called water quality criteria in the CWA.)

Water Quality Standards - Water quality standards, as defined in Clean Water Act section 303(c) consist of the beneficial uses (e.g., swimming, fishing, municipal drinking water supply, etc.,) of a water body and criteria (referred to as water quality objectives in the California Water Code) necessary to protect those uses. Under the Water Code, the water boards establish beneficial uses and water quality objectives in water quality control or basin plans. Together with an anti-degradation policy, these beneficial uses and water quality objectives serve as water quality standards under the Clean Water Act. In Clean Water Act parlance, state beneficial uses are called “designated uses” and state water quality objectives are called “criteria.” Throughout this Order, the relevant term is used depending on the statutory scheme.

Waters of the State - Any water, surface or underground, including saline waters within the boundaries of the State [CWC section 13050 (e)]. The definition of the Waters of the State is broader than that for the Waters of the United States in that all water in the State is considered to be a Waters of the State ~~regardless of circumstances or condition.~~. Under this definition, portions of a MS4 ~~is always~~may be considered to be a Waters of the State. However, man-made portions of the MS4 constructed for the sole purpose of flow and/or pollutant reduction are not considered waters of the state.

Waters of the United States - As defined in the 40 CFR 122.2, the Waters of the U.S. are defined as: “(a) All waters, which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters, including interstate “wetlands;” (c) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, “wetlands,” sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation or destruction of which would affect or could affect interstate or foreign commerce including any such waters: (1) Which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) Which are used or could be used for industrial purposes by industries in interstate commerce; (d) All impoundments of waters otherwise defined as waters of the United States under this definition: (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial seas; and (g) “Wetlands” adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area’s status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with the EPA.”

Watershed - That geographical area which drains to a specified point on a water course, usually a confluence of streams or rivers (also known as drainage area, catchment, or river basin).

Wet Season (aka Rainy Season) – The period of time from October 1 to April 30 when the San Diego Region experiences the most rainfall.

Wet Weather – Weather is considered wet if there is a storm event of 0.1 inches and greater and the following 72 hours, unless defined in another regulatory mechanism such as a TMDL.

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM ANNUAL REPORT FORM

FY ________________

I. COPERMITTEE INFORMATION		
Copermittee Name:		
Copermittee Primary Contact Name:		
Copermittee Primary Contact Information: Address: City: County: State: Zip: Telephone: Fax: Email:		
II. LEGAL AUTHORITY		
Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES NO	☐ ☐
III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE		
Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES NO	☐ ☐
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES NO	☐ ☐
IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM		
Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
Number of non-storm water discharges reported by the public		
Number of non-storm water discharges detected by Copermittee staff or contractors		
Number of non-storm water discharges investigated by the Copermittee		
Number of sources of non-storm water discharges identified		
Number of non-storm water discharges eliminated		
Number of sources of illicit discharges or connections identified		
Number of illicit discharges or connections eliminated		
Number of enforcement actions issued		
Number of high level enforcement actions issued		
V. DEVELOPMENT PLANNING PROGRAM		
Has the Copermittee implemented a development planning program that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
Was an update to the ~~Permanent~~ BMP ~~Sizing Criteria~~ Design Manual required or recommended by the San Diego Water Board?	YES NO	☐ ☐
If YES to the question above, did the Copermittee update its ~~Permanent~~ BMP ~~Sizing Criteria~~ Design Manual and make it available on the Regional Clearinghouse?	YES NO	☐ ☐
Number of proposed development projects in review		
Number of Priority Development Projects in review		
Number of Priority Development Projects approved		
Number of approved Priority Development Projects exempt from any BMP requirements		
Number of approved Priority Development Projects requiring mitigation		
Number of Priority Development Projects granted occupancy		
Number of completed Priority Development Projects in inventory		
Number of high priority Priority Development Project ~~permanent~~ structural BMP inspections		
Number of Priority Development Project ~~permanent~~ structural BMP violations		
Number of enforcement actions issued

Number of high level enforcement actions issued	

FY ________________

VI. CONSTRUCTION MANAGEMENT PROGRAM		
Has the Copermittee implemented a construction management program that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
Number of construction sites in inventory		
Number of active construction sites in inventory		
Number of inactive construction sites in inventory		
Number of construction sites closed/completed during reporting period		
Number of construction site inspections		
Number of construction site violations		
Number of enforcement actions issued		
Number of high level enforcement actions issued		
VII EXISTING DEVELOPMENT MANAGEMENT PROGRAM		
Has the Copermittee implemented an existing development management program that complies with Order No. R9-2012-0011?	YES NO	☐ ☐

	Municipal	Commercial	Industrial	Residential
Number of existing developments in inventory				
Number of existing development inspections				
Number of follow-up inspections				
Number of existing development violations				
Number of enforcement actions issued				
Number of high level enforcement actions issued				

VIII PUBLIC EDUCATION AND PARTICIPATION		
Has the Copermittee implemented a public education program that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
Has the Copermittee implemented a mechanism for public participation and where necessary intergovernmental coordination that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
IX. FISCAL ANALYSIS		
Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2012-0011?	YES NO	☐ ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☐ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

**JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM**

ADMINISTRATIVE DRAFT

ATTACHMENT E

SPECIFIC PROVISIONS FOR TOTAL MAXIMUM DAILY LOADS APPLICABLE TO ORDER NO. R9-2012-0011

These provisions implement Total Maximum Daily Loads (TMDLs), adopted by the San Diego Water Board and approved by USEPA under Clean Water Act section 303(c), which are applicable to discharges regulated under this Order. The provisions and schedules for implementation of the TMDLs described below must be incorporated into the Water Quality Improvement Plans and monitoring requirements, required pursuant to Provisions B and D of this Order, respectively, for the specified Watershed Management Areas.

1. Total Maximum Daily Load for Diazinon in Chollas Creek Watershed~~Total Maximum Daily Load for Diazinon in Chollas Creek WatershedTotal Maximum Daily Load for Diazinon in Chollas Creek Watershed~~ Resolution No. R9-2002-0123
2. Total Maximum Daily Loads for Dissolved Copper in Shelter Island Yacht Basin Resolution No. R9-2005-0019
~~3. Total Maximum Daily Loads for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed~~
~~4.~~3. Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek Resolution No. R9-2007-0043
~~5.~~4. Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay Resolution No. R9-2008-0027
~~6.~~5. Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek) Resolution No. R9-2010-0001

ADMINISTRATIVE DRAFT

1. Total Maximum Daily Load for Diazinon in Chollas Creek Watershed

a. Applicability

(1) TMDL Basin Plan Amendment: Resolution No. R9-2002-0123

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date:	August 14, 2002
State Water Board Approval Date:	July 16, 2003
Office of Administrative Law Approval Date:	September 11, 2003
US EPA Approval Date:	November 3, 2003

(3) TMDL Effective Date: September 11, 2003

(4) Watershed Management Area: San Diego Bay

(5) Water Body: Chollas Creek

(6) Responsible Copermittees: City of La Mesa, City of Lemon Grove, City of San Diego, County of San Diego, Unified Port District of San Diego

b. Water Quality Based Effluent Limitations

The WQBELs for Chollas Creek consist of the following:

(1) Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedule under Specific Provision 1.~~II~~c:

Table 1.1
Receiving Water Limitations as Concentrations in Chollas Creek

Constituent	Exposure Duration	Receiving Water Limitation	Averaging Period
Diazinon	Acute	0.08 µg/L	1 hour
	Chronic	0.05 µg/L	4 days

(2) Effluent Limitations

Discharges from the MS4s must not contain concentrations that exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 1.~~II~~c:

Table 1.2
Effluent Limitations as Concentrations in MS4 Discharges to Chollas Creek

Constituent	Exposure Duration	Effluent Limitation	Averaging Period
Diazinon	Acute	0.072 µg/L	1 hour
	Chronic	0.045 µg/L	4 days

(3) Best Management Practices

~~The following~~ BMPs for Chollas Creek ~~must~~may be incorporated into the Water Quality Improvement Plan for the San Diego Bay Watershed Management Area and implemented by the Responsible Copermittees:

~~(a) The Responsible Copermittees must implement BMPs capable of achieving the WQBELs under Specific Provision 1. for Chollas Creek.~~
~~(b) Responsible Copermittees must implement the Diazinon Toxicity Control Plan and Diazinon Public Outreach/Education Program as described in the report titled, *Technical Report for Total Maximum Daily Load for Diazinon in Chollas Creek Watershed, San Diego County*, dated August 14, 2002, including subsequent modifications, in order to achieve the WQBELs under Specific Provision 1..~~

~~(c)~~(a) The Responsible Copermittees should coordinate ~~the~~any implemented BMPs to address this TMDL with Caltrans ~~wherever and whenever~~ , as possible.

c. COMPLIANCE SCHEDULE

The Responsible Copermittees were required to achieve their WLA by December 31, 2010. The Responsible Copermittees must be in compliance with the WQBELs under Specific Provision 1.b~~kk~~.

d. COMPLIANCE DETERMINATION

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(1) There is no discharge from the MS4, or

(2) Applicable effluent limitations are met, or

(3) Receiving waters meet the applicable receiving water limitations or water quality objective, or

(4) Loading from the MS4 is such that it does not cause water quality objective exceedances, or

(5) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision A as described in Provision A.4.

e. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

ADMINISTRATIVE DRAFT

(1) The Responsible Copermittees must implement the monitoring and assessment requirements issued under Investigation Order No. R9-2004-0277, *California Department of Transportation and San Diego Municipal Separate Storm Sewer System Copermittees Responsible for the Discharge of Diazinon into the Chollas Creek Watershed*. The monitoring reports required under Investigation Order No. R9-2004-0277 must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~The Responsible Copermittees must monitor the effluent of the MS4 outfalls for diazinon within the Chollas Creek watershed, and calculate or estimate the monthly and annual diazinon loads, in accordance with the requirements of Provisions , , and of this Order. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision of this Order.~~

ADMINISTRATIVE DRAFT

2. Total Maximum Daily Loads for Dissolved Copper in Shelter Island Yacht Basin

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2005-0019

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date:	February 9, 2005
State Water Board Approval Date:	September 22, 2005
Office of Administrative Law Approval Date:	December 2, 2005
US EPA Approval Date:	February 8, 2006

(3) TMDL Effective Date: December 2, 2005

(4) Watershed Management Area: San Diego Bay

(5) Water Body: Shelter Island Yacht Basin

(6) Responsible Copermittees: City of San Diego, San Diego Unified Port District

b. WATER QUALITY BASED EFFLUENT LIMITATIONS

The WQBELs for Shelter Island Shoreline Park consist of the following:

(1) Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedule under Specific Provision 2.c~~qq~~:

Table 2.1
Receiving Water Limitations as Concentrations in Shelter Island Yacht Basin

Constituent	Exposure Duration	Effluent Limitation	Averaging Period
Dissolved Copper	Acute	4.8 µg/L	1 hour
	Chronic	3.1 µg/L	4 days

(2) Effluent Limitations

Discharges from the MS4s must not contain pollutant loads that exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 2.~~qq~~c:

Table 2.2
Effluent Limitations as Annual Loads in MS4 Discharges to Shelter Island Yacht Basin

Constituent	Effluent Limitation
Dissolved Copper	30 kg/yr

(3) Best Management Practices

The Responsible Copermittees ~~must~~may implement BMPs ~~capable of achieving~~to support the achievement of WQBELs under Specific Provision 2.~~pp~~ bfor Shelter Island Yacht Basin

c. Compliance Schedule

The Responsible Copermittees ~~was~~ are required to achieve ~~its~~ respective WLAs ~~upon the effective date of the TMDL,~~by December 2, ~~2005~~2022. The Responsible Copermittees must be in compliance with the WQBELs under Specific Provision 2.b~~pp~~.

d. Compliance Determination

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(1) There is no discharge from the MS4, or

(2) Applicable effluent limitations are met, or

(3) Receiving waters meet the applicable receiving water limitations or water quality objective, or

(4) Loading from the MS4 is such that it does not cause water quality objective exceedances, or

(5) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision A as described in Provision A.4.

~~d.~~e. Specific Monitoring and Assessment Requirements

(1) The Responsible Copermittees must ~~monitor~~implement the ~~effluent of its MS4 outfalls for dissolved copper, and calculate or estimate the monthly and annual dissolved copper loads, in accordance with the~~ monitoring and assessment requirements ~~of Provisions , , and of this~~ issued under Order~~.~~ No. R9-2005-0019. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~Specific Monitoring and Assessment Requirements~~

~~The Responsible Copermittee must implement the Sampling and Analysis Plan for Rainbow Creek Nutrient Reduction TMDL Implementation Water Quality Monitoring, dated January 2010. The results of any monitoring conducted during the reporting period, and assessment of whether the interim and final WQBELs have been achieved must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.~~

3. Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek

a. Applicability

(1) TMDL Basin Plan Amendment: Resolution No. R9-2007-0043

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date:	June 13, 2007
State Water Board Approval Date:	July 15, 2008
Office of Administrative Law Approval Date:	October 22, 2008
US EPA Approval Date:	December 18, 2008

(3) TMDL Effective Date: October 22, 2008

(4) Watershed Management Area: San Diego Bay

(5) Water Body: Chollas Creek

(6) Responsible Copermittees: City of La Mesa, City of Lemon Grove, City of San Diego, County of San Diego, San Diego Unified Port District ~~of San Diego~~

b. Water Quality Based Effluent Limitations

The WQBELs for Chollas Creek consist of the following:

(1) Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedule under Specific Provision 4.c.(1):

Table 3.1
Receiving Water Limitations as Concentrations in Chollas Creek

Constituent	Exposure Duration	Effluent Limitation (µg/L)	Averaging Period
Dissolved Copper	Acute	$(0.96) \times e^{[0.9422 \times \ln(\text{hardness}) - 1.700]} \times WER^*$	1 hour
	Chronic	$(0.96) \times e^{[0.8545 \times \ln(\text{hardness}) - 1.702]} \times WER^*$	4 days
Dissolved Lead	Acute	$[1.46203 - 0.145712 \times \ln(\text{hardness})] \times e^{[1.273 \times \ln(\text{hardness}) - 1.460]} \times WER^*$	1 hour
	Chronic	$[1.46203 - 0.145712 \times \ln(\text{hardness})] \times e^{[1.273 \times \ln(\text{hardness}) - 4.705]} \times WER^*$	4 days
Dissolved Zinc	Acute	$(0.978) \times e^{[0.8473 \times \ln(\text{hardness}) + 0.884]} \times WER^*$	1 hour
	Chronic	$(0.986) \times e^{[0.8473 \times \ln(\text{hardness}) + 0.884]} \times WER^*$	4 days

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

(2) Effluent Limitations

Discharges from the MS4s must not contain pollutant loads that exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 4.c.(1):

Table 3.2
Effluent Limitations as Concentrations in MS4 Discharges to Chollas Creek

Constituent	Exposure Duration	Effluent Limitation (µg/L)	Averaging Period
Dissolved Copper	Acute	$90\% \times (0.96) \times e^{[0.9422 \times \ln(hardness) - 1.700]} \times WER^*$	1 hour
	Chronic	$90\% \times (0.96) \times e^{[0.8545 \times \ln(hardness) - 1.702]} \times WER^*$	4 days
Dissolved Lead	Acute	$90\% \times [1.46203 - 0.145712 \times \ln(hardness)] \times e^{[1.273 \times \ln(hardness) - 1.460]} \times WER^*$	1 hour
	Chronic	$90\% \times [1.46203 - 0.145712 \times \ln(hardness)] \times e^{[1.273 \times \ln(hardness) - 4.705]} \times WER^*$	4 days
Dissolved Zinc	Acute	$90\% \times (0.978) \times e^{[0.8473 \times \ln(hardness) + 0.884]} \times WER^*$	1 hour
	Chronic	$90\% \times (0.986) \times e^{[0.8473 \times \ln(hardness) + 0.884]} \times WER^*$	4 days

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

(3) Best Management Practices

(a) The Responsible Copermittee ~~must~~may implement BMPs ~~capable of achieving~~to support the achievement of WQBELs under Specific Provision 4.c~~uu~~ for Chollas Creek.

(b) The Responsible Copermittees should coordinate the BMPs to address this TMDL with Caltrans and the U.S. Navy ~~wherever and whenever~~, as possible.

c. Compliance Schedule

(1) WLA Compliance Date

The Responsible Copermittee is required to achieve the WLA, thus must be in compliance with the WQBELs under Specific Provision 4.b~~uu~~, by October 22, 2028.

(2) Interim Compliance Requirements

The Responsible Copermittee must comply with the following interim WQBELs by the interim compliance date:

Table 3.1
Interim Effluent Limitations as Concentrations in MS4 Discharges to Chollas Creek

Interim Compliance Date	Constituent	Exposure Duration	Effluent Limitation (µg/L)	Averaging Period
October 22, 2018	Dissolved Copper	Acute	1.2 x 90% x (0.96) x $e^{[0.9422 \times \ln(\text{hardness}) - 1.700]}$ x WER*	1 hour
		Chronic	1.2 x 90% x (0.96) x $e^{[0.8545 \times \ln(\text{hardness}) - 1.702]}$ x WER*	4 days
	Dissolved Lead	Acute	1.2 x 90% x [1.46203 – 0.145712 x ln(hardness)] x $e^{[1.273 \times \ln(\text{hardness}) - 1.460]}$ x WER*	1 hour
		Chronic	1.2 x 90% x [1.46203 – 0.145712 x ln(hardness)] x $e^{[1.273 \times \ln(\text{hardness}) - 4.705]}$ x WER*	4 days
	Dissolved Zinc	Acute	1.2 x 90% x (0.978) x $e^{[0.8473 \times \ln(\text{hardness}) + 0.884]}$ x WER*	1 hour
		Chronic	1.2 x 90% x (0.986) x $e^{[0.8473 \times \ln(\text{hardness}) + 0.884]}$ x WER*	4 days

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

d. Compliance Determination

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(1) There is no discharge from the MS4, or

(2) Applicable effluent limitations are met, or

(3) Receiving waters meet the applicable receiving water limitations or water quality objective, or

(4) Loading from the MS4 is such that it does not cause water quality objective exceedances, or

(5) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision A as described in Provision A.4.

e. Specific Monitoring and Assessment Requirements

(1) The Responsible Copermittees must implement the monitoring and assessment requirements issued under Investigation Order No. R9-2004-0277, *California Department of Transportation and San Diego Municipal Separate Storm Sewer System Copermittees Responsible for the Discharge of Diazinon into the Chollas Creek Watershed*, when it is amended to include monitoring requirements for the Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek. The monitoring reports required under Investigation Order No. R9-2004-0277 must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

(2) The Responsible Copermittees must ~~monitor~~implement the ~~effluent of the MS4 outfalls discharging to Chollas Creek for dissolved copper, lead, and zinc, and calculate or estimate the monthly and annual dissolved copper, lead, and zinc loads, in accordance with the~~ monitoring and assessment requirements ~~of Provisions , , and of~~ issued under Order No. R9-2007-0043, as consistent with this Order~~.~~.. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

ADMINISTRATIVE DRAFT

4. Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2008-0027

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date: June 11, 2008
State Water Board Approval Date: June 16, 2009
Office of Administrative Law Approval Date: September 15, 2009
US EPA Approval Date: October 26, 2009

(3) TMDL Effective Date: September 15, 2009

(4) Watershed Management Areas: See Table 5.0

(5) Water Bodies: See Table 5.0

(6) Responsible Copermittees: See Table 5.0

Table 4.0
Applicability of Total Maximum Daily Loads for Indicator Bacteria
Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay

Watershed Management Area	Water Body	Segment or Area	Responsible Copermittees
South Orange County	Dana Point Harbor	Baby Beach	-City of Dana Point -County of Orange
San Diego Bay	San Diego Bay	Shelter Island Shoreline Park	-Unified Port of San Diego

b. WATER QUALITY BASED EFFLUENT LIMITATIONS

The WQBELs for segments or areas of the water bodies listed in Table 5.0 consist of the following:

(1) Receiving Water Limitations

(a) Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedules under Specific Provisions 5.c.(1)(a) and 5.c.(2):

ADMINISTRATIVE DRAFT

Table 4.1
Receiving Water Limitations as Bacteria Densities in the Water Body

Constituent	Receiving Water Limitations: Single Sample Maximum[1,2]	Receiving Water Limitations: 30-Day Geometric Mean[2]
Total Coliform	10,000 MPN/100mL	1,000 MPN/100mL
Fecal Coliform	400 MPN/100mL	200 MPN/100mL
Enterococcus	104 MPN/100mL	35 MPN/100mL

Notes:
1. During wet weather days, only the single sample maximum receiving water limitations are required to be achieved.
2. During dry weather days, the single sample maximum and 30-day geometric mean receiving water limitations are required to be achieved.

(b) If the above receiving water limitations are not met in the receiving water, the Responsible Copermittees must demonstrate that the discharges from the MS4s are not causing or contributing to the violation of receiving water limitations. The Copermittee must provide data that demonstrate the discharges from the MS4s are meeting the effluent limitations under Specific Provision 5.b.(2).

(2) Effluent Limitations

Discharges from the MS4s must not contain densities that exceed the following effluent limitations by the end of the compliance schedules under Specific Provisions 5.c.(1)(a) and 5.c.(2) to demonstrate the discharge is not causing or contributing to a violation of receiving water quality standards:

Table 4.2
Effluent Limitations as Bacteria Densities in MS4 Discharges to the Water Body

Constituent	Effluent Limitations: Single Sample Maximum[1,2]	Effluent Limitations: 30-Day Geometric Mean[2]
Total Coliform	10,000 MPN/100mL	1,000 MPN/100mL
Fecal Coliform	400 MPN/100mL	200 MPN/100mL
Enterococcus	104 MPN/100mL	35 MPN/100mL

Notes:
1. During wet weather days, only the single sample maximum effluent limitations are required to be achieved.
2. During dry weather days, the single sample maximum and 30-day geometric mean effluent limitations are required to be achieved.

Interim effluent limitations expressed as pollutant loads are given in the compliance schedule under Specific Provision 5.c.

(3) Best Management Practices

(a) The Water Quality Improvement Plans for the applicable Watershed Management Areas in Table 5.0 fulfill the Bacteria Load Reduction Plan (BLRP) requirements in Resolution No. R9-2008-0027.

(b) The Responsible Copermittee must implement BMPs capable of achieving the WQBELs under Specific Provision 5.0 for the segments or areas of the water bodies listed in Table 5.0

c. COMPLIANCE SCHEDULE

(1) Baby Beach in Dana Point Harbor

(a) WLA Compliance Dates

The Responsible Copermittees for MS4 discharges to Baby Beach are required to achieve the WLA, thus must be in compliance with the WQBELs under Specific Provision 5.0, according to the following compliance schedule:

Table 4.3
Compliance Schedule Dates to Achieve Baby Beach WLAs

Constituent	Dry Weather WLA Compliance Date	Wet Weather WLA Compliance Date
Total Coliform	September 15, 2014	September 15, 2009
Fecal Coliform		September 15, 2009
Enterococcus		September 15, 2019

(b) Interim Compliance Requirements

The Responsible Copermittees for MS4 discharges to Baby Beach must comply with the following interim WQBELs by the interim compliance date:

Table 4.4
Interim Effluent Limitations as Loads in MS4 Discharges to Baby Beach

Constituent	Interim Compliance Date	Dry Weather Interim Effluent Limitation	Wet Weather Interim Effluent Limitation
Total Coliform	September 15, 2012	$5.32x10^9$ MPN/day	NA*
Fecal Coliform	September 15, 2012	$0.59x10^9$ MPN/day	NA*
Enterococcus	September 15, 2012	$0.42x10^9$ MPN/day	NA**
	September 15, 2016	NA*	$207x10^9$ MPN/30days

Notes:
* The WQBELs under Specific Provision 5.b must already be achieved by the given interim compliance date.
** There is no corresponding interim WQBEL for the given interim compliance date.

(2) Shelter Island Shoreline Park in San Diego Bay

The Responsible Copermittee for MS4 discharges to Shelter Island Shoreline Park is required to achieve the WLA, thus must be in compliance with the WQBELs under Specific Provision 5.0, by December 31, 2012.

d. COMPLIANCE DETERMINATION

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(1) There is no discharge from the MS4, or

(2) Applicable effluent limitations are met, or

(3) Receiving waters meet the applicable receiving water limitations or water quality objective, or

(4) Loading from the MS4 is such that it does not cause water quality objective exceedances, or

(5) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision A as described in Provision A.4.

~~d.~~e. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

(1) Monitoring Stations and Procedures

The Responsible Copermittees must implement the monitoring requirements issued under Order No. R9-2008-0027.

~~(a) designate the MS4 outfalls within their jurisdiction discharging to the segments or areas of the water bodies listed in Table 5.0 as high priority non-storm water MS4 monitoring stations, in accordance with the requirements of Provision D.1.~~

~~(b)~~

~~(c) The Responsible Copermittees must establish at least one monitoring station within the receiving water body.~~

~~(2) Monitoring Procedures~~

~~(a) The Responsible Copermittees must monitor the effluent of the designated MS4 outfalls within their jurisdiction discharging during dry weather conditions to the segments or areas of the water bodies listed in Table 5.0 in accordance with the dry weather jurisdictional monitoring requirements of Provision D.1.a.(1)(b). Samples required to be submitted to a laboratory for analysis must include analysis for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.~~

~~(b) The Responsible Copermittees must monitor, within the first 24 hours of each storm event,[25] the effluent of the designated MS4 outfalls within their~~

~~[25] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].~~

~~jurisdiction discharging to the segments or areas of the water bodies listed in Table 5.0 in accordance with the wet weather jurisdictional monitoring requirements of Provision D.1.b.(1)(b) of this Order. Samples required to be submitted to a laboratory for analysis must include analysis for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.~~

~~(c) The Responsible Copermittees must collect samples from the monitoring stations within the receiving water body for each dry weather and wet weather MS4 outfall monitoring event. Samples must be analyzed for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.~~

~~(3)~~(2) Assessment and Reporting Requirements

(a) The Responsible Copermittees must analyze the dry weather and wet weather monitoring data to assess whether the interim and final WQBELs have been achieved.

(b) The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

5. Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2010-0001

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date: ___February 10, 2010
State Water Board Approval Date: ___December 14, 2010
Office of Administrative Law Approval Date: ___April 4, 2011
US EPA Approval Date: ___June 22, 2011

(3) TMDL Effective Date: April 4, 2011

(4) Watershed Management Areas: See Table 6.0

(5) Water Bodies: See Table 6.0

The water bodies identified in Table 6.0 are subject to the requirements of this Attachment E, except those water bodies listed in Table 6.0 that have been delisted from the 303(d) list for REC-1 bacteria impairments. These delisted water bodies are not subject to the requirements of this Attachment E so long as monitoring data continues to support compliance with water quality standards.

(6) Responsible Copermittees: See Table 6.0

b. WATER QUALITY BASED EFFLUENT LIMITATIONS

The WQBELs for segments or areas of the water bodies listed in Table 6.0 consist of the following:

~~(1) Receiving Water Limitations~~

~~(a) Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedules under Specific Provision 6.c.(1):~~

~~**Table 6.1**~~
~~*Receiving Water Limitations as Bacteria Densities and Allowable Exceedance Frequencies in the Water Body*~~

		~~Receiving Water Limitations~~		
~~Constituent~~	~~Single Sample Maximum[1,2] (MPN/100mL)~~	~~Single Sample Maximum Allowable Exceedance Frequency[3]~~	~~30-Day Geometric Mean[2] (MPN/100mL)~~	~~30-Day Geometric Mean Allowable Exceedance Frequency~~
~~Total Coliform~~	~~10,000~~	~~22% / 0%~~	~~1,000~~	~~0%~~
~~Fecal Coliform~~	~~400~~	~~22% / 0%~~	~~200~~	~~0%~~
~~*Enterococcus*~~	~~104[4] / 61[5]~~	~~22% / 0%~~	~~35[4] / 33[5]~~	~~0%~~

~~Notes:~~
~~1. During wet weather days, only the single sample maximum receiving water limitations are required to be achieved.~~
~~2. During dry weather days, the single sample maximum and 30-day geometric mean receiving water limitations are required to be achieved.~~
~~3. The 22% single sample maximum allowable exceedance frequency only applies to wet weather days. The 0% single sample maximum allowable exceedance frequency applies to dry weather days.~~
~~4. This *Enterococcus* receiving water limitation applies to segments of areas of Pacific Ocean Shoreline listed in Table 6.0.~~
~~5. This *Enterococcus* receiving water limitations applies to segments or areas of creeks or creek mouths listed in Table 6.0.~~

~~Interim receiving water limitations expressed as allowable exceedance frequencies are given in the compliance schedule under Specific Provision 6.fff.~~

~~(b) If the above receiving water limitations are not met in the receiving water, the Responsible Copermittees must demonstrate that the discharges from the MS4s are not causing or contributing to the violation of receiving water limitations. The Copermittee must provide data that demonstrate the discharges from the MS4s are meeting the effluent limitations under Specific Provision 6.b..~~

~~(2)~~(1) Effluent Limitations

Discharges from the MS4s must not ~~contain densities that exceed the following effluent limitations by the end of the compliance schedules under Specific Provision 6.c. to demonstrate the discharge is not causing~~cause or ~~contributing~~contribute to a violation of receiving water ~~quality standards~~limitations. The mass-based waste load allocations presented in Resolution No. R9-2010-0001 can be used to demonstrate that loading from the MS4 is such that it does not cause water quality objective exceedances, as described in bullet (4) under Specific Provision 6.d. ~~:~~

~~2. During dry weather days, the single sample maximum and 30-day geometric mean effluent limitations are required to be achieved.~~
~~3. The 22% single sample maximum allowable exceedance frequency only applies to wet weather days. The 0% single sample maximum allowable exceedance frequency applies to dry weather days~~
~~4. This *Enterococcus* effluent limitation applies to MS4 discharges to segments of areas of Pacific Ocean Shoreline listed in Table 6.0.~~
~~5. This *Enterococcus* effluent limitation applies to MS4 discharges to segments or areas of creeks or creek mouths listed in Table 6.0.~~

~~Interim effluent limitations expressed as allowable exceedance frequencies are given in the compliance schedule under Specific Provision 6.c.~~

~~(3)~~(2) Best Management Practices

(a) The Water Quality Improvement Plans for the applicable Watershed Management Areas in Table 6.0 ~~fulfill~~will incorporate the Comprehensive Load Reduction ~~Plan~~Plans (CLRP) ~~requirements in~~drafted pursuant to Resolution No. R9-2010-0001.

(b) The Responsible Copermittee ~~must~~may implement BMPs ~~capable of achieving~~to support the achievement of WQBELs under Specific Provision 6.~~eee~~ b for the segments or areas of the water bodies listed in Table 6.0.

(c) The Responsible Copermittees ~~should coordinate~~may implement BMPs to support the ~~BMPs~~achievement of ~~to address~~ this TMDL with Caltrans and owners/operators of small MS4s ~~wherever and whenever~~, as possible.

c. COMPLIANCE SCHEDULE

(1) WLA Compliance Dates

The Responsible Copermittees for MS4 discharges to a segment or area of the water bodies listed in Table 6.0 are required to achieve the WLA, thus must be in compliance with the WQBELs under Specific Provision 6.0, according to the following compliance schedule:

Table 5.2
Compliance Schedule Dates to Achieve Indicator Bacteria WLAs

Constituent	Dry Weather WLA Compliance Date	Wet Weather WLA Compliance Date
Total Coliform[1]	April 4, 2021	April 4, 2031
Fecal Coliform		
Enterococcus		

1 - Total coliform receiving water limitations apply only to segments of areas of Pacific Ocean Shoreline listed in Table 6.0.

(2) Interim Compliance Requirements

The Responsible Copermittees must comply with the ~~following~~ interim WQBELs by the interim compliance dates~~:~~ provided as part of the CLRP and supported by Order No. R9-2010-0001.

(a) Interim Dry Weather WQBELs

Interim dry weather WQBELS are expressed as receiving water limitations. The Responsible Copermittee must calculate the "existing" exceedance frequencies of the 30-day geometric mean water quality objectives for each of the indicator bacteria by analyzing the monitoring data collected between January 1, 2002 and April 4, 2011. "Existing" exceedance frequencies may be calculated by segment or area of a water body, or by water body, and/or by Watershed Management Area listed in Table 6.0. Separate "existing" exceedance frequencies must be calculated for beaches and creeks/creek mouths.

The Responsible Copermittees must achieve a 50 percent reduction in the "existing" exceedance frequency of the 30-day geometric mean WQBELs for the segments or areas of the water bodies listed in Table 6.0 ~~by the interim compliance dates for achieving the interim dry weather WQBELs given in Table 6.5~~. A 50 percent reduction in the "existing" exceedance frequency is equivalent to half of the "existing" exceedance frequency of the 30-day geometric mean WQBELs.

(3) Submittals to Support TMDL Basin Plan Amendment

The Responsible Copermittees are encouraged to submit data to support the TMDL reopener scheduled for April 2016 including but not limited to data related to reference watershed monitoring and beneficial use usage frequency.

~~The "existing" exceedance frequencies and the interim dry weather allowable exceedance frequencies (i.e. interim dry weather WQBELs) calculated by the Responsible Copermittees must be included in the Water Quality Improvement Plans for the applicable Watershed Management Areas.~~

~~Interim Wet Weather WQBELs~~

~~The Responsible Copermittees must achieve the interim wet weather WQBELs in Table~~

~~6.4, expressed as interim allowable exceedance frequencies, by the interim compliance dates for achieving the interim wet weather WQBELs given in Table 6.5.~~

a. COMPLIANCE DETERMINATION

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(1) There is no discharge from the MS4, or

(2) Applicable effluent limitations are met, or

(3) Receiving waters meet the applicable receiving water limitations or water quality objective, or

(4) Loading from the MS4 is such that it does not cause water quality objective exceedances, or

(5) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision A as described in Provision A.4.

The Phase I MS4s may demonstrate that their discharges are not causing the exceedances in the receiving waters by providing data from their discharge points to the receiving waters, by providing data collected at jurisdictional boundaries, and/or by using other methods accepted by the San Diego Water Board. Otherwise, at the end of the dry weather TMDL compliance schedule, the municipal Phase I MS4s will be held responsible and considered out of compliance unless other information or evidence indicates another controllable or uncontrollable source is responsible for the exceedances in the receiving waters. If controllable sources other than discharges from the municipal Phase I MS4s are identified before or after the end of the dry weather TMDL Compliance Schedule as causing the exceedances, those controllable sources will be responsible for reducing their bacteria loads and/or demonstrating that discharges from those sources are not causing the exceedances. The San Diego Water Board shall implement additional actions (e.g., issue enforcement actions, amend existing NPDES requirements or conditional waivers), as needed, to bring all controllable sources into compliance with the dry weather TMDLs.

e. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

The Bacteria Load Reduction Plans (BLRPs) and CLRPs to be submitted by the Copermittees and approved by the Regional Board Executive Officer contain monitoring programs. Implementation of those Regional Board-approved monitoring programs constitutes compliance with the Monitoring Station and Monitoring Procedure requirements, described below.

(1) Monitoring and Assessment Requirements for Beaches

(a) Monitoring Stations

~~(i) The Responsible Copermittees must designate the MS4 outfalls within their jurisdiction discharging to the Pacific Ocean Shoreline segments or areas listed in Table 6.0 as high priority non-storm water MS4 monitoring stations, in accordance with the requirements of Provision of this Order.~~

ADMINISTRATIVE DRAFT

~~(ii) For the Pacific Ocean Shoreline segments or areas listed in Table 6.0 with MS4 outfalls, the Responsible Copermittees must establish at least one monitoring station within the receiving water.~~

For beaches addressed by these TMDLs, monitoring locations should consist of, at a minimum, the same locations used to collect data required under MS4 NPDES monitoring requirements and beach monitoring for Health and Safety Code section 115880.[75] If exceedances of the receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations and/or other source identification methods must also be used to demonstrate that the bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters.

ADMINISTRATIVE DRAFT

(b) Monitoring Procedures

(i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations at least monthly.

(ii) The Responsible Copermittees must collect wet weather monitoring samples from the receiving water monitoring stations at least once within the first 24 hours of the end of a storm event[26] that occurs during the rainy season (i.e., October 1 through April 30).

~~(i) The Responsible Copermittees must monitor, within the first 24 hours of each storm event,[27] the effluent of the designated MS4 outfalls within their jurisdiction discharging to the Pacific Ocean Shoreline segments or areas listed in Table 6.0 in accordance with the wet weather jurisdictional monitoring requirements of Provision of this Order. Samples required to be submitted to a laboratory for analysis must include analysis for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.~~

~~(ii)~~(iii) ~~The Responsible Copermittees must collect samples from the monitoring stations within the receiving water body for each dry weather and wet weather MS4 outfall monitoring event.~~ Samples must be analyzed for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.

(c) Assessment and Reporting Requirements

(i) The Responsible Copermittees must analyze the dry weather and wet weather monitoring data to assess whether the interim and final WQBELs for the Pacific Ocean Shoreline segments or areas listed in Table 6.0 have been achieved.

[28] Commonly referred to as AB 411 monitoring

~~(i)~~(ii) The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

[26] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].

~~[27] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].~~

(2) Monitoring and Assessment Requirements for Creeks and Creek Mouths

(a) Monitoring Stations

~~(i) The Responsible Copermittees must establish at least one receiving water monitoring station at or near the mouth of the creeks listed in Table 6.0.~~

~~(ii)~~

~~(iii) The Responsible Copermittees must establish at least one receiving water monitoring station upstream of the station established for Specific Provision 6.d.(2)(a). At least one monitoring station must be established for each Responsible Copermittee at the most downstream location within its jurisdiction, and one monitoring station at the most upstream location within its jurisdiction.~~

~~(iv) The Responsible Copermittees must identify the MS4 outfalls discharging to the segments or areas of the creeks and creek mouths listed in Table 6.0. The Responsible Copermittees must identify the MS4 outfalls that are monitored in accordance with the dry weather jurisdictional monitoring requirements of Provision of this Order and the wet weather jurisdictional monitoring requirements of Provision of this Order.~~

For creeks addressed by these TMDLs, monitoring locations should consist of, at a minimum, a location at or near the mouth of the creek (e.g., Mass Loading Station or Mass Emission Station) and one or more locations upstream of the mouth (e.g., Watershed Assessment Stations). If exceedances of the receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations and/or other source identification methods must also be used to demonstrate that the bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters.

(b) Monitoring Procedures

(i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations ~~at least monthly.~~ according to the WQIP.

(ii) The Responsible Copermittees must collect wet weather monitoring samples from the receiving water monitoring stations within the first 24 hours of the end of a storm event[28] that occurs during the rainy season (i.e., October 1 through April 30).

(iii) Samples collected from receiving water monitoring stations must be analyzed for ~~total coliform,~~ fecal coliform~~,~~ and *Enterococcus* indicator bacteria.

(c) Assessment and Reporting Requirements

(i) The Responsible Copermittees must analyze the receiving water monitoring data to assess whether the interim and final receiving water WQBELs for the creeks and creek mouths listed in Table 6.0 have been achieved.

~~(ii) If the receiving water WQBELs for the creeks and creek mouths listed in Table 6.0 have not been achieved, the Responsible Copermittees must review the MS4 outfall monitoring data to assess whether the interim and final effluent WQBELs have been achieved.~~

~~(iii) The Responsible Copermittee must identify and incorporate additional MS4 outfall and receiving water monitoring stations and/or adjust monitoring frequencies to identify sources causing exceedances of the receiving water WQBELs.~~

(ii) The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

[28] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].

SUBJECT: DRAFT REGIONAL MUNICIPAL PERMIT

Dear ~~Mr. Gibson~~, Dave

I am writing to express the City of Santee's general support for the revised comments being submitted on behalf of the San Diego County Copermittees. We have been actively participating in the development of these comments; the focused meetings; and associated discussions with RWQCB staff and stakeholders.

We appreciate the opportunity to constructively participate in the development of this permit and hope that the RWQCB will continue the discussion with us as the administrative draft is developed.

We commend your leadership in enabling this process to occur.

Pedro Orso Delgado

CITY OF VISTA
CALIFORNIA

September 14, 2012

Regional Water Quality Control Board
Attention: Ms. Laurie Walsh
9174 Sky Park Court, Suite 100
San Diego, CA 92123-4340

Subject: **City of Vista Comments regarding the Administrative Draft of the Tentative Order No. R9-2012-0011, the NPDES Permit for Municipal Separate Storm Sewer Systems (MS4) Draining the Watersheds within the San Diego Region**

Dear Ms. Walsh:

The City of Vista appreciates the efforts that the Regional Water Board staff has undertaken to involve the stakeholders in the development of the new permit. The release of the administrative draft to the stakeholders is a positive step that fosters early and collaborative input and will provide for an improved Tentative Order when released. The focused meetings were successful in bringing together the various stakeholders and provided for fruitful discussions of the permit requirements that allowed for the expression of many points of view. Thank you for these efforts.

The City of Vista participated in the development of the comments submitted by the County of San Diego on behalf of the 21 Copermittees in San Diego County. We support the comments and look forward to their inclusion in the revised Tentative Order. Additionally, we respectfully submit the following comments for your consideration. Due to staffing limitations and time constraints, these comments were unable to be put forward for consideration in the Copermittee comments.

1. E.4.b.(2) - Construction Site Inventory and Tracking: This section addresses minimums in determining construction sites that are a high threat to water quality. The requirement to "identify all construction sites within its jurisdiction that represent a high threat to downstream surface water quality" is acceptable practice. However, the following requirements to include all sites within areas of the watershed that have water bodies that are impacted by sediment does not allow for prioritization of construction sites. **The statement "At a minimum, high threat to water quality sites must include:" should be changed to read "At a minimum, prioritization of construction sites must consider:"**

   Through many discussions with Regional Board Staff, the City understands that the concept of prioritization and adaptation is supported and will be incorporated throughout the permit. The City would appreciate the latitude to prioritize construction sites appropriately. In the past, prioritization has been accomplished taking many factors into account including site size, erosion potential, location related to an Environmentally Sensitive Area, sediment impaired waterbodies, etc. When

P: 760-639-6111 | www.cityofvista.com | F: 760-639-6112
200 Civic Center Drive, Vista, California 92084-6275

determining the threat to water quality of a construction site, the overall potential for the discharge of sediment is the critical consideration with respect to determining priority. The watershed and receiving water problems should be a factor in this determination, but should not automatically deem construction sites a high priority, regardless of other factors.

As written, it is likely that small sites, with limited ground disturbance and a low threat to water quality, will be deemed high priority due to their location within the jurisdiction. This may result in a misdirection of resources to provide frequent inspections at these sites with relatively little benefit to water quality.

2. Attachment C: **The definition of Monitoring Year should be changed to October 1 through September 30** to align with hydrologic patterns. This modification will allow for reporting of a full wet season followed by the subsequent dry season. This definition is consistent with the proposed Provision D submitted by the San Diego County Copermittees. Defining the monitoring year as written (July 1 – June 30) breaks up the dry season which will present challenges and inconsistencies in data interpretation and reporting.

We understand the need to balance the collaborative process in the development of the permit with the regulatory oversight incumbent on the Regional Water Quality Control Board. Thank you for the opportunities provided thus far for the Copermittees to add their experience and insights to the process. We look forward to further discussions on the concepts put forward as we all work towards a permit that will efficiently and effectively lead to improvements in water quality in the San Diego Region.

Sincerely,

Paul Hartman
Water Quality Protection Program Manager

Subject: County of Orange Comments on the Administrative Draft of Tentative Order No. R9-2012-0011, NPDES No. CAS0109266

Dear Ms. Walsh:

We are in receipt of April 9, 2012, *Administrative Draft Order No. R9-2012-0011 NPDES No. CAS0109266 National Pollutant Discharge Eliminations System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds Within the San Diego Region*. The County of Orange, as Principal Permittee of the Orange County Stormwater Program, welcomes the opportunity to provide comments on the Draft Administrative Order that has been prepared, distributed, and discussed by your staff. The south Orange County Permittees (Permittees) were involved in the development of these comments and the cities of Aliso Viejo, Dana Point and Mission Viejo have directed that they be recognized as concurring entities on this letter. We also support the comments of the Permittees in Riverside and San Diego Counties (except where noted in the attachments), who have identified many of the same issues with the Administrative Draft Order.

Since April 9, the Permittees have participated with Board staff in an initial public workshop (April 25), four "focused meetings" (June 27, July 11, July 25 and August 22), a hydromodification workshop (August 30), and a final public workshop (September 5). There have also been two separate Orange County-specific meetings. We recognize the significant efforts of your staff to engage the Permittees and key stakeholders in the initial development of this regional permit in a collaborative manner. While you are already aware of our concerns regarding the scheduling and appropriateness of this effort (see prior correspondence dated May 10, 2012, May 17, 2012 and July 3, 2012, which are incorporated by reference), this approach nonetheless represents a notable departure from prior permit renewal processes. It is hoped that this initial consultative effort is a harbinger for meaningful compromise on issues of concern to the Permittees.

In starting to conceive of a fifth term permit, the Permittees share an understanding that MS4 permitting needs to be informed by the following guiding principles:

1. The ability of the Permittees to direct resources toward specific water quality priorities in a given watershed, rather than all potential problems simultaneously, is more likely to result in actual / meaningful improvements in water quality.

2. The Permittees must be able to truly and fully adaptively manage their programs to focus their resources on those BMP strategies and monitoring efforts that are identified in the approved Water Quality Improvement Plan (WQIP) as being most effective, consistent with the MEP standard, to address each watershed's priorities.

3. The regional permit through the Water Quality Improvement plan (WQIP) should enable the Permittees to specify the jurisdictional and regional BMP strategies and the monitoring efforts that will be implemented to address the watershed's highest priorities, monitor and measure progress, identify and control pollutant sources, etc.

4. Once the WQIP is approved by the Regional Board, each Permittee's implementation of their respective responsibilities as laid out and scheduled within the WQIP, should alone constitute compliance with the regional permit.

5. The Jurisdictional Runoff Management Program (JRMP) is a procedural document that describes how each Permittee will accomplish their WQIP responsibilities.

6. The WQIP (and the BMP strategies and Monitoring and Assessment Plans (MAP) therein), should be updated at least every five years based upon the Report of Waste Discharge (ROWD), and as needed in between. Attachment D shows a conceptual representation of how we see the elements of the Draft Administrative Order working together cohesively, which would suggest structural change is needed to the organization of the Order.

7. The JRMP and monitoring program requirements should be written in the regional permit as a "default menu of options," recognizing that the WQIP - which will be publically vetted and approved by the Regional Board - will specify those jurisdictional and regional activities that will be implemented to address the watershed's priorities, the appropriate frequencies, performance standards, and other compliance elements.

We look forward to continuing to meet with Regional Board staff to discuss the development of the Permittees' next permit based upon these principles. In the meantime, we have summarized our overarching concerns with the Draft Administrative Order as general comments in this letter and provide additional comments and concerns in the following attachments:

- Attachment A presents a tabulation on our technical concerns.
- Attachment B presents a redline/strikeout version of the Draft Order.
- Attachment C presents a set of principles regarding monitoring.

- Attachment D presents a conceptual representation of how we see the elements of the Draft Administrative Order working together cohesively.

General Comments

I. MS4 Permitting

In 2009, your staff committed in the last permit renewal to look at consistency with the State's other MS4 permits, notably those being promulgated by the Santa Ana and Los Angeles Regional Boards. This commitment represented recognition of the Little Hoover Commission's highlighting of the lack of consistency in MS4 permits as a critical area of concern and consideration of the regulated communities and USEPA's interest in seeing greater permitting consistency. Nonetheless, while Regional Board staff has stated that the Draft Administrative Order is meant to be a modest incremental update of the current south Orange County permit, it nevertheless escalates the regulatory requirements in many key areas, creates greater variance with the north Orange County permit, and appears to represent a singular rather than statewide vision of the future of MS4 permitting.

To the extent that the Draft Administrative Order may ease the regulatory burden for your staff, there will be a commensurate increase in burden for the local governments that are dealing with multiple Regional Board jurisdictions if permitting in California continues to be defined by divergent rather than convergent approaches. It is therefore necessary for us to seek revisions to the Draft Administrative Order and an enrollment schedule supportive of a more cogent alignment of our countywide program. This consistency is important to the credibility of our respective efforts to manage urban runoff and is vital to sustaining the obvious cost effectiveness of a coordinated countywide program in Orange County with promising synergies in other regions at a time of widespread economic distress for many communities.

It should also be noted that the Draft Administrative Order provides no consideration at all for the five Permittees whose jurisdictional area is regulated under separate permits from the Santa Ana and San Diego Regional Boards.

II. Planning

Since 1993, the Drainage Area Management Plan (DAMP) has provided policy and programmatic guidance to each Permittee in the development of its DAMP/Local Implementation Plan that describes how stormwater management actions will be implemented on a jurisdictional basis (equivalent to the JRMP). It also includes Watershed Workplans (previously Watershed Action Plans) for each of the south Orange County watersheds. Concurrently, the annual progress report has developed into a systematic assessment of program effectiveness at jurisdictional, watershed, and countywide levels of resolution, using California Stormwater Quality Association program effectiveness assessment guidance and a comprehensive environmental quality dataset.

In 2009, it appeared that the DAMP was in danger of being dismissed as inconsequential "procedural correspondence." Consequently, the renewed importance of effective adaptive management to be described in a policy and program guidance document, i.e., the Water Quality Improvement Plan (WQIP), is welcomed by the Permittees. The attached redline/strikeout version of the Draft Administrative Order provides a number of suggested revisions related to this provision intended to more fully develop this planning process both as a robust basis for compliance and as a basis for ensuring meaningful water quality outcomes. However, the revisions do not address the separation of the planning and reporting processes that is a consequence of the current structure of the Draft Administrative Order. The Permittees believe that such structural adjustments need to be made in Draft Administrative Order to realize the full potential of the WQIP-JRMP alignment and planning and reporting process. See again attached Attachment D.

III. New Requirements for Land Development

The history of MS4 permitting has largely been defined by a focus on land development. In 2009, MS4 programs on a statewide basis started to transition requirements for land development from "treat and release" runoff management to onsite retention, a new emphasis on Low Impact Development (LID), and hydromodification. In 2012, while there is perhaps recognition of an emerging paradigm that the future management of urban landscapes should be based upon the principal of seeking to restore of natural hydrologic processes, there is absolutely no clear consensus on how and where this approach should be effected.

The attached comments are intended to shift the land development program toward an approach based upon nationally accepted LID principles, recognize the uncertainties and need for greater flexibility in hydromodification requirements, and offer a mitigative approach to urban land development that will produce meaningful environmental outcomes. Our revisions would recognize biofiltration as a LID BMP; ensure that the significantly more challenging requirements related to hydromodification are not imposed for discharges to channels that are engineered, concrete lined, significantly hardened, and/or are regularly maintained as part of a regional flood control program; and incorporate USEPA green street guidance to provide greater flexibility for land-constrained street, road, and highway projects consistent with other adopted MS4 permits in the State.

IV. Monitoring

The Permittees consider it axiomatic that the purpose of environmental monitoring is to inform and support decisions regarding the management, protection, and improvement of Orange County's surface water resources. During the focused meetings your staff explicitly encouraged submittal of alternate monitoring proposals that might better support the WQIP management approach. We have been party to the San Diego Permittees' efforts to define an alternative monitoring approach in response to this request and, indeed, concur with many elements of their proposal. However, we do not believe that this proposal represents a model for the permit that would be appropriate for Orange County. Instead, we believe that the WQIP management approach would be best served by permit requirements for monitoring that establish the principles and review criteria for a monitoring program that is reviewed and approved as an integral component of the WQIP. These principles should substitute for the Draft

Administrative Order's prescription in this area. Our recommendation regarding these principles is provided in Attachment C.

V. Technical Justification

To the extent that the Draft Administrative Order seeks to prescribe any requirements that escalate the future compliance obligations beyond the Permittees' current MS4 Permit, such requirements need to be supported by a rigorous technical justification. The Permittees are concerned that the Fact Sheet, which is the document for establishing the technical rationale for the regulations, has not been made available and appears to be on a schedule to follow rather precede the Tentative Order. At the same time the Report of Waste Discharge (ROWD), which represents the opportunity of the Permittees to consider and apply experiential knowledge is being made largely irrelevant by the regional permit approach. The Permittees believe that the integrity and credibility of the MS4 permitting process risks being compromised by the sidelining of the Fact Sheet and ROWD documents. These potentially significant shortcomings would be addressed by your staff releasing a Fact Sheet for review and comment in advance of the release of the Tentative Order and a re-crafting of the enrollment process to re-establish the role of the ROWD.

VI. Compliance

In responding to your staff's requests for comments on the Draft Administrative Order, the focus has been on providing technical comments intended to assist development of a MS4 permit that will support the Orange County Stormwater Program's continued progress toward our mutual goals based upon a robust and achievable basis for maintaining compliance centered on the WQIP. However, establishing the WQIP as the fundamental basis of compliance has tremendous legal significance. The Permittees believe that the Ninth Circuit Court of Appeals decision in the case of Natural Resources Defense Council vs. Los Angeles County Flood Control District will create an unavoidable situation of non-compliance unless the Receiving Water Limitations language is revised. The importance of making the revisions as shown in Attachment B cannot be overstated and its focus as a State Board workshop in November highlights this.

Thank you for your attention to our comments. Please contact me directly if you have any questions. For technical questions, please contact Chris Crompton at (714) 955-0630 or Richard Boon at (714) 955-0670.

Sincerely,

MAskorpanich

SUMMARY TABLE OF COMMENTS

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
1	General Comments	N/A	Throughout	The term "prohibit" is broader than the Clean Water Act requirements, and should be changed to "effectively prohibit." CWA section 402(p) (3) (B) (ii) reads as follows: (B) Municipal Discharge – Permits for discharges from municipal storm sewers – (ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewer; (Emphasis added) The permit shall "effectively prohibit non-stormwater discharges" but may exempt certain discharges that are not significant sources of pollutants from the prohibition. The section does not require a full prohibition but rather an effective prohibition. The operative word is "effective", which recognizes the constraints of owning and operating a stormwater drainage system, which includes hundreds of miles of open channel. The finding/provision should note that non-stormwater discharges are effectively prohibited (per 402(p)(3)(B)(ii)). In addition, discharges that are not significant sources of pollutants are exempted from the prohibition. In a practical sense, the use of word "effective" also provides flexibility to assess the impacts of relatively benign discharges such as landscape irrigation, air condition condensate, individual car washing, and non-emergency fire-fighting flows or non-anthropogenic sources before instituting a prohibition.	**Revise language throughout the Permit to read as follows:** Change "prohibit" to "effectively prohibit."
2	General	N/A	Throughout	Language similar to that which is deleted in the	**Revise language throughout the Permit to read**

[1] Refers to the page numbers of the original Administrative Draft issued by the Regional Board on April 9, 2012

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
	Comments			proposed changes is in several sections of the Admin Draft. This language provides an overly broad interpretation of the stormwater regulations.	**as follows:** "The goal of this provision is to address the impacts of MS4 discharges so that such discharges do not impair~~protect, preserve, enhance, and restore the~~ water quality and designated beneficial uses of waters of the state."
3	General Comments	1-2	Cover Pages	The Copermittees request clarification that waste discharge requirements are for their respective jurisdictions, in order to limit the entire permit to within each Copermittee's jurisdictional boundaries and preempt any such clauses that would extend requirements beyond the Copermittee's jurisdiction.	**As shown in the attached revised Permit, revise the cover page as follows:** "The San Diego County Copermittees in Table 1a are subject to waste discharge requirements within their respective jurisdictions as set forth in this Order" This change is also requested for other sections of the Permit, including Provision A. Add the same language for Orange and Riverside County Copermittees.
4	General Comments	N/A	Throughout	Jurisdictional boundaries only partially define the geographic extent of areas where Copermittees can control, reduce, or prohibit stormwater pollutants. The other component that must be incorporated into the Permit language is ownership/operation. There can be multiple MS4s within a municipal boundary (e.g., Phase 2 MS4s), and some MS4 areas are neither owned nor operated by Copermittees, preventing them from controlling pollutants or flows. The Permit should clarify that Permit requirements apply to MS4s owned and operated by the Copermittees. Other MS4 permits in California, including the Los Angeles County MS4 permit, include the "owned and operated" distinction.	**Clarify/Make distinction between different MS4 classifications:** Throughout the Permit replace "MS4s" with "MS4s owned and operated by the Copermittee".

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page**[1]	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
I. FINDINGS					
5		1	Finding 4	Minor edit change	**As shown in the attached revised Permit, revise the language as follows:** Delete space from "in to" to "into".
6		2	Finding 7	The interpretation of the Federal regulations is overly broad. The suggested deletion narrows the applicability of this Finding.	**As shown in the attached revised Permit, revise the language as follows:** The federal regulations [40 CFR 122.26(d)(2)(iv)(B)] require the Copermittees to have a program to effectively prohibit~~preventall types of non-stormwater discharges, or~~ illicit discharges, from entering the MS4.
7		2	Finding 9	Discharges may contain waste or pollutants, but it should not be presumed that they necessarily always contain waste or pollutants.	**As shown in the attached revised Permit, revise the language as follows:** "Discharges from the MS4s may contain waste, as defined in the CWC, and pollutants that adversely affect the quality of the waters of the state. A discharge from an MS4 is a "discharge of pollutants from a point source" into waters of the U.S. as defined in the CWA. Storm water and non-storm water discharges from the MS4s may contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the Basin Plan."
8		4	Finding 16	Although the Permittees do not agree with the Regional Board's Finding that the MEP technology-based standard does not apply to non-stormwater discharges, the Permittees are, at a minimum, recommending the proposed change to the existing language.	**As shown in the attached revised Permit, revise the language as follows:** "Non-storm water discharges ~~from~~into the MS4s are not considered storm water discharges and therefore are not subject to the MEP…"

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page**[1]	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
9		8	Finding 33	The Copermittees reserve the right to submit additional comments on the Fact Sheet and/or on Provisions of the Tentative Order based on the information that is provided in the Fact Sheet when it is made available for review. To date the Fact Sheet has not been provided to the Copermittees for review.	N/A
II. PROVISIONS					
A. Prohibitions and Limitations					
10	A	9	Prohibitions and Limitations	The proposed Prohibitions and Limitation provisions may be construed as standalone provisions that could expose the Copermittees to state and federal enforcement actions, as well as to third party actions under the federal Clean Water Act's citizen suit provisions. Consistent with the recent 9th Circuit Court of Appeal decision, each provision of the permit could be read separately so if provision A.2.a states that "the MS4 must not cause or contribute to a violations of a water quality standard" then that is the stand-alone provision, and the accompanying language found in A.4 (Compliance with Discharge Prohibitions) regarding compliance may be considered irrelevant. As such, a clear linkage between the compliance provisions and the prohibitions, receiving water limitations, and effluent limitations must be established.	**As shown in the attached revised Permit, insert the following sentence at the end of the introductory paragraph of Provision A:** "The process for determining compliance with the Discharge Prohibitions (A.1), Receiving Water Limitations (A.2), and Effluent Limitations (A.3, including effluent limitations derived from the TMDL requirements – Attachment E) is defined in Provision A.4." In this manner, Provisions A.1, A.2, and A.3 are clearly linked to A.4, as opposed to being standalone provisions.
11	A.1.a	9	Discharge Prohibitions	The Discharge Prohibitions do not establish a sufficient linkage with approved compliance schedules for TMDLs that have been incorporated into the Basin Plan. TMDLs adopted within the region include a schedule to provide MS4 Permittees the time necessary to develop and implement a plan to achieve water quality standards in impaired waters. The compliance schedules for effective TMDLs have been incorporated into Attachment E and language is included in the RWLs provisions (A.2.c.) and the Effluent Limitations	**As shown in the attached revised Permit:** **Revise 1.a. as follows:** "Except as otherwise permitted herein, ~~D~~ discharges ~~into and~~ fromMS4s, owned and operated by a Copermittee, in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance in ~~receiving~~ waters of the state are prohibited."

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page**[1]	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				provisions (A.3.b.) pointing to the TMDL compliance schedules.	
12	A.1.d	9	Discharge Prohibitions	The first sentence seems to conflict with the remainder of the paragraph and may create a conflict with the State Water Board's policy if not clarified. The revised language clarifies authorized and unauthorized discharges to the ASBS and limits the jurisdiction.	**As shown in the attached revised Permit, revise the language as follows:** "~~Discharges from MS4s to ASBS are prohibited unless specifically authorized.~~ Stormwater dischargesfrom the City of San Diego's MS4 to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's MS4 to the Heisler Park ASBS are authorized under this Order subject to the Special Protections contained in Attachment B to State Water Board Resolution No. 2012-0012applicable to these discharges, included in Attachment A to this Order. <u>All other discharges from MS4s to ASBS are prohibited, unless authorized by a subsequent order.</u>"
13	A.2.a, A.2.c	9-10	Receiving Water Limitations	Without modification to the RWLs, they conflict with TMDL compliance schedules. Language should be included to clarify that in instances where a TMDL iseffective, the Copermittees shall achieve compliance with these provisions as outlined in Attachment E (Specific Provisions for Total Maximum Daily Loads). Without the requested change, the RWLs put the municipalities in immediate and ongoing non-compliance with the permit, as opposed to incorporating TMDL implementation schedules.	**To provide a more direct tie in between Provision A.2.a, TMDL compliance schedules, and A.4 the following language is proposed, as shown in the attached revised Permit**. **Revise A.2.a by adding the following onto the end of the provision:** "…the list below to the extent they remain in effect and are operative, unless such discharges are being addressed by the Copermittee(s) through the processes set forth in this Order (including Provision A.4 below and Attachment E, the TMDL Provisions):." **As shown in the attached revised Permit, delete 2.c.**

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
14	A.2.a.3.b	10	Receiving Water Limitations	The Sediment Quality Control Plan applies specifically to bays and estuaries and only subtidal surficial sediments that have been deposited or emplaced seaward of the intertidal zone. Many Copermittees do not discharge to the intertidal zone. Text should be revised to clarify that this does not apply to inland MS4 discharges.	**As shown in the attached revised Permit, revise A.2.a.3.b as follows**: "Sediment Quality Control Plan which includes the following narrative objectives <u>for bays and estuaries:</u>"
15	A.2.a.4.b. Footnote 3	10	Receiving Water Limitations	Footnote to A.2.a.4.b requires Copermittees to not cause or contribute to the more stringent of a water quality objective or a CTR criterion. Instances may exist where it has been determined that one or the other is more appropriate given site specific conditions or analysis (i.e., a TMDL has been established).	**As shown in the attached revised Permit, attach the following to the end of footnote 3**: "unless a previous regulatory action (i.e., TMDL) has specified otherwise."
16	A.3	10	Effluent Limitations	Two types of effluent limitations, technology-based and water quality-based, are described in A.3, which should be reflected in the Permit.	**As shown in the attached revised Permit, revise subsections (a) and (b) for Technology-based and Water Quality-based Effluent Limitations, respectively.** **a.** Technology and Water Quality Based Effluent Limitations (including Effluent Limitations based on TMDLs). Each Copermittee shall reduce pollutants in discharges from the MS4 to the maximum extent practicable (MEP[2]). **b.** It is understood that compliance with this requirement will be achieved through the use of MEP-compliance best management practices (BMPs) or other controls that are

[2] This does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants in storm water discharges to the MEP prior to entering receiving waters (e.g., low flow diversions to the sanitary sewer).Runoff treatment must occur prior to the discharge of runoff into receiving waters per Finding **Error! Reference source not found.**.

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					consistent with the MEP standard.
17	A.3	10	Effluent Limitations	The water quality-based effluent limitations and compliance with the limitations should be linked to Attachment E; currently the language reads in a manner that is standalone from Attachment E. Instead, the language should reference Attachment E and the compliance determination language the Copermittees propose for inclusion therein.	**As shown in the attached revised Permit, revised the WQBEL language in A.3 as follows to better reflect the role of Attachment E:** "This Order establishes WQBELs consistent with the assumptions and requirements of all available TMDL waste load allocations assigned to discharges from the respective MS4s. Each Copermittee shall comply with applicable WQBELs as set forth in Attachment E to this Order, pursuant to the applicable TMDL compliance schedules."
18	A.4	11	Compliance with Discharge Prohibitions and Receiving Water Limitations	Language in Provision A.4 should be consistent with the CASQA proposed receiving water limitation language (also attached).	**As shown in the attached revised Permit, please modify A.4**.
19	A.4	12	Compliance with Discharge Prohibition and Receiving Water Limitations Compliance with Discharge Prohibitions, Receiving Water Limitations, and Effluent Limitations (Title Revision)	The Copermittees envision WQIPs as the foundation for a BMP-based compliance approach for the Discharge Prohibitions and RWLs. However, the language in the Provision A.4 describes the WQIPs as a document trail rather than a compliance mechanism. In essence, the language suggests that Copermittees shall expend significant resources to develop and implement WQIPs, but taking the actions in the WQIPs has no effect on the Regional Board's compliance determination. The iterative process is a fundamental aspect of MS4 programs, as envisioned by State Water Board Order 99-05 and later reconfirmed in Order WQ 2001-15 (BIA Order), and is the mechanism by which MS4 Permittees should <u>demonstrate</u> compliance. The WQIPs	**As shown in the attached revised Permit, modify the opening paragraph to A.4 to reflect the 99-05 order, using the WQIP in place of the SWMP, as follows:** 1. Change the title of the section and first sentence in A.4 to also include effluent limitations (A.3) 2. Add the following language to the end of the paragraph: "The Water Quality Improvement Plans described in Provision B shall be designed to achieve compliance to the MEP standard with the discharge prohibitions, receiving water limitations, and all effluent limitations. If the Executive Officer

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				now provide a mechanism to provide the detail and quantitative analyses used to identify pollutant sources and implement BMPs to address those sources.	approves a Water Quality Improvement Plan and subsequent updates as described in Provision B and F.1, and the plan is being implemented in a timely and good faith manner, such implementation of the plan shall constitute compliance with Provisions A.1, A.2, and A.3."
20	A.4	11	Compliance with Discharge Prohibition and Receiving Water Limitations	The WQIPs are intended to focus on water quality priorities. Pollutants addressed by existing TMDLs or are exceeding frequently such that a TMDL may be warranted are clearly high priority. However, pollutants that intermittently exceed a WQO or exceed once during a permit term appear to result in violations of the RWL provisions and will require Copermittees to expend resources in line with pollutants that have been identified as a priority. Provision A.4 describes the iterative process for MS4s to respond to exceedances of water quality standards that persist. However, the language in A.4 appears too broad and suggests the Copermittees should revise their WQIPs even in cases when (1) TMDL pollutant WLAs are exceeded but the TMDL compliance date has not yet occurred and (2) non-TMDL pollutant RWLs are exceeded and the pollutant is a WQIP priority but the BMP implementation schedule described in the WQIP has not yet been exhausted. In these two cases, the water quality standards exceedances are "expected" and no WQIP update is needed; instead the Copermittees should simply complete the implementation of actions identified in the WQIP.	**As shown in the attached revised Permit, revise the language as follows:** Revise the approach to determining compliance with the RWL provisions such that the primary focus of WQIPs is on priorities rather than random and infrequent exceedances of WQO. See also the language added to the introduction to Provision B. "The Water Quality Improvement Plans described in Provision B shall be designed to achieve compliance to the MEP standard with the discharge prohibitions, receiving water limitations, and all effluent limitations.“
B. Water Quality Improvement Plans					
21	B	13	Water Quality Improvement	Although Board staff have indicated that the WQIPs, once developed and approved, will functionally replace the CLRPs and BLRPs, the permit does not formally	**As shown in the attached revised Permit, revise the language as follows and add footnote 5:**

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
			Plans	recognize this. This footnote would clarify that this is the case.	"Once developed and approved, the Water Quality Improvement Plan and corresponding Jurisdictional Runoff Management Plans will functionally replace the Load Reduction Plans."
22	B	13	Water Quality Improvement Plans	The Copermittes request a revision to the WQIP goal statement. A concise goal statement that is more central to MS4 permitting is requested. This goal statement provides context to several requested revisions to subsequent provisions.	**As shown in the attached revised Permit, revise the second sentence of the first paragraph of Provision B as follows:** "The goal of the Water Quality Improvement Plan is to <u>1) effectively prohibit non-storm water discharges into the MS4s, 2) reduce pollutants in storm water discharges from the MS4s to the MEP, and 3)</u> attain the reasonable protection, ~~preservation, andenhancement and restoration~~ of water quality and designated beneficial uses of waters of the state."
23	B	13	Water Quality Improvement Plans	The County envisions the WQIPs as the foundation for a BMP-based compliance approach for the Discharge Prohibitions and RWLs. However, language is needs to be added to Provision B to provide a clear linkage between Provision A and B.	**As shown in the attached revised Permit, insert the following in the first paragraph of Provision B, after the second sentence:** "<u>Therefore, implementation of the WQIPs also provides the basis for complying with Provisions II.A.1, II.A.2, and II.A.3, as described in Provision II.A.4.</u>"
24	B	13	Water Quality Improvement Plans	Additional language should be added to clarify that Provision E requirements may be modified for consistency with Water Quality Improvements Plans.	**As shown in the attached revised Permit, insert the following at the end of the first paragraph of Provision B:** <u>"As such, the requirements outlined in Provision E may be modified for consistency with the Water Quality Improvement Plan for the applicable Watershed Management Area, if appropriate justification is provided."</u>

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					Insert the following language at the beginning of the second paragraph: "Development of the Water Quality Improvement Plans allows permittees to customize the requirements in Provision E to address the highest watershed priorities."
25	B	13	Water Quality Improvement Plans	Similarly, the Copermittees request revisions to the required/critical elements of the WQIPs. These elements reflect several requested revisions to the WQIP process (e.g., B.2), described below.	**As shown in the attached revised Permit, revise the second paragraph of Provision B as follows:** The Copermittees must develop Water Quality Improvement Plans for each Watershed Management Area that 1) prioritize water quality ~~issues~~ conditions resulting from the Copermittee's MS4 discharges ~~to and from the MS4s with~~in each Watershed Management Area, 2) identify MS4 pollutant sources ~~and other stressors~~ associated with ~~those~~the water quality priorities, 3) define numeric ~~targets~~goals and schedules to ~~achieve improvement of~~address water quality priorities, 4) describe water quality improvement strategies to achieve numeric ~~targets~~goals, and 5) develop and execute a coordinated monitoring and assessment program to facilitate adaptive management of the Water Quality Improvement Plansand determine progress towards achieving ~~improved water quality~~those goals.
26	B	13	Water Quality Improvement Plans	It is unclear whether the 12-month timeline identified in the third paragraph of Provision B applies to the development of the WQIP or the implementation of the BMPs identified in the WQIP. It would appear that the	**As shown in the attached revised Permit, revise the last introductory paragraph of Provision B, as follows:** "The Copermittees must submit Water Quality

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				provision requires that the MS4s must *implement* all the requirements (including BMPs) of Provision B within 12 months of permit adoption.	Improvement Plans for public review and Regional Board Executive Officer review and approval per the schedule outline in Provision II.B.0. "
27	B	13	Water Quality Improvement Plans	The development of a WQIP will require at a minimum of 18 months and BMP implementation will likely be staggered over a certain time frame. Once the permit is adopted, Copermittees will begin the planning process. However, Copermittees must have at least one full fiscal year budgeting cycle within which to seek additional funding to implement the WQIP from our governing bodies (i.e., City councils and County supervisors). Thus the more reasonable time schedule is to require the development of the WQIP within 18 months and the implementations of the BMPs to occur consistent with the final approved WQIP.	**See the proposed changes to the last paragraph of the opening section of Provision B in the attached revised Permit.** A staggered approach to WQIP development is proposed, as detailed in a proposed section B.6. This staggered approach ensures rapid progress on WQIP development while providing a feasible WQIP submittal and initiation schedule: 1. The WQIP priorities and numeric goals are presented to the Regional Board within 6 months of the adopted Order. (B.6.a) 2. The complete WQIPs and corresponding jurisdiction measures are submitted 12 months later. (B.6.b) 3. WQIP implementation is initiated at the beginning of the next fiscal year. (B.6.b)
28	B.1	13-14	Watershed Management Areas	Several changes to Table B-1 are requested. The Copermittees request addition of a tenth WMA, for Mission Bay which is entirely in the jurisdiction of the City of San Diego. Furthermore, the City of Poway is not a responsible Copermittee for San Diego River. City of Escondido is not a responsible Copermittee for San Luis Rey River. Finally, the waterbody Loma Alta Slough should be listed under the Carlsbad WMA. Penasquitos WMA includes Miramar Reservoir HA and Poway HA.	**Make the following changes to Table B-1, per the attached revised Permit:** 1. Add a WMA for Mission Bay which includes Scripps HA, Miramar HA, and Tecolote HA. 2. Remove Penasquitos HA and Mission Bay HA from Penasquitos WMA and insert Miramar Reservoir HA and Poway HA. 3. Remove City of Poway from San Diego River 4. Remove City of Escondido from San Luis Rey River.

COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011					
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
					5. Add the waterbody "Loma Alta Slough" to the Carlsbad WMA.
29	B.2	15-18	Identification of Water Quality Priorities	The Copermittees have fully embraced the concept of WQIPs and appreciate the Regional Board's approach to identifying priorities, setting goals, and developing a strategy and schedule to meet those goals. The Copermittees have identified an alternative to Provision B.2, which follows the general approach proposed by the Regional Board but increases focus on addressing MS4 impacts.	The following changes are requested, as detailed in the attached revised Permit section B and further described in subsequent comments: 1. Revisions are proposed to section B.2.a to refine the purpose and add considerations for assessing receiving water conditions. 2. A new section B.2.b is proposed to provide a linkage between receiving water conditions and corresponding impacts from the MS4s (versus other sources). 3. Section B.2.c is expanded to describe the considerations when identifying priority receiving water conditions. 4. Section B.2.d is refined to focus on MS4 impacts and pollutant generating activities. 5. Section B.2.e is refined to elucidate the meaning of numeric goals and their implication for MS4 compliance. 6. The schedule component of B.2.e is moved to a new section B.6 to improve organization of WQIP concepts.
30	B.2.a	15-16	Assessment of Receiving Water Conditions	The assessment of receiving water conditions is a critical first step to WQIP development. Changes to purpose of this step are proposed, to focus on water quality issues related to MS4s. Further, data quality and relevance are critical to this assessment, and requirement to consider "all available data" should be refined to address accessibility and quality control issues. Finally, whether a receiving water condition can be achieved and maintained should be assessed.	**As shown in the attached revised Permit, the following changes/revisions were made in Permit section B.2.a:** **Revise the opening paragraph**: "The Copermittees must consider the following, at a minimum, to support the identification of water quality priorities based on the impacts of MS4 discharges on receiving water beneficial uses:"

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					Under part (7): replace "All available data" with "Available, relevant, and appropriately collected…data meeting appropriate QA/QC standards" **Insert a new part (10):** "The potential for long-term achievement and maintenance of beneficial use attainment in the Watershed Management Area."
31	*Language Addition* B.2.b	Not in original (Add at: 17-18)	Assessment of MS4 Discharge Quality and Impacts	For WQIP development, it is critical to differentiate between receiving water conditions and MS4 discharges and impacts. Many receiving water conditions are not driven by MS4 impacts, and Copermittees can have the greatest effect on receiving water quality by focusing on reduction of pollutants discharged by their MS4s.	**As shown in the attached revised Permit, add a new section B.2.b titled "Assessment of MS4 Discharge Quality and Impacts", as follows:** "To support the identification of priorities based on the impacts of MS4 discharges on receiving water beneficial uses, the Copermittees must review appropriately collected MS4 discharge quality data and consider the extent to which MS4s cause or contribute to the adverse impacts to receiving water beneficial uses identified in II.B.2.a. Considerations include: (1) Locations of the Copermittees' MS4 discharges with respect to receiving waters; (2) MS4 discharge quality results relevant to impacts in receiving waters and action levels, including the temporal and geographic variation of the results: (3) The requirements of Provisions II.A.1 and II.A.3.; and (4) Whether MS4 discharge quality is sufficiently well known or other information is available to assess whether MS4 discharges are causing or contributing to specific receiving water

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					conditions, or whether additional data need to be collected through the Monitoring and Assessment Program developed as part of the Water Quality Improvement Plan."
32	B.2.b	16	Identify Priority Pollutants and Receiving Water Conditions Identification of Priority Receiving Water Conditions (Title Revision)	We appreciate the Regional Board's approach to identifying priorities for receiving water conditions. Our proposed revisions to the Permit add several elements that should be included by Copermittees when identifying priority receiving water conditions. Following the Regional Board's approach, "priorities" are also differentiated from "highest priorities" (see new sub-bullet 6). Note the proposed revision to the title of the section, which better reflects the envisioned effort/outcome.	**As shown in the attached revised Permit, rename section to "Identification of Priority Receiving Water Conditions" and add the following to the end of the Section B.2., as follows:** "The Water Quality Improvement Plans shall describe the following for each priority receiving water condition: (1) The beneficial use(s) and pollutant(s) associated with the priority receiving water condition(s); (2) The geographic extent of the priority receiving water condition(s)within the WMA, if known; (3) The Copermittees with MS4s that contribute discharges to the priority water receiving condition(s); (4) The temporal extent of the priority receiving condition(s) (i.e., dry weather and/or wet weather); (5) Whether receiving waters have been monitored sufficiently to adequately characterize the priority receiving condition(s), including a consideration of spatial and temporal variation; and (6) The reasoning for selecting specific receiving water conditions as a priority and a subset of priorities as the highest priorities."
33	B.2.c	16-	Pollutant Source	The success of WQIPs will hinge on the ability of	

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
		17	and/or Stressor Identification MS4 Pollutant Source Identification (Title Revision)	MS4s to identify and abate sources of pollutants within the MS4s. The pollutant source identification process proposed by the Regional Board is too broad and inhibits the Copermittees from focusing on the sources they are most able to control. In addition, some pollutants are poorly understood and need to be further investigated to allow for design of pollutant control strategies [new sub-bullet d.(4).(5)]. The proposed revisions to the Source ID section are intended to effectively focus the WQIP prioritization process.	**As shown in the attached revised Permit, rename section to "MS4 Pollutant Source Identification" and revise the section, as follows:** See the changes proposed in the attached revised Permit, which focuses the Source ID section on MS4 sources and impacts. **The new section B.2.d follows:** "The Copermittees must identify <u>and prioritize</u> known and suspected storm water and non-storm water pollutant sources within the MS4 associated with the highest priority receiving water conditions identified under II.B.2.c. The identification of known and suspected sources of the highest water quality priorities as identified for Provision B.2.c shall consider the following : (1) Land uses and their potential contribution to the highest priority receiving water conditions; (2) Pollutant generating facilities, areas, and/or activities within the Watershed Management Area;: (3) Locations of the Copermittees' MS4s outfalls. (4) Review of available data, including: (a) Findings from the Copermittees' illicit discharge detection and elimination programs, (b) Findings from the Copermittees' MS4 outfall monitoring,

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					(c) Other available, relevant, and appropriately-collected data, information, or studies related to pollutant sources and pollutant-generating activities that contribute to the highest priority receiving water conditions identified in Provision II.B.2. (5) Whether MS4 sources are sufficiently well known to design an effective, directed control strategy, or whether additional source/stressor identification needs to be conducted through the Monitoring and Assessment Program developed as part of the Water Quality Improvement Plan to identify and prioritize sources/stressors within the watershed."
34	B.2.d	17-18	Numeric Targets and Schedules Numeric Goals (Title Revision)	We appreciate the Board staff efforts to allow the MS4s to prioritize their water quality issues and to develop a plan to address these issues. However, the terminology in Provision B.2.d regarding interim and final targets are terms used in TMDL program and their use here confuses the issue. In fact, Provision 2.d (3)(e) clearly ties the numeric "targets" with a TMDL. The WQIP should identify interim and final numeric "goals" to keep the distinction clear between a TMDL and a WQIP. It is entirely possible that the interim goal may in fact be the same as an interim TMDL target but not necessarily.	**Replace "numeric target" with "numeric goal" throughout Provision B.**
35	B.2.d	17-18	Numeric Targets and Schedules	It will be critical to quantify the expected outcomes of WQIP implementation efforts, and numeric goals serve	**As shown in attached revised Permit, revise section B.2.d, as follows:**

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Numeric Goals (Title Revision)	to elucidate those expected outcomes. Based on the proposed revisions to the WQIP goals and elements, revisions to the description of the purpose of numeric goals are also proposed. Furthermore the notation of "target" implies a compliance effluent limit and thereby subject to enforcement action, versus goals set by the Copermittees that do not trigger any enforcement action by themselves.	The Copermittees must develop and incorporate interim and final numeric[6] goals goals[7] into the Water Quality Improvement Plans. Numeric goals and schedules are intended to support Water Quality Improvement Plan development and to measure progress towards addressing the highest priority receiving water conditions identified under II.B.2.**Error! Reference source not found.**. Numeric goals themselves are not enforceable compliance standards, effluent limitations, or receiving water limitations. When establishing numeric goals and corresponding schedules, the Copermittees must consider the following: (1) Final numeric goals must be based on measureable criteria or indicators, to be achieved in the receiving waters and/or MS4 discharges for the highest priority receiving water conditions which will be capable of demonstrating progress toward the achievement of the restoration and/or protection of water quality standards in receiving waters; and (2) Interim numeric goals must be based on measureable criteria or indicators that can demonstrate incremental progress toward achieving the final numeric goals in the receiving waters and/or MS4 discharges. **Footnote 7:** "Interim and final numeric goals may take a variety of forms such as TMDL targets, TMDL wasteload allocations, TMDL based

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					WQBELs incorporated in Attachment E of this Order, action levels, pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric goals are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators. To the extent that a goal is not based on an enforceable regulatory mechanism (i.e., TMDL, WLA), WQIP goals and schedules may be revised through the iterative process. Numeric goals are not subject to enforcement or non-compliance actions under this Order."
36	B.2.d.3	17-18	Numeric Targets and Schedules Implementation Schedules (Title Revision)	The schedule for achieving a numeric goal is tied to *implementation* not the goals itself. Therefore, it is recommended that part B.2.3 be moved to the section that describes WQIP implementation schedule requirements.	**As shown in the revised Permit, sub-bullet (3), which is the schedule component of B.2.e, should be moved to section B.3.b to improve organization of WQIP concepts.**
37	B.3	18-19	Water Quality Improvement Strategies and Schedules	The current version of B.3 requires that the MS4s have all of the following water quality improvement strategies in their WQIP (sub-bullets B.3.a.1 through B.3.a.4): structural and non-structural BMPs, retrofit projects, stream and/or habitat rehabilitation, and other water quality improvements associated with eliminating non-stormwater discharges to the MS4s. This may be an appropriate menu of actions to choose from, but pending the water quality issues and the watershed, the WQIP strategies may include all or only one of the strategies listed.	**As shown in the revised Permit, revise section B.3, as follows:** See the changes proposed in the attached revised Permit section B.3. Sub-bullets B.3.a.1 through a.4 are revised and condensed into two sub-bullets, one for JRMP activities and one for other structural and non-structural BMPs. These two sub-bullets compose the universe of BMPs that would be implemented by the Copermittees to meet the WQIP numeric goals:

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					(1) Copermittee-selected activities identified in Provision E ,either as described in the jurisdictional runoff management programs or as modified with justification, that will address the highest priority receiving water conditions; and (2) Additional Copermittee-selected structural and/or non-structural BMPs that are designed to achieve the interim and final numeric goals. **a. WATER QUALITY IMPROVEMENT STRATEGIES** The water quality improvement strategies must prioritize, based on their likely effectiveness and efficiency, and implement measures, as appropriate, to effectively prohibit non-storm water discharges into its MS4, reduce pollutants in storm water discharges from its MS4 to the MEP, and achieve the interim and final numeric goals in accordance with the schedules in Provision II.B.2.e. Measures shall include: (1) Activities identified in Provision E either as described or as modified, with justification, at the discretion of each Copermittee[3]; and (2) Structural and/or non-structural BMPs that are designed to achieve the interim

[3] Activities considered for modification shall include those required in Provisions II.D and II.E with the exception of II.E.3.c.(2)(b), II.E.3.c.(2)(d) and II.E.3.c.(3).

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					and final numeric goals identified in Provision II.B.2.e.
38	B.3.b	19	Implementation Schedules	Implementation of the WQIPs should form the basis of Permit compliance. As commented above, the schedule bullets from the Numeric Targets section should be moved to the Implementation Schedule section. Furthermore, the requirement that "Final dates for achieving final numeric targets must not extend more than 10 years..." is one of the most disconcerting requirements in the Permit. Based on conversations with Regional Board staff, it is understood that goals can take a number of forms and the "10 year" requirement is not intended as a requirement to attain all Basin Plan water quality standards within 10 years. However, to ensure this requirement is not mis-interpreted by third parties, language should be added to make this clarification.	**As shown in the attached revised Permit, add a footnote to sub-bullet (5), as follows:** "Achievement of final numeric goals within 10 years represents progress towards attainment of water quality standards, but is not a requirement to fully attain all applicable water quality standards or all priority receiving water conditions within 10 years."
39	B.4	19-20	Water Quality Improvement Monitoring and Assessment	Monitoring and assessment will be a critical component of the WQIP process. The vision for WQIP monitoring and assessment is reflected in the proposed revised language for Permit section B.4. A major aspect of this vision is that monitoring requirements in Provision D will be fully integrated into the WQIPs and modified as the WQIPs evolve. The proposed language clarifies the Copermittee's vision for purpose and components of WQIP monitoring and assessment. The requested linkage with Provision D is highlighted through the proposed revision.	As shown in the attached revised Permit revise section B.4, as follows: The Copermittees in each Watershed Management Area must develop an integrated Water Quality Improvement Plan Monitoring and Assessment Program that assesses: 1) progress toward achieving the numeric goals and schedules, 2) progress toward addressing the highest priority receiving water conditions for each Watershed Management Area, and 3) each Copermittee's overall efforts implementing the requirements of Provision B. The water quality improvement monitoring and assessment program must include the monitoring and assessment requirements of

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page**[1]	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					Provision D, which may be modified for consistency with the priority receiving water conditions of each Watershed Management Area and associated Copermittees. For Watershed Management Areas with applicable TMDLs, the water quality monitoring and assessment program must incorporate the specific monitoring and assessment requirements of Attachment E. For Watershed Management Areas with any ASBS, the water quality monitoring and assessment program must also incorporate the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-001**2** (see Attachment A).
40	B.5	20-21	Adaptive Management Process	The WQIPs provide an opportunity to integrate water quality improvement strategies (e.g, TMDL implementation) and jurisdictional runoff management programs. The Copermittees have embraced the concept of WQIPs and propose to revise the Permit to fully integrate JRMPs into the WQIP process. The Adaptive Management section B.5 proposed by the Regional Board has two components: WQIP adaptive management and JRMP adaptive management. With the proposed expanded scope of the WQIPs proposed by the Copermittees, the two components of the adaptive management process are not WQIP and JRMP, instead the components are (1) Priority Receiving Water Conditions and Numeric Goals and (2) Water Quality Improvement Strategies and Schedules. The proposed revisions to section B.5 reflect the Copermittee's vision for WQIP implementation.	**As shown in the attached revised Permit revise section B.5, as follows:** The Copermittees in each Watershed Management Area must implement the iterative process, adapting the Water Quality Improvement Plan to become more effective and meet the requirements of Provisions II.A, and shall consider the following: **a. PRIORITY RECEIVING WATER CONDITIONS AND NUMERIC GOALS** The priority receiving water conditions and numeric goals, developed pursuant to II.B.2.c. and II.B.2.e respectively, shall guide jurisdictional implementation efforts for the duration of this Order. Recommendations for changes to priority receiving water conditions and numeric goals shall be provided in the Report of Waste Discharge and shall consider the following:

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				Most of the components of the adaptive management process proposed by the Regional Board (sub-bullets B.5.a.1.a thru h and B.5.b.1.a thru e) are included. The proposed language adds clarification on the purpose of the adaptive management process and re-organizes into two alternative management categories: (1) Priority Receiving Water Conditions and Numeric Goals and (2) Water Quality Improvement Strategies and Schedules. Note that these two management categories are adapted on different timelines: • Priority Receiving Water Conditions and Numeric Goals would be adapted, at a minimum, on a frequency that corresponds to Permit cycles (every 5 years). In this manner the ROWD for future permits is supported by the WQIP process. It is not expected that priority receiving water conditions and numeric goals would vary on a shorter frequency, and thus resources for adaptive management should be focused on the strategies/BMPs used to *achieve* the numeric goals. • Water Quality Improvement Strategies and Schedules would be adapted annually, allowing modification to the JRMP elements, structural BMPs, and non-structural BMPs for achieving numeric goals. Finally, to improve organization, it is proposed that the requirements regarding WQIP and JRMP modification and submittals (sub-bullets B.5.a.2 thru 3 and B.5.b.2 thru 3) be moved to a new section B.6.	(1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan; (2) Progress toward achieving interim and final numeric goals in receiving waters and/or MS4 discharges for the highest water quality priorities in the Watershed Management Area (3) New scientific information or new or updated policies or regulations that affect identified numeric goals including revised water quality objectives or TMDLs; (4) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality problems and implementation measures to address the highest priority receiving water conditions; (5) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
					informs the effectiveness of the actions implemented by the Copermittees; (6) The factors listed in Provision II.B.2.a.(1)-(10); (7) San Diego Water Board recommendations; and Recommendations for modifications solicited through a public participation process. **b. WATER QUALITY IMPROVEMENT STRATEGIES AND SCHEDULES** The water quality improvement strategies and schedules required pursuant to II.B.3 shall be adapted as new information becomes available to inform more effective and efficient means of achieving the numeric goals established in II.B.2.e. Copermittees shall consider adaptation to ~~b. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM ADAPTIVE MANAGEMENT PROCESS~~ jurisdictional programs and monitoring and assessment strategies and schedules at least annually considering the following: (1) Changes to priority receiving water conditions and numeric goals based on recommendations from II.B.5.a.;

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					(2) Measurable or demonstrable reductions of non-storm water discharges to each Copermittee's MS4; (3) Measurable or demonstrable reductions of pollutants in storm water discharges from each Copermittee's MS4 to the MEP; (4) Information on the MS4 sources and/or pollutant-generating activities determined to be most significantly contributing to priority receiving water conditions; (5) Efficiency in implementing the Water Quality Improvement Plan; (6) San Diego Water Board recommendations; and (7) Recommendations for modifications solicited through a public participation process.
41	B.6	21	Water Quality Improvement Plan Implementation	The WQIP development and implementation process has several components and requirements for submittals to the Regional Board. As described in the first comments for Provision B, a staggered WQIP submittal schedule is proposed to extend the timeline to 18 months while still ensuring rapid progress on WQIP development. This proposal is described in the	**6. Water Quality Improvement Plan Submittal, Implementation, and Modifications** **a. PRIORITY RECEIVING WATER CONDITIONS, MS4 SOURCES, AND NUMERIC GOALS**

COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011					
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				proposed language for the new Section B.6. Furthermore, requirements for submittals to the Regional Board following modifications due to adaptive management would also fall under section B.6. A staggered approach to WQIP development is proposed, as detailed in a proposed section B.6. This staggered approach ensures rapid progress on WQIP development while providing a feasible WQIP submittal and initiation schedule: 1. The WQIP priorities and numeric goals are presented to the Regional Board within 6 months of the adopted Order. (B.6.a) 2. The complete WQIPs and corresponding jurisdiction measures are submitted 12 months later. (B.6.b) 3. WQIP implementation is initiated at the beginning of the next fiscal year. (B.6.b) Furthermore, adaptive management submittals (i.e., WQIP modifications) are combined and described under Section B.6.c and B.6.d (these requirements were previously described under section B.5.a.2 thru 3 and section B.5.b.2 thru 3.	The Copermittees in each Watershed Management Area must submit the proposed priority receiving water conditions, MS4 sources, and numeric goals required in Provisions II.B.2.c-e. for San Diego Water Board Executive Officer review and approval no later than 6 months following adoption of this Order. Priority receiving water conditions, MS4 sources, and numeric goals are deemed approved if no response is provided to the Copermittees within 2 months of the submittal date. **a. WATER QUALITY IMPROVEMENT PLANS** Copermittees shall commence development of the remaining portions of the Water Quality Improvement Plans upon approval of the priority receiving water conditions, MS4 sources, and numeric goals by the San Diego Water Board Executive Officer in II.B.6.a. Copermittees must submit complete Water Quality Improvement Plans for San Diego Water Board review and approval no later than 18 months following adoption of this Order. Copermittees must commence with implementation of the Water Quality Improvement Plan no later than the fiscal year (July 1) following San Diego Water Board approval. Water Quality

Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					Improvement Plans are deemed approved if no response is provided to the Copermittees within 6 months of the submittal date. **b. WATER QUALITY IMPROVEMENT PLAN MODIFICATIONS** Copermittees must submit requested modifications to the Water Quality Improvement Plan either in the Annual Report required pursuant to Provision II.F.3.b, or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision II.F.5 .b. Once approved by the San Diego Water Board Executive Officer, the Copermittees must implement any modifications to the Water Quality Improvement Plan in accordance with the schedules developed pursuant to Provisions II.B.2 and II.B.3.b. Requests for modification are deemed approved if no response is provided to the requesting Copermittee(s) within 3 months of the request date.
C. Action Levels					
42	C. (Intro)	22	Action Levels	The Draft Order in Provision B states that the goal of the WQIP is to identify the highest water quality priorities within a watershed and implement strategies to achieve improvements in the quality of discharge and receiving waters. Furthermore in Provision B.2.d the Permittees are required to develop and use *interim and final numeric targets/goals* to measure progress towards the protection/enhancement of the receiving	**As shown in the attached revised Permit, revise introductory paragraphs of section C, as follows:** "The purpose of this provision is for the Copermittees to incorporate numeric non-storm water and storm water action levels in the Water Quality Improvement Plans and numeric non-

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				waters and beneficial uses. The choice of the target/goals of the watershed may be biological, chemical, or physical based and may include multiple criteria and/or indicators. The permit should provide a clear linkage between Provision B and Provision C and state that the WQIP should guide the customization of the NALs/SALs to meet the highest water quality priorities in a given watershed and that NALs/SALs will be used to assist Copermittees in reaching the goals specified in the WQIP. The introduction to Provision C indicates that the *action levels* (NALs and/or SALs) will be incorporated into the WQIPs (B.2.d) and used to: a) Measure progress towards the protection/ enhancement of the receiving waters and beneficial uses (B.4) ; b) Direct and focus the JRMP implementation efforts for addressing MS4 discharges (D.4.a); and c) Detect and eliminate non-stormwater and illicit discharges to the MS4 (E.2) Although action levels will be used for several different purposes, the action levels defined in Provision C.1 and C. 2 are chemically based and may be in conflict with the selected watershed metrics. As an example, if the watershed metric is improved IBI scores for a water body, then NALs and SALs associated with water chemistry are unlikely to be the best metric to evaluate progress towards improving IBI scores or for assessing our implementation efforts. Thus, the chemically based NALs/SALs may direct resources away from the watershed priorities. Since Provision C indicates that there are three different	stormwater action levels into the IDDE Program. The action levels shall be used to guide the following program planning efforts and measure progress towards attaining the reasonable protection, preservation, and enhancement of water quality and designated beneficial uses of waters of the state: 1) Support development and prioritization of water quality improvement strategies through the Water Quality Improvement Plans. Discharge data above action levels can be evaluated using a statistical approach considering the frequency, magnitude, and loading of discharges to the receiving waters to support development of actions and prioritization of their implementation. 2) Assist in the effective prohibition of non-stormwater discharges from the MS4 pursuant to Provision E.2. 3) Support the detection and elimination of illicit discharges to the MS4 pursuant to Provision E.2. These goals will be accomplished through monitoring and assessing the quality of the MS4 discharges prior to and during the implementation of the Water Quality Improvement Plans and as a part of the IDDE Program. Exceedances of action levels are not subject to enforcement or non-compliance actions under this Order. ”

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				purposes for the action levels, the permit should recognize that the action levels for each permit provision (B.4, D.4.a, and/or E.2) may be based on different constituents, metrics, and/or may be different values. As a result, the permit should establish the purposes of the action levels and then allow the Copermittees to establish the numeric action levels. For our purpose we would submit that the action levels should be developed to support program planning and measure progress towards attaining the protection of the beneficial uses.	
43	C. (Intro)	22	Action Levels	The development of action levels, including the timeline should be clearly linked to the Water Quality Improvement Plans. A timeline that is separate and different from the development of the Water Quality Improvement Plans is not necessary. Previously developed action levels should serve as interim action levels until the Water Quality Improvement Plans are completed.	**As shown in the attached revised Permit, revise concluding paragraph of section C, as follows:** Action levels will be developed and incorporated into the Water Quality Improvement Plans (Provision B) including the Illicit Discharge Detection and Elimination (IDDE) Program (Provision E.2). Depending upon the goals/objectives for the use of the action levels and the priority receiving water conditions, the constituents and values at which they are set may differ between watersheds. Copermittees may develop Watershed Management Area specific numeric action levels for non-storm water and storm water MS4 discharges using an approach approved by the Regional Board or use the default non-stormwater and stormwater action levels prescribed within C.1 and C.2 below, respectively. The Copermittees will submit action levels as part of their Water Quality Improvement Plan(s). The action levels currently established will serve as the interim action levels until revised action levels are

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					completed and approved.
44	C. (Intro)	22	Action Levels	The introduction to Provision C indicates that numeric action levels must be *developed* for non-stormwater and stormwater MS4 discharges….. Although the permit states that NALs/SALs must be *developed*, the permit then mandates which constituents must have NALs/SALs and what the values of the action levels are. As stated above, the Permit should include an approach that allows the Permittees the opportunity to *develop* the NALs/SALs.	**As shown in the attached revised Permit, add the following to the introduction to C.1, as follows:** The following non-storm water action levels (NALs) must be incorporated in the Water Quality Improvement Plan and IDDE program if the Permittees have not developed their own NALs using an approach approved by the Regional Board EO:
45	C.1		Non-Stormwater Action Levels	Referencingthe CTR as a "source" is misleading. It is unclear why the Board is excluding the conversion factor from the CMC and CCC Metals Criteria equations from the CTR to generate total recoverable metals criteria. Table notes need to be updated to explain how NALs were derived. It should be made clear that the MDALs and AMALs were calculated using State Implementation Standard (SIP) procedures.	Add appropriate references to the State Implementation Standard procedures and provide a narrative explanation for reasoning and application in the fact sheet, when provided.
46	C.1	22-24	Non-Stormwater Action Levels	Provision C.1.b of the permit requires that additional NALs must be incorporated into the Permit for any constituents causing or contributing to conditions associated with the highest non-stormwater related water quality priorities. In Provision C.1.a the Permit mandates the NALs that must be incorporated into the WQIP. This provision results in the potential for NALs to be incorporated into the WQIP that may have no direct	The permit should provide a clear linkage between Provision B and Provision C and state allow the WQIP to guide the customization of the NALs based on the watershed needs. As a result, the Permit should provide two approaches for the NALs: 1. Permittees develop the NALs based on the highest water quality priorities; or 2. Permittees use the default NALs and

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				linkage to the highest water quality priorities. Flexibility should be added to the permit language to allow Copermittees to implement NALs based on the watershed's highest priorities and for those NALs to be included, as appropriate, in the WQIP. Otherwise Copermittees may be required to expend time and resources on numeric metrics not associated with the highest priorities in a given watershed instead of addressing the highest priorities.	approach identified in Provision C (both provision C.1.a and C.1.b) **The following is recommended language to support this approach.** C.1.c. Dry weather monitoring and assessment data from MS4 outfalls collected in accordance with Provision D.1.a may be used to develop or revise NALs based upon watershed-specific data. Revision of NALs is subject to Regional Board approval.
47	C.2	25	Storm Water Action Levels	Provision C.2.b requires that additional SALs must be incorporated into the Permit for any constituents causing or contributing to conditions associated with the highest non-stormwater related water quality priorities. The development of SALs may be based on one of 3 options: 1) water quality standards; 2) site specific conditions; and 3) numeric WQBELs. As noted previously the Copermittees believe that it is critical that flexibility be provided in the development and implementation of the SALs to allow the Copermittees to address their highest water quality issue(s). Consequently the Copermittees support other options for developing SALs.	Other options that should be included for the development of the SALs in the Permit are the approaches identified in the California Storm Water Panel in its report, "The Feasibility of Numerical Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities" (June 2006). As previously noted, if the Copermittees do not establish action levels to support the WQIP then the Copermittees must use the SALs identified in Provision C.
D. Monitoring and Assessment Requirements [See attached Monitoring Principles**]**					
E. Jurisdictional Runoff Management Programs					
48	E	53	Jurisdictional Runoff Management Programs	Modifications/clarifications to the first sentence.	**As shown in the attached revised Permit, revise the language, as follows:** "The purpose of this provision is for each Copermittee to implement a program to control the discharge~~contribution~~ of pollutants into and ~~the discharges~~ from theirrespective MS4sto receiving

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					waterswithin its jurisdiction and to focus and prioritize those implementation actions based on the highest water quality priorities identified within the associated Water Quality Improvement Plan."
49	E	53	Jurisdictional Runoff Management Programs	As stated in the second introductory paragraph in Provision E "The jurisdictional runoff management programs implemented by each Copermittee must be consistent with the Water Quality Improvement Plan for the applicable Watershed Management Area required by Provision B." Additionally, as stated in the introduction to the WQIP (Section B) "The purpose of this provision is to develop Water Quality Improvement Plans that guide the Copermittees' jurisdictional runoff management program implementation efforts…" However, the provisions do not clearly allow for the appropriate modification of the JRMP requirements contained in the permit. Given this, it is unclear that the Copermittees would be able to implement a JRMP consistent with the WQIP unless the WQIP was designed to implement the JRMP in the exact manner as required by the current provisions in Provision E.	Include language into the introductory paragraph that clearly indicates that the JRMP requirements contained in Provision E may be modified to allow for implementation of the JRMP consistent with the WQIP if appropriate justification is provided. **Add the following language:** "As such, the requirements of the jurisdictional runoff management programs as outlined below may be modified and prioritized as appropriate for consistency with the highest water quality priorities identified in the Water Quality Improvement Plan for the applicable Watershed Management Area if appropriate justification is provided."
50	E & Attachment C	Throughout	Jurisdictional Runoff Management Programs	Clarification.	Refer to Permanent BMPs as Structural BMPs and add a definition for structural BMPs into Attachment C.
51	E	Throughout	Jurisdictional Runoff Management Programs	Clarification for consistency.	Change "~~Permanent BMP Sizing Criteria Design Manual"~~ to"BMP Design Manual" and make reference to the current design requirements under R9-2007-0001.
52	E.1.a.2	53	Legal Authority Establishment and Enforcement	Sites regulated under the Construction and Industrial General Permits are regulated elsewhere and through alternative means. Clarification is necessary for sites that are not regulated under the respective General Permits.	**As shown in the attached revised Permit, revise the language, as follows:** "Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity into its MS4 and control the

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					quality of runoff from industrial and construction sites ~~including industrial and construction sites whichhave coverage under the statewide General Permit for Discharges of Storm Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit), as well as to those sites which do not~~;" **And add the footnote:** "The Permittees will only be responsible for administering and enforcing the codes and ordinances applicable to their jurisdictions (i.e.; a municipality is not responsible for administering and/or enforcing a permit issued by the State of California)."
53	E.1.a.4 and E.1.a.5	53-54	Legal Authority Establishment and Enforcement	The Copermittees do not have jurisdiction to control MS4 discharges outside of their respective MS4s and the Regional Board does not have the authority to require interagency agreements to grant such jurisdiction, particularly for those agencies not subject to the Order (Caltrans, Native American Tribes, Military installations, etc.)	**As shown in the attached revised Permit, revise the language, as follows:** "~~Control through interagency agreements among Copermittees the contribution of pollutants from one portion MS4 to another portion of the MS4;~~" and "~~Control through interagency agreements with other owners of the MS4 such as Caltrans, the U.S. federal government, or sovereign Native American Tribes, where possible, the contribution of pollutants from one portion of the MS4 to another portion of the MS4;~~" (4) The permittees are encouraged to enter into interagency agreements with owners of other MS4 systems, such as Caltrans, school and college districts, universities, Department of Defense, Native American Tribes, etc., to control the

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					contribution of pollutants from one portion of the MS4s to another portion.
54	E.1.a.7&8	54	Legal Authority Establishment and Enforcement	Copermittees must have the legal authority to control contribution of pollutants in discharges of runoff to its MS4 – mandating the legal authority to require BMPs is not necessary. Additionally, it is not realistic to require homeowners or other private responsible parties to ensure effectiveness of structural BMPs.	Delete E.1.a.7 and E.1.a.8
55	E.1.a.10	54	Legal Authority Establishment And Enforcement	Incorporate language from existing Orange County permit that acknowledges that legal authority will be included in ordinances to the extent permitted by the constitution.	**As shown in the attached revised Permit, revise the language, as follows:** "The Copermittee's ordinance must include adequate legal authority, to the extent permitted by California and Federal Law and subject to the limitations on municipal action under the constitutions of California and the United States,"
56	E.2.a	54	Illicit Discharge Detection and Elimination	Some non-storm water discharges are authorized under the permit unless the Copermittee or San Diego Water Board determines they are a source of pollutants in receiving waters. Language should be provided to account for subsection E.2.a.(3).	**As shown in the attached revised Permit, revise the language, as follows:** "Each Copermittee must address all non-storm water discharges as illicit discharges, where the likelihood exists that they are a source of pollutants to waters of the state."
57	E.2.a.2	55	Illicit Discharge Detection and Elimination	There is no basis for addressing potable water as an illicit discharge to the MS4 unless pollutants are discharged as a result of the water line flushing or a water main break.	**As shown in the attached revised Permit, revise the language, as follows:** "Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges unless the discharge has coverage under a valid NPDES Permit,. This includes water line flushing and water main break discharges from water purveyors under the Copermittee's jurisdiction that has been issued a water supply permit by the California Department of Public Health or federal military installations. Discharges from recycled or reclaimed water lines to the MS4 must be addressed as illicit discharges, unless the discharges have coverage under a

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page**[1]	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					separate NPDES permit.
58	E.2.a.1	55	Illicit Discharge Detection and Elimination	There is no technical basis or water quality concern that justifies the classification of uncontaminated pumped ground water, discharges from foundation drains, water from crawl space pumps, water from footing drains, water line flushing and water main breaks as illicit discharges. These discharges have little to no contribution to water quality pollution. Addressing these non-stormwater discharges as illicit discharges is not a good use of Copermittee resources and they should be added back to the list of allowable non-stormwater discharges.	Add the following back to the list of allowable non-stormwater discharges: • Uncontaminated pumped ground water • Discharges from foundation drains • Water from crawl space pumps • Water line flushing • Water main breaks
59	E.2.a.2	55	Illicit Discharge Detection and Elimination	The provision states: "Discharges from recycled or reclaimed water lines to the MS4 must be addressed as illicit discharges, unless the discharges have coverage under a separate NPDES permit." What does this mean for Cities where a separate Water District has a separate Permit for recycled water lines? Are cities primarily responsible for "addressing the illicit discharge," or is the Water District responsible for enforcing its permit? Does this discussion apply to on-site irrigation lines?	Please clarify.
60	E.2.a.4	56	Illicit Discharge Detection and Elimination	See comment E.2.a.	**As shown in the attached revised Permit, revise the language, as follows:** "or similar means<u>where there is evidence that those discharges are a source of pollutants to waters of the state</u>"
61	E.2.a.4.a	56	Illicit Discharge Detection and Elimination	Individual buildings may require substantial structural modifications to redirect air conditioning condensation to landscaped areas. Redirection should be encouraged instead of required.	**As shown in the attached revised Permit, revise the language, as follows:** "The discharge of air conditioning condensation ~~must~~ <u>should</u> be directed to landscaped areas or other pervious surfaces where feasible;"

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page**[1]	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
62	E.2.a.4.b	56	Illicit Discharge Detection and Elimination	Complete removal of residential car washing activities is unrealistic and resources would be better used to educate the public. Public outreach has proven to be also effective in minimizing water and detergent use and encouraging the use of commercial facilities.	**As shown in the attached revised Permit, revise the language, as follows:** "(b) Individual residential vehicle washing – <u>Residents should be encouraged, through public outreach and education, to implement the following when washing their vehicles</u>: <u>(i)</u> <u>Direct</u> the discharge of wash ~~water must be directed~~ to landscaped areas or other pervious surfaces where feasible, and <u>(ii)</u> Minimize the use of water for vehicle washing, use as little washing detergent and other vehicle wash products as possible, wash vehicles at commercial wash facilities, and implement other practices or behaviors that will prevent the discharge of pollutants associated with individual residential vehicle washing from entering the MS4; and"
63	E.2.a.4.c.ii	56	Illicit Discharge Detection and Elimination	Clarify. Discharges of saline water to the MS4 cannot be directed out of the MS4 once the discharge has occurred. Allow saline discharges to salt water receiving waters.	**As shown in the attached revised Permit, revise the language, as follows:** "The discharge of saline swimming pool water ~~to the MS4~~ must be directed to the sanitary sewer (with approval from the sanitary sewer agency), landscaped areas, or other pervious surfaces that can accommodate the volume of water<u> or to the MS4 if the MS4 discharges to a saltwater receiving water</u>."
64	E.2.a.5.b	56-57	Illicit Discharge Detection and Elimination	Priorities for emergency procedures such as firefighting are public health and safety. The paragraph on Emergency Fire Fighting discharges should reflect the language included in the County's current permit. In addition, the language for the non-emergency fire fighting activities should be streamlined.	**As shown in the attached revised Permit, revise the language, as follows:** (1) "Firefighting discharges to the MS4 must be addressed by the Copermittees ~~as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a significant source of pollutants to receiving~~

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011

					~~waters. Firefighting discharges to the MS4 not identified as a significant source of pollutants to receiving waters, must be addressed, at a minimum,~~ as follows:" **Delete language in E.2.a.5.b and replace with:** (a) "<u>Emergency fire fighting flows (i.e., flows necessary for the protection of life or property) do not require BMPs and need not be prohibited. As part of the Jurisdictional Runoff Management Plan (JRMP), each Copermittee must develop and implement a program to address pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes and maintenance activities) identified by the Copermittee to be significant sources of pollutants to waters of the United States.</u>"
65	E.2.b.1.e	58	Illicit Discharge Detection and Elimination	Clause is redundant and confusing.	**As shown in the attached revised Permit, revise the language, as follows:** ~~(i.e., receiving water segments that are both a receiving water and part of the MS4),~~
66	E.2.b.2	58	Illicit Discharge Detection and Elimination	Clarification is necessary to limit employee responsibilities to within the terms of their employment.	**As shown in the attached revised Permit, revise the language, as follows:** "~~Each Copermittee must use~~ Copermittee personnel and contractors <u>should</u>~~to~~ assist in identifying and reporting illicit discharges and connections<u>, if observed</u> during <u>the course of</u> their daily <u>employment</u> activities;"
67	E.2.b.4	58	Illicit Discharge Detection and Elimination	The addition of language is necessary to limit Copermittees responsibility to standards that may reasonably be met.	**As shown in the attached revised Permit, revise the language, as follows:** "Each Copermittee must implement practices and procedures (including a notification mechanism) to prevent, respond to, contain, and clean up any spills

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					that may discharge into the MS4 <u>within their jurisdiction</u> from any source. The Copermittee must coordinate with spill response teams to prevent <u>to the extent possible</u> entry of spills into the MS4, and prevent contamination of surface water, ground water, and soil."
68	E.2.c	58	Illicit Discharge Detection and Elimination: Field Screening and Monitoring	Visual observations should be acknowledged as a way to detect non-storm water and illicit discharges and connections.	Add "<u>Visual Observations</u>" to the provision header and acknowledge within the text.
69	E.2.d.2 & E.2.d.3	59 – 61	Illicit Discharge Detection and Elimination: Investigate and Eliminate	Sections 2 and 3 outline the procedures that Copermittees must have in place. Not all language under these headers speak to procedures. Additionally, some overlap exists between these two sections.	Edit were made to ensure that requirements addressed the development of procedures. Additional edits made for clarity and to reduce overlap between sections. See the strikeout document of the admin draft for specifics.
70	E.2.d.2	59	Illicit Discharge Detection and Elimination	Language should be added for discharges to receiving waters <u>within</u> the jurisdiction of the Copermittee.	**As shown in the attached revised Permit, revise the language, as follows:** "Each Copermittee must implement procedures to investigate and inspect portions of its MS4 that, based on reports or notifications, <u>visual observations</u>, field screening and monitoring, or other appropriate information, indicate a reasonable potential of ~~receiving, containing, or~~ discharging pollutants <u>to receiving waters within the Copermittees jurisdiction</u> due to illicit discharges <u>or</u> illicit connections, ~~or other sources of non-storm water~~."
71	E.2.d.2.b & c	60	Illicit Discharge Detection and Elimination	Provision E.2.d.2 states that the Copermittee must implement procedures and develop criteria for responding to and addressing incidents. Providing additional specificity in (b) and (c) is unnecessary and contradicts previous statements that Copermittees develop their own criteria. Delete b and c.	**Delete the following:** ~~(b) Each Copermittee must immediately investigate and seek to identify the source(s) of discharges of non-storm water where flows are observed in and from the MS4 during the field screening and monitoring required pursuant to Provision D.1.a.(1). The investigation must include field~~

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					~~investigations to identify sources or potential sources for the discharge, unless the source or potential source has already been identified during previous investigations;~~ ~~(c) Each Copermittee must investigate and seek to identify the source(s) of non-storm water discharges from the MS4 where there is evidence of non-storm water having been discharged into or from the MS4 (e.g., pooled water). The investigation may include field investigations, reviewing Copermittee inventories, and other land use data to identify potential sources of the discharge; and~~
72	E.2.d.4	61	Illicit Discharge Detection and Elimination	Language used in the current Orange County Permit (Provision R9-2009-0002) provides clearer language regarding follow through.	**Use Orange County permit language instead:** If the Copermittee suspects the source of the non-storm water discharge as natural in origin (i.e. non-anthropogenically influenced) and in conveyance into the MS4, then the Copermittee must ~~collect the data and evidence necessary to demonstrate to the San Diego Water Board that it is natural in origin; and~~document the rationale for why the discharge does not need further investigation. This documentation shall be included in the Annual Report.
73	E.3	61	Permanent BMP Requirements for All Development Projects	No jurisdictional limitations are provided in this section. As a result, language in the subsections may be interpreted as expanding Copermittee requirements outside their MS4 jurisdiction. In addition how the Copermittees implement their program should be a decision left to the Copermittees.	**As shown in the attached revised Permit, revise the language, as follows:** "Each Copermittee, within their respective jurisdictions, must ~~use their land use/planning authorities to~~ implement a development planning program…"
74	E.3.	61-74	Development Planning	Permanent BMPs. This nomenclature can be confusing. "Treatment controls and structural LID BMPs" is more apt language than "permanent" to the type of BMPs in these provisions.	**As shown in the attached revised Permit, revise the language, as follows:** Change "permanent" to "Treatment controls and

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					structural LID BMPs" throuought the section.
75	E.3.a	61	Permanent BMP Requirements for All Development Projects	Requiring specific types of BMPs (i.e. LID) does not allow for Copermittees to implement adaptive management practices based on the best available technology for the soil and climate types of specific developments. This is an increase in BMP requirements to all development (including redevelopment) projects as compared to the prior permit and will require additional TCBMP inspections and maintenance. It will also impact the Copermittee's ability to maintain their infrastructure due to additional requirements, costs, and time associated with implementation. An exception should also be added for the protection of persons and property, particularly as it applies to BMPs not being implemented in waters of the U.S. or state. This language is consistent with Cal. Water Code §13269(c)(1-2). Flood control projects are intended for the protection of public safety and property and are mandated by the Orange County Flood Control Act of 1927. Requiring flood control projects to implement BMPs which are intended for traditional types of development projects is inappropriate and in most cases infeasible. Furthermore requiring flood control projects to implement BMPs may cause flood control projects to be infeasible which in many cases will increase the risk of flooding. If flooding does occur in these areas it would increase the risk of pollutants discharging into receiving waters from the flooded areas.	**As shown in the attached revised Permit, revise the language, as follows:** "Each Copermittee, as practical and feasible, must prescribe the following BMP requirements during the planning process (i.e. prior to project approval and issuance of grading or building permits) for all development projects (regardless of project type or size), where local permits are issued, including unpaved roads, ~~and flood management projects~~, except emergency projects implemented for the protection of persons and property:"
76	E.3.a.3	62	Permanent BMP Requirements for All Development Projects	Specified LID BMPs should be implemented consistent with technical guidance developed by the Copermittees.	**As shown in the attached revised Permit, revise the language, as follows:** Add the following foot note to this section: "Implementation of LID BMPs shall be consistent with technical guidance developed by the Copermittees."

Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
77	E.3.a.5	63	Infiltration and Groundwater Protection	Infiltration BMPs must not have a reasonable potential to cause an exceedance of an applicable groundwater quality objective as identifying that it has caused an exceedance would be difficult.	**As shown in the attached revised Permit, revise the language, as follows:** "Infiltration and treatment control BMPs designed to primarily function as large, centralized infiltration devices (such as large infiltration trenches and infiltration basins) must not <u>have reasonable potential</u> to cause or contribute to an exceedance of an applicable groundwater quality objective."
78	E.3.b.1.a	64	Definition of Priority Development Project	The entire project footprint should not be required to adhere to the new development requirements as only project features that qualify as PDP projects should be subject to the PDP requirements. Other non-PDP land uses have not been identified as PDPs for a reason as they are not a significant source of pollutants. If they were a source of pollutants then they would be categorized as a PDP. Identification of PDP types has focused in the past on those land uses that are a significant source of pollutants, and so requiring non-PDP land uses to meet PDP requirements has no technical basis since they are not a significant source of pollutants there will be no significant reduction in pollutants through the implementation of PDP requirements. Furthermore this non-PDP land uses also do not represent an increase in the volume of runoff as they do not contain large amounts of impervious surfaces as if they did then they we trigger the impervious area thresholds of the PDP categories. Therefore requiring non-PDP land uses to meet PDP requirements has no technical basis since they are also not a significant source of increases of volume of runoff and therefore there will be no significant reduction in the volume of runoff through the implementation of PDP requirements.	Delete the section from the permit.

Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
79	E.3.b.1.b	64	Definition of Priority Development Project	Limit to requirements not subject to prior PDP requirements as these projects already have water quality treatment and the new requirements should not apply to areas that already have water quality treatment.	**As shown in the attached revised Permit, revise the language, as follows:** "Where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development and was not subject to previous Priority Project Development requirements, the performance and sizing requirements apply to the entire development."
80	E.3.b.1.c	64-65	Definition of Priority Development Project	Clarify that regardless of the 50% threshold, portions of the site that were subject to and meet previous Priority Development Project requirements are not subject to the new requirements. Proposed language has been modified from Ventura County NPDES MS4 Permit (Order No. 00-108).	**As shown in the attached revised Permit, revise the language, as follows:** Add the following: "(c) Projects where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development *was* subject to previous Priority Project Development Requirements, only the altered portion is subject to the new Priority Development Project requirements. "
81	E.3.b.2	65	Priority Development Project Categories	This provision establishes the scope of development projects subject to the post-construction controls. Sometimes the criterion is based on impervious area and other times it is based on surface area. Also, this is an increase in requirements from the prior permit, which was limited to much larger development projects.	In the interest of consistency, revise the criterion so that impervious area is the mechanism for determining applicability as it is an accurate surrogate for establishing project eligibility.
82	E.3.b.2.g	66	Priority Development Project Categories	This requires PDP requirements for development and redevelopment of streets, roads, highways, freeways, and residential driveways over 5,000 square feet. This requirement was present in the prior permit; however, the residential driveways requirement was added under the proposed permit and will require additional Copermittee effort for treatment control and structural LID BMP inventory, inspections, and maintenance	**As shown in the attached revised Permit, revise the language, as follows:** "Streets, roads, highways, and freeways~~, and residential driveways~~. This category is defined as any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other internal

Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
87	E.3.b.3.g	66	Definition of Priority Development Project	This provision establishes an exemption for emergency public safety projects where a delay due to a SSMP would compromise public safety, public health and/or the environment. Permittees need an exemption where if public health or safety or environmental protection is threatened the project can proceed without a SSMP.	**As shown in the attached revised Permit, revise the language, as follows:** "(d) Emergency public safety projects in any of the Priority Development Categories may be excluded if the delay caused due to the requirement for a SSMP compromises public safety, public health and/or environmental protection."
88	E.3.c.2	66 – 68	Priority Development Project Permanent BMP Performance and Sizing Criteria	The permit should allow offsite regional groundwater replenishment as an option that is coequal with onsite retention. This promotes groundwater infiltration at a regional scale where it can have watershed-wide benefits. As currently written in the Administrative Draft, a project applicant must prove technical infeasibility before pursuing alternative compliance. This will limit the need for alternative compliance. Copermittees may not be willing to take on the risk of investing in regional groundwater replenishment projects if the permit requirements do not foster a need for such projects. Allowing onsite retention and offsite regional groundwater replenishment as coequal options provides for a higher number of project applicants paying into a fund to construct regional facilities.	**As shown in the attached revised Permit, revise the language, as follows:** Allow offsite regional groundwater replenishment as an option coequal with onsite retention. Suggest adding the following language: "(a) Each Priority Development Project must be required to implement LID BMPs as described in Provision E.3.a.(3) or offsite regional groundwater replenishment if the following conditions apply:; (i) The volume of stormwater runoff used to replenish groundwater must be equal to or greater than the design capture volume; (ii) Pollutant reduction is provided through treatment of the design capture volume at the project site."
89	E.3.c.2.b	67	Priority Development Project BMP Implementation and Oversight	Retention should not be limited to requiring retention for the 85th percentile storm but also allow, as an option, the matching of the volumes between the pre and post-project conditions. The former will result in lesser flows necessary for downstream habitats and may be less desirable in some circumstances.	**As shown in the attached revised Permit, revise the language, as follows:** "Each Priority Development Project must be required to implement LID BMPs that are sized and designed to retain the volume equivalent to runoff produced from a 24-hour 85th percentile storm event or to retain the difference in the volume

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
					between the runoff volume produced in the post-project condition as compared to the pre-project condition resulting from a 24-hour 85th percentile storm event ("design capture volume").
90	E.3.c.2.c	67	Priority Development Project BMP Implementation and Oversight	This provision removes the BMP hierarchy recently adopted in both the South Orange County Permit (R9-2009-0002) and the Santa Margarita Region Permit (R9-2010-0016): retention, then biofiltration, and then conventional BMPs including offsite mitigation with no technical justification. Biofiltration provided an option for those sites where in their natural condition soils are not suitable for infiltration, and where harvesting and use is not feasible. By removing the biofiltration step from the hierarchy the existing soils of the site are no longer considered in the implementation of BMPs for the site. In the above mentioned permits, soils of a site can be factored into BMP implementation as when infiltration is not feasible due to poor soilsbiofiltration is a viable option. This provision in the Administrative Draft removes the biofiltration option and additionally requires offsite mitigation for those siteswith natural site conditions that prevent full retention from occurring onsite. This in effect punishes sites that have poor soils, which is a factor beyond the control of the site. Furthermore this provision as currently written will result in development being implemented in areas of well draining soils so that the retention standard can be met through infiltration. This result is antithetical to one of the primary LID site design techniques, which is to concentrate development and impervious surfaces on poor draining soils to help maintain the natural hydrology. The result of this provision will be that development will be located on well draining	**As shown in the attached revised Permit, revise the language, as follows:** "(c) If onsite retention of the design capture volume using LID BMPs is technically infeasible per Provision E.3.c.(4)flow-thru LID ~~and/or conventional treatment control~~ BMPs must be implemented to treat the portion of the design capture volume that is not retained onsite. Flow-thru LID treatment control BMPs must be designed for an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP. (d) If retention and/or equivalent pollutant removal of the design capture volume to meet E.3.c.(2)(a) or E.3.c.(2)(b) are infeasible onsite~~Additionally~~ project applicants must perform mitigation for the portion of the pollutant load in the design capture volume that is not retained onsite, as described in Provision E.3.c.(4)**Error! Reference source not found.**."

Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				soilswhere meeting retention through infiltration is feasible, which could have a disastrous impact on the overall health of a watershed as land with good draining soils will be targeted for development vs being preserved in the watershed.	
91	E.3.c.(3)	68	Hydromodification Management BMP Requirements	The Regional Board adopted the San Diego Hydromodification Management Plan (HMP) in July 2010. Significant work, technical analysis and input have gone into the development of the HMP and these requirements have been in effect for only 16 months. Rather than providing separate criteria, the permit should acknowledge implementation of the Regional Board approved HMP as a sufficient mechanism for meeting hydromodification requirements. The Orange County MS4 permit states only guidelines/criteria regarding hydromodification and refer to the HMP for detailed requirements. Similarly significant work and technical analysis and input have gone into the development of the South Orange County HMP, which would essentially become obsolete shortly after approval and beginning of implementation. The Regional Board has provided no technical justification for the new hydromodification provisions. The HMPs for San Diego and South Orange County are based on sound science and should be allowed time to understand if they are adequate for mitigating hydromodification impacts. The administrative draft proposes to lower project applicability thresholds substantially in some categories. For example, commercial and industrial projects will be lowered from one acre to 10,000 sqftor	**As shown in the attached revised Permit, revise the language, as follows:** "Each Copermittee must require each Priority Development Projects greater than one acre to implement hydromodification management BMPs as described in the Copermittees' current HMP, as applicable ~~so that~~." Delete sections E.3.c.3(a)(i) and (ii).

					land uses and proposed future development and changes in land use. (ii) Development of watershed hydromodification management objectives. (iii) Development of criteria to identify when stream rehabilitation or regional mitigation projects are preferable to onsite hydromodification controls for PDPs, in order to restore watershed functions and processes,. (iv) Identification of opportunities for stream rehabilitation and mitigation projects to restore watershed functions and processes (v) Development of a mitigation fund and program for implementation of stream rehabilitation and mitigation projects
94	E.3.c.3.d.ii	69	Hydromodification Management BMP Requirements – Exemptions	Section F.1.h.(3) provides discretion to the Copermittees to identify hydromodification requirements that are not required. Hydromodification requirements are not appropriate for channels that are designed to accept increased flows from upstream	**As shown in the attached revised Permit, revise the language, as follows:** "(ii) Discharges storm water runoff into conveyance channels <u>that are engineered for the</u>

Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				development, as the potential for erosion, if any, is minimal. A waiver for projects that discharge to concrete-lined or engineered channels should be included. Studies have shown that hydromodification is caused by the smaller storms up to the 10 year event. Based on these studies those engineered channels designed to convey the 10-year ultimate build out condition will therefore not experience hydromodification impacts. These channels were installed for the purpose of flood control and protection of public safety and property as historically flooding occurred where there is now development. These channels cannot be removed as they serve the important and mandated service of flood control. It is also unrealistic to think that development can be removed from the floodplain so that these flood control channels could be removed and returned to a natural state. Since removal of these channels is infeasible restoration of these channels to a natural state is also infeasible. Since there is no potential for restoration to a natural state and because these channels are designed to be flood control channels they should be allowed to convey the storm events they are designed for. Since there is no potential for removal of these channels there is no environmental benefit to requiring onsite mitigation of hydromodification when these channels are designed and engineered to accept these flows.	capacity to convey the 10-year ultimate build out condition flow and are regularly maintained to ensure flow capacity ~~whose bed and bank are concrete lined~~ all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean;"
95	E.3.c.3.d.iii	69	Hydromodification Management BMP Requirements – Exemptions	Studies have shown that cumulative watershed impacts are minimal in stream reaches of large depositional rivers. Analysis in the San Diego HMP demonstrated that the effects of cumulative watershed impacts are minimal in those reaches which the drainage area exceeds 100 square miles and with a 100-year design flow in excess of 20,000 cfs. An exemption for those reaches that meet these criteria should be included in	**As shown in the attached revised Permit, revise the language, as follows:** " (iv) Discharges to large rivers where large rivers are defined as reaches for which the contributing drainage area exceeds 100 square miles and with a 100-year design flow in excess of 20,000 cfs;"

				the exemption provisions of the permit.	
96	E.3.c.3.d.iv	69	Hydromodification Management BMP Requirements – Exemptions	Infill redevelopment projects offer an opportunity for improvement in water quality. Due to the usual tight constraints and limited footprint of infill development projects implementing onsite hydromodification controls is often infeasible. In many cases projects will not be able to meet the hydromodification criteria and so will choose "greenfield" developments where meeting hydromodification criteria are more feasible. To encourage infill development over "urban sprawl" and "greenfield" development, a hydromodification exemption should be provided for infill development projects. This will also provide the benefit of improving water quality as the water quality/LID requirements will still be required to be met. Overtime infill redevelopment projects will address the significant issue of improving water quality from existing development. Without this exemption redevelopment for infill projects will likely not occur as implementing onsite hydromodification will just be too expensive for these types of projects and so the benefits meeting the water quality/LID requirements will not be realized at these sites. Criteria for what projects qualify for the infill development exemption shall be developed by each of the Permittees as part of updates to their HMPs.	**As shown in the attached revised Permit, revise the language, as follows:** " (v) Discharges from infill redevelopment projects that meet criteria to be established in the Permittees' HMPs; or"
97	E.3.c.3.d.v	69	Hydromodification Management BMP Requirements – Exemptions	Flood control projects are intended for the protection of public safety and property and are mandated by the Orange County Flood Control Act of 1927. Requiring flood control projects to implement hydromodification controls intended for traditional types of development projects is inappropriate and in most cases infeasible. Furthermore requiring flood control projects to implement hydromodification controls may cause flood control projects to be infeasible which may increase the risk of flooding. If flooding does occur in these areas it	**As shown in the attached revised Permit, revise the language, as follows:** "(vi) In-stream flood control and restoration projects."

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				would increase the risk of pollutants discharging into receiving waters from the flooded areas. In-stream restoration projects are designed to restore beneficial use of streams and channels. These projects also serve as a potential option for restoring impacts from hydromodification. It is counterproductive to require mitigation of a restoration project.	
98	E.3.c.4.a.iv	69	Alternative Compliance for Technical Infeasibility	Add additional language to encourage strategically important regional BMP projects	**As shown in the attached revised Permit, revise the language, as follows:** <u>"(iv) The project applicant is required to perform mitigation described in Provision E.3.c.(4)(c) and has the option or ability to contribute to a regionally important mitigation project/program as defined in the Water Quality Improvement Plan that would address strategic high-priority water quality protection and/or more-direct restoration of beneficial uses in receiving waters than if achieved if the Priority Development Project had fully implemented the retention LID and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) onsite."</u>
99	E.3.c.4.b.i.	70	Alternative Compliance for Technical Infeasibility: Criteria	Contaminated groundwater at a project development site should also be included as reason for technical infeasibility.	**As shown in the attached revised Permit, revise the language, as follows:** "(i) Locations that cannot meet the infiltration and groundwater protection requirements in Provision E.3.a.(5)due to the presence of shallow bedrock, contaminated soils, <u>contaminated groundwater</u>, near surface groundwater, underground facilities, or utilities;"
100	E.3.c.4.c	70	Alternative Compliance for	The permit should clearly provide Copermittees' with the option to develop an alternative compliance	**As shown in the attached revised Permit, revise the language, as follows:**

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
			Technical Infeasibility: Mitigation	program that fits their specific program needs.	"Priority Development Projects that meet the Copermittee's technical infeasibility criteria developed pursuant to Provision E.3.c.(4)**Error! Reference source not found.** must be required to mitigate for the increased flow rates, increased flow durations, and/or increased pollutant loads expected to be discharged from the site. ~~Forpollutant load in the volume of storm water~~Copermittees may establish an offsite mitigation program that requires the developer to mitigate for the water quality equivalencenot retained onsite with retention LID BMPs, or increased potential erosion of downstream receiving waters not fully controlled onsite with hydromodification management BMPs, the Copermittee must require the project applicant to either 1) implement an offsite mitigation project, and/or 2) provide sufficient funding for a public or private offsite mitigation project via a mitigation fund."
101	E.3.c.4.c.ii	71	Mitigation Project Types	Groundwater recharge projects are a viable offsite mitigation project as they promote and integrated water resources approach and should be listed as an option for offsite mitigation. In-stream rehabilitation projects need the flexibility to incorporate a variety of materials to be effective at restoring beneficial uses and stream function. Limiting the types of materials that can be used will prevent many project from being implemented. Regional Board staff will have an opportunity to review the materials used in all stream restoration projects through the 401 certification.	**As shown in the attached revised Permit, revise the language, as follows:** "Offsite mitigation projects ~~must~~may include, where applicable and feasible, retrofitting opportunities and stream and/or habitat rehabilitation or restoration opportunities identified in the Water Quality Improvement Plans, identified pursuant to Provision B.3.a. Other offsite mitigation projects may include green streets or infrastructure projects, groundwater recharge projects, or regional BMPs upstream of receiving waters. ~~In stream rehabilitation or restoration measures to protect~~

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					~~or prevent adverse physical changes to creek bed and banks must not include the use of nonnaturally occurring hardscape material such as concrete, riprap, or gabions.~~ Project applicants seeking to utilize these alternative compliance provisions may propose other offsite mitigation projects, which the Copermittees may approve if they meet the requirements of Provision E.3.c.(4)**Error! Reference source not found.**.
102	E.3.c.4.c.iii	71	Mitigation Project Timing	Offsite mitigation projects being implemented by a PDP should be completed upon completion of the PDP project, however the Copermitees should be provided the opportunity to develop a timing scheme if they choose to develop a Copermittee offsite mitigation program.	**As shown in the attached revised Permit, revise the language, as follows:** "The Copermittee and/or project applicant must develop a schedule for the completion of offsite mitigation projects, including milestone dates to identify, fund, design, and construct the projects. PDP implemented~~O~~offsite mitigation projects must be completed upon ~~the granting of occupancy for the first project that contributed funds~~completion of thePDP, unless a longer period is authorized by the San Diego Water Board. The timing of mitigation projects associated with a Copermittee offsite mitigation program will be developed by the Copermittees as part of developing their offsite mitigation program."
103	E.3.e.2.a	73	Priority Development Project BMP Implementation and Oversight	Removal of the term "continuously" is suggested so ensure Copermittees do not have to allocate resources for incessant updates to the database. Language should also be added to clarify that, although the database will be watershed-based, each Copermittee is responsible only for inventory under their jurisdiction.	**As shown in the attached revised Permit, revise the language, as follows:** "Each Copermittee must develop and ~~continuously~~regularly maintain a watershed-based

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page**[1]	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					database to track and inventory all Priority Development Projects and associated ~~permanent~~ treatment control and structural LIDBMPs within their jurisdiction…"
104	E.4	75	Construction Management	The current language does not provide clarity on when the construction management program is applicable or what the Copermittees responsibilities are under the program.	Revise section to clarify Copermittees responsibilities and applicability of the program.
105	E.4.a.	75	Construction Management	Include the word "sediment" in this section as construction stormwater management requires an effective combination of erosion and sediment controls. Remove the word "equivalent" as this term is ambiguous as there is no set standard for SWPPPs and so equivalency is undefined.	Revise the section include the word "sediment" in the sections that identify erosion control plans and remove the word "equivalent" related to erosion and sediment control plans.
106	E.4.a.4	75	Project Approval Process	Copermittees are required to verify that the project applicant has obtained coverage under applicable permits. The US ACOE requires all other permits to be in place prior to issuing the 404 permit. It is not possible to have the 404 permit prior to issuing a grading or building permit. The requirement from the 4th Term permit was to verify coverage under the Construction General Permit.	**As shown in the attached revised Permit, revise the language, as follows:** "Verify that the project applicant has obtained coverage under ~~applicable permits, including, but not limited to~~ the Construction General Permit.~~, Clean Water Act Section 401 Water Qaulity Certification and Section 404 Permit, and California Department of Fish and Game Streambed Alteration Agreement.~~
107	E.4.b.(1)	75	Construction Management	The current language requires monthly update of construction sites. Quarterly update of the inventory is more appropriate to track construction sites as this is a significant burden on the Copermittees. These sites are tracked through SMARTS already and more frequent tracking is not necessary.	**As shown in the attached revised Permit, revise the language, as follows:** "(1) Each Copermittee must maintain, and update at least ~~monthly~~quarterly, a watershed-based inventory of all construction sites requiring construction, grading, or building permits within its jurisdiction."
108	E.5	79	Existing Development	After years of implementation of existing development programs, the Copermittees have the knowledge and	Replace the current provision E.5 with the proposed Provison E.5 provided in the attachment.

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Management	experience to implement programs consistent with the goals of the Order and the adaptive management process required under the Order. In order to accomplish this goal, the Copermittees have reorganized and provided a concise existing development section as an alternative to the current provision E.	
109	E.5	79	Existing Development Management	Provision E.5.a mixes types of facilities, areas, and activities that should be included in the inventory and the information that should be included within the database regarding each type of facility, area, and activity.	If the current provision E.5 is not replaced with the proposed provision E.5, then the reorganization of this provision is recommended. Specific edits for this section are provided below.
110	E.5.a	79	Existing Development Management	Regulation of residential sites, while not entirely new, will increase cost, responsibility, and liability as currently presented due to the magnitude of increased regulatory requirements. There will be significant enforcement issues, particularly with the residential portion. Adding the term "reasonable potential to discharge" allows flexibility for the Copermittees to determine priorities. Practically all existing properties have the potential to generate pollutant loads and the inspection program will be ineffective and impractical to implement as written. The focus needs to be on significant pollutant load discharges so inspections and enforcement can actually succeed in receiving water pollutant load reductions versus spending an exhaustive amount of time and money inspecting sites that discharge no pollutant loads, but have the potential to generate minimal loads.	**If the current Provision E.5 is not replaced, modify as follows**: "Each Copermittee must maintain an updated watershed-based inventory and/or map of its existing development that has the reasonable potential to ~~may potentiallygenerate~~discharge a pollutant load into ~~and from~~ the MS4."
111	E.5.a.4, E.5.a.7	79	Existing Development Management	Minor grammatical corrections.	**If the current Provision E.5 is not replaced, modify as follows**: "(4) Identification ~~if a business is a~~ of mobile businesses;

Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					(7) ~~Identification if an area is a~~ Common Interest Areas (CIAs) / Home Owner Associations (HOAs), ~~or~~and mobile home parks;”
112	E.5.a.13	80	Existing Development Management	The continual requirement for map updating is excessive. Regularly updated maps should be sufficient for up-to-date information without requiring Copermittees to expend excessive resources. Expand to highlight what has already been accomplished by permittees.	**If the current Provision E.5 is not replaced, modify as follows**: “A ~~continually~~regularly updated map showing the location of inventoried existing development, watershed boundaries, water bodies, and retrofits implemented~~and pollutants generated~~ at the inventoried existing development and/or rehabilitations implemented at channels and/or receiving waters.”
113	E.5.b	80	Retrofitting and Channel Rehabilitation in Areas of Existing Development	This is a new requirement, as compared to the prior permit, which only requires an evaluation of channels that may be retrofitted. Requiring Municipalities to take responsibility for entire stream channels and rehabilitate them to restore impaired beneficial uses of streams is beyond the responsibility that MS4 operators have over MS4 discharges. MS4 operators are not the sole discharger to/cause of impaired channels. Additionally in many instances the channels are flood control facilities which may be required to sustain the existing surrounding development. In many instances, channel rehabilitation of channels may not be feasible and other options for improving discharge water quality would need to be considered.	Remove this Provision entirely or include it as an option for compliance as stated below: “…and rehabilitatechannels and/or receiving waters to restore impaired beneficial uses of streams, as feasible.”
114	E.5.b.1	80	Retrofitting and Channel Rehabilitation in Areas of Existing Development	Minor modifications to language to better encompass creek restoration projects.	**As shown in the attached revised Permit, revise the language, as follows:** “Each Copermittee must identify areas of existing development as candidates for retrofitting, and channels and/or receiving waters ~~in areas of~~

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					~~existing development~~ as candidates for rehabilitationwithin its jurisdiction<u>, as feasible</u>. Areas of existing development must be selected based on a likelihood that retrofitting and channel rehabilitation will address the highest water quality priorities identified in the Water Quality Improvement Plan prepared pursuant to Provision B."
115	E.5.b.2	80	Retrofitting and Channel Rehabilitation in Areas of Existing Development	Minor modifications to language to acknowledge that benefits of creek restoration may occur immediately downstream.	**As shown in the attached revised Permit, revise the language, as follows:** "The evaluation must also include an assessment of the channels <u>and/or receiving waters</u> within its jurisdiction where ~~channel~~ rehabilitation will improve beneficial uses of streams within <u>or immediately downstream of</u> the Copermittee's jurisdiction."
116	E.5.b.3	80	Retrofitting and Channel Rehabilitation in Areas of Existing Development	The proposed permit requires the Copermittees to "encourage" landowner retrofit to private property through the "Copermittee's use of subsidies, penalties, or other incentives." Copermittees will face serious enforcement (and possibly legal) issues if they attempt to penalize private landowners for failing to expend their own time, effort, and money retrofitting properties that landowners had no intention of altering in the first place. As this is a first time requirement to implement channel restoration projects, the logical first step in retrofitting is to identify projects and prioritize them for implementation based on the highest benefit to water quality and beneficial uses.	**As shown in the attached revised Permit, revise the language, as follows:** "Each Copermittee must ~~implement~~<u>prioritize for implementation</u> retrofit and channel rehabilitation projects<u>, as feasible,</u> that address the highest water quality priorities identified in the Water Quality Improvement Plan pursuant to Provision B.3.a. <u>Ranking may also take into account project feasibility and cost effectiveness.</u> The Copermittee ~~must~~ <u>should</u> encourage private landowners to implement retrofit <u>designs, at minimum, through the use of public education and outreach.</u> ~~and channel rehabilitation projects whenever practical. Private landowners should be encouraged through the Copermittee's use of subsidies, penalties, or other incentives.~~"

148	F.3.b	91	Reporting	Clarification as to a date when the annual reporting period will begin under the permit is necessary.	**As shown in the attached revised Permit, revise the language, as follows:** "…The first Annual Report must be prepared for the reporting period beginning July 1 after adoption of the permit, and upon San Diego Water Board Determination that~~the date the San Diego Water Board determines that~~…"
149	F.3.b.1.e and F.3.b.2	92	Reporting	Unclear how form will improve upon existing reporting processes. Form seems to restrict reporting and require the compilation of cumbersome and uninformative numbers such as "number of existing developments in residential inventory." Permittees should be allowed to continue current reporting formats. Either delete the form or make optional.	Delete the following language: "~~(a) A completed Jurisdictional Runoff Management Program Annual Report Form (Attachment D) for each Copermittee in the Watershed Management Area, certified by a Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative.~~" "~~(2) Each Copermittee must complete and submit a Jurisdictional Runoff Management Program Annual Report Form (Attachment D) no later than October 31 of each year until the first Annual Report is required to be submitted.~~"
150	F.4	93	Reporting	The Copermittees require language clarification that the regional clearinghouse may be maintained by another agency.	**As shown in the attached revised Permit, revise the language, as follows:** Add a footnote: "The Copermittee may elect to develop and maintain the clearinghouse(s) provided by other Copermittees or agencies."
151	F.4	93	Reporting	Delete all references to a Regional Clearinghouse. Copermittees have been and will continue to make key	**As shown in the attached revised Permit, revise the language, as follows:**

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				documents and information related to permit compliance available to the public. Copermittees should not be required to invest time and resources into a potentially expensive and time consuming clearinghouse that would require coordination amongst all permittees. The benefit of a clearinghouse does not appear to outweigh the resources necessary to make it possible.	Delete all references throughout permit to "Regional Clearinghouse" and replace with reference to comply with Provision F4. Additionally, modify language as follows: "4.~~**Regional Clearinghouse**~~**Mechanism for Data and Information Sharing** The Copermittees must identify and implement a mechanism to ~~develop, update, and maintain an internet-based Regional Clearinghouse that can be used to~~ store, disseminate, and share the Copermittees' Water Quality Improvement Plans, Annual Reports, jurisdictional runoff management program documents, monitoring data, special studies, and ~~any~~ other pertinent data or information generated by the Copermittees during the implementation of this Order. Monitoring data collected pursuant to Provision D must be uploaded to CEDEN, ~~with links to the uploaded data available on the Regional Clearinghouse. The Regional Clearinghouse may be linked to other internet-based data portals and databases where the original documents and data are stored. The Regional Clearinghouse~~Copermittees must make this information ~~be~~ available and accessible to members of the public. The ~~Regional Clearinghouse~~ mechanism for sharing Copermittee data and information must be developed and made available to the public no later than 12 months after the adoption of this Order."
152	F.5	93	Reporting	See F.4.	Add similar language from F.4.
G. Principal Watershed Copermittee Responsibilities					
153	G	96	Principal Watershed	Coordinating and developing, with the other Copermittees, the requirements of Provisions F.3.c, F.4,	Remove requirement that Principal Copermittee can only be Principal Copermittee for 2 watersheds.

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
			Copermittee Responsibilities	and F.5.b of this Order.	Clarify that all Copermittees have some level of commitment, not just the Principal Watershed Copermittee.
H. Modification of Programs					
154	H	97	Modification of Programs	Modifications of programs are allowed under the WQIP as part of the iterative process and adaptive management. Language should be added to that effect or there may be annual amendments to the Order.	"Proposed modifications <u>outside of the WQIP process</u> that are not minor require amendment of this Order in accordance with this Order's rules, policies, and procedures."
I. Standard Permit Provisions and General Provisions					
				N/A	None.
Attachment A. Discharge Prohibitions					
155	Attachment A, 2	A-2	Attachment B to State Water Board Resolution 2012-001X	The Resolution has been adopted as 2012-0012 and should be updated accordingly throughout the document. Order should be incorporated by reference instead duplication.	Reference adopted SWRCB Resolution 2012-0012.
Attachment B. Standard Permit Provisions and General Provisions					
156	Attachment B	B1-B5	Standard Permit Provisions and General Provisions	This attachment incorporates the standard NPDES permit provisions as identified in 40 CFR 122.41. Although correctly transposed from the regulations the provisions are obviously developed for a traditional point source permit (i.e. wastewater permit). As such there are a number of standard provision that pose challenges to the Copermittees to comply with. Clarification is requested on a number of the provisions.	See specific changes noted below.
157	Attachment B, 1.m	B-7	Bypass	This provision requires the Copermittees to notify the Regional Board whenever an anticipated or unanticipated bypass will occur. Given the nature of storm events and the fact that stormwater treatment BMPs include bypass provisions to protect the BMP integrity it would appear that the Copermittees should notify the Regional Board anytime a storm is predicted	Delete this provision.

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				to ensure compliance with the provision (whether anticipated or unanticipated). This provision was crafted for typical wastewater discharges and has little relevance to stormwater.	
Attachment C. Acronyms, Abbreviations and Definitions					
158	Attachment C	C1-C10	Definitions	Definitions need to be added for: properly designed, rehabilitation, and retrofit. As currently written, the permit authorizes subjective broad authority and deference to the Regional Board in interpretation of the definitions, if not included. Minor clarifications and grammatical corrections are also included.	Suggested definitions are provided in the strikeout.
159	Attachment C	C-4	Definitions - Infiltration	The current definition only makes reference to infiltration of water into the sewer system. This definition should also include a traditional definition of infiltration.	**As shown in the attached revised Permit, revise the language, as follows:** Add: In the context of low impact development, infiltration may also be defined as the percolation of water into the ground. Infiltration is often expressed as a rate (inches per hour), which is determined through an infiltration test.
160	Attachment C	C-6	Definitions – MS4	The addition of CWA language to the definition of MS4 limits Copermittees' responsibilities to within their jurisdiction and strengthens support that Copermittees are not responsible for discharges in MS4s that they do not operate.	**As shown in the attached revised Permit, revise the language, as follows:** Add: "Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators." 40 CFR §122.21(a)(vi).
161	Attachment C	C-10	Definitions – Waters of the state	Current permit language, citing the California Water Code, presupposes that all portions of the MS4 are considered waters covered by the definition of waters of the state, "Any water, surface or underground, including saline waters within the boundaries of the State [CWC Provision 13050 (e)]." This language	**"Waters of the State -** Any water, surface or underground, including saline waters within the boundaries of the State [CWC Provision 13050 (e)]. The definition of the Waters of the State is broader than that for the Waters of the United States in that all water in the State is considered to

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				should be limited based on the intent of the definition (natural water sources) and should not include dry man-made structures that collect runoff for the sole purpose of flow volume/velocity and/or pollutant reduction.	be a Waters of the State~~ regardless of circumstance or condition~~. Under this definition, portions of a MS4 may be~~is always~~ considered to be a Waters of the State. However, man-made portions of the MS4 constructed for the sole purpose of flow and/or pollutant reduction will not be considered Waters of the State.”
162	Attachment C	C-11	Definitions – Wet Weather	Grammatical edits –words appear to be missing from the definition	Edit as follows: **“Wet Weather –** Weather is considered wet if there is a storm event of 0.1 inches and greater and ~~the following~~preceded by 72 hours of dry weather.”
Attachment D. Jurisdictional Runoff Management Program Annual Report Form					
163	Attachment D			See previous comments in F.3.b	Delete form or make optional.
Attachment E. Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011					
164	Attachment E	E-1 to E-30	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011	Most requirements are outlined already in the TMDLs and the redundancy of this Attachment is unnecessary. In fact, Attachment E *adds* many TMDL requirements not provided in the TMDL Resolutions, circumventing the TMDL public process. Implementation will be inconsistent with previously adopted resolutions and CLRPs and MPs already drafted, submitted, approved, and/or implemented.	On page E-1, reword to clarify that TMDL implementation must be incorporated into the WQIP and Monitoring sections by the Copermittees and reference the Resolution Numbers in the TMDL list and add recommended compliance language per comments below.
165	Attachment E	E-1	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011	The Rainbow Creek TMDL for Total Nitrogen and Phosphorous does not include Wasteload Allocations for the County of San Diego Copermittees. The TMDL only contains Load Allocations. Load allocations should not be implemented through an NPDES permit. It is in appropriate to simply “re-name” the Load Allocations as Wasteload Allocations.	Strike the following TMDL from Attachment E in its entirety: Total Maximum Daily Loads for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed
166	Attachment	E-1	Specific		

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
	E	to E-30	Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011	State and federal law do not require the use of numeric effluent limitations for MS4 permittees, but rather encourage flexible implementation of best management practices through an iterative process. Specifically, the choice to include either management practices or numeric limitations in MS4 permits is within the regulatory agency's discretion, and on the question of whether MS4 permits must contain numeric effluent limitations, the court upheld EPA's use of iterative BMPs in place of numeric effluent limitations for storm water discharges. (See *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)[4] Given the challenges with meeting the numeric WQBELs (even with the implementation of a comprehensive suite of BMPs) and the flexibility allowed by State and federal regulations and guidance, a BMP-based WQBEL approach should be allowed for complying with TMDLs. Removing the numeric WQBELs is not proposed. Rather, inclusion of a WQIP-based "compliance path" is recommended. The WQIPs can and should be used as the basis for establishing WQBELs expressed as BMPs. The WQIPs can satisfy the necessary elements of BMP-based WQBELs. For example, the WQIPs would meet the requirements described in the 2010 EPA memo (which updated key aspects of the 2002 memorandum) regarding federal expectations for incorporation of TMDLs WLAs into NPDES stormwater permits as BMP-based WQBELs.	See recommended changes in the attached revised Permit to the following: • Provision A.4.c • Provision A.4.d • Provision B (first paragraph) • Provision B.3 Additionally, within the requirements for each individual TMDL in Attachment E, include language similar to the following: Compliance may be demonstrated via any one of the following methods: 1. There is no discharge from the MS4, or 2. Applicable effluent limitations are met, or 3. Receiving waters meet the applicable receiving water limitations or water quality objective, or 4. Loading from the MS4 is such that it does not cause water quality objective exceedances, or 5. For Permittee(s) that are implementing a Regional Board-approved WQIP, WQBELs will be implemented as BMPs and compliance will be based upon implementing all provisions of the WQIP in accordance with the approved milestones and schedule.

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
167	Attachment E	E-1 to E-30	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011	The findings of California's Stormwater Blue Ribbon Panel, which was convened specifically to examine the feasibility of incorporating numeric effluent limits in stormwater permits, ultimately concluded that numeric limits were generally infeasible across all three stormwater activities (municipal, industrial, and construction), with a few exceptions (*The Feasibility of Numeric Effluent Limits Applicable to Discharges of Stormwater Associated with Municipal, Industrial and Construction Activities, June 19, 2006*). Additionally, state law and policy does not require the use of numeric effluent limitations in MS4 permits. In 2009, the State Water Board affirmed this approach in a precedential order, stating: [i]t is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California's NPDES storm water permits. This is not to say that a wasteload allocation will result in numeric effluent limitations for municipal storm water dischargers. Whether a future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board's findings *supporting either the numeric or non-numeric* effluent limitations contained in the permit. (Order WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).)	See recommended changes in the attached revised Permit to the following: • Provision A.4.c • Provision A.4.d • Provision B (first paragraph) • Provision B.3 Additionally, within the requirements for each individual TMDL in Attachment E, include language similar to the following,: Compliance may be demonstrated via any one of the following methods: 1. There is no discharge from the MS4, or 2. Applicable effluent limitations are met, or 3. Receiving waters meet the applicable receiving water limitations or water quality objective, or 4. Loading from the MS4 is such that it does not cause water quality objective exceedances, or 5. For Permittee(s) that are implementing a Regional Board-approved WQIP, WQBELs will be implemented as BMPs and compliance will be based upon implementing all provisions of the WQIP in accordance with the approved milestones and schedule.

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page**[1]	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
168	Attachment E. Part 1.b, 2.b, 3.b, 4.b, 5.b, and 6.b	E-2, E-4, E-6, E-9, E-13, and E-19	Water Quality Based Effluent Limitations	Federal regulations (40 CFR 122.44(d)(1)(vii)(B)) require inclusion of effluent limits that are "consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA." Attachment E outlines the requirements of effective TMDLs and appears to incorporate numeric receiving water limitations (RWL) <u>and</u> effluent limitations, where the effluent limitations are set equal to the TMDL Waste Load Allocations (WLAs) and the RWLs are set equal to the TMDL numeric targets. This approach results in a situation where the Copermittees are in double jeopardy. Copermittees should not be put in double jeopardy by being required to meet both RWLs and effluent limitations. Rather, attainment of either RWLs <u>**or**</u> effluent limitations should represent compliance with the permit and the requirements of the TMDL.	See recommended changes in the attached revised Permit. Additional language should be added to the WQBELs sections for all TMDLs in Attachment E to clearly define compliance with WQBELs via any of the following methods: - There is no discharge from the MS4, **OR** - Applicable effluent limitations are met, **OR** - Receiving waters meet the applicable receiving water limitations or water quality objective, **OR** - Loading from the MS4 is such that it does not cause water quality objective exceedances, **OR** - For Permittee(s) that are implementing a Regional Board-approved WQIP, WQBELs will be implemented as BMPs and compliance will be based upon implementing all provisions of the WQIP in accordance with the approved milestones and schedule.
169	Attachment E	E-1 to E-30	Multiple	Attachment E specifies outfall monitoring requirements for several TMDLs, "in accordance with the requirements of Provisions D.1, D.4.a.(1)(b), and D.4.a.(3)(b) of this Order." Adding outfall monitoring to the TMDL provisions is inappropriate and unnecessary. Attachment E should focus on integrating the monitoring requirements *specified in the TMDL Basin Plan Amendments.* The monitoring requirements for TMDLs were developed through a public comment	Modify the Specific Monitoring and Assessment Requirements for the following TMDLs: 1. Total Maximum Daily Load for Diazinon in Chollas Creek Watershed 2. Total Maximum Daily Loads for Dissolved Copper in Shelter Island Yacht Basin 3. Total Maximum Daily Loads for Dissolved

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				process and adopted by the Regional Board, and are the only monitoring requirements that should be specified in Attachment E. Furthermore, there is no reason to re-state the requirements from Provision D, which makes it likely that Attachment E and Provision D will have inconsistencies. Provision D requirements should only be listed in Provision D.	Copper, Lead, and Zinc in Chollas Creek 4. Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay Specifically, for each of these TMDLs, the sub-bullet under section (d) regarding effluent monitoring should be stricken and replaced with the following: "The Responsible Copermittees must implement the monitoring and assessment requirements issued under Order No. XXXX. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.", where "XXXX" reflects the order numbers for each TMDL, shown in the attached revised Permit on Page E-1. For the Chollas Creek Metals and Diazinon TMDLs, the XXX refers to the order number for the issued Investigation Orders. For the Project I Bacteria TMDL, specific changes to the monitoring requirements are requested to reflect those specified in the TMDL Basin Plan Amendment, as described below.
170	Attachment E. Part 4.b.	E-10	Water Quality Based Effluent Limitations	The TMDL for Dissolved Copper, Lead, and Zinc in Chollas Creek states that "If all copper, lead, and zinc concentrations in urban runoff to Chollas Creek meet their respective TMDL concentrations, the loading capacity of the creek should not be exceeded" (Section	If WQBELs are to be expressed as numeric effluent limits consistent with the WLAs, then mass-based WQBELs should be included as a mechanism for demonstrating compliance to allow for options to demonstrate load-based pollutant reductions. As described above, the mass-based WQBELs

Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				8). The TMDL further states that "because this WLA is concentration-based it will apply to each land use and each sub-watershed at all times and will not be specific to any land use or sub-watershed (Section 8.1). Requiring all land uses and sub-watersheds to meet effluent limits consistent with RWLs is not a cost-effective or practicable approach to BMP strategy development. Volume reduction strategies such as Low Impact Development and Green Infrastructure should be a viable compliance path for the San Diego region. The WQBELs should include the mass-load based WLAs to consider the pollutant loads reduced, which will be impacted by both pollutant concentration reductions *and* stormwater volume reductions. Alternatives for load-based approaches should be included as effluent limitations, which will correspond to targets for meaningful CLRP and WQIP development.	should only be included with an "or" statement (not an "and" statement). The recommended Compliance Determination language in the attached revised Permit addresses this issue.
171	Attachment E. Part 5.b (1) and (2)		Effluent Limits	The effluent limits listed within the permit apply the water quality objectives end of pipe for the MS4 dischargers. The permit language should be consistent with the TMDL and state what the load allocations are that are assigned to the dischargers.	**As shown in the attached revised Permit, revise the language, as follows:** Delete the following from 5.b (1)(b): "The Copermittee must provide data that demonstrate the discharges from the MS4s are meeting the effluent limitations under Specific Provision 5.b.**Error! Reference source not found.**" Delete section 5.b.(2) "Effluent Limits" and replace with the following: "For both (a) and (b) above, if the REC-1 water quality objectives cannot be met in the receiving waters, and if the natural and

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					background sources appear to be the sole source of the continued impairment, the natural sources exclusion approach (NSEA) may be applied. The Municipal Dischargers are responsible for collection of the data to support the application of the NSEA to recalculate the TMDL." www.waterboards.ca.gov/sandiego/water_issues/programs/basin_plan/docs/update082812/Chpt_7_2012.pdf, Page 7-56
172	Attachment E. Part 5.c		Compliance Schedule	The waste load reduction milestones should be consistent with the milestones included in the current Order R9-2009-0002 (page 78).	**As shown in the attached revised Permit, revise the language, as follows:** Revise 5.c.(1) to include the waste load reduction compliance dates.
173	Attachment E. Part 6.a	E-19	Applicability	Since adoption of the Project I Bacteria TMDL, the Copermittees have submitted data to the Regional Board to demonstrate that 303(d) listings for San Marcos HA, San Dieguito River HA, and Los Penasquitos HA were incorrectly applied to REC beneficial uses. The Regional Board has responded and agreed, indicating "that Los Penasquitos has posted data to the Regional Board to demonstrate that 303(d) listings for San Marcos HA, Pacific Ocean Shoreline at Los Penasquitos River Mouth is not subject to further action under Resolution No. R9-2010-0001." Similar responses are expected for the other HAs.	In Table 6.0, the San Dieguito River WMA and Carlsbad WMAs should be deleted. The Los Penasquitos WMA should be re-named to the Mission Bay WMA and Torrey Pines State Beach at Del Mar should be removed. The recommended language in the attached revised Permit addresses this issue by also adding the following to Specific Provision 6.a.(5): "Subsequent to TMDL adoption, it has been established by the Regional Board that the following water bodies are not

<table>

					any further action as long as monitoring data continues to support compliance with water quality standards." www.waterboards.ca.gov/sandiego/water_issues/programs/basin_plan/docs/update082812/Chpt_7_2012.pdf, Page 7-60
175	Attachment E. Part 6.b	E-19	Receiving Water Limitations	The Basin Plan Amendment for the Project I Bacteria TMDL contains Receiving Water Limitations. These Receiving Water Limitations should be incorporated directly into the Permit. However, Attachment E contains Receiving Water Limitations that do not match those from the TMDL. The Regional Board should not revise or translate the RWLs from the TMDL, they should be incorporated directly. The RWLs incorporated into Attachment E have several discrepancies with the RWLs in the TMDL, including application of single sample targets to the dry weather RWLs and application of total coliform RWLs for inland waters.	Replace entirely the RWLs in the Permit with those from the TMDL. The attached revised Permit incorporates RWLs for beaches (Table 6.1) and RWLs for Creeks (Table 6.2). Note these RWLs were *pasted directly* from the Basin Plan Amendment (Attachment A, page 52).
176	Attachment E. Part 6.b	E-19 and E-20	Water Quality Based Effluent Limitations	Attachment E specifies WQBELs for dry weather flows as both receiving water and effluent limitations for the Project I Bacteria TMDL, in terms of zero allowable exceedances of the single sample maximum and the 30-day geometric mean. However, the dry weather component of the TMDL only considered the 30-day geometric mean, and did not consider the single sample maximum within its calculation. Incorporating single sample effluent limitations into the Permit goes beyond the TMDL requirements. In addition, if the TMDL had included single sample limits, there would have been a corresponding allowable exceedance frequency, just as	It is recommended that the single sample maximum not be used for dry weather WQBELs. At a minimum, an acceptable dry weather exceedance frequency should be assumed and applied. Specific Provision 6.b.(2) of the attached revised Permit addresses this issue by (1) incorporating the RWLs directly from the TMDL, and (2) linking the receiving water limitations and effluent limitations.

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
				for wet weather. The 22% allowable exceedance rate for wet weather was based on a reference beach within the Los Angeles Region, and although not used in the technical approach for the San Diego Beaches and Creeks TMDL, the reference beach also exhibits exceedances during dry weather, which is incorporated into beach TMDLs in the Los Angeles region.	
177	Attachment E. Part 6.b	E-20	Water Quality Based Effluent Limitations	The Project I Bacteria TMDL applies mass-load based TMDLs to point sources. Many of the BMPs used for achieving pollutant reductions, such as structural BMPs and green infrastructure, emphasize infiltration and associated volume reduction as the primary mechanism for reducing urban runoff. A significant investment could be made to implement structural BMPs to reduce urban runoff to meet the mass-load based WLAs assigned in the TMDL. These reductions could result in meeting the mass-based WLA and have a positive impact on receiving waters by significantly reducing urban loads to receiving waters. However, even the small amount of flows remaining could exceed the numeric effluent limitations currently in the Permit, but <u>not</u> cause or contribute to WQO exceedances. In this manner, a violation of the numeric WQBELs would result in zero credit for the millions invested and penalty for discharges that did <u>not</u> negatively impact attainment of WQ standards. Volume reduction strategies such as Low Impact Development and Green Infrastructure should be a viable compliance path for the San Diego region. The WQBELs should include the mass-load based WLAs to consider the pollutant loads reduced, which will be impacted by both pollutant concentration reductions *and* stormwater volume reductions.	If WQBELs are to be expressed as numeric effluent limits consistent with the WLAs, the mass based WLAs for both dry and wet weather presented in the TMDL should be included as a mechanism for demonstrating compliance to 1) be consistent with the assumptions of the WLAs and 2) allow for options to demonstrate load based pollutant reductions. The attached revised Permit addresses this issue by incorporating the mass-based wasteload allocations into Section 6.b.(2).

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
178	Attachment E. Part 6.b	E-20	Water Quality Based Effluent Limitations	The reference conditions and associated allowable exceedance frequencies for WQBELs addressing Project I Bacteria TMDL were based on a marine reference beach within Los Angeles, and are not necessarily applicable to fresh water flows in the San Diego Region. The Los Angeles reference beach was influenced by salt water (increasing bacterial die-off) and mixing/dilution from wave action that likely resulted in lower exceedances of REC-1 objectives than would be found in a freshwater stream. Freshwater TMDLs in the Los Angeles region now incorporate freshwater reference systems (instead of a marine reference system), and the marine beach exceedance rates have been updated through a recent TMDL reopener for Santa Monica Bay. In addition, a reference study is currently underway for the San Diego Region.	The permit should include language that allows for update of the allowable exceedance frequencies as these results become available. The attached revised Permit addresses this issue by added the following paragraph to Specific Provision 6.b.(1).(a): "The allowable exceedance frequencies in Table 6.1 and Table 6.2 can be updated by the Regional Board Executive Officer if sufficient data is provided regarding reference systems in the San Diego Region."
179	Attachment E. Part 6.c	E-20	Compliance Schedule	Total coliform WQOs do not apply to inland waters.	As shown in the attached revised Permit, add a footnote to Table 6.3 as follows: "Total coliform receiving water limitations apply only to segments of areas of Pacific Ocean Shoreline listed in Table 6.0."
180	Attachment E. Part 6.c	E-27	Compliance Schedule	The CLRPs to be submitted by Copermitees will propose interim compliance dates, as allowed by the Project I Bacteria TMDL, generally 7 and 10 years, respectively, to meet the 50% reduction milestone for dry and wet weather. The CLRPs submitted by Copermittees may not all propose the same interim compliance dates and the Permit should acknowledge the flexibility allowed by the TMDL (see page 68 of Attachment A of the Basin Plan Amendment). In fact, this scheduling flexibility was a primary "incentive" for Copermitees to develop CLRPs instead of BLRPs.	The interim compliance dates should not be specified in the Permit. Instead, the Permit should reference the submitted and Regional Board-approved CLRPs. This approach will avoid conflict between the TMDL, Permit, and CLRPs. The attached revised Permit addresses this issue by revising the opening of Section 6.c.(2): "The Responsible Copermittees must comply with

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
					the following interim WQBELs by the interim compliance dates submitted in the Regional Board-approved CLRPs and supported by Order No. R9-2010-0001:" Table 6.5 should be deleted from Attachment E to allow the CLRPs the scheduling flexibility provided in the TMDL adopted by the Regional Board.
181	Attachment E. Part 6.c	E-21 thru E-27	Compliance Schedule	Similar to the flexibility allowed for scheduling, the TMDL allows CLRPs flexibility in expressing and achieving TMDL milestones/interim requirements. Furthermore, the wet weather interim compliance dates are well-beyond the term of this Permit, and should be not included in Attachment E.	Delete Table 6.4 because (1) the CLRPs have flexibility to express interim milestones and (2) the wet weather interim requirements do not apply until 2022, well beyond the term of this Permit.
182	Attachment E. Part 6.c	E-27	Compliance Schedule	The Copermittees request an acknowledgement of the TMDL reopener scheduled for April 2016 which falls within the term of this Permit.	Add a part (3) to Specific Provision 6.c: "(3) Submittals to Support TMDL Basin Plan Amendment The Responsible Copermittees are encouraged to submit data to support the TMDL reopener scheduled for April 2016 including but not limited to data related to reference watershed monitoring and beneficial use usage frequency."
183	Attachment E. Part 6.d (new section added to revised)	E-27	Compliance Determination	The BPA for the Project I Bacteria TMDL contains specific language regarding MS4 compliance determination in the case that receiving water limitations are not attained. This language should be added directly to the Permit.	As shown in the attached revised Permit, add the following language to Section 6 of Attachment E, which is *pasted directly* from the BPA: "The municipal MS4s may demonstrate that their discharges are not causing the exceedances in the receiving waters by providing data from their discharge points to the receiving waters, by providing data collected at jurisdictional

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	Permit Section	Permit Page[1]	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
					boundaries, and/or by using other methods accepted by the San Diego Water Board. Otherwise, at the end of the wet weather TMDL compliance schedule, the municipal Phase I MS4s will be held responsible and considered out of compliance unless other information or evidence indicates another controllable or uncontrollable source is responsible for the exceedances in the receiving waters. If controllable sources other than discharges from the municipal Phase I MS4s are identified before or after the end of the wet weather TMDL Compliance Schedules as causing the exceedances, those controllable sources will be responsible for reducing their bacteria loads and/or demonstrating that discharges from those sources are not causing the exceedances. If controllable sources other than the Phase I MS4s are identified as causing the exceedances, and the Phase I MS4s have demonstrated they are not causing or contributing to the exceedances, the Phase I MS4s will not be considered out of compliance. The San Diego Water Board shall implement additional actions (e.g., issue enforcement actions, amend existing NPDES requirements or conditional waivers), as needed, to bring all those controllable sources into compliance with the wet weather TMDLs.”
184	Attachment E. Part 6.d	E-27	Specific Monitoring and Assessment Requirements	As described above, the CLRPs envisioned in the Project I Bacteria TMDL include flexibility to develop certain components based on watershed-specific issues and conditions. Each CLRP submitted by the Copermittees will include a monitoring and assessment component. It is important to allow the CLRP process to drive the monitoring programs.	As shown in the attached revised Permit, include the following at the beginning of the Monitoring and Assessment section: “The BLRPs and CLRPs to be submitted by the Copermittees and approved by the Regional Board

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					Executive Officer contain monitoring programs. Implementation of those Regional Board-approved monitoring programs constitutes compliance with the Monitoring Station and Monitoring Procedure requirements, described below."
185	Attachment E. Part 6.d	E-27	Specific Monitoring and Assessment Requirements	The Project I Bacteria TMDL included specific beach monitoring requirements, which were subject to a public comment process and adopted by the Regional Board. Attachment E adds many additional components to these requirements, which undermines the TMDL adoption and public commenting process. Instead of re-interpreting and adding onto the TMDL monitoring requirements in the Basin Plan Amendment, the Permit should adopt those requirements directly (BPA Attachment A, page 50-51).	As shown in the attached revised Permit, the beach monitoring requirement should be incorporated directly from the TMDL. The following language/requirement for beaches is *pasted directly* from the TMDL: "(1) Monitoring and Assessment Requirements for Beaches (a) Monitoring Stations For beaches addressed by these TMDLs, monitoring locations should consist of, at a minimum, the same locations used to collect data required under MS4 NPDES monitoring requirements and beach monitoring for Health and Safety Code section 115880.75 If exceedances of the receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations and/or other source identification methods must also be used to demonstrate that the bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters. (b) Monitoring Procedures

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					(i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations at least monthly. (ii) The Responsible Copermittees must collect wet weather monitoring samples from the receiving water monitoring stations at least once within the first 24 hours of the end of a storm event that occurs during the rainy season (i.e., October 1 through April 30). (iii) Samples must be analyzed for total coliform, fecal coliform, and *Enterococcus* indicator bacteria."
186	Attachment E. Part 6.d	E-27	Specific Monitoring and Assessment Requirements	Similarly, the creek monitoring requirements should reflect the TMDL that was approved and subject to public comment (BPA Attachment A, page 50-51). Note that total coliform should not be a requirement for creek monitoring, as creeks are not subject to total coliform WQOs, RWLs, or WLAs.	As shown in the attached revised Permit, the creek monitoring requirement should be incorporated directly from the TMDL. The following language/requirement for creeks is *pasted directly* from the TMDL: "Monitoring and Assessment Requirements for Creeks and Creek Mouths (a) Monitoring Stations For creeks addressed by these TMDLs, monitoring locations should consist of, at a minimum, a location at or near the mouth of the creek (e.g., Mass Loading Station or Mass Emission Station) and one or more locations upstream of the mouth (e.g., Watershed Assessment Stations). If exceedances of the receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations and/or other source

	COUNTY OF ORANGE COMMENTS ON TENTATIVE ORDER NO. R9-2012-0011				
Comment #	**Permit Section**	**Permit Page[1]**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
					identification methods must also be used to demonstrate that the bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters. (b) Monitoring Procedures (i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations at least monthly. (ii) The Responsible Copermittees must collect wet weather monitoring samples from the receiving water monitoring stations within the first 24 hours of the end of a storm event that occurs during the rainy season (i.e., October 1 through April 30) (iii) Samples collected from receiving water monitoring stations must be analyzed for fecal coliform and *Enterococcus* indicator bacteria.”

ADMINISTRATIVE DRAFT

The Riverside County Copermittees in Table 1c are subject to waste discharge requirements within their respective jurisdictions as set forth in this Order upon expiration of Order No. R9-2010-0016, NPDES No. CAS0108766 on November 10, 2015.

Table 1c. Riverside County Copermittees

City of Murrieta	County of Riverside
City of Temecula	Riverside County Flood Control and Water Conservation District
City of Wildomar	

The Orange County Copermittees and Riverside County Copermittees may enroll under this Order at a date earlier than the expiration date of their current Orders subject to the conditions described in Provision F.6 of this Order and the Copermittees in the respective county receive a Notice of Enrollment (NOE) from the San Diego Water Board.

The term Copermittee in this Order refers to any San Diego County, Orange County, or Riverside County Copermittee enrolled under this Order, unless specified otherwise.

This Order provides permit coverage for the Copermittee discharges described in Table 2.

Table 2. Discharge Locations and Receiving Waters

Discharge Description	Municipal Separate Storm Sewer System (MS4) Discharges
Receiving Waters	Inland Surface Waters, Enclosed Bays and Estuaries, and Coastal Ocean Waters of the San Diego Region

Table 3. Administrative Information

This Order was adopted by the San Diego Water Board on:	**Month Day, 2012**
This Order will become effective on:	**Month Day, 2012**
This Order will expire on:	**Month Day, 2017**
The Copermittees must file a Report of Waste Discharge (ROWD) in accordance with Title 23, California Code of Regulations, as application for issuance of new waste discharge requirements no later than 180 days in advance of the Order expiration date.	

I, David W. Gibson, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on Month Day, 2012.

TENTATIVE

David W. Gibson
Executive Officer

ADMINISTRATIVE DRAFT

TABLE OF CONTENTS
(Cont'd)

I. FINDINGS

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board), finds that:

JURISDICTION

1. **MS4 Ownership or Operation.** Each of the Copermittees owns or operates an MS4, through which it discharges storm water and non-storm water into waters of the U.S. within the San Diego Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is "interrelated" to a medium or large MS4; or (3) an MS4 which contributes to a violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the U.S.

2. **Legal and Regulatory Authority.** This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations (Code of Federal Regulations [CFR] Title 40, Part 122 [40 CFR 122]) adopted by the United States Environmental Protection Agency (USEPA), and chapter 5.5, division 7 of the California Water Code (CWC) (commencing with section 13370). This Order serves as an NPDES permit for discharges from MS4s to surface waters. This Order also serves as waste discharge requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the CWC (commencing with section 13260).

3. **CWA Technology Based Standards and Prohibitions.** Pursuant to CWA section 402(p)(3)(B), NPDES permits for storm water discharges from MS4s must include requirements to effectively prohibit non-storm water discharges into MS4s, and require controls to reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP).

4. **CWA NPDES Permit Conditions.** Pursuant to CWA section 402(a)(2), NPDES permits must prescribe conditions to assure compliance with CWA section 402(p)(3)(B) and 40 CFR 122.26(d)(2)(iv)(B). This Order prescribes conditions to assure compliance with the CWA requirements for owners and operators of MS4s to effectively prohibit non-storm water discharges in~~-~~to the MS4s, and require controls to reduce the discharge of pollutants in storm water from the MS4s to the MEP.

5. **CWA and CWC Monitoring Requirements.** Pursuant to 40 CFR 122.48, NPDES permits must specify requirements for recording and reporting monitoring results. In addition, CWC sections 13267 and 13383 authorize the San Diego Water Board to require technical and monitoring reports. This Order establishes monitoring and reporting requirements to implement federal and State requirements.

ADMINISTRATIVE DRAFT

6. **Total Maximum Daily Loads.** CWA section 303(d)(1)(A) requires that "[e]ach state shall identify those waters within its boundaries for which the effluent limitations…are not stringent enough to implement any water quality standard applicable to such waters." The CWA also requires states to establish a priority ranking of impaired water bodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired water bodies is called the Clean Water Act Section 303(d) List of Water Quality Limited Segments, commonly referred to as the 303(d) List. The CWA requires the 303(d) List to be updated every two years. Requirements of this Order implement the TMDLs adopted by the San Diego Water Board and approved by USEPA.

7. **Non-Storm Water Discharges.** Pursuant to CWA section 402(p)(3)(B)(ii), this Order requires each Copermittee to effectively prohibit discharges of non-storm water into its MS4. Nevertheless, non-storm water discharges into and from the MS4s continue to be reported to the San Diego Water Board by the Copermittees and other persons. Monitoring conducted by the Copermittees, as well as the 303(d) List, have identified dry weather, non-storm water discharges from the MS4s as a source of pollutants causing or contributing to receiving water quality impairments in the San Diego Region. The federal regulations [40 CFR 122.26(d)(2)(iv)(B)] require the Copermittees to have a program to ~~prevent~~ effectively prohibit ~~all types of non-storm water discharges, or~~ illicit discharges, from entering the MS4. The federal regulations, however, allow for specific categories of non-storm water discharges ~~or flows~~ to be addressed as illicit discharges only where such discharges are identified as sources of pollutants to waters of the U.S.

8. **In-Stream Treatment Systems.** Pursuant to federal regulations [40 CFR 131.10(a)], in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Authorizing the construction of a runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Runoff treatment must occur prior to the discharge of runoff into receiving waters. Treatment control best management practices (BMPs) must not be constructed in waters of the U.S. or state. Construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body.

DISCHARGE CHARACTERISTICS AND RUNOFF MANAGEMENT

9. **Point Source Discharges of Pollutants.** Discharges from the MS4s may contain waste, as defined in the CWC, and pollutants that adversely affect the quality of the waters of the state. A discharge from an MS4 is a "discharge of pollutants from a point source" into waters of the U.S. as defined in the CWA. Storm water and non-storm water discharges from the MS4s may contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the Basin Plan. Storm water and non-storm water discharges from the MS4s are subject to the conditions and requirements established in the Basin Plan for point source

discharges.

10. **Potential Beneficial Use Impairment.** The discharge of pollutants and/or increased flows from MS4s may cause or threaten to cause the concentration of pollutants to exceed applicable receiving water quality objectives and impair or threaten to impair designated beneficial uses resulting in a condition of pollution, contamination, or nuisance.

11. **Pollutants Generated by Land Development.** Land development has created and continues to create new sources of non-storm water discharges and pollutants in storm water discharges as human population density increases. This brings higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, and trash. Pollutants from these sources are dumped or washed off the surface by non-storm water or storm water flows into and from the MS4s. When development converts natural vegetated pervious ground cover to impervious surfaces such as paved highways, streets, rooftops, and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving a developed area contains greater pollutant loads and is significantly greater in runoff volume, velocity, and peak flow rate than pre-development runoff from the same area.

12. **Runoff Discharges to Receiving Waters.** The MS4s discharge runoff into lakes, drinking water reservoirs, rivers, streams, creeks, bays, estuaries, coastal lagoons, the Pacific Ocean, and tributaries thereto within the eleven hydrologic units comprising the San Diego Region. Numerous receiving water bodies and water body segments have been designated as impaired by the San Diego Water Board pursuant to CWA section 303(d).

13. **Pollutants in Runoff.** The most common pollutants in runoff discharged from the MS4s include total suspended solids, sediment, pathogens (e.g., bacteria, viruses, protozoa), heavy metals (e.g., cadmium, copper, lead, and zinc), petroleum products and polynuclear aromatic hydrocarbons, synthetic organics (e.g., pesticides, herbicides, and PCBs), nutrients (e.g., nitrogen and phosphorus), oxygen-demanding substances (decaying vegetation, animal waste), detergents, and trash.

14. **Human Health and Aquatic Life Impairment.** Pollutants in runoff discharges from the MS4s can threaten and adversely affect human health and aquatic organisms. Adverse responses of organisms to chemicals or physical agents in runoff range from physiological responses such as impaired reproduction or growth anomalies to mortality. Increased volume, velocity, rate, and duration of storm water runoff greatly accelerate the erosion of downstream natural channels. This alters stream channels and habitats and can adversely affect aquatic and terrestrial organisms.

15. **Water Quality Effects.** The Copermittees' water quality monitoring data submitted to date documents persistent exceedances of Basin Plan water quality objectives for runoff-related pollutants at various watershed monitoring stations. Persistent toxicity has also been observed at several watershed monitoring stations. In addition,

bioassessment data indicate that the majority of the monitored receiving waters have Poor to Very Poor Index of Biotic Integrity (IBI) ratings. These findings indicate that runoff discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in the San Diego Region. Non-storm water discharges from the MS4s have been shown to contribute significant levels of pollutants and flow in arid, developed Southern California watersheds, and contribute significantly to exceedances of applicable receiving water quality objectives.

16. **Non-Storm Water Discharges.** Non-storm water discharges ~~from~~ into the MS4s are not considered storm water discharges and therefore are not subject to the MEP standard from CWA 402(p)(3)(B)(iii), which is explicitly for "Municipal … *Stormwater Discharges* (emphasis added)" from the MS4s. Pursuant to CWA 402(p)(3)(B)(ii), non-storm water discharges into the MS4s must be effectively prohibited.

17. **Best Management Practices.** Pollutants can be effectively reduced in runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Pollution prevention is the reduction or elimination of pollutant generation at its source and is the best "first line of defense". Source control BMPs (both structural and non-structural) minimize the contact between pollutants and runoff, therefore keeping pollutants onsite and out of receiving waters. Treatment control BMPs remove pollutants that have been mobilized by storm water or non-storm water flows.

18. **BMP Implementation.** Runoff needs to be addressed during the three major phases of development (planning, construction, and use) in order to reduce the discharge of storm water pollutants to the MEP, effectively prohibit non-storm water discharges, and protect receiving waters. Development which is not guided by water quality planning policies and principles can result in increased pollutant load discharges, flow rates, and flow durations which can negatively affect receiving water beneficial uses. Construction sites without adequate BMP implementation result in sediment runoff rates which greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. Existing development can generate substantial pollutant loads which are discharged in runoff to receiving waters.

19. **Long Term Planning and Implementation.** Federal regulations require municipal storm water permits to expire 5 years from adoption, after which the permit must be renewed and reissued. The San Diego Water Board recognizes that the degradation of water quality and impacts to beneficial uses of the waters in the San Diego Region occurred over several decades. The San Diego Water Board further recognizes that a decade or more may be necessary to realize demonstrable improvement to the quality of waters in the Region. This Order includes a long term planning and implementation approach that will require more than a single permit term to complete.

WATER QUALITY STANDARDS

20. **Basin Plan.** The San Diego Water Board adopted a Water Quality Control Plan for the San Diego Basin (Basin Plan) on September 8, 1994 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for receiving waters addressed through the plan. The Basin Plan was subsequently approved by the State Water Resources Control Board (State Water Board) on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the San Diego Water Board and approved by the State Water Board. Requirements of this Order implement the Basin Plan.

    The Basin Plan identifies the following existing and potential beneficial uses for inland surface waters in the San Diego Region: Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1), Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), Rare, Threatened, or Endangered Species (RARE), Freshwater Replenishment (FRSH), Hydropower Generation (POW), and Preservation of Biological Habitats of Special Significance (BIOL). The following additional existing and potential beneficial uses are identified for coastal waters of the San Diego Region: Navigation (NAV), Commercial and Sport Fishing (COMM), Estuarine Habitat (EST), Marine Habitat (MAR), Aquaculture (AQUA), Migration of Aquatic Organisms (MIGR), Spawning, Reproduction, and/or Early Development (SPWN), and Shellfish Harvesting (SHELL).

21. **Ocean Plan.** The State Water Board adopted the Water Quality Control Plan for Ocean Waters of California, California Ocean Plan (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005 and it became effective on February 14, 2006. The Ocean Plan is applicable, in its entirety, to point source discharges to the ocean. Requirements of this Order implement the Ocean Plan.

    The Ocean Plan identifies the following beneficial uses of ocean waters of the state to be protected: Industrial water supply; water contact and non-contact recreation, including aesthetic enjoyment; navigation; commercial and sport fishing; mariculture; preservation and enhancement of designated Areas of Special Biological Significance; rare and endangered species; marine habitat; fish spawning and shellfish harvesting

22. **Sediment Quality Control Plan**. On September 16, 2008, the State Water Board adopted the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality (Sediment Quality Control Plan). The Sediment Quality Control Plan became effective on August 25, 2009. The Sediment Quality Control Plan establishes 1) narrative sediment quality objectives for benthic community protection from exposure to contaminants in sediment and to protect human health, and 2) a program of implementation using a multiple lines of evidence approach to interpret

ADMINISTRATIVE DRAFT

the narrative sediment quality objectives. Requirements of this Order implement the Sediment Quality Control Plan.

23. **National Toxics Rule and California Toxics Rule.** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the National toxics Rule (NTR) applied in California. On May 18, 2000, USEPA adopted the California Toxics Rule (CTR). The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants

24. **Antidegradation Policy.** This Order is in conformance with the federal Antidegradation Policy described in 40 CFR 131.12, and State Water Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality Waters in California*. Federal regulations at 40 CFR 131.12 require that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The San Diego Water Board's Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies.

CONSIDERATIONS UNDER FEDERAL LAW

25. **Coastal Zone Act Reauthorization Amendments.** Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA addresses five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This Order addresses the management measures required for the urban category, with the exception of septic systems. The runoff management programs developed pursuant to this Order fulfill the need for coastal cities to develop a runoff non-point source plan identified in the Non-Point Source Program Strategy and Implementation Plan. The San Diego Water Board addresses septic systems through the administration of other programs.

26. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the Federal Endangered Species Act (16 USCA sections 1531 to 1544). This Order requires compliance with receiving water limits, and other requirements to protect the beneficial uses of waters of the State. The Copermittees are responsible for meeting all requirements of the applicable Endangered Species Act.

ADMINISTRATIVE DRAFT

CONSIDERATIONS UNDER STATE LAW

27. **Unfunded Mandates.** This Order does not constitute an unfunded local government mandate subject to subvention under Article XIIIB, Section (6) of the California Constitution for several reasons, including, but not limited to, the following:

   a. This Order implements federally mandated requirements under CWA section 402. (33 USC 1342(p)(3)(B).)

   b. The local agency Copermittees' obligations under this Order are similar to, and in many respects less stringent than, the obligations of non-governmental and new dischargers who are issued NPDES permits for storm water and non-storm water discharges.

   c. The local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order.

   d. The Copermittees have requested permit coverage in lieu of compliance with the complete prohibition against the discharge of pollutants contained in CWA section 301(a) (33 USC 1311(a)) and in lieu of numeric restrictions on their MS4 discharges (i.e. effluent limitations).

   e. The local agencies' responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under State law predates the enactment of Article XIIIB, Section (6) of the California Constitution.

   f. The provisions of this Order to implement TMDLs are federal mandates. The CWA requires TMDLs to be developed for water bodies that do not meet federal water quality standards. (33 USC 1313(d).) Once the USEPA or a state develops a TMDL, federal law requires that permits must contain effluent limitations consistent with the assumptions and requirements of any applicable wasteload allocation. (40 CFR 122.44(d)(1)(vii)(B).)

28. **California Environmental Quality Act.** The issuance of WDRs and an NPDES permit for the discharge of runoff from MS4s to waters of the U.S. is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (CEQA) (Public Resources Code, Division 13, Chapter 3, section 21000 et seq.) in accordance with CWC section 13389.

STATE WATER BOARD DECISIONS

29. **Compliance with Prohibitions and Limitations.** The receiving water limitation language specified in this Order is consistent with language recommended by the USEPA and established in State Water Board Order WQ-99-05, *Own Motion Review of the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03, NPDES Permit No. CAS0108740*, adopted by the State Water Board on June 17, 1999. The receiving water limitation language in this Order requires compliance with water quality standards, which for storm water discharges is to be achieved through an iterative approach requiring the

implementation of improved and better-tailored BMPs over time. Implementation of the iterative approach to comply with receiving water limitations based on applicable water quality standards is necessary to ensure that storm water discharges from the MS4 ultimately will not cause or contribute to violations of water quality standards and the creation of conditions of pollution, contamination, or nuisance.

30. Special Conditions for Areas of Special Biological Significance. On March 20, 2012, the State Water Board approved Resolution No. 2012-~~001X~~ 0012 approving an exception to the Ocean Plan prohibition against discharges to Areas of Special Biological Significance (ASBS) for certain nonpoint source discharges and NPDES permitted municipal storm water discharges. The Resolution requires monitoring and testing of marine aquatic life and water quality in several ASBS to protect California's coastline during storms when rain water overflows into coastal waters. Specific terms, prohibitions, and special conditions were adopted to provide special protections for marine aquatic life and natural water quality in ASBSs. The City of San Diego's municipal storm water discharges to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's municipal storm water discharges to the Heisler Park ASBS are subject terms and conditions of the Resolution. The Special Protections contained in Attachment B to the Resolution applicable to these discharges are hereby incorporated in this Order as if fully set forth herein.

ADMINISTRATIVE FINDINGS

31. Executive Officer Delegation of Authority. The San Diego Water Board by prior resolution has delegated all matters that may legally be delegated to its Executive Officer to act on its behalf pursuant to CWC section 13223. Therefore, the Executive Officer is authorized to act on the San Diego Water Board's behalf on any matter within this Order unless such delegation is unlawful under CWC section 13223 or this Order explicitly states otherwise.

32. Standard Provisions. Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR 122.42, are provided in Attachment B to this Order.

33. Fact Sheet. The Fact Sheet for this Order contains background information, regulatory and legal citations, references and additional explanatory information and data in support of the requirements of this Order. The Fact Sheet is hereby incorporated into this Order and constitutes part of the Findings of this Order.

34. Public Notice. The San Diego Water Board notified the Copermittees, and interested agencies and persons of its intent to prescribe WDRs for MS4 discharges of pollutants to waters of the U.S. and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet.

35. Public Hearing. The San Diego Water Board held a public hearing on Month Day, 2012 and heard and considered all comments pertaining to the terms and conditions of this Order. Details of the public hearing are provided in the Fact Sheet.

II. PROVISIONS

THEREFORE, IT IS HEREBY ORDERED that the Copermittees, in order to meet the provisions contained in division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA and regulations adopted thereunder, must each comply with the following:

A. PROHIBITIONS AND LIMITATIONS

The purpose of this provision is to describe the conditions under which ~~storm water and~~ non-storm water discharges into ~~and from~~ the MS4s are to be effectively prohibited or limited, and to describe how pollutants in discharges from the MS4, whether from stormwater or non-stormwater, are to be reduced to the maximum extent practicable (MEP). The goal of this provision is to address the impacts of MS4 discharges so that such discharges do not impair~~protect, preserve, enhance, and restore the~~ water quality and designated beneficial uses of waters of the state. This goal will be accomplished through implementation of control measures that effectively prohibit non-storm water discharges into ~~and from~~ the Copermittees' MS4s, and reduce pollutants in ~~storm water~~all discharges from the Copermittees' MS4s to the MEP. The process for determining compliance with the Discharge Prohibitions (A.1), Receiving Water Limitations (A.2), and Effluent Limitations (A.3, including effluent limitations derived from the TMDL requirements – Attachment E) is defined in Provision A.4.

1. Discharge Prohibitions

a. Except as otherwise permitted herein, ~~Discharges~~ discharges ~~into and~~ from MS4s~~s~~ owned and operated by a Copermittee, in a manner causing~~, or threatening to cause,~~ a condition of pollution, contamination, or nuisance in ~~receiving~~ waters of the state are prohibited.

b. Non-storm water discharges into ~~and from~~ MS4s are effectively prohibited, unless such discharges are either authorized by a separate NPDES permit, or the discharge is a category of non-storm water discharges or flows that must be addressed pursuant to Provisions E.2.a.(1)-(5) of this Order.

c. Discharges from MS4s are subject to all waste discharge prohibitions in the Basin Plan, included in Attachment A to this Order.

d. ~~Discharges from MS4s to ASBS are prohibited.~~ Storm water discharges from the City of San Diego's MS4 to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's MS4 to the Heisler Park ASBS are authorized under this Order subject to the Special Protections contained in Attachment B to State Water Board Resolution No. 2012-~~001X~~ 0012 applicable to these discharges, included in Attachment A to this Order. All other discharges from MS4s to ASBS are prohibited, unless authorized by a separate Order.

2. Receiving Water Limitations

a. Discharges from MS4s owned and operated by a Copermittee must not cause or contribute to the violation of water quality standards in any receiving waters, including but not limited to all applicable provisions contained in the list below to the extent they remain in effect and are operative, unless such discharges are being addressed by the Copermittee(s) through the processes set forth in this Order (including Provision A.4 below and Attachment E, the TMDL Provisions):

(1) The San Diego Water Board's Basin Plan, including beneficial uses, water quality objectives, and implementation plans;

(2) State Water Board plans for water quality control including the following:

(a) Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries (Thermal Plan), and

(b) The Ocean Plan, including beneficial uses, water quality objectives, and implementation plans;

(3) State Water Board policies for water and sediment quality control including the following:

(a) Water Quality Control Policy for the Enclosed Bays and Estuaries of California,

(b) Sediment Quality Control Plan which includes the following narrative objectives for bays and estuaries:

(i) Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities, and

(ii) Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health,

(c) The Statement of Policy with Respect to Maintaining High Quality of Waters in California (State Water Board Resolution No. 68-16).

(4) Priority pollutant criteria promulgated by the USEPA through the following:

(a) National Toxics Rule (NTR)[1] (promulgated on December 22, 1992 and amended on May 4, 1995), and

[1] 40 CFR 131.36

(b) California Toxics Rule (CTR)[2,3]

~~Discharges from MS4s composed of storm water runoff must not alter natural ocean water quality in an ASBS.~~

~~Discharges from MS4s must not cause or contribute to the violation of any receiving water limitations expressed as water quality based effluent limitations (WQBELs) required to meet the WLAs established for the TMDLs in Attachment E to this Order, pursuant to the applicable TMDL compliance schedules.~~

3. Effluent Limitations

a. Technology and Water Quality Based Effluent Limitations (including Effluent Limitations based on TMDLs).
Each Copermittee shall reduce pollutants in discharges from the MS4 to the maximum extent practicable (~~Pollutants in storm water discharges from MS4s must be reduced to the~~ MEP[4]).

~~a.~~ It is understood that compliance with this requirement will be achieved through the use of MEP-compliance best management practices (BMPs) or other controls that are consistent with the MEP standard.

b. ~~Pollutants in discharges from MS4s must be reduced to comply with any effluent limitations expressed as WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order, pursuant to the applicable TMDL compliance schedules.~~

4. Compliance with Discharge Prohibitions, ~~and~~ Receiving Water Limitations, and Effluent Limitations

Comment [A1]: It is recommended that this section be replaced with the language similar to what CASQA provided to the State Board. Although this language has been slightly modified, it is consistent with the CASQA language.

a. Each Copermittee must comply with the discharge prohibitions (A.1), ~~and~~ receiving water limitations (A.2), and effluent limitations (A.3, including effluent limitations developed based on TMDLs) of this Order through timely implementation of ~~control~~ strategies, control measures and other actions as specified in Provisions B, ~~and~~ E, and Attachment E (TMDLs) of this Order. The Water Quality Improvement Plans described in Provision B shall be designed to achieve compliance to the MEP standard with the discharge prohibitions, receiving water limitations, and all effluent limitations. If the Executive Officer approves a Water Quality Improvement Plan and subsequent updates as described in Provision B and F.1, and the plan is being implemented in a timely and good faith manner, such

2 65 Federal Register 31682-31719 (May 18, 2000), adding Section 131.38 to 40 CFR
3 If a water quality objective and a CTR criterion are in effect for the same priority pollutant, the more stringent of the two applies, unless a previous regulatory action (i.e., TMDL) has specified otherwise.
4 This requirement does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants in ~~storm water~~ discharges to the MEP prior to entering receiving waters (e.g., low flow diversions to the sanitary sewer). Runoff treatment must occur prior to the discharge of runoff into receiving waters per Finding 8.

implementation of the plan shall constitute compliance with Provisions A.1, A.2, and A.3.

b. In instances where discharges from the MS4 for which the permittee is responsible, causes or contributes to an exceedance of any applicable water quality standard or effluent limitation, or causes a condition of nuisance in the receiving water; and the pollutant(s) associated with the discharge is otherwise not specifically addressed by a provision of this Order (such as specific scheduled actions in a Water Quality Improvement Plan), the Permittee shall comply with the following iterative procedure:

1. Submit a report to the Executive Officer that:
    i. Summarizes and evaluates water quality data associated with the pollutant of concern in the context of the applicable water quality objective, discharge prohibition, or effluent limitation including the magnitude and frequency of the exceedances.
    ii. Includes a work plan to identify the sources of the constituents of concern (including those not associated with the MS4 such that non-MS4s sources can be pursued).
    iii. Describes the strategy and schedule for implementing MEP-compliant BMPs and other MEP-compliant controls (including those that are currently being implemented) that will address the Permittee's sources of constituents that are causing or contributing to the exceedances of any applicable water quality standard, discharge prohibition, or effluent limitation, or causing a condition of nuisance, and are reflective of the severity of the exceedances. The strategy shall demonstrate that the selection of BMPs will address the Permittee's sources of constituents and include a mechanism for tracking BMP implementation. The strategy shall provide for future refinement pending the results of the source identification work plan noted above.
    iv. Outlines, if necessary, additional monitoring to evaluate improvement in water quality and, if appropriate, special studies that will be undertaken to support future management decisions.
    v. Includes a methodology(ies) that will assess the effectiveness of the BMPs to address the exceedances.
    vi. This report may be submitted in conjunction with the Annual Report unless the Executive Officer directs an earlier submittal.

2. Submit any modifications to the report that are required by the Executive Officer and that are consistent with the MEP standard within 60 days of notification from the Executive Officer. The report is deemed approved within 60 days of its submission if no response is received from the Executive Officer.

3. Implement the actions specified in the report in accordance with the acceptance or approval of the Executive Officer, including the implementation schedule.

c. Compliance with the procedure set forth above for the subject pollutant or pollutants shall constitute compliance with the applicable discharge prohibition, receiving water limitation or effluent limitation (including the applicable TMDL) in issue, and the Permittee does not have to repeat the same procedure for continuing or recurring exceedances.

The information developed pursuant to A.4.b must be incorporated into the Water Quality Improvement Plans and/or the jurisdictional runoff management programs, as needed.

~~**a.** If exceedance(s) of water quality standards persist in receiving waters notwithstanding implementation of this Order, the Copermittees must comply with the following procedures:~~

~~(1) Upon a determination by either the Copermittees or the San Diego Water Board that discharges from the MS4 are causing or contributing to an exceedance of an applicable water quality standard, the Copermittees must submit the following updates to the Water Quality Improvement Plan required under Provision B as part of the Annual Report required under Provision F.3.b, unless the San Diego Water Board directs an earlier submittal:~~

~~(a) The water quality improvement strategies being implemented that are effective and will continue to be implemented;~~

~~(b) Additional water quality improvement strategies (i.e. BMPs, retrofitting projects, stream and/or habitat rehabilitation or restoration projects) that will be implemented to reduce or eliminate any pollutants or conditions that are causing or contributing to the exceedance of water quality standards;~~

~~(c) Updates to the schedule for implementation of the existing and additional water quality improvement strategies; and~~

~~(d) Updates, when necessary, to the schedule for achieving compliance with the discharge prohibitions and receiving water limitations of this Order;~~

~~(2) The San Diego Water Board may require the incorporation of additional modifications to the Water Quality Improvement Plan required under Provision B. The applicable Copermittees must submit any modifications to the update to the Water Quality Improvement Plan within 30 days of~~

ADMINISTRATIVE DRAFT

~~notification that additional modifications are required by the San Diego Water Board, or as otherwise directed;~~

~~(3) Within 30 days of the San Diego Water Board determination that the update to the Water Quality Improvement Plan meets the requirements of this Order, the Copermittees must revise the jurisdictional runoff management program documents to incorporate the updated water quality improvement strategies that have been and will be implemented, the implementation schedule, and any additional monitoring required; and~~

~~(4) The Copermittees must implement the revised jurisdictional runoff management programs and updated jurisdictional monitoring and assessment component of the Water Quality Improvement Plan.~~

B. WATER QUALITY IMPROVEMENT PLANS[5]

The purpose of this provision is to develop Water Quality Improvement Plans that guide the Copermittees' jurisdictional ~~runoff management program~~ implementation efforts (Provision E) towards achieving the outcome of improved water quality in MS4 discharges and receiving waters. The goal of the Water Quality Improvement Plan is to 1) effectively prohibit non-stormwater discharges into the MS4s, 2) reduce pollutants in stormwater discharges from the MS4s to the MEP, and 3) attain the reasonable protection~~, preservation, enhancement, and restoration~~ of water quality and designated beneficial uses of waters of the state. Therefore, implementation of the WQIPs also provides the basis for complying with Provisions II.A.1, II.A.2, II.A.3, as described in Provision II.A.4. This goal will be accomplished through an adaptive planning and management process that identifies the highest water quality priorities within a watershed and implements customized strategies, control measures, and BMPs to achieve improvements in the quality of discharges from the MS4s and receiving waters. As such, the requirements outlined in Provision E may be modified for consistency with the Water Quality Improvement Plan for the applicable Watershed Management Area, if appropriate justification is provided.

Development of the Water Quality Improvement Plans allows permittees to customize the requirements in Provision E to address the highest watershed priorities. The Copermittees must develop Water Quality Improvement Plans for each Watershed Management Area that 1) prioritize water quality ~~issues~~ conditions resulting from the Copermittee's MS4 discharges ~~to and from the MS4s with~~in each Watershed Management Area, 2) identify MS4 pollutant sources ~~and other stressors~~ associated with th~~os~~e water quality priorities, 3) define numeric ~~targets~~goals and schedules to ~~achieve~~ address ~~improvement of~~ water quality priorities, 4) describe water quality improvement strategies to achieve numeric ~~targets~~goals, and 5) develop and execute a coordinated monitoring and assessment program to facilitate adaptive management of the WQIPs and determine progress towards achieving ~~improved water quality~~those goals.

The Copermittees must submit WQIPs for public review and Regional Board Executive Officer review and approval per the schedule outline in Provision II.B.6.~~implement all the requirements of Provisions B.1 through B.4 no later than 12 18 months after the adoption of this Order, or in accordance with Provision F.5.a~~ of this Order.

1. Watershed Management Areas

The Copermittees must develop Water Quality Improvement Plans for each of the Watershed Management Areas in Table B-1. A total of ~~nine~~ ten Water Quality Improvement Plans must be developed for the San Diego Region.

Table B-1. Watershed Management Areas

---

[5] Once developed and approved, the Water Quality Improvement Plan and corresponding Jurisdictional Runoff Management Plans will functionally replace Load Reduction Plans.

ADMINISTRATIVE DRAFT

Watershed Management Area	Hydrologic Unit(s)	Major Surface Water Bodies	Responsible Copermittees
South Orange County	San Juan (901.00)	Aliso Creek San Juan Creek San Mateo Creek Pacific Ocean	- City of Aliso Viejo[1] - City of Dana Point[1] - City of Laguna Beach[1] - City of Laguna Hills[1] - City of Laguna Niguel[1] - City of Laguna Woods[1] - City of Lake Forest[1] - City of Mission Viejo[1] - City of Rancho Santa Margarita[1] - City of San Clemente[1] - City of San Juan Capistrano[1] - County of Orange[1] - Orange County Flood Control District[1]

Watershed Management Area	Hydrologic Unit(s)	Major Surface Water Bodies	Responsible Copermittees
San Diego Bay	Pueblo San Diego (908.00) Sweetwater (909.00) Otay (910.00)	Sweetwater River Otay River San Diego Bay Pacific Ocean	- City of Chula Vista - City of Coronado - City of Imperial Beach - City of La Mesa - City of Lemon Grove - City of National City - City of San Diego - County of San Diego - San Diego County Regional Airport Authority - Unified Port of San Diego
Tijuana River	Tijuana (911.00)	Tijuana River Tijuana Estuary Pacific Ocean	- City of Imperial Beach - City of San Diego - County of San Diego

Notes:
1. The Orange County Copermittees will be enrolled under this Order upon expiration of Order No. R9-2009-0002, or earlier if the Orange County Copermittees meet the conditions in Provision F.6.
2. The Riverside County Copermittees will be enrolled under this Order upon expiration of Order No. R9-2010-0016, or earlier if the Riverside County Copermittees meet the conditions in Provision F.6.
3. The County of San Diego will not be required to implement the requirements of Provision B for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees are enrolled under this Order. Until then, the County of San Diego is responsible for implementing and complying with the requirements of Provisions D.1, D.4.a.(1)&(3), E, F.2.a-b, F.3.b, and F.4 for the areas of the Santa Margarita River Watershed Management Area within its jurisdiction.

2. Identification of Water Quality Priorities

The Copermittees must identify the water quality priorities within each Watershed Management Area that will be addressed by the Water Quality Improvement Plan. Where appropriate, Watershed Management Areas may be separated into subwatersheds to focus water quality prioritization and jurisdictional ~~runoff management program~~ implementation efforts by receiving water.

a. Assessment of Receiving Water Conditions

The Copermittees must consider ~~review pollutant sources, discharges, and receiving water conditions and assess~~ the following, at a minimum, to support ~~determine~~ the identification ~~degree~~ of water quality priorities based on the ~~adverse~~ impacts of MS4 discharges on ~~to~~ receiving water beneficial uses:

(1) Receiving waters listed as impaired on the CWA Section 303(d) List of Water Quality Limited Segments (303(d) List);

(2) TMDLs adopted and under development by the San Diego Water Board;

~~(2)~~(3) The requirements of Provision II.A.2;

~~(3)~~(4) Receiving waters recognized as sensitive or highly valued by the Copermittees, including estuaries designated under the National Estuary Program under CWA section 320, wetlands defined by the State or U.S. Fish and Wildlife Service's National Wetlands Inventory as wetlands, and receiving waters identified as ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-~~001X~~ 0012 (Attachment A);

~~(4)~~(5) Water quality standards established in the Basin Plan;

~~(5)~~(6) Known historical versus current physical, chemical, and biological water quality conditions;

~~(6)~~(7) A~~All a~~vailable, relevant, and appropriately collected physical, chemical, and biological receiving water monitoring data meeting appropriate QA/QC standards~~,~~ including ~~, but not limited to,~~ data describing:

(a) Chemical constituents;

(b) Water quality parameters (i.e. pH, temperature, conductivity, etc.);

(c) Toxicity Identification Evaluations for both receiving water column and sediment;

(d) Trash impacts;

(e) Bioassessments; and

(f) Physical habitat.

~~(7)~~(8) Available evidence of erosional impacts in receiving waters due to accelerated flows (i.e. hydromodification); ~~and~~

(9) Available evidence of adverse impacts to the chemical, physical, and biological integrity of receiving waters~~.~~; and

~~(8)~~(10) The potential for long-term achievement and maintenance of beneficial use attainment in the Watershed Management Area.

b. Assessment of MS4 Discharge Quality and Impacts

To support the identification of priorities based on the impacts of MS4 discharges on receiving water beneficial uses, the Copermittees must review appropriately collected MS4 discharge quality data and consider the extent to which MS4s cause or contribute to the adverse impacts to receiving water beneficial uses identified in II.B.2.a. Considerations include:

(1) Locations of the Copermittees' MS4 discharges with respect to receiving waters;

(2) MS4 discharge quality results relevant to impacts in receiving waters and action levels, including the temporal and geographic variation of the results:

(3) The requirements of Provisions II.A.1 and II.A.3.; and

(4) Whether MS4 discharge quality is sufficiently well known or other information is available to assess whether MS4 discharges are causing or contributing to specific receiving water conditions, or whether additional data need to be collected through the Monitoring and Assessment Program developed as part of the Water Quality Improvement Plan.

~~b.~~c. IDENTIFICATION OF ~~Y~~ PRIORITY ~~POLLUTANTS AND~~ RECEIVING WATER CONDITIONS

The Copermittees must use the information gathered in Provision B.2.a. and B.2.b to develop a list of water quality priorities as pollutants and/or receiving water conditions that are the highest threat to water quality or that most adversely affect the physical, chemical, and biological integrity of receiving waters. The Copermittees must identify the highest water quality priorities to be addressed by the Water Quality Improvement Plan. The WQIPs shall describe the following for each priority receiving water condition:

(1) The beneficial use(s) and pollutant(s) associated with the priority receiving water condition(s);

(2) The geographic extent of the priority receiving water condition(s)within the WMA, if known;

(3) The Copermittees with MS4s that contribute discharges to the priority water receiving condition(s);

(4) The temporal extent of the priority receiving condition(s) (i.e., dry weather and/or wet weather);

(5) Whether receiving waters have been monitored sufficiently to adequately characterize the priority receiving condition(s), including a consideration of spatial and temporal variation; and

(6) The reasoning for selecting specific receiving water conditions as a priority and a subset of priorities as the highest priorities.

~~c.~~d. MS4 POLLUTANT SOURCE ~~AND/OR STRESSOR~~ IDENTIFICATION

The Copermittees must identify and prioritize known and suspected storm water and non-storm water pollutant sources within the MS4 associated with ~~and any other stressors causing or contributing to~~ the highest priority receiving water conditions identified under II.B.2.c. ~~quality priorities.~~ The identification of known and suspected sources of the highest water quality priorities as identified for

Provision B.2.c~~b~~ shall~~must~~ consider the following:

(1) Land uses and their potential contribution to the highest priority receiving water conditions;

~~(1)~~(2) Pollutant generating facilities ~~or~~, areas, and/or activities within the Watershed Management Area~~, including:~~;

~~(2) Each Copermittee's inventory of construction, municipal, commercial, industrial, and residential facilities, areas, and/or activities,~~
~~(3)~~
~~(4) Publicly owned parks and/or recreational areas,~~
~~(5)~~
~~(6) Open space areas,~~
~~(7)~~
~~(8) All currently operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, and~~
~~(9)~~
~~(10) Areas not within the Copermittees' jurisdictions (e.g., tribal lands, state lands, federal lands) that may be pollutant sources related to the highest water quality priorities within the Watershed Management Area;~~
~~(11)~~
~~(12)~~ Locations of the Copermittees' MS4s~~, including the following:~~
~~(13)~~
~~(14)~~(3) ~~All MS4~~ outfalls ~~that discharge to receiving waters, and~~ .

~~(15) Locations of major structural controls for storm water and non-storm water (e.g., retention basins, detention basins, major infiltration devices, etc.);~~
~~(16)~~
~~(17) Other known and suspected sources of non-storm water or pollutants in storm water discharges to receiving waters within the Watershed Management Area, including the following:~~
~~(18)~~
~~(19) Other MS4 outfalls (e.g., Phase II Municipal and Caltrans),~~
~~(20)~~
~~(21) Other NPDES permitted discharges,~~
~~(22)~~
~~(23) Any other discharges that may be considered point sources (e.g., private outfalls), and~~
~~(24)~~
~~(25) Any other discharges that may be considered non-point sources (e.g., agriculture, wildlife or other natural sources);~~
~~(26)~~
~~(27)~~(4) Review of available data, including ~~but not limited to~~:

(a) Findings from the Copermittees' illicit discharge detection and elimination programs,

ADMINISTRATIVE DRAFT

(b) Findings from the Copermittees' MS4 outfall monitoring,

~~(c) Findings from the Copermittees' receiving water monitoring,~~
~~(d)~~
~~(e) Findings from the Copermittees' MS4 discharges and receiving water assessments, and~~
~~(f)~~
~~(g)~~(c) ~~Any other~~Other available, relevant, and appropriately-collected data, information, or studies related to pollutant sources and ~~conditions~~ pollutant-generating activities that contribute to the highest priority receiving water ~~quality priorities as~~conditions identified ~~for~~ in Provision II.B.2.b.

~~(28)~~(5) Whether MS4 sources are sufficiently well known to design an effective, directed control strategy, or whether additional source/stressor identification needs to be conducted through the Monitoring and Assessment Program developed as part of the Water Quality Improvement Plan to identify and prioritize sources/stressors within the watershed.

~~d.~~e. NUMERIC ~~TARGETS~~ GOALS ~~AND SCHEDULES~~

The Copermittees must develop and incorporate interim and final numeric ~~targets[6] and schedules~~ goals[7] into the Water Quality Improvement Plans. Numeric ~~targets~~goals and schedules ~~must be used~~are intended to support Water Quality Improvement Plan development and to measure progress towards addressing the highest priority receiving water conditions identified under II.B.2.b~~water quality priorities and an ultimate outcome of protections, preservation, enhancement, and restoration of~~. Numeric goals themselves are not enforceable compliance standards, effluent limitations, or receiving water ~~beneficial uses.~~ limitations. When ~~developing~~establishing numeric ~~targets~~goals and corresponding schedules, the Copermittees must consider the following:

~~[6] Interim and final numeric targets may take a variety of forms such as pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric targets are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators.~~

[7] Interim and final numeric goals may take a variety of forms such as TMDL targets, TMDL wasteload allocations, TMDL based WQBELs incorporated in Attachment E of this Order, action levels, pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric goals are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators. To the extent that a goal is not based on an enforceable regulatory mechanism (i.e., TMDL, WLA), WQIP goals and schedules may be revised through the iterative process. Numeric goals are not subject to enforcement or non-compliance actions under this Order.

ADMINISTRATIVE DRAFT

(1) Final numeric ~~targets~~goals must be based on measureable criteria or indicators, to be achieved in the receiving waters and/or MS4 discharges for the highest priority receiving water ~~quality priorities~~conditions which will ~~result in~~be capable of demonstrating progress toward the achievement of the restoration and/or protection of water quality standards in receiving waters; and

(2) Interim numeric ~~targets~~goals must be based on measureable criteria or indicators that can demonstrate incremental progress toward achieving the final numeric ~~targets~~goals in the receiving waters and/or MS4 discharges~~;~~. ~~and~~

~~(3) Schedules must be adequate for measuring progress toward achieving the interim and final numeric targets required for Provisions B.2.d. and B.2.d.. Schedules must incorporate the following:~~

3. Water Quality Improvement Strategies and Schedules

The Copermittees must develop specific water quality improvement strategies to address the highest ~~water quality~~ priorit~~yies~~ receiving water conditions identified within a Watershed Management Area. The water quality improvement strategies must address the highest water quality priorities by preventing or eliminating non-storm water discharges to and from the MS4, reducing pollutants in storm water discharges from the MS4 to the MEP, and restoring and/or protecting the water quality standards of receiving waters.

a. Water Quality Improvement Strategies

The water quality improvement strategies must prioritize, based on their likely effectiveness and efficiency, and implement ~~the following~~ measures, as appropriate, to effectively prohibit non-storm water discharges into its MS4, reduce pollutants in storm water discharges from its MS4 to the MEP, and achieve the interim and final numeric ~~targets~~goals in accordance with the schedules ~~required for~~in Provision II.B.2~~.:~~.e. Measures include:

(1) Activities identified in Provision E ,either as described in the jurisdictional runoff management programs or as modified with justification, that will address priority receiving water conditions; and

~~(1)~~ Additional ~~S~~structural and/or non-structural BMPs that are designed to achieve the interim and final numeric goals identified in Provision II.B.2.e.~~targets in the receiving waters and/or MS4 discharges;~~
~~(2)~~

~~(3) Retrofitting projects for areas of existing development known or suspected to contribute to the highest water quality priorities, and where retrofitting will contribute to reducing or eliminating non-storm water discharges to the MS4 and/or reducing pollutants in storm water discharges from the MS4 to the MEP;~~

~~(4)~~

~~(5)~~(2) ~~Stream and/or habitat rehabilitation or restoration projects where stream and/or habitat rehabilitation or restoration are necessary for, or will contribute to demonstrable improvements in the physical, chemical, and biological receiving water conditions and restoration and/or protection of water quality standards in receiving waters; and~~

~~Other water quality improvement strategies that will result in preventing or eliminating non-storm water discharges to and from the MS4, reducing pollutants in storm water discharges from the MS4 to the MEP, and restoring and/or protecting the water quality standards of receiving waters.~~

b. IMPLEMENTATION SCHEDULES

The Copermittees must develop schedules for implementing the water quality improvement strategies identified under Provision II.B.3.a to achieve the interim and final numeric ~~targets~~goals identified in ~~the receiving waters and/or MS4 discharges for the highest water quality priorities~~B.2.e in the Watershed Management Area. Schedules must be developed for both the water quality improvement strategies implemented by each Copermittee within its jurisdiction and for strategies that ~~will be implemented by multiple Copermittees~~ Copermittees' choose to implement on a collaborative basis. Schedules must incorporate the following:

(a) Interim dates for achieving the interim numeric ~~targets~~goals;

(b) Compliance schedules for any applicable TMDLs in Attachment E to this Order;

(c) Compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012~~X~~ (see Attachment A);

(d) Achievement of the final numeric goals~~targets~~ in the receiving waters and/or MS4 discharges for the highest water quality priorities must be as soon as possible, and

(e) Final dates for achieving the final numeric ~~targets~~ goals must not extend more than 10 years beyond the date this Order is adopted, unless the schedule includes an applicable TMDL in Attachment E to this Order[8]

[8] Achievement of final numeric goals within 10 years represents progress towards attainment of water quality standards, but is not a requirement to fully attain all applicable water quality standards or all priority receiving water conditions within 10 years.

4. Water Quality Improvement Monitoring and Assessment

The Copermittees in each Watershed Management Area must develop an integrated ~~program to assess the~~Water Quality Improvement Plan Monitoring and Assessment Program that assesses: 1) progress toward achieving the numeric ~~targets~~goals and schedules, ~~and~~2) ~~the~~ progress toward addressing the highest priority receiving water ~~quality priorities~~conditions for each Watershed Management Area, and 3) each Copermittee's overall efforts implementing the requirements of Provision B. The water quality improvement monitoring and assessment program must include the monitoring and assessment requirements of Provision D~~.~~, which may be modified for consistency with the priority receiving water conditions of each Watershed Management Area and associated Copermittees. For Watershed Management Areas with applicable TMDLs, the water quality monitoring and assessment program must incorporate the specific monitoring and assessment requirements of Attachment E. For Watershed Management Areas with any ASBS, the water quality monitoring and assessment program must also incorporate the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012~~X~~ (see Attachment A).

5. Adaptive Management Process

~~1. WATER QUALITY IMPROVEMENT PLAN ADAPTIVE MANAGEMENT PROCESS~~

The Copermittees in each Watershed Management Area must implement the iterative process, ~~at least once every 3 years,~~ adapting the Water Quality Improvement Plan to become more effective~~, based on, but not limited to~~ and meet the requirements of Provisions II.A, and shall consider the following ~~considerations~~:

a. **PRIORITY RECEIVING WATER CONDITIONS AND NUMERIC GOALS**

The priority receiving water conditions and numeric goals, developed pursuant to II.B.2.c. and II.B.2.e respectively, shall guide jurisdictional implementation efforts for the duration of this Order. Recommendations for changes to priority receiving water conditions and numeric goals shall be provided in the Report of Waste Discharge and shall consider the following:

(1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan;

(2) Progress toward achieving interim and final numeric ~~targets~~goals in receiving waters and/or MS4 discharges for the highest water quality priorities in the Watershed Management Area~~,~~

~~(3) Appropriateness of the highest water quality priorities identified for the Watershed Management Area;~~
~~(4)~~
~~(5) Progress toward achieving outcomes according to established schedules;~~

~~(6)~~
(3) New scientific information or new or updated policies or regulations that affect identified numeric goals including revised water quality objectives or TMDLs;

~~(7)~~(4) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality problems and implementation measures to address the highest priority receiving water ~~quality problems~~conditions;

~~(8)~~(5) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees;

(6) The factors listed in Provision II.B.2.a.(1)-(10);

~~(9)~~(7) San Diego Water Board recommendations; and

~~(10)~~(8) Recommendations for modifications ~~to the Water Quality Improvement Plan~~ solicited through a public participation process.

b. ~~Based on the results of the iterative process~~ **WATER QUALITY IMPROVEMENT STRATEGIES AND SCHEDULES**
~~(11)~~ The water quality improvement strategies and schedules required pursuant to ~~Provision B.5.a., the~~II.B.3 shall be adapted as new information becomes available to inform more effective and efficient means of achieving the numeric goals established in II.B.2.e. Copermittees ~~must report any modifications necessary~~shall consider adaptation to ~~improve the effectiveness of the Water Quality Improvement Plan in the Annual Report required pursuant to Provision , or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision F.5..~~

~~(12) The Copermittees must implement any modifications to the Water Quality Improvement Plan in accordance with the schedules developed pursuant to Provisions B.2. and B.3., unless directed otherwise by the San Diego Water Board.~~

~~2. **JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM ADAPTIVE MANAGEMENT PROCESS**~~

~~Each Copermittee in the Watershed Management Area must implement the iterative process,~~jurisdictional runoff management programs and monitoring and assessment strategies and schedules at least annually~~, adapting its jurisdictional runoff management program to become more effective, based on, but not limited to~~ considering the following:

<ins>(1) Changes to priority receiving water conditions and numeric goals based on recommendations from II.B.5.a.;</ins>

~~(1)~~(2) Measurable or demonstrable reductions of non-storm water discharges to ~~and from~~ each Copermittee's MS4;

~~(2)~~(3) Measurable or demonstrable reductions of pollutants in storm water discharges from each Copermittee's MS4 to the MEP;

(4) Information on the MS4 sources and/or pollutant-generating activities determined to be most significantly contributing to priority receiving water conditions;

~~(3)~~(5) Efficiency in implementing the Water Quality Improvement Plan;

~~(4)~~(6) San Diego Water Board recommendations; and

~~(5)~~(7) Recommendations for modifications ~~to each Copermittee's jurisdictional runoff management program~~ solicited through a public participation process~~.~~.

6. Water Quality Improvement Plan Submittal, Implementation, and Modifications

a. PRIORITY RECEIVING WATER CONDITIONS, MS4 SOURCES, AND NUMERIC GOALS

The ~~Based on~~Copermittees in each Watershed Management Area must submit the ~~results of the iterative process~~proposed priority receiving water conditions, MS4 sources, and numeric goals required ~~pursuant~~in Provisions II.B.2.c-e. for San Diego Water Board Executive Officer review and approval no later than 6 months following adoption of this Order. Priority receiving water conditions, MS4 sources, and numeric goals are deemed approved if no response is provided to the Copermittees within 2 months of the submittal date.

b. WATER QUALITY IMPROVEMENT PLANS

Copermittees shall commence development of the remaining portions of the Water Quality Improvement Plans upon approval of the priority receiving water conditions, MS4 sources, and numeric goals by the San Diego Water Board Executive Officer in II.B.6.a, and must submit complete Water Quality Improvement Plans for San Diego Water Board review and approval no later than 12 months thereafter. Water Quality Improvement Plans are deemed approved if no response is provided to the Copermittees within 2 months of the submittal date. Copermittees must commence with implementation of the Water Quality Improvement Plan no later than ~~180 days after submission, unless otherwise directed in writing by the San Diego Water Board.~~ the fiscal year (July 1) following San Diego Water Board approval of the Water Quality

Improvement Plan.

c. WATER QUALITY IMPROVEMENT PLAN MODIFICATIONS

~~(a)~~ Copermittees must submit requested modifications ~~necessary~~ to ~~improve the effectiveness its jurisdictional runoff management program document~~the Water Quality Improvement Plan either in the Annual Report required pursuant to Provision II.F.3.b, or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision II.F.5~~.~~.

~~Each Copermittee~~.b. Once approved by the San Diego Water Board Executive Officer, the Copermittees must implement any modifications to ~~its jurisdictional runoff management program~~the Water Quality Improvement Plan in accordance with the schedules developed pursuant to Provisions ~~B.2. and B.3., unless directed otherwise by the San Diego Water Board~~II.B.2 and II.B.3.b. Requests for modification are deemed approved if no response is provided to the requesting Copermittee(s) within 2 months of the request date.

d. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM MODIFICATIONS

Copermittees must submit requested modifications to the jurisdictional runoff management programs either in the Annual Report required pursuant to Provision II.F.3.b, or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision II.F.5.b. Once approved by the San Diego Water Board Executive Officer, the Copermittees must implement any modifications to the Water Quality Improvement Plan in accordance with the schedules developed pursuant to Provisions II.B.3.b. Requests for modification are deemed approved if no response is provided to the requesting Copermittee(s) within 2 months of the request date.

~~**6. Water Quality Improvement Plan Implementation**~~

~~Copermittees must commence with implementation of the Water Quality Improvement Plan no later than 180 days after submission, unless otherwise directed in writing by the San Diego Water Board.~~

C. ACTION LEVELS

The purpose of this provision is for the Copermittees to incorporate numeric non-storm water and storm water action levels in the Water Quality Improvement Plans and numeric non-storm water action levels in the IDDE Program. The action levels ~~will~~shall be used to guide the following program planning efforts and measure progress towards ~~attaining~~ the reasonable protection~~, preservation, and enhancement, and restoration~~ of water quality and designated beneficial uses of waters of the state~~. This goal will be accomplished through monitoring and assessing the quality of the MS4 discharges during the implementation of the Water Quality Improvement Plans.~~:

1) ~~The Copermittees must incorporate numeric action levels in the~~ Support development and prioritization of water quality improvement strategies through the Water Quality Improvement Plans ~~to direct and focus~~. Discharge data above action levels can be evaluated using a statistical approach considering the ~~Copermittees' jurisdictional runoff management program implementation efforts for addressing MS4~~ frequency, magnitude, and loading of discharges to the receiving waters~~. The numeric action levels will be used as part of the MS4~~ to support development of actions and prioritization of their implementation.
2) Assist in the effective prohibition of non-stormwater discharges ~~assessments required under~~ from the MS4 pursuant to Provision ~~, and each Copermittee's program to detect and eliminate non-storm water~~ E.2.
3) Support the detection and elimination of illicit discharges to the MS4 ~~required under~~pursuant to Provision ~~. Numeric~~E.2.

These goals will be accomplished through monitoring and assessing the quality of the MS4 discharges prior to and during the implementation of the Water Quality Improvement Plans and as a part of the IDDE program. Exceedances of action levels are not subject to enforcement or non-compliance actions under this Order.

Action levels will be developed and incorporated into the Water Quality Improvement Plans (Provision B) and~~including~~ the Illicit Discharge Detection and Elimination (IDDE) Program (Provision E.2). Depending upon the goals/objectives for the use of the action levels ~~must be developed~~ and the priority receiving water conditions, the constituents and values at which they are set may differ between watersheds. Copermittees may develop Watershed Management Area specific numeric action levels for non-storm water and storm water MS4 discharges using an approach approved by the Regional Board or use the default non-stormwater and stormwater action levels prescribed within C.1 and C.2 below, respectively. The Copermittees will submit action levels as part of their Water Quality Improvement Plan(s). The action levels currently established ~~as follows:part of R9-2007-0001~~ will serve as the interim action levels until ~~the Water Quality Improvement Plans~~revised action levels are completed and approved.

PROVISION C: ACTION LEVELS
C.1. Non-Storm Water Action Levels

1. Non-Storm Water Action Levels

The following non-storm water action levels (NALs) must be incorporated in the Water Quality Improvement Plan and IDDE program if the Permittees have not developed their own NALs using an approach approved by the Regional Board EO:

a. The following non-storm water action levels (NALs) must be incorporated ~~in the Water Quality Improvement Plan~~:

(1) Non-Storm Water Discharges from MS4s to Ocean Surf Zone

Table C-1. Non-Storm Water Action Levels for Discharges from MS4s to Ocean Surf Zone

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100 ml	1,000	-	10,000/1,000[1]	OP
Fecal Coliform	MPN/100 ml	200[2]	-	400	OP
Enterococci	MPN/100 ml	35	-	104[3]	OP

Abbreviations/Acronyms
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
MPN/100 ml – most probable number per 100 milliliters

Notes:
1. Total coliform density ~~shall not exceed~~NAL is 1,000 MPN/100 ml when the fecal/total coliform ratio exceeds 0.1
2. Fecal coliform density ~~may not exceed~~NAL is 200 MPN per 100 ml during any 30 day period
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas"

(2) Non-Storm Water Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Table C-2. Non-Storm Water Action Levels for Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Turbidity	NTU	75	-	225	OP
pH	Units	Within limit of 6.0 to 9.0 at all times			OP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	35	-	104[3]	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
BP – Basin Plan water quality objective
NTU – Nephelometric Turbidity Units
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period
2. NAL is reached if n~~N~~o more than 10 percent of total samples may exceed 400 MPN per 100 ml during any 30 day period
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas" and is not applicable to waterbodies that are not designated REC-1

Table C-3. Non-Storm Water Action Levels for Priority Pollutants

Parameter	Units	Freshwater (CTR)		Saltwater (CTR)	
		MDAL	AMAL	MDAL	AMAL
Cadmium	ug/L	**	**	16	8
Copper	ug/L	*	*	5.8	2.9
Chromium III	ug/L	**	**	-	-
Chromium VI	ug/L	16	8.1	83	41
Lead	ug/L	*	*	14	2.9
Nickel	ug/L	**	**	14	6.8
Silver	ug/L	*	*	2.2	1.1
Zinc	ug/L	*	*	95	47

Abbreviations/Acronyms:
CTR – California Toxic Rule
ug/L – micrograms per liter
AMAL – average monthly action level
MDAL – maximum daily action level

Notes:
* Action levels developed on a case-by-case basis (see below)
** Action levels developed on a case-by-case basis (see below), but calculated criteria are not to exceed Maximum Contaminant Levels (MCLs) under the California Code of Regulations, Title 22, Division 4, Chapter 15, Article 4, Section 64431

The Cadmium, Copper, Chromium (III), Lead, Nickel, Silver and Zinc NALs for MS4 discharges to freshwater receiving waters will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data (receiving water hardness). For these priority pollutants, the following equations (40 CFR 131.38.b.2) will be required:

Cadmium (Total Recoverable)	= exp(0.7852[ln(hardness)] -2.715)
Chromium III (Total Recoverable)	= exp(0.8190[ln(hardness)] + .6848)
Copper (Total Recoverable)	= exp(0.8545[ln(hardness)] - 1.702)
Lead (Total Recoverable)	= exp(1.273[ln(hardness)] - 4.705)
Nickel (Total Recoverable)	= exp(.8460[ln(hardness)] + 0.0584)
Silver (Total Recoverable)	= exp(1.72[ln(hardness)] - 6.52)
Zinc (Total Recoverable)	= exp(0.8473[ln(hardness)] + 0.884)

(3) Non-Storm Water Discharges from MS4s to Inland Surface Waters

Table C-4. Non-Storm Water Action Levels for Discharges from MS4s to Inland Surface Waters

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Dissolved Oxygen	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters			BP
Turbidity	NTU	-	20	See MDAL	BP
pH	Units	Within limit of 6.5 to 8.5 at all times			BP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	33	-	61[3]	BP
Total Nitrogen	mg/L	-	1.0	See MDAL	BP
Total Phosphorus	mg/L	-	0.1	See MDAL	BP
MBAS	mg/L	-	0.5	See MDAL	BP
Iron	mg/L	-	0.3	See MDAL	BP
Manganese	mg/L	-	0.05	See MDAL	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
- AMAL – average monthly action level
- BP – Basin Plan water quality objective
- COLD – cold freshwater habitat beneficial use
- NTU – Nephelometric Turbidity Units
- mg/L – milligrams per liter
- MDAL – maximum daily action level
- WARM – warm freshwater habitat beneficial use
- MBAS – Methylene Blue Active Substances
- MPN/100 ml – most probable number per 100 milliliters
- ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period
2. NAL is reached if n~~N~~o more than 10 percent of total samples may exceed 400 MPN per 100 ml during any 30 day period
3. This value has been set to the Basin Plan water quality objective for freshwater "designated beach areas" and is not applicable to waterbodies that are nor designated REC-1.

b. If not identified in Provision C.1.a, NALs must be identified and incorporated in the Water Quality Improvement ~~Plan~~ Plan and/or IDDE program for any pollutants or waste constituents that cause~~ing~~ or contribute~~ing~~, or are threatening to cause or contribute to a condition of pollution or nuisance in waters of the state associated with the highest water quality priorities related to non-storm water discharges from the MS4s. NALs must be based on:

(1) Applicable water quality standards which may be dependent upon site-specific or receiving water-specific conditions or assumptions to be identified by the Copermittees; or

(2) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. Dry weather monitoring and assessment data from MS4 outfalls collected in accordance with Provision D.1.a may be used to develop or revise NALs based upon watershed-specific data. Revision of NALs is subject to Regional Board EO approval.

2. Storm Water Action Levels

The following storm water action levels (SALs) must be incorporated in the Water Quality Improvement Plan if the Permittees have not developed their own SALs using an approach approved by the Regional Board EO:

a. The following storm water action levels (SALs) for discharges of storm water from the MS4 must be incorporated ~~in the Water Quality Improvement Plan~~:

Table C-5. Storm Water Action Levels for Discharges from MS4s to Receiving Waters

Parameter	Units	Action Level
Turbidity	NTU	126
Nitrate & Nitrite (Total)	mg/L	2.6
Phosphorus (Total P)	mg/L	1.46
Cadmium (Total Cd)*	µg/L	3.0
Copper (Total Cu)*	µg/L	127
Lead (Total Pb)*	µg/L	250
Zinc (Total Zn)*	µg/L	976

Abbreviations/Acronyms:
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
ug/L – micrograms per liter

Notes:
* The sampling must include a measure of receiving water hardness at each MS4 outfall. If a total metal concentration exceeds the corresponding metals SAL in Table C-5, that concentration must be compared to the California Toxics Rule criteria and the USEPA 1-hour maximum concentration for the detected level of receiving water hardness associated with that sample. If it is determined that the sample's total metal concentration for that specific metal exceeds that SAL, but does not exceed the applicable USEPA 1-hour maximum concentration criterion for the measured level of hardness, then the sample result will not be considered ~~as an excursion~~ above the SAL for that measurement.

b. If not identified in Provision C.2.a, SALs must be identified and incorporated in the Water Quality Improvement Plan for pollutants or waste constituents that caus~~eing~~ or contribut~~eing~~, or are threatening to cause or contribute to a condition of pollution or nuisance in waters of the state associated with the highest water quality priorities related to storm water discharges from the MS4s. SALs must be based on:

(1) Federal and State water quality guidance and/or water quality standards; ~~and~~or

(2) Site-specific or receiving water-specific conditions; or

~~(2)~~(3) One of the approaches recommended by the California Water Board's Storm Water Panel in its report, "The Feasibility of Numerical Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities" (June 2006); or

~~(3)~~(4) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. Wet weather monitoring and assessment data from MS4 outfalls collected in accordance with Provision D.1.b may be used to develop or revise SALs based upon watershed-specific data. Revision of SALs is subject to ~~San Diego Water~~Regional Board EO approval.

D. MONITORING AND ASSESSMENT REQUIREMENTS

Comment [A2]: The Orange County Copermittees are working on revised monitoring language with the San Diego County Copermittees. While the OC Copermittees do not have specific language that can be offered at this time, the Monitoring Principles that we would like to see incorporated as a part of the monitoring program are included as an attachment.

The purpose of this provision is for the Copermittees to monitor and assess the chemical, physical, and biological impact on receiving waters caused by discharges from the Copermittees' MS4s under wet weather and dry weather conditions. The goal of this provision is to inform the Copermittees about the nexus between the health of receiving waters and the water quality condition of the discharges from their MS4s. This goal will be accomplished through implementing and complying with the monitoring and assessment requirements of this Order.

The Copermittees must implement the following minimum monitoring and assessment requirements:

1. Jurisdictional Monitoring Requirements

~~b.~~a. DRY WEATHER JURISDICTIONAL MONITORING [D.1.a]

For dry weather days,[9] each Copermittee must implement the following minimum monitoring requirements within its jurisdiction:

(1) Non-Storm Water MS4 Monitoring Program [D.1.a.(1)]

Each Copermittee must develop and conduct a program to monitor and characterize non-storm water flows and pollutant loads during dry weather conditions within its jurisdiction. The non-storm water MS4 monitoring program must be utilized to detect and eliminate non-storm water discharges and illicit discharges and connections to the Copermittee's MS4. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittee. The non-storm water MS4 monitoring program must meet the following minimum requirements:

(a) Non-Storm Water MS4 Monitoring Stations [D.1.a.(1)(a)]

Each Copermittee must identify the non-storm water MS4 monitoring stations within its jurisdiction that will be screened and monitored during dry weather days to identify non-storm water discharges and illicit discharges and connections to the MS4. Non-storm water MS4 monitoring stations must be selected in accordance with the following guidelines and criteria:

(i) A grid system consisting of perpendicular north-south and east-west lines spaced ¼ mile apart must be overlayed on a map of the Copermittee's MS4. All cells that contain a segment of the Copermittee's MS4 must be identified;

[9] Dry weather day is defined as any day with less than 0.1 inches of rain observed on each of the previous 3 days.

(ii) At least one non-storm water MS4 monitoring station must be selected in each cell containing a segment of the Copermittee's MS4, which must consist of one of the following:

[a] A major outfall,
[b] Other outfall point, or
[c] Other point of access (e.g., manhole);

(iii) Each non-storm water MS4 monitoring station should be located downstream of any areas that are known or suspected to be sources of non-storm water discharges and/or illicit discharges or connections to the MS4;

(iv) Each non-storm water MS4 monitoring station must be located to the degree practicable at the farthest outfall, manhole, or other accessible location downstream in the MS4, within each cell;

(v) In addition to the non-storm water MS4 monitoring stations identified in accordance with Provisions D.1.a.(1)(a)(i)-(iv) above, each Copermittee must identify stations that will be screened and monitored during dry weather days to identify non-storm water discharges from sources not directly under the jurisdiction of the Copermittee.[10] These stations must be selected in accordance with the following guidelines and criteria:

[a] Stations should be located at or prior to the point of discharge into the Copermittee's MS4, but may be located downstream of the source as long as the station remains appropriate for characterizing the discharge from the source not within the authority of the Copermittee to control,
[b] Any non-storm water MS4 monitoring station identified in accordance with Provisions D.1.a.(1)(a)(i)-(iv) and located at the point of discharge or directly downstream of a known or suspected source of non-storm water discharges not within the authority of the Copermittee to control may also be utilized as a station to monitor the source not within the authority of the Copermittee to control;

(vi) The following factors should be considered in determining the location of each non-storm water MS4 monitoring station:

[a] Safety of personnel and accessibility of the location,
[b] Total area draining to the location,
[c] Population density of the area draining to the location,
[d] Traffic density,
[e] Age of the structures or buildings in the area,

[10] Sources not directly under the jurisdiction of and subject to regulation by the Copermittee may include lands or areas under the jurisdiction of other Copermittees, owners or operators of federal and state lands or facilities, tribal lands, special districts, etc.

[f] History of the area,
[g] Land use types draining to the location,
[h] Hydrological conditions, and
[i] Recommendations from the San Diego Water Board; and

(vii) No more than 500 non-storm water MS4 monitoring stations need to be selected by each Copermittee within its jurisdiction for any given year.

(b) Non-Storm Water MS4 Station Prioritization [D.1.a.(1)(b)]

Based on the first year of non-storm water field observations collected consistent with the Provision D.1.a.(1)(c)(i), each Copermittee must identify the high priority non-storm water MS4 monitoring stations. The non-storm water MS4 monitoring stations that meet the following criteria must be identified as high priority:

(i) The Copermittee has not identified and eliminated the source of the non-storm water discharges; or

(ii) The Copermittee has not been able to eliminate the source of an identified illicit discharge, and

(iii) The non-storm water discharges and/or illicit discharges are known or suspected to contribute and/or contain pollutants that cause or contribute, or threaten to cause or contribute to a condition of pollution or nuisance associated with the highest water quality priorities related to discharges from the MS4s.

(iv) The Copermittee may also designate any non-storm water MS4 monitoring stations that do not meet the criteria above as high priority.

(c) Non-Storm Water Monitoring Procedures [D.1.a.(1)(c)]

Each Copermittee must monitor the non-storm water MS4 monitoring stations within its jurisdiction as follows:

(i) *Non-Storm Water Field Observations* [D.1.a.(1)(c)(i)]

[a] Monitoring events for each non-storm water MS4 monitoring station must be scheduled as follows:
[1] During the first year of enrollment under this Order, the Copermittee must record field observations consistent with Table D-1 at each non-storm water MS4 monitoring station within its jurisdiction at least one time per month;

Table D-1. Field Observations for Non-Storm Water MS4 Monitoring Stations

Field Observations
• Station identification and location. • Presence of flow, or pooled or ponded water. • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate), - Flow characteristics (i.e. presence of floatables, surface scum, or sheens, odor, color), - Flow source(s) suspected or identified from non-storm water source investigation, and - Flow source(s) eliminated during non-storm water source identification. • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, or sheens, odor, color), and - Known or suspected source(s) of pooled or ponded water. • Station description (i.e. deposits or stains, vegetation condition, structural condition, observable biology). • Presence and assessment of trash in and around station. • Evidence or signs of illicit connections or illegal dumping.

[2] For any stations monitoring sources not within the authority of the Copermittee to control where flows are observed during the first year of enrollment under this Order, the Copermittee must develop a field screening and monitoring schedule that can characterize the monthly non-storm water discharges and pollutant loads from the sources in or discharging to the Copermittee's MS4;

[3] High priority non-storm water MS4 monitoring stations must be monitored in accordance with the following:

A. Each Copermittee must designate at least 5 high priority non-storm water MS4 monitoring stations that are representative of non-storm water discharges from areas consisting primarily of residential, commercial, and industrial land uses present within and directly under the Copermittee's jurisdiction. Where there are less than 5 non-storm water MS4 monitoring stations within a Copermittee's jurisdiction, all stations must be designated as high priority, and

B. Each Copermittee must develop a monitoring schedule that can characterize the monthly non-storm water discharges and pollutant loads in or discharging from the high priority non-storm water MS4 monitoring stations;

[4] At least 10 percent of the non-storm water MS4 monitoring stations not identified as high priority must be screened and monitored each month. In addition, each non-storm water MS4 monitoring station must be screened and monitored at least once per year. If non-storm water flows are observed at

any non-storm water MS4 monitoring stations not identified as high priority, then they must become high priority pursuant to Provision D.1.a.(1)(b).

[b] For each monitoring events required above, the narrative descriptions and observations in Table D-1 must be recorded at each non-storm water MS4 monitoring station.

(ii) *Non-Storm Water Field Monitoring* [D.1.a.(1)(c)(ii)]

If flows, or pooled or ponded water are present during the field observations required under Provision D.1.a.(1)(c)(i), the Copermittee must monitor and record the parameters in Table D-2:

Table D-2. Field Monitoring Parameters for Non-Storm Water MS4 Monitoring Stations

Parameters
• pH • Temperature • Specific conductivity • Dissolved oxygen • Turbidity • Total chlorine • Total copper* • Total phenol • Detergents (or surfactants)* • Total hardness* • Reactive phosphorus* • Nitrate* • Ammonia as nitrogen*

* Field measurement not required if flow is observed and collection of a sample for analysis is required.

(iii) *Non-Storm Water Analytical Monitoring* [D.1.a.(1)(c)(iii)]

If flows are present during the field observations required under Provision D.1.a.(1)(c)(i), samples must be collected and analyzed as follows:

[a] If the Copermittee identifies and eliminates the source of non-storm water discharge, analysis of the sample is not required, but encouraged;

[b] During the first year of enrollment under this Order, samples must be collected if flows are observed at non-storm water MS4 monitoring stations. Samples must be analyzed for the following constituents, unless the Copermittee has historical data that can demonstrate or provide justification that the analysis of the constituent is not necessary:

[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,

[2] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection,

[3] Constituents listed in Table D-3;

Table D-3. Analytical Monitoring Constituents for Non-Storm Water MS4 Monitoring Stations

Conventionals, Nutrients, Hydrocarbons	Pesticides	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Total Phosphorus • Dissolved Phosphorus • Nitrite[1] • Nitrate[1] • Total Kjeldhal Nitrogen • Ammonia • Oil and Grease	• Diazinon • Chlorpyrifos • Pyrethroids	• Cadmium • Copper • Lead • Zinc	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

[c] **After** the first year of enrollment under this Order, samples must be collected from all high priority non-storm water MS4 monitoring stations for analysis at least two times per year. Samples must be collected at least once during the dry season (May-September) and at least once after the first storm event of the wet season (October-April). Samples must be analyzed for the following constituents:
[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,
[2] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and
[3] Constituents listed in Table D-3 must be analyzed at least once per year;

[d] Samples must be collected from all non-storm water MS4 monitoring stations not identified as high priority for analysis if flows are observed during required field screening and monitoring events. Samples must be analyzed for the following constituents, unless the Copermittee has historical data that can demonstrate or provide justification that the analysis of the constituent is not necessary:
[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,
[2] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and
[3] Constituents listed in Table D-3.

(2) Dry Weather Ambient Receiving Water Monitoring Program [D.1.a.(2)]

Each Copermittee must develop and conduct a program to monitor and characterize the ambient conditions of the receiving waters utilized for conveying non-storm water within and through its jurisdiction. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittee. The dry weather ambient receiving water monitoring program must meet the following minimum requirements:

(a) Dry Weather Ambient Receiving Water Monitoring Stations [D.1.a.(2)(a)]

Each Copermittee must identify the dry weather ambient receiving water monitoring stations that will be screened and monitored. Any location in a receiving water that is already monitored by the Copermittee or another entity may also be utilized as a dry weather ambient receiving water monitoring station. The monitoring stations must be selected in accordance with the following criteria:

(i) The following factors should be considered in determining the location of each dry weather ambient receiving water monitoring station:

[a] Permission to cross private property and public land,
[b] Safety of personnel and accessibility of the location,
[c] Location can complement or supplement historical ambient receiving water data,
[d] Location should not be in close proximity to any MS4 outfalls or other point source discharges to the receiving water,
[e] Natural or relatively unaltered areas in receiving waters are preferred, and
[f] Recommendations from the San Diego Water Board;

(ii) Locate at least one monitoring station in the lowest part of the Watershed Management Area near the boundary of its jurisdiction;

(iii) Locate at least one monitoring station located in the uppermost part of the Watershed Management Area near the boundary of its jurisdiction; and

(iv) The monitoring stations identified in Provisions D.1.a.(2)(a)(ii) and D.1.a.(2)(a)(iii) must be hydraulically connected.

(b) Dry Weather Ambient Receiving Water Monitoring Procedures [D.1.a.(2)(b)]

Each Copermittee must monitor the dry weather ambient receiving water monitoring stations as follows:

(i) *Dry Weather Ambient Receiving Water Field Observations* [D.1.a.(2)(b)(i)]

Monitoring events for each monitoring station must be scheduled as follows:

[a] During the first year of enrollment under this Order, the Copermittee must record field observations consistent with Table D-4 at each dry weather ambient receiving water monitoring station at least one time per month; and

Table D-4. Field Observations for Dry Weather Ambient Receiving Water Monitoring Stations

Field Observations
• Station identification and location. • Presence of flow, or pooled or ponded water. • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate), - Flow characteristics (i.e. presence of floatables, surface scum, or sheens, odor, color), • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, or sheens, odor, color),. • Station description (i.e. deposits or stains, vegetation condition, structural condition, observable biology). • Presence and assessment of trash in and around station.

[b] For any monitoring stations where flows are observed during the first year of enrollment under this Order, the Copermittee must develop a field screening and monitoring schedule that can characterize the monthly flows and pollutant loads in the receiving water.

(ii) *Dry Weather Ambient Receiving Water Field Monitoring* [D.1.a.(2)(b)(ii)]

If flow, or pooled or ponded water is present during the field observations required under Provision D.1.a.(2)(b)(i), the Copermittee must monitor and record the parameters in Table D-2.

(iii) *Dry Weather Ambient Receiving Water Analytical Monitoring* [D.1.a.(2)(b)(iii)]

If flows are present during the field observations required under Provision D.1.a.(2)(b)(i), samples of the ambient receiving water flows must be collected and analyzed as follows:

[a] During the first year of enrollment under this Order, samples must be collected for each observation of flow in the ambient receiving water monitoring stations for analysis. Samples must be analyzed for the following constituents:

[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,

[2] Any non-storm water pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and
[3] Constituents listed in Table D-3; and

[b] **After** the first year of enrollment under this Order, samples of flows observed at ambient receiving water monitoring stations must be collected for analysis at least two times during the remaining term of this Order. Samples must be collected at least once during the dry season (May-September) and at least once after the first storm event of the wet season (October-April). Samples must be analyzed for the following constituents:
[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,
[2] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection,
[3] Constituents listed in Table D-3 must be analyzed at least once per year.

~~c.~~b. **WET WEATHER JURISDICTIONAL MONITORING** [D.1.b]

For wet weather days,[11] each Copermittee must implement the following minimum monitoring requirements within its jurisdiction:

(1) Storm Water MS4 Outfall Monitoring Program [D.1.b.(1)]

Each Copermittee must develop and conduct a program to monitor and characterize the storm water flows and pollutant loads from the MS4 outfalls within its jurisdiction during wet weather days. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittee. The monitoring program must meet the following minimum requirements:

(a) Storm Water MS4 Outfall Monitoring Stations [D.1.b.(1)(a)]

Each Copermittee must identify the wet weather MS4 outfall monitoring stations within its jurisdiction that will be monitored and sampled during wet weather days. Any non-storm water MS4 monitoring station identified under Provision D.1.a.(1)(a) may also be utilized as a storm water MS4 outfall monitoring station. Monitoring stations must be selected in accordance with the following guidelines and criteria:

(i) The following factors should be considered in determining the location of each wet weather MS4 outfall monitoring station:

[11] Wet weather day defined as any day with 0.1 inches of rain or greater and the following 3 days.

[a] Safety of personnel and accessibility of the location,
[b] Total area draining to the location,
[c] Population density of the area draining to the location,
[d] Traffic density,
[e] Age of the structures or buildings in the area,
[f] History of the area,
[g] Land use types draining to the location,
[h] Hydrological conditions, and
[i] Recommendations from the San Diego Water Board.

(ii) Each wet weather MS4 outfall monitoring station must consist of one of the following:

[a] A major outfall, or
[b] Other outfall point, or
[c] Other point of access (e.g., manhole), only as an alternate location if safety during wet weather discharge sampling at available outfall locations discharging to receiving waters is a significant concern and limits accessibility;

(iii) Each Copermittee must designate at least 5 monitoring stations that are representative of storm water flows from areas consisting primarily of residential, commercial, and industrial land uses present within the Copermittee's jurisdiction. Where there are less than 5 MS4 outfalls within a Copermittee's jurisdiction, all MS4 outfalls must be designated as wet weather MS4 outfall monitoring stations.

(iv) Any monitoring station that does not have any SAL exceedances for 3 successive years may be replaced with a different monitoring station.

(b) Storm Water MS4 Outfall Monitoring Procedures [D.1.b.(1)(b)]

Each Copermittee must develop monitoring procedures to be consistent with the following criteria:

(i) A narrative description must be provided of the station identification and location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(ii) Flow rates and volumes for each monitoring station must be measured or estimated during each monitoring event in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), sections 3.2.1 or 3.2.2, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board;

(iii) Each Copermittee must develop and implement a monitoring frequency during the wet season to characterize pollutant discharges from the MS4 outfalls within its jurisdiction. At a minimum, storm water samples must be collected from two storm events occurring at least one month apart for each monitoring station. Samples must be collected as follows:

[a] Grab samples may be collected only for pH, temperature, specific conductivity, dissolved oxygen, hardness, oil and grease, and indicator bacteria,
[b] For all other constituents, one of the following methods must be used to collect the samples:
[1] A 24-hour composite sample, using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours. Results of the analyses of individual grab samples may be averaged to obtain the daily average,
[2] A flow-weighted composite sample for either the entire discharge or for the first 3 hours of the discharge. The flow-weighted composite sample for the storm water discharge may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes. Only one analysis of the composite of aliquots is required, or
[3] A minimum of one grab sample may be collected for storm water discharges from holding ponds or other impoundments with a retention period greater than 24 hours;

(iv) Storm water MS4 outfall monitoring stations must be monitored and sampled during the first wet weather event of the wet season. Samples must be analyzed for the following constituents:

[a] Any pollutants contributing to the highest water quality priorities for the Watershed Management Area as identified in the Water Quality Improvement Plan,
[b] Any non-storm water pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and
[c] Constituents listed in Table D-5.

Table D-5. Analytical Monitoring Constituents for Wet Weather MS4 Outfall Monitoring Stations

Conventionals, Nutrients, Hydrocarbons	Pesticides	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity[1] • Total Hardness • pH • Specific Conductivity • Temperature • Dissolved Oxygen • Biological Oxygen Demand, 5-day • Chemical Oxygen Demand • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus[1] • Dissolved Phosphorus • Nitrite[1,2] • Nitrate[1,2] • Total Kjeldhal Nitrogen • Ammonia • Oil and Grease	• Diazinon • Chlorpyrifos • Pyrethroids	• Arsenic • Cadmium[1] • Chromium • Copper[1] • Iron • Lead[1] • Manganese • Mercury • Nickel • Selenium • Silver • Thallium • Zinc[1]	• Total Coliform • Fecal Coliform[3] • *Enterococcus*

Notes:
1. Constituent with a storm water action level (SAL) specified under Provision C.2.
2. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
3. *E. Coli* may be substituted for Fecal Coliform.

(v) Samples collected after the first wet weather monitoring event and during the remaining period of the wet season must be analyzed for the following constituents:

[a] Any pollutants contributing to the highest water quality priorities for the Watershed Management Area as identified in the Water Quality Improvement Plan.

[b] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection.

(2) <u>Storm Water Pollutant Source Identification Monitoring Program</u> [D.1.b.(2)]

Each Copermittee must develop and conduct a program within its jurisdiction to identify the sources of pollutants in storm water discharged from the Copermittee's MS4 during wet weather conditions. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittee. The storm water pollutant source identification monitoring program must include focused monitoring which moves upstream into each MS4 outfall drainage area as necessary to identify sources of the highest water quality priorities in the receiving waters. The wet weather source identification monitoring program must begin no later than the wet season following the date the San Diego Water Board determines that the Water Quality Improvement Plan meets the requirements of this Order.

2. Watershed Monitoring Requirements

a. WATERSHED MONITORING STATIONS [D.2.a]

The Copermittees must identify watershed monitoring stations within the Watershed Management Area. The watershed monitoring stations must be selected in accordance with the following criteria:

(1) All mass loading stations (MLSs) previously established by the Copermittees in each Watershed Management Area must continue to be utilized as watershed monitoring stations;

(2) All temporary watershed assessment stations (TWASs), bioassessment stations, and stream assessment stations previously established by the Copermittees must be considered for continued use as watershed monitoring stations;

(3) Any dry weather ambient receiving water monitoring station identified pursuant to Provision D.1.a.(2)(a) may be considered for use as a watershed monitoring station;

(4) At least one reference watershed monitoring station must be selected for each Watershed Management Area; and

(5) At least one watershed monitoring station located between and hydrologically connected to each MLS and each reference station must be selected for each Watershed Management Area.

b. DRY WEATHER WATERSHED MONITORING [D.2.b]

The Copermittees must develop and conduct a program to monitor the condition of the receiving waters in each Watershed Management Area during dry weather conditions. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittees. For dry weather days, the Copermittees must develop and/or update its written dry weather watershed monitoring procedures to be consistent with the following criteria:

(1) Dry Weather Watershed Field Observations [D.2.b.(1)]

For each dry weather watershed monitoring event, the Copermittee must record field observations consistent with Table D-4 at each monitoring station. Dry weather watershed monitoring is required at least every two years for each monitoring station. At least two dry weather watershed monitoring events must be scheduled for each watershed monitoring station per monitoring year. One monitoring event is required during the dry season (May-September) and one monitoring event is required on a dry weather day during the wet season (October-April), after the first storm event.

(2) Dry Weather Watershed Field Monitoring [D.2.b.(2)]

If flow, or pooled or ponded water is present during the dry weather watershed monitoring event required pursuant to Provision D.2.b.(1), and conditions allow the collection of the data, the Copermittee must monitor and record the parameters in Table D-2.

(3) Dry Weather Watershed Analytical Monitoring [D.2.b.(3)]

Samples from each monitoring station must be collected for analysis at least every two years. At least two dry weather watershed analytical monitoring events must be scheduled for each watershed monitoring station per monitoring year. Samples must be collected once during the dry season (May-September) and once on a dry weather day during the wet season (October-April), after the first storm event. Analytical monitoring samples must be collected and analyzed as follows:

(a) Grab samples may be collected only for pH, temperature, specific conductivity, dissolved oxygen, hardness, oil and grease, and indicator bacteria;

(b) For all other constituents, time-weighted composites composed of 24 discrete hourly samples must be collected; and

(c) Analysis for the following constituents is required:

(i) Any other pollutants contributing to the highest water quality priorities for the Watershed Management Area as identified in the Water Quality Improvement Plan,

(ii) Any pollutants that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and

(iii) Constituents listed in Table D-5.

(4) Dry Weather Watershed Toxicity Monitoring [D.2.b.(4)]

Samples from each monitoring station must be collected for toxicity testing at least every two years. At least two dry weather watershed toxicity monitoring events must be scheduled for each watershed monitoring station per monitoring year. Samples must be collected once during the dry season (May-September) and once on a dry weather day during the wet season (October-April), after the first storm event. Toxicity testing must be conducted in accordance with the following table:

Table D-6. Toxicity Testing for Dry Weather Watershed Monitoring Station Flows

Dry Weather Watershed Monitoring Station	Freshwater Organisms	Estuarine and Marine Organisms
Mass Loading Stations[1]	3 acute[2] 3 chronic[2]	1 chronic[3]
Others Stations	3 acute[2] 3 chronic[2]	None

Notes:
1. Dry weather toxicity testing at a mass loading station may be omitted if the channel flows are diverted year-round during dry weather conditions to the sanitary sewer for treatment.
2. The presence of acute toxicity must be determined in accordance with USEPA protocol EPA-821-R-02-012. The presence of chronic toxicity must be determined in accordance with USEPA protocol EPA-821-R-02-013. Toxicity testing must include the use of *Pimephales promelas* (fathead minnow), *Hyalella azteca*, and *Psuedokirchneriella subcapitata* (formerly *Selenastrum capricornutum*, unicellular algae).
3. The presence of chronic marine toxicity must be determined in accordance with USEPA guidance EPA 600/R95/136, except for chronic mysid tests which must be conducted in accordance with USEPA protocol EPA-821-R-02-014. *Americamysis bahia* may be used as a marine test organism if *Holmesimysis costata* cannot be reasonably obtained. The use of, and justification for, *A. bahia* must be clearly reported in the Annual Report.

(5) Dry Weather Watershed Bioassessment Monitoring [D.2.b.(5)]

Bioassessment monitoring for each monitoring station is required at least every two years. Bioassessment monitoring is required to be conducted in May or June for each watershed monitoring station, and must be conducted as follows:

(a) The following bioassessment samples and measurements must be collected:

(i) Macroinvertebrate samples must be collected in accordance with the "Reachwide Benthos (Multihabitat) Procedure" in the most current Surface Water Ambient Monitoring Program (SWAMP) Bioassessment Standard Operating Procedures (SOP), and amendments, as applicable;[12]

[12] Ode, P.R.. 2007. Standard operating procedures for collecting macroinvertebrate samples and associated physical and chemical data for ambient bioassessments in California. California State Water Resources Control Board Surface Water Ambient Monitoring Program (SWAMP) Bioassessment SOP 001. http://www.swrcb.ca.gov/water_issues/programs/swamp/tools.shtml#monitoring

(ii) The "Full" suite of physical habitat characterization measurements must be collected in accordance with the most current SWAMP Bioassessment SOP, and as summarized in the SWAMP Stream Habitat Characterization Form – Full Version;[13] and

(iii) Freshwater algae samples must be collected in accordance with the SWAMP Standard Operating Procedures for Collecting Algae Samples.[14] Analysis of samples must include algal taxonomic composition (diatoms and soft algae) and algal biomass.

(b) The bioassessment samples, measurements, and appropriate water chemistry data must be used to calculate the following:

(i) An Index of Biotic Integrity (IBI) for macroinvertebrates for each monitoring station where bioassessment monitoring was conducted, based on the most current calculation method;[15] and

(ii) An IBI for algae for each monitoring station where bioassessment monitoring was conducted, when a calculation method is developed.[16]

(6) Dry Weather Watershed Hydromodification Monitoring [D.2.b.(6)]

In addition to the hydromodification monitoring conducted as part of the Copermittees' Hydromodification Management Plans, for any year dry weather watershed monitoring is required, hydromodification monitoring is required to be conducted at least once during the dry weather season (May-September) for each monitoring station. The following hydromodification monitoring observations and measurements must be collected within an appropriate domain of analysis for the monitoring station:

(a) Channel conditions, including:

(i) Channel dimensions,

(ii) Hydrologic and geomorphic conditions, and

(iii) Presence and condition of vegetation and habitat;

[13] Available at: http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/fieldforms_fullversion052908.pdf
[14] Fetscher et al. 2009. Standard Operating Procedures for Collecting Stream Algae Samples and Associated Physical Habitat and Chemical Data for Ambient Bioassessments in California.
[15] The most current calculation method at the time the Order was adopted is outlined in "A Quantitative Tool for Assessing the Integrity of Southern California Coastal Streams" (Ode, et al. 2005. Environmental Management. Vol. 35, No. 1, pp. 1-13). If an updated or new calculation method is developed, either both (i.e. current and updated/new) methods must be used, or historical IBIs must be recalculated with the updated or new calculation method.
[16] When a calculation method is developed, IBIs must be calculated for all available and appropriate historical data.

(b) Location of discharge points;

(c) Habitat integrity;

(d) Photo documentation of existing erosion and habitat impacts, with location (i.e. latitude and longitude coordinates) where photos were taken;

(e) Measurement or estimate of dimensions of any existing channel bed or bank eroded areas, including length, width, and depth of any incisions; and

(f) Known or suspected cause(s) of existing downstream erosion or habitat impact, including flow, soil, slope, and vegetation conditions, as well as upstream land uses and contributing new and existing development.

(7) <u>Dry Weather Watershed Sediment Quality Monitoring</u> [D.2.b.(7)]

Sediment monitoring must be performed by the Copermittees to assess compliance with sediment quality receiving water limits applicable to MS4 discharges to enclosed bays and estuaries. The monitoring may be performed either by individual or multiple Copermittees to assess compliance with receiving water limits, or through participation in a water body monitoring coalition. The Copermittees must identify sediment sampling stations that are spatially representative of the sediment within the water body segment or region of interest. Sediment quality monitoring must be conducted at least once every two years between June and September. Sediment quality monitoring must be conducted in conformance with the monitoring requirements set forth in the State Water Board Sediment Quality Control Plan.

c. WET WEATHER WATERSHED MONITORING [D.2.c]

The Copermittees in each Watershed Management Area must develop and conduct a program to monitor the condition in receiving waters and characterize storm water flows during wet weather days of the wet season. Any available monitoring data not collected specifically for this Order that meet the monitoring requirements may be utilized by the Copermittee. For wet weather days, the Copermittees must develop and/or update its written wet weather watershed monitoring procedures to be consistent with the following criteria:

(1) <u>Wet Weather Watershed Field Observations</u> [D.2.c.(1)]

Wet weather watershed monitoring events are required at least once every two years for each dry weather watershed monitoring station. Each monitoring station must be monitored during at least two wet weather events in any period (July 1 to June 30) that monitoring is required, including the first wet weather event of the wet season beginning October 1 and ending April 30, and at least one wet weather event after February 1. For each wet weather watershed monitoring event, the following narrative descriptions and observations must be recorded at each monitoring station:

(a) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(b) The flow rates and volumes measured or estimated. Data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board;

(c) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and

(d) Presence and assessment of trash in and around station.

(2) Wet Weather Watershed Field Monitoring [D.2.c.(2)]

For each wet weather watershed monitoring event, the parameters in Table D-2 must be monitored and recorded.

(3) Wet Weather Watershed Analytical Monitoring [D.2.c.(3)]

Samples from each wet weather watershed monitoring station must be collected for analysis at least two times during the term of this Order, at least once for the first wet weather event of the wet season, and at least once for a wet weather event after February 1. Wet weather samples must be collected and analyzed as follows:

(a) Grab samples may be collected only for pH, temperature, specific conductivity, dissolved oxygen, hardness, oil and grease, and indicator bacteria;

(b) For all other constituents, one of the following methods must be used to collect the samples:

(i) A 24-hour composite sample, using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours. Results of the analyses of individual grab samples may be averaged to obtain the daily average, or

(ii) A flow-weighted composite sample for either the entire discharge or for the first 3 hours of the discharge. The flow-weighted composite sample for the storm water discharge may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes. Only one analysis of the composite of aliquots is required; and

(c) Analysis for the following constituents is required:

(i) Any other pollutants contributing to the highest water quality priorities for the Watershed Management Area as identified in the Water Quality Improvement Plan,

(ii) Any water pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and

(iii) Constituents listed in Table D-5.

(4) Wet Weather Watershed Toxicity Monitoring [D.2.c.(4)]

Samples from each wet weather watershed monitoring station must be collected for toxicity testing at least two times during the term of this Order, at least once for the first wet weather event of the wet season, and at least once for a wet weather event after February 1. Toxicity testing must be conducted in accordance with the following table:

Table D-7. Toxicity Testing for Wet Weather Watershed Monitoring Station Flows

Wet Weather Watershed Monitoring Station	Freshwater Organisms	Estuarine and Marine Organisms
Mass Loading Stations	3 acute[1]	1 acute[2] 2 chronic[2]
Others Stations	None	None

Notes:
1. The presence of acute toxicity must be determined in accordance with USEPA protocol EPA-821-R-02-012. Toxicity testing must include the use of *Pimephales promelas* (fathead minnow), *Hyalella azteca*, and *Psuedokirchneriella subcapitata* (formerly *Selenastrum capricornutum*, unicellular algae).
2. The presence of acute toxicity must be determined in accordance with USEPA protocol EPA-821-R-02-012. The presence of chronic marine toxicity must be determined in accordance with USEPA guidance EPA 600/R95/136, except for chronic mysid tests which must be conducted in accordance with USEPA protocol EPA-821-R-02-014. *Americamysis bahia* may be used as a marine test organism if *Holmesimysis costata* cannot be reasonably obtained. The use of, and justification for, *A. bahia* must be clearly reported in the Annual Report.

d. ALTERNATIVE WATERSHED MONITORING REQUIREMENTS [D.2.d]

In lieu of implementing the watershed monitoring requirements under Provisions D.2.a-c, the San Diego Water Board may direct the Copermittees to participate with other regulated entities, other interested parties, and the San Diego Water Board in the development, refinement, implementation, and coordination of regional monitoring and assessment programs to determine the status and trends of water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and 3) streams.

e. WATERSHED MANAGEMENT AREA SPECIAL STUDIES [D.2.e]

(1) Within the term of this Order, the Copermittees must implement at least three special studies in each Watershed Management Area. The Copermittees are to determine which special studies will be developed and implemented in the Watershed Management Area. The monitoring plans for the Watershed Management Area special studies must be submitted with the Water Quality Improvement Plan required pursuant to Provision F.1. The Watershed Management Area special studies must, at a minimum, be in conformance with the following criteria:

(a) The special studies must be related to the highest water quality priorities identified by the Copermittees within the Watershed Management Area;

(b) The special studies must be implemented within the Watershed Management Area;

(c) The special studies must require some form of participation by all Copermittees within the Watershed Management Area; and

(d) One of the three required special studies may be implemented as part of a regional special study required pursuant to Provision D.3.

(2) The Copermittees must report the progress and findings of the Watershed Management Area Special Studies as part of the Annual Report for each Watershed Management Area, as required pursuant to Provision F.3.b.

3. Regional Special Studies

Within the term of this Order, the Copermittees must develop and implement at least two regional special studies for the San Diego Region. The Copermittees must determine which regional special studies will be developed and implemented. The regional special studies must be identified in the Water Quality Improvement Plans required pursuant to Provision F.1. The regional special studies must, at a minimum, be in conformance with the following criteria:

a. The special studies must be related to a water quality priority issue or potential water quality concern identified by the Copermittees for the entire San Diego Region;

b. The special studies must be implemented within the San Diego Region; and

c. The special studies must require some form of participation by all Copermittees enrolled under this Order.

4. Assessment Requirements

Each Copermittee must evaluate the data collected pursuant to Provisions D.1, D.2 and D.3 to identify causes of exceedances of action levels developed pursuant to Provision C, assess the quality of the discharges into and from the MS4s, and assess the quality of receiving waters. Each Copermittee must also assess the progress of the water quality improvement strategies required pursuant to Provision B.3 in restoring and protecting beneficial uses of receiving waters. Assessments must be performed as described in the following provisions:

a. MS4 DISCHARGES ASSESSMENTS [D.4.a]

(1) Jurisdictional Non-Storm Water Discharges Reduction Assessment [D.4.a.(1)]

(a) Non-Storm Water Action Levels [D.4.a.(1)(a)]

Each Copermittee must analyze the jurisdictional non-storm water monitoring data collected pursuant to Provision D.1.a and identify causes of NAL exceedances. The analysis must include, but not be limited to, all of the following considerations:

(i) For non-storm water discharges from the Copermittee's MS4 outfalls to receiving waters within the Copermittee's jurisdiction causing exceedances of NALs, the Copermittee must analyze its municipal, commercial, industrial, and residential inventories and activities, and other land use data, and identify sources or potential sources that may have caused or contributed to the NAL exceedances;

(ii) Each Copermittee must provide non-storm water monitoring and analytical data to demonstrate that NAL exceedances were caused by pollutants which are not anthropogenic in origin; and

(iii) Each Copermittee must provide non-storm water monitoring and analytical data to demonstrate that NAL exceedances were caused by pollutants which originate from sources or potential sources not within the authority of the Copermittee to control (e.g. Phase II dischargers or Caltrans).

(b) Calculate Jurisdictional Non-Storm Water Discharges and Pollutant Loads [D.4.a.(1)(b)]

Each Copermittee must analyze the jurisdictional non-storm water monitoring data collected pursuant to Provision D.1.a to calculate non-storm water discharges and pollutant loads from the MS4s and receiving waters in each jurisdiction. These calculations must be updated annually in the Annual Report required per Provision F.3.b. Each Copermittee must calculate:

(i) Monthly non-storm water discharges and pollutant loads from each known or potential source not within the authority of the Copermittee to control to an MS4 or receiving waters within the Copermittee's jurisdiction;

(ii) Monthly non-storm water discharges and pollutant loads from the Copermittee's MS4 outfalls to receiving waters within the Copermittee's jurisdiction, with an estimate of the percent contribution from each land use type within the drainage basin for each MS4 outfall;

(iii) Monthly non-storm water flows and pollutant loads in receiving waters at the downstream boundary of the Copermittee's jurisdiction; and

(iv) Monthly non-storm water flows and pollutant loads in receiving waters from areas or facilities subject to the Copermittee's legal authority that are discharged from the Copermittee's MS4 to downstream receiving waters.

(c) Review Progress and Evaluate Jurisdictional Actions [D.4.a.(1)(c)]

Each Copermittee must review the NAL exceedances, discharge and flow analyses, and pollutant load analyses required pursuant to Provisions D.4.a.(1)(a) and D.4.a.(1)(b) on an annual basis to:

(i) Identify reductions and progress in achieving reductions in non-storm water and illicit discharges and connections from different land uses and/or drainage areas to its MS4;

(ii) Assess the effectiveness of current actions being implemented by the Copermittee toward the reduction or elimination of non-storm water discharges from the MS4 within its jurisdiction; and

(iii) Identify modifications necessary to increase the effectiveness of the jurisdictional runoff management program toward reducing or eliminating non-storm water discharges to and from the MS4 within its jurisdiction.

(2) Watershed Management Area Non-Storm Water Assessment [D.4.a.(2)]

(a) Calculate Watershed Non-Storm Water Flows and Pollutant Loads [D.4.a.(2)(a)]

The Copermittees must analyze the jurisdictional non-storm water and watershed monitoring data collected per Provisions D.1.a and D.2.b to calculate non-storm water flows and pollutant loads in receiving waters for each Watershed Management Area. These calculations must be updated annually in the Annual Report required per Provision F.3.b. The Copermittees must develop or utilize appropriate methods or models to calculate:

(i) Monthly non-storm water runoff flows and pollutant loads at each watershed monitoring station from different land uses and drainage basins;

(ii) Monthly non-storm water flows and pollutant loads at each watershed monitoring station from all the Copermittees' MS4 outfalls to receiving waters, with an estimate of the percent contribution from different land uses; and

(iii) Monthly non-storm water flows and pollutant loads at each watershed monitoring station, with an estimate of the percent contribution from both areas or facilities subject to the Copermittees' legal authority and areas or facilities not subject to the Copermittees' legal authority.

(b) Evaluate Water Quality Improvement Strategies [D.4.a.(2)(b)]

The Copermittees in each Watershed Management Area must review the non-storm water flow and pollutant load analyses required pursuant to Provision D.4.a.(2)(a) on an annual basis to:

(i) Assess the effectiveness of the water quality improvement strategies being implemented within the Watershed Management Area toward reducing or eliminating non-storm water discharges and pollutant loads from entering and discharging from the MS4 to receiving waters; and

(ii) Identify modifications necessary to increase the effectiveness of the water quality improvement strategies toward reducing or eliminating non-storm water discharges and pollutant loads from entering and discharging from the MS4 to receiving waters.

(3) Jurisdictional Storm Water Pollutant Discharges Reduction Assessment [D.4.a.(3)]

(a) Storm Water Action Levels [D.4.a.(3)(a)]

(i) For storm water discharges from the Copermittee's storm water MS4 outfall monitoring stations with analytical monitoring data indicating exceedances of SALs, the Copermittee must analyze its municipal, commercial, industrial, and residential inventories and activities, and other land use data and identify sources or potential sources that may have caused or contributed to the SAL exceedances;

(ii) Each Copermittee must provide storm water monitoring and analytical data to demonstrate that SAL exceedances were caused by the constituents in storm water discharges from the MS4 which are not anthropogenic in origin; and

(iii) Each Copermittee must provide storm water monitoring and analytical data to demonstrate that SAL exceedances were caused by the constituents in storm water discharges from the MS4 which originate from sources or potential sources not within the authority of the Copermittee to control.

(b) Calculate Jurisdictional Storm Water Discharges and Pollutant Loads [D.4.a.(3)(b)]

Each Copermittee must analyze the jurisdictional storm water monitoring data collected pursuant to Provision D.1.b to calculate storm water discharges and pollutant loads from the MS4s in each jurisdiction. These calculations must be updated annually in the Annual Report required per Provision F.3.b. Each Copermittee must calculate or estimate:

(i) The monthly mean rainfall estimates (or summary of weather bureau data) and the monthly average number of storm events;

(ii) The average storm water runoff coefficient for each land use type within the Copermittee's jurisdiction;

(iii) The volume of storm water discharged from each of the Copermittee's MS4 outfalls to receiving waters within its jurisdiction for each storm event;

(iv) The pollutant loads from each of the Copermittee's MS4 outfalls to receiving waters within its jurisdiction for each storm event; and

(v) The percent contribution of pollutant loads from each land use type within the drainage basin to storm water discharges for each MS4 outfall within its jurisdiction, for each storm event.

(c) Review Progress and Evaluate Jurisdictional Actions [D.4.a.(3)(c)]

Each Copermittee must review the SAL exceedances, discharge analyses, and pollutant load analyses required pursuant to Provisions D.4.a.(3)(a) and D.4.a.(3)(b) on an annual basis to:

(i) Identify reductions and progress in achieving reductions in pollutant concentrations and/or pollutant loads from different land uses and/or drainage areas discharging from its MS4;

(ii) Assess the effectiveness of current actions being implemented by the Copermittee toward the reduction of pollutants in storm water discharges from the MS4 within its jurisdiction to the MEP; and

(iii) Identify modifications necessary to increase the effectiveness of the jurisdictional runoff management program toward reducing pollutants in storm water discharges from the MS4 within its jurisdiction to the MEP.

(4) Watershed Management Area Storm Water Assessment [D.4.a.(4)]

(a) Calculate Watershed Storm Water Flows and Pollutant Loads [D.4.a.(4)(a)]

The Copermittees must analyze the jurisdictional storm water and watershed monitoring data collected per Provisions D.1.b and D.2.c to calculate storm water flows and pollutant loads in receiving waters for each Watershed Management Area. These calculations must be updated annually in the Annual Report required per Provision F.3.b. The Copermittees must develop or utilize appropriate methods or models to calculate:

(i) Storm water runoff flows and pollutant loads at each watershed monitoring station from different land uses and drainage basins;

(ii) Storm water flows and pollutant loads at each watershed monitoring station from all the Copermittees' MS4 outfalls, with an estimate of the percent contribution from different land uses; and

(iii) Storm water pollutant loads in receiving waters at each watershed monitoring station, with an estimate of the percent contribution from both areas or facilities subject to the Copermittees' legal authority and areas or facilities not within the authority of the Copermittees to control.

(b) Evaluate Water Quality Improvement Strategies [D.4.a.(4)(b)]

The Copermittees in each Watershed Management Area must review the storm water flow and pollutant load analyses required pursuant to Provision D.4.a.(4)(a) on an annual basis to:

(i) Assess the effectiveness of the water quality improvement strategies being implemented in each Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to the MEP; and

(ii) Identify modifications necessary to increase the effectiveness of the water quality improvement strategies toward reducing pollutants in storm water discharges from the MS4s to the MEP.

b. RECEIVING WATERS ASSESSMENTS [D.4.b]

The Copermittees must annually perform assessments of receiving waters based on data collected pursuant to Provision D.2 and any appropriate receiving water monitoring data available from other sources. The receiving waters assessments must analyze the status and trends of water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and 3) streams under dry weather and wet weather conditions. For each of the three types of receiving waters, the Copermittees in each Watershed Management Area must:

(1) Identify the most critical beneficial uses that must be protected or restored to ensure overall health of the receiving water;

(2) Determine whether or not those critical beneficial uses are being protected or must be restored; and

(3) Identify short-term and/or long-term improvements or degradation of those critical beneficial uses.

c. WATER QUALITY IMPROVEMENT ASSESSMENTS [D.4.c]

The Copermittees in each Watershed Management Area must review the numeric ~~targets~~goals in the Water Quality Improvement Plan, the data collected pursuant to Provisions D.1 and D.2, and the findings from the assessments required pursuant to Provisions D.4.a and D.4.b to assess the following:

(1) Beneficial uses of the receiving waters that are protected or must be restored;

(2) Appropriateness of final dry weather and wet weather numeric ~~targets~~goals for the highest water quality priorities that will restore the impacted beneficial uses in the receiving waters;

(3) Non-storm water and storm water pollutant load reductions, or other improvements to receiving water or water quality conditions, that are necessary to attain the final numeric ~~targets~~goals for restoring impacted beneficial uses in the receiving waters;

(4) Non-storm water and storm water pollutant load reductions necessary for the Copermittees to demonstrate that non-storm water and storm water discharges from their MS4s are not causing or contributing to exceedances of water quality objectives or impacts to beneficial uses in receiving waters;

(5) Non-storm water and storm water pollutant loads from their MS4s and/or receiving water flows that may be attributed to sources or potential sources not within the authority of the Copermittee to control and other non-anthropogenic sources identified by the Copermittees;

(6) Progress of the water quality improvement strategies toward attaining non-storm water and storm water pollutant load reductions or improvements to water quality conditions; and

(7) Progress toward achieving the interim and final numeric ~~targets~~goals for restoring impacted beneficial uses in the receiving waters.

5. Monitoring Provisions

Each Copermittee must comply with all the monitoring, reporting, and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

E. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS

The purpose of this provision is for each Copermittee to implement a program to control the ~~contribution~~ discharge of pollutants into ~~and the discharges~~and from their respective MS4s to receiving waters within its jurisdiction and to focus and prioritize those implementation actions based on the highest water quality priorities identified within the associated Water Quality Improvement Plan.

The goals of this program are: 1) to effectively prohibit non-stormwater discharges into the MS4s, 2) to reduce pollutants in stormwater discharges from the MS4s to the MEP, and 3) to address impacts of ~~provision is to reduce the discharge of pollutants from~~in ~~storm water to the MEP and effectively prohibit non-storm water discharges into~~ the MS4 discharges ~~provide the reasonable protection, preservation, enhancement, and restoration of water quality and designated beneficial uses of waters of the state~~so that such discharges do not impair water quality and designated beneficial uses of waters of the state**.** These goals will be accomplished through compliance with the jurisdictional runoff management program requirements of this Provision, and as modified or supplemented per Provision B (Water Quality Improvement Plans).

Each Copermittee must implement ~~all~~ the requirements of Provision E no later than 18~~2~~ months after the adoption of this Order, or in accordance with Provision F.5.a. Each Copermittee must update its jurisdictional runoff management program document, in accordance with Provision F.2.a, to include ~~all~~ the requirements of Provision E. The jurisdictional runoff management programs implemented by each Copermittee must be consistent with the Water Quality Improvement Plan for the applicable Watershed Management Area required by Provision B. As such, the requirements of the jurisdictional runoff management programs as outlined below may be modified and prioritized as appropriate for consistency with the highest water quality priorities identified in the Water Quality Improvement Plan for the applicable Watershed Management Area if appropriate justification is provided. Until the Copermittee has updated its jurisdictional runoff management program document with the requirements of Provision E, the Copermittee must continue implementing its current jurisdictional runoff management program.

Field Code Changed

Field Code Changed

Field Code Changed

Field Code Changed

1. Modification of Jurisdictional Runoff Management Program Requirements

The requirements of this section apply to each Copermittee on a jurisdiction-wide basis. Copermittees that are in multiple WMAs may implement any activity or requirement at a level different than a specified minimum within any individual WMA so long as the requirement (as specified below) is met for the jurisdiction as a whole and compliance with all other applicable permit directives is maintained jurisdictionally and within each WMA.

Upon approval of the Executive Officer, specific minimum requirements may be modified or waived as follows:

a. Modifications within a WMA
Specific requirements may be reduced or waived for a WMA or a jurisdictional portion of a WMA only where the following conditions have been met:

i. The proposed change must be approved as a part of the approval of a Water Quality Improvement Plan or any update to it;

ii. Activities or requirements that can be reasonably demonstrated to provide an equivalent or higher level of water quality protection must be substituted for those being reduced or waived;

iii. Approved modifications will apply only to the portion of the WMA applicable to the Copermittee or Copermittees for which an approval has been granted; and

iv. Where a requirement has been reduced or waived within any WMA or portion of it, the requirement shall continue to apply to the remainder of the WMA, and to all remaining areas within the jurisdiction of the respective Copermittee(s) for which the modification has been granted.

b. Modifications within a Jurisdiction (Jurisdiction-Wide)
Specific requirements may be reduced or waived on a jurisdictional basis only where the following conditions have been met:

i. The Copermittee's proposed JRMP modifications must be submitted to the San Diego Water Board within 3 months of approval of the Water Quality Improvement Plan. The San Diego Water Board will issue a public notice and solicit public comments on the JRMP modification for a minimum of 30 days. Based on the comments received, the San Diego Water Board will determine whether to hold a public hearing or to limit public input to submittal of written comments. If no hearing is held the San Diego Water Board will notify the Copermittee that the JRMP modification has been approved following its review and determination that it meets the requirements of this Order;

ii. On RWQCB approval, the Copermittee's JRMP must be amended per Section II.F.2.a. to incorporate the modification(s);

iii. Activities or requirements that can be reasonably demonstrated to provide an equivalent or higher level of water quality protection must be substituted for those being reduced or waived; and

iv. Applicable portions of any WQIP to which an approved modification applies must be modified to reference or incorporate it, and the updated WQIP made available on the Regional Clearinghouse pursuant to Provision F.4.

1. Legal Authority Establishment and Enforcement

a. Each Copermittee must establish, maintain, and enforce adequate legal authority within its jurisdiction to control pollutant discharges into ~~and from~~ its MS4 through statute, ordinance, permit, contract, order, or similar means. This legal authority must, at a minimum, authorize the Copermittee to:

(1) Effectively p~~P~~rohibit and eliminate ~~all~~ illicit discharges and illicit connections into its MS4;

(2) Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity into its MS4 and control the quality of runoff from industrial and construction sites[17]., ~~including industrial and construction sites which that do not have coverage under the statewide General Permit for Discharges of Storm Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit), as well as to those sites which do not;~~

(3) Control the discharge of spills, dumping, or disposal of materials other than storm water into its MS4;

(4) The permittees are encouraged to enter into interagency agreements with owners of other MS4 systems, such as Caltrans, school and college districts, universities, Department of Defense, Native American Tribes, etc., to control the contribution of pollutants from one portion of the MS4s to another portion. ;

~~(3) Control through interagency agreements among Copermittees the contribution of pollutants from one portion MS4 to another portion of the MS4;~~

~~(4) Control through interagency agreements with other owners of the MS4 such as Caltrans, the U.S. federal government, or sovereign Native American Tribes, where possible, the contribution of pollutants from one portion of the MS4 to another portion of the MS4;~~

(5) Require compliance with conditions in its statutes, ordinances, permits, contracts, orders, or similar means to hold dischargers to its MS4 accountable for their contributions of pollutants and flows;

---

[17] The Permittees will only be responsible for administering and enforcing the codes and ordinances applicable to their jurisdictions (i.e.; a municipality is not responsible for administering and/or enforcing a permit issued by the State of California).

(6) Require the use of BMPs to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;

~~(6) Require documentation on the effectiveness of BMPs implemented to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;~~

~~(7)~~

~~(8)~~(7) Utilize enforcement mechanisms to require compliance with its statutes, ordinances, permits, contracts, orders, or similar means; and

~~(9)~~(8) Carry out all inspections, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with its statutes, ordinances, permits, contracts, orders, or similar means and with the requirements of this Order, including the effective prohibition of illicit discharges and connections to its MS4. The Copermittee's ordinance must include adequate legal authority, to the extent permitted by California and Federal Law and subject to the limitations on municipal action under the constitutions of California and the United States, ~~the Copermittee must also have authority~~ to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from industrial facilities, including construction sites, discharging into its MS4.

b. With the first Annual Report required by Provision F.3.b, each Copermittee must submit a statement certified by its Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative that the Copermittee has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in this Order.

2. Illicit Discharge Detection and Elimination

Each Copermittee must implement a program to actively detect and eliminate illicit discharges and improper disposal into the MS4, or otherwise require the discharger to apply for and obtain a separate NPDES permit. The illicit discharge detection and elimination program must include, at a minimum, the following requirements:

a. Non-Storm Water Discharges

Each Copermittee must address ~~all~~ non-storm water discharges as illicit discharges, where the likelihood exists that they are a source of pollutants to the waters of the state, unless ~~a non-storm water~~the discharge is either identified as a discharge authorized by a separate NPDES permit, or identified as a category of non-storm water discharges or flows that must be addressed pursuant to the following requirements:

~~(1) Discharges of non-storm water to the MS4 from the following categories must~~

~~be addressed as illicit discharges unless the discharge has coverage under NPDES Permit No. CAG919001 (Order No. R9-2007-0034, or subsequent order) for discharges to San Diego Bay, or NPDES Permit No. CAG919002 (Order No. R9-2008-0002, or subsequent order) for discharges to surface waters other than San Diego Bay:~~

~~(a) Uncontaminated pumped ground water;~~

~~(b) Discharges from foundation drains;~~

~~(c) Water from crawl space pumps; and~~

~~(d) Water from footing drains.~~

~~(2)~~(1) Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges unless the discharge has coverage under a valid NPDES Permit ~~No. CAG 679001 (Order No. R9-2010-0003, or subsequent order)~~. This includes water line flushing and water main break discharges from water purveyors under the Copermittee's jurisdiction that has been issued a water supply permit by the California Department of Public Health or federal military installations. Discharges from recycled or reclaimed water lines to the MS4 must be addressed as illicit discharges, unless the discharges have coverage under a separate NPDES permit.

~~(3)~~(2) Discharges of non-storm water to the MS4 from the following categories must be addressed by the Copermittee as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a source of pollutants to receiving waters within the Copermittee's jurisdiction:

(a) Diverted stream flows;

(b) Rising ground waters;

(c) Uncontaminated ground water infiltration to MS4s;

(d) Uncontaminated pumped ground water;

~~(c)~~(e) Discharges from foundation drains;

(f) Springs;

(g) Water from crawl space pumps;

~~(d)~~(h) Water from footing drains;

~~(e)~~(i) Flows from riparian habitats and wetlands; and

~~(f)~~(j) Discharges from potable water sources.

~~(4)~~(3) Discharges of non-storm water into the MS4 from the following categories must be controlled by the requirements given below through statute, ordinance, permit, contract, order, or similar means where there is evidence that those discharges are a source of pollutants to waters of the state. Discharges of non-storm water into the MS4 from the following categories not controlled by the requirements given below through statute, ordinance, permit, contract, order, or similar means must be addressed by the Copermittee as illicit discharges.

(a) Air conditioning condensation

The discharge of air conditioning condensation ~~must~~ should be directed to landscaped areas or other pervious surfaces where feasible;

(b) Individual residential vehicle washing – Residents should be encouraged, through public outreach and education, to implement the following when washing their vehicles:

(i) Direct t~~T~~he discharge of wash water ~~must be directed~~ to landscaped areas or other pervious surfaces where feasible, and

(ii) Minimize the use of water for vehicle washing, use as little washing detergent and other vehicle wash products as possible, wash vehicles at commercial wash facilities, and implement other practices or behaviors that will prevent the discharge of pollutants associated with individual residential vehicle washing from entering the MS4; and

(c) Dechlorinated swimming pool discharges

(i) Eliminate residual chlorine, algaecide, filter backwash, or other pollutants from swimming pools prior to discharging to the MS4, and

(ii) The discharge of saline swimming pool water ~~to the MS4~~ must be directed to the sanitary sewer (with approval from the sanitary sewer agency) landscaped areas, ~~or~~ other pervious surfaces that can accommodate the volume of water, or to the MS4 if the MS4 discharges to a saltwater receiving water.

~~(5)~~(4) Firefighting discharges to the MS4 must be addressed by the Copermittees ~~as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a significant source of pollutants to receiving waters. Firefighting discharges to the MS4 not identified as a~~

~~significant source of pollutants to receiving waters, must be addressed, at a minimum,~~ as follows:

(a) Non-emergency firefighting discharges

(i) Building fire suppression system maintenance discharges (e.g. sprinkler line flushing) to the MS4 must be addressed as illicit discharges.

(ii) Non-emergency firefighting discharges (i.e., discharges from controlled or practice blazes, firefighting training, and maintenance activities not associated with building fire suppression systems) must be addressed by a program, to be developed and implemented by the Copermittee in conjunction with the local Fire Authority/District, to reduce or eliminate pollutants in such discharges from entering the MS4.

~~(b) Emergency firefighting discharges~~

~~(b)~~

(b) ~~Each Copermittee must develop and encourage implementation of BMPs to reduce or eliminate pollutants in emergency firefighting discharges to the MS4s and receiving waters within its jurisdiction. During emergency situations, priority of efforts should be directed toward life, property, and the environment (in descending order). BMPs should not interfere with immediate emergency response operations or impact public health and safety.~~ Emergency fire fighting flows (i.e., flows necessary for the protection of life or property) do not require BMPs and need not be prohibited. As part of the Jurisdictional Runoff Management Plan (JRMP), each Copermittee must develop and implement a program to address pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes and maintenance activities) identified by the Copermittee to be significant sources of pollutants to waters of the United States.

~~(6)~~(5) If the Copermittee or San Diego Water Board identifies any category of non-storm water discharges listed under Provisions E.2.a.(1)-(4) as a source of pollutants to receiving waters, the category must be prohibited through ordinance, order, or similar means and addressed as an illicit discharge.

b. PREVENT AND DETECT ILLICIT DISCHARGES AND CONNECTIONS

Each Copermittee must include the following measures within its program to prevent and detect illicit discharges to the MS4:

(1) Each Copermittee must maintain an updated map of its entire MS4 and the corresponding drainage areas. The accuracy of the MS4 map must be confirmed during non-storm water MS4 monitoring events. The MS4 map

Formatted: No underline, Not Highlight

Formatted: List Paragraph, Outline numbered + Level: 5 + Numbering Style: a, b, c, … + Start at: 1 + Alignment: Left + Aligned at: 0.75" + Tab after: 1" + Indent at: 1"

Formatted: Not Highlight

must be included as part of the jurisdictional runoff management program document. Any geographic information system (GIS) layers or files used by the Copermittee to maintain the MS4 map must be made available to the San Diego Water Board upon request. The MS4 map must identify the following:

(a) All segments of the MS4 owned, operated, and maintained by the Copermittee,

(b) All known locations of inlets that discharge and/or collect runoff into the Copermittee's MS4,

(c) All known locations of connections with other MS4s not owned or operated by the Copermittee (e.g. Caltrans MS4s),

(d) All known locations of MS4 outfalls that discharge runoff collected from areas within the Copermittee's jurisdiction,

(e) All segments of receiving waters within the Copermittee's jurisdiction that receive and convey runoff discharged from the Copermittee's MS4 outfalls ~~(i.e., receiving water segments that are both a receiving water and part of the MS4)~~, and

(f) Locations of the non-storm water MS4 monitoring stations, identified pursuant to Provision D.1.a.(1)(a), within its jurisdiction.~~;~~

Field Code Changed

(2) ~~Each Copermittee must use~~ Copermittee personnel and contractors should~~to~~ assist in identifying and reporting illicit discharges and connections~~,~~ if observed during the course of their daily employment activities;

(3) Each Copermittee must promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges into ~~or from~~ the MS4. Each Copermittee must facilitate public reporting through development and operation of a public hotline. Public hotlines can be Copermittee-specific or shared by the Copermittees. All public hotlines must be capable of receiving reports in both English and Spanish 24 hours per day and seven days per week;

(4) Each Copermittee must implement practices and procedures (including a notification mechanism) to prevent, respond to, contain, and clean up any spills that may discharge into the MS4 within their jurisdiction from any source. The Copermittee must coordinate with spill response teams to prevent to the extent possible entry of spills into the MS4, and prevent contamination of surface water, ground water, and soil. The Copermittee must coordinate spill prevention, containment, and response activities throughout all appropriate Copermittee departments, programs, and agencies; and

~~(4)~~(5) Each Copermittee must implement practices and procedures to prevent and limit infiltration of seepage from sanitary sewers (including private laterals and failing septic systems) to the MS4.

c. **VISUAL OBSERVATIONS, FIELD SCREENING AND/OR MONITORING**

Each Copermittee must conduct visual observations, field screening and/or monitoring of MS4 outfalls and other portions of its MS4 within its jurisdiction to detect non-storm water and illicit discharges and connections to the MS4 in accordance with the jurisdictional non-storm water MS4 monitoring program requirements in Provision D.1.a.(1).

d. **INVESTIGATE AND ELIMINATE ILLICIT DISCHARGES AND CONNECTIONS**

Each Copermittee must include the following measures within its program to investigate and eliminate illicit discharges to the MS4:

(1) Each Copermittee must prioritize and determine when follow-up investigations will be performed in response to visual observations and/or water quality monitoring data collected during an investigation of a detected non-storm water or illicit discharge into ~~or from~~ the MS4. The criteria for follow-up investigations must include the following:

(a) Pollutants identified as causing or contributing to the highest water quality priorities identified in the Water Quality Improvement Plan;

(b) Pollutants identified as causing or contributing, or are threatening to cause or contribute to impairments in water bodies on the 303(d) List and/or in environmentally sensitive areas (ESAs), located within its jurisdiction;

(c) Pollutants identified from sources or land uses known to exist within the area, drainage basin, or watershed that discharges to the portion of the MS4 within its jurisdiction included in the investigation; and

(d) Pollutants identified as causing or contributing to and exceedance of an NAL described in Provision C.1; and

(e) Pollutants identified as an immediate and significant threat to human health or the environment.

(2) Each Copermittee must implement procedures to investigate and inspect portions of its MS4 that, based on reports, ~~or~~ notifications, visual observations, field screening, monitoring, or other appropriate information, indicate a reasonable potential of ~~receiving, containing, or~~ discharging pollutants to receiving waters within the Copermittees jurisdiction due to illicit discharges or~~,~~ illicit connections~~, or other sources of non-storm water~~. The

procedures must include the following:

(a) The Copermittee may develop criteria to assess the validity of, and prioritize the response to, each report or notification received. Each Copermittee must respond to each report or notification (e.g., public hotline reports, staff or contractor reports and notifications, etc.) of an incident in a timely manner. ~~The Copermittee may develop criteria to assess the validity of, and prioritize the response to, each report or notification received;~~

~~(b) Each Copermittee must immediately investigate and seek to identify the source(s) of discharges of non-storm water where flows are observed in and from the MS4 during the field screening and monitoring required pursuant to Provision D.1.a.(1). The investigation must include field investigations to identify sources or potential sources for the discharge, unless the source or potential source has already been identified during previous investigations;~~

~~(c) Each Copermittee must investigate and seek to identify the source(s) of non-storm water discharges from the MS4 where there is evidence of non-storm water having been discharged into or from the MS4 (e.g., pooled water). The investigation may include field investigations, reviewing Copermittee inventories, and other land use data to identify potential sources of the discharge; and~~

~~(d)~~(b) Procedures should address field investigations to identify sources or potential sources for the discharge, unless the source or potential source has already been identified during previous investigations.

(i) Obvious illicit discharges must be immediately investigated to identify the source(s) of discharges of non-storm water where flows are observed in and from the MS4 during the field screening and monitoring required pursuant to Provision D.1.a.(1);~~.~~

(ii) The investigation must include field investigations to identify sources or potential sources for the discharge, unless the source or potential source has already been identified during previous investigations;

(iii) The investigation may include field investigations, reviewing Copermittee inventories, and other land use data to identify potential sources of the discharge; and

~~(i)~~(iv) Procedures should address tracking of illicit discharges and connections.

(3) Each Copermittee must maintain records and a database of the

investigations, including the following information:

(i) Location of incident, including hydrologic subarea, portion of MS4 receiving the non-storm water or illicit discharge, and point of discharge or potential discharge from MS4 to receiving water,

(ii) Source of information initiating the investigation (e.g., public hotline reports, staff or contractor reports and notifications, monitoring data, etc.),

(iii) Date the information used to initiate the investigation was received,

(iv) Date the investigation was initiated,

(v) Dates of follow-up investigations,

(vi) Identified or suspected source of the illicit discharge or connection, if determined,

(vii) Known or suspected related incidents, if any,

(viii) Result of the investigation, and

(ix) If a source cannot be identified and the investigation is not continued, a rationale for why a discharge does not pose a threat to water quality and/or does not require additional investigation.

(4) Each Copermittee must initiate the implementation of procedures, in a timely manner, to detect, control, and/or eliminate all detected and identified illicit discharges and connections within its jurisdiction. The procedures must include the following:

(a) Procedures should address ~~Each Copermittee must enforce its~~ legal authority, as required under Provision E.1, to eliminate illicit discharges and connections to the~~its~~ MS4. If the Copermittee identifies the source as a controllable ~~source of non-storm water or~~ illicit discharge or connection, the Copermittee must implement its Enforcement Response Plan pursuant to Provision E.6 and enforce its legal authority to effectively prohibit and eliminate illicit discharges and connections to its MS4~~;~~. Responses to discharges may include:

(i) If the Copermittee identifies the source of the discharge as a category of non-storm water discharges in Provision E.2.a, and the discharge ~~to or from the MS4~~ is in exceedance of NALs developed ~~under Provision C.1~~in the Water Quality Implementation Plan, then the Copermittees must determine if this is an isolated incident or set of circumstances, or if the category of discharge must be addressed through the prohibition of that category of discharge as an illicit discharge pursuant to Provision E.2.a.(5);

(ii) If the Copermittee suspects the source of the non-storm water discharge as natural in origin (i.e. non-anthropogenically influenced) and in conveyance into the MS4, then the Copermittee must ~~collect the data and evidence necessary to demonstrate to the San Diego Water Board that it is natural in origin; and~~document the rationale for why the discharge does not need further investigation. This documentation shall be included in the Annual Report.

(iii) If the Copermittee is unable to identify ~~and document~~ the source of a recurring, documented ~~non-storm water~~illicit discharge into ~~or from~~ the MS4, then the Copermittee must ~~address the discharge as an illicit discharge and~~ update its jurisdictional runoff management program to address the common and suspected sources of the non-storm water discharge within its jurisdiction in accordance with the Copermittee's priorities.

(5) Each Copermittee must submit a summary of the ~~non-storm water discharges and~~ illicit discharges and connections investigated and eliminated within its jurisdiction with each Annual Report required under Provision F.3.b of this Order.

3. Development Planning

Each Copermittee within their respective jurisdictions, must ~~use their land use/planning authorities to~~ implement a development planning program that includes, at a minimum, the following requirements.

a. ~~PERMANENT~~ BMP REQUIREMENTS FOR ALL DEVELOPMENT PROJECTS

Each Copermittee, as practical and feasible, -must prescribe ~~the following~~ BMP requirements during the planning process (i.e. prior to project approval and issuance of grading or building permits) for all development projects ~~(regardless of project type or size)~~, where local permits are issued, including unpaved roads ~~and flood management projects~~, except emergency projects implemented for the protection of persons and property.

(1) General Requirements

(a) All BMPs must be located so as to remove pollutants from runoff prior to its discharge to any receiving waters, and as close to the source as possible;

(b) Multiple development projects may use shared ~~permanent~~ treatment control or structural LID BMPs as long as construction of any shared BMP is completed prior to the use or occupation of any development project from which the BMP will receive runoff; and

(c) Treatment control and structural LID~~Permanent~~ BMPs must not be constructed within a waters of the U.S. or waters of the state.

(2) Source Control BMP Requirements

The following source control BMPs must be implemented at all development projects where applicable and feasible:

(a) Prevention of illicit discharges into the MS4;

(b) Storm drain system stenciling or signage;

(c) Properly designed outdoor material storage areas;

(d) Properly designed outdoor work areas;

(e) Properly designed trash storage areas; and

(f) Any additional BMPs necessary to minimize pollutant generation at each project.

(3) Low Impact Development (LID) BMP Requirements

The following LID BMPs must be implemented at all development projects where applicable and feasible[18]:

(a) Maintenance or restoration of natural storage reservoirs and drainage corridors (including topographic depressions, areas of permeable soils, natural swales, and ephemeral and intermittent streams);[19]

(b) Buffer zones for natural water bodies (where buffer zones are technically infeasible, require project applicant to include other buffers such as trees, access restrictions, etc.);

(c) Conservation of natural areas within the project footprint including existing trees, other vegetation, and soils;

(d) Construction of streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided public safety is not compromised;

(e) Minimization of the impervious footprint of the project;

[18] Implementation of LID BMPs shall be consistent with technical guidance developed by the Copermittees.

[19] Development projects proposing to dredge or fill materials in waters of the U.S. must obtain a CWA Section 401 Water Quality Certification. Projects proposing to dredge or fill waters of the State must obtain Waste Discharge Requirements.

(f) Minimization of soil compaction to landscaped areas;

(g) Disconnection of impervious surfaces through distributed pervious areas;

(h) Landscaped or other pervious areas designed and constructed to effectively receive and infiltrate, retain and/or treat runoff from impervious areas, prior to discharge to the MS4;

(i) Small collection strategies located at, or as close as possible to, the source (i.e. the point where storm water initially meets the ground) to minimize the transport of runoff and pollutants to receiving waters;

(j) Use of permeable materials for projects with low traffic areas and appropriate soil conditions;

(k) Landscaping with native or drought tolerant species; and

(l) Harvesting and using precipitation.

(4) Long-Term Treatment Control/Structural LID~~Permanent~~ BMP Maintenance

Each Copermittee must require the project applicant to submit proof of the mechanism under which ongoing long-term maintenance of all treatment control and structural LID~~permanent~~ BMPs will be conducted.

(5) Infiltration and Groundwater Protection

(a) Infiltration and treatment control BMPs designed to primarily function as large, centralized infiltration devices (such as large infiltration trenches and infiltration basins) must not cause or contribute to an exceedance of an applicable groundwater quality objective. At a minimum, such infiltration and treatment control BMPs must be in conformance with the design criteria listed below, unless the development project applicant demonstrates to the Copermittee that one or more of the specific design criteria listed below are not necessary to protect groundwater quality. The design criteria listed below do not apply to small infiltration systems dispersed throughout a development project.

(i) Runoff must undergo pretreatment such as sedimentation or filtration prior to infiltration;

(ii) Pollution prevention and source control BMPs must be implemented at a level appropriate to protect groundwater quality at sites where infiltration treatment control BMPs are to be used;

(iii) Infiltration treatment control BMPs must be adequately maintained to remove pollutants in storm water to the MEP;

(iv) The vertical distance from the base of any infiltration treatment control BMP to the seasonal high groundwater mark must be at least 10 feet. Where groundwater basins do not support beneficial uses, this vertical distance criteria may be reduced, provided groundwater quality is maintained;

(v) The soil through which infiltration is to occur must have physical and chemical characteristics (e.g., appropriate cation exchange capacity, organic content, clay content, and infiltration rate) which are adequate for proper infiltration durations and treatment of runoff for the protection of groundwater beneficial uses;

(vi) Infiltration treatment control BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee, unless first treated or filtered to remove pollutants prior to infiltration; and

(vii) Infiltration treatment control BMPs must be located a minimum of 100 feet horizontally from any water supply wells.

(b) The Copermittees may collectively or individually develop alternative mandatory design criteria to that listed above for infiltration and treatment control BMPs which are designed to primarily function as centralized infiltration devices. Before implementing the alternative design criteria in the development planning process the Copermitee(s) must:

(i) Notify the San Diego Water Board of the intent to implement the alternative design criteria submitted; and

(ii) Comply with any conditions set by the San Diego Water Board.

b. PRIORITY DEVELOPMENT PROJECTS

(1) Definition of Priority Development Project

Priority Development Projects include the following:

(a) ~~All new development projects that fall under the Priority Development Project categories listed under Provision E.3.b.(2). Where a new development project feature, such as a parking lot, falls into a Priority Development Project category, the entire project footprint is subject to Priority Development Project requirements; and~~

(b) Those redevelopment projects that create, add, or replace at least 5,000 square feet of impervious surfaces on an already developed site, ~~or~~ and the redevelopment project is a Priority Development Project category listed under Provision E.3.b.(2). Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to Priority Development Project requirements, the performance and sizing requirements discussed in Provisions E.3.c.(2) and E.3.c.(3) apply only to the addition or replacement, and not to the entire development. Where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development and was not subject to previous Priority Project Development requirements, the performance and sizing requirements apply to the entire development.

(c) Projects where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development was subject to previous Priority Project Development requirements, only the altered portion is subject to the new Priority Development Project requirements.

(2) Priority Development Project Categories

(a) New development projects that create 10,000 square feet or more of impervious surfaces (collectively over the entire project site). This category includes commercial, industrial, residential, mixed-use, and public development projects on public or private land which fall under the planning and building authority of the Copermittee.

(b) Automotive repair shops. This category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

(c) Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812), where the land area for development is 5,000 square feet or more of impervious surface.

(d) Hillside development projects. This category includes any development which creates 5,000 square feet or more of impervious surface which is located in an area with known erosive soil conditions, where the development will grade on any natural slope that is twenty-five percent or greater.

(e) Environmentally sensitive areas (ESAs). This category includes any development located within, directly adjacent to, or discharging directly to an ESA, which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. “Directly adjacent to” means situated within 200 feet of the ESA. “Discharging directly to” means outflow from a drainage conveyance system that collects runoff from the subject development or redevelopment site and terminates at or in receiving waters within the ESA.

(f) Parking lots. This category is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce that has 5,000 square feet or more of impervious surface.

(g) Streets, roads, highways, and freeways~~, and residential driveways~~. This category is defined as any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other internal combustion vehicles.

(h) Retail gasoline outlets (RGOs). This category includes RGOs that meet the following criteria: (a) 5,000 square feet or more of impervious surface or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day.

(i) Large development projects. This category includes any post-construction pollutant-generating new development projects that result in the disturbance of one acre or more of land.

(3) Priority Development Project Exemptions

Each Copermittee has the discretion to exempt the following projects from being defined as Priority Development Projects:

(a) Sidewalks constructed as part of new streets or roads and designed to direct storm water runoff to adjacent vegetated areas;

(b) Bicycle lanes that are constructed as part of new streets or roads but are not hydraulically connected to the new streets or roads and designed to direct storm water runoff to adjacent vegetated areas;

(c) Impervious trails constructed and designed to direct storm water runoff to adjacent vegetated areas, or other non-erodible permeable areas;

(d) Sidewalks, bicycle lanes, ~~or~~ trails, driveways, or parking lots constructed with permeable surfaces.

(e) Single-family residential projects that are not part of a larger development or proposed subdivision.

(f) Any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles that follows the USEPA guidance regarding Management Wet Weather with Green Infrastructure: Green Streets[20] to the MEP.

~~(d)~~(g) Emergency public safety projects in any of the Priority Development Categories may be excluded if the delay caused due to the requirement for a SSMP compromises public safety, public health and/or environmental protection.

[20] http://water.epa.gov/infrastructure/greeninfrastructure/index.cfm

c. PRIORITY DEVELOPMENT PROJECT ~~PERMANENT~~ BMP PERFORMANCE AND SIZING REQUIREMENTS

In addition to the BMP requirements listed for all development projects under Provision E.3.a, Priority Development Projects must also implement ~~permanent~~ BMPs that conform to performance and sizing requirements.

(1) Source Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement applicable source control BMPs listed under Provision E.3.a.(2).

(2) Retention and Treatment Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement BMPs to retain and treat pollutants onsite in the following order:

(a) Each Priority Development Project must be required to implement LID BMPs as described in Provision E.3.a.(3) or offsite regional groundwater replenishment if the following conditions apply:~~;~~

(i) The volume of stormwater runoff used to replenish groundwater must be equal to or greater than the design capture volume;

(ii) Pollutant reduction is provided through treatment of the design capture volume at the project site.

~~(a)~~(b) Each Priority Development Project must be required to implement LID BMPs that are sized and designed to retain the volume equivalent to runoff produced from a 24-hour 85th percentile storm event[21] or to retain the difference in the volume between the runoff volume produced in the post-project condition as compared to the pre-project condition resulting from a 24-hour 85th percentile storm event ("design capture volume");

[21] This volume is not a single volume to be applied to all areas covered by this Order. The size of the 85th percentile storm event is different for various parts of the San Diego Region. The Copermittees are encouraged to calculate the 85th percentile storm event for each of its jurisdictions using local rain data pertinent to its particular jurisdiction. In addition, isopluvial maps may be used to extrapolate rainfall data to areas where insufficient data exists in order to determine the volume of runoff for the local 85th percentile storm event in such areas. Where the Copermittees will use isopluvial maps to determine the 85th percentile storm event in areas lacking rain data, the Copermittees must describe their method for using isopluvial maps in its BMP Design Manuals.

(c) If onsite retention of the design capture volume using LID BMPs is technically infeasible per Provision E.3.c.(4) flow-thru LID ~~and/or conventional treatment control~~ BMPs must be implemented to treat the portion of the design capture volume that is not retained onsite. Flow-thru LID treatment control BMPs must be designed for an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP.

~~(b)~~(d) If retention and/or equivalent pollutant removal of the design capture volume to meet E.3.c.(2)(a) or E.3.c.(2)(b) are infeasible onsite ~~Additionally,~~ project applicants must perform mitigation for the portion of the pollutant load in the design capture volume that is not retained onsite, as described in Provision E.3.c.(4)(c).

~~(c)~~(e) All onsite treatment control BMPs must:

(i) Be correctly sized and designed so as to remove pollutants from storm water to the MEP;

(ii) Be sized to comply with the following numeric sizing criteria:

[a] Volume-based treatment control BMPs must be designed to mitigate (infiltrate, filter, or treat) the remaining portion of the design capture volume that was not retained onsite; or

[b] Flow-based treatment control BMPs must be designed to mitigate (filter or treat) either: 1) the maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour, for each hour of a storm event; or 2) the maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity (for each hour of a storm event), as determined from the local historical rainfall record, multiplied by a factor of two.

(iii) Be ranked with high or medium pollutant removal efficiency for the project's most significant pollutants of concern. Treatment control BMPs with a low removal efficiency ranking must only be approved by a Copermittee when a feasibility analysis has been conducted which exhibits that implementation of treatment control BMPs with high or medium removal efficiency rankings are infeasible for a Priority Development Project or portion of a Priority Development Project.

(3) Hydromodification Management ~~BMP Requirements~~

Each Copermittee must require each Priority Development Projects greater than one acre to implement hydromodification management BMPs as described in the Copermittees' current HMP, as applicable. ~~so that:~~

(a) Post-project runoff flow rates and durations do not exceed pre-project

~~development (naturally occurring)~~ runoff flow rates and durations by more than 10 percent (for the range of flows that result in increased potential for erosion or degraded channel conditions downstream of Priority Development Projects).

~~(i) In evaluating the range of flows that results in increased potential for erosion of natural (non-hardened) channels, the lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or that erodes the toe of channel banks.~~

~~(ii) For artificially hardened channels, analysis to identify the lower boundary must use characteristics of a natural stream segment similar to that found in the watershed. The lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or erodes the toe of the channel banks.~~

~~(iii)~~(i) The Copermittees may use monitoring results pursuant to Provision D.2.b.(6) to re-define the range of flows resulting in increased potential for erosion or degraded channel conditions, as warranted by the data.

(b) Post-project runoff flow rates and durations must compensate for the loss of sediment supply due to the development project, should loss of sediment supply occur as a result of the development project.

(c) If hydromodification management BMPs are technically infeasible per Provision E.3.c.(4) or it is identified that stream rehabilitation projects or regional mitigation projects are preferable for restoration of watershed functions, project applicants must perform mitigation for the portion of the runoff volume that is not controlled and will cause or contribute to increased potential for erosion of receiving waters downstream of the Priority Development Project, as described in Provision E.3.c.(4)(c) or contribute to an established mitigation fund per Provision (3)(d)(v).

(d) Offsite Hydromodification Mitigation Program

Each Copermittee, in collaboration with the other Copermittees may develop and implement a watershed based approach to hydromodification management that may include the following:

(i) Analysis to identify current land uses and proposed future development and changes in land use.

(ii) Development of watershed hydromodification management objectives.

(iii) Development of criteria to identify when stream rehabilitation or regional mitigation projects are preferable to onsite hydromodification controls for PDPs, in order to restore watershed functions and processes,.

(iv) Identification of opportunities for stream rehabilitation and mitigation projects to restore watershed functions and processes

(v) Development of a mitigation fund and program for implementation of stream rehabilitation and mitigation projects

~~(c)~~(e) Exemptions

Each Copermittee has the discretion to exempt a Priority Development Project from the hydromodification management BMP requirements where the project:

(i) Discharges storm water runoff into underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean;

(ii) Discharges storm water runoff into conveyance channels that are engineered for the capacity to convey the 10-year ultimate build out condition flow and are regularly maintained to ensure flow capacity ~~whose bed and bank are concrete lined~~ all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean;

(iii) Discharges to large rivers where large rivers are defined as reaches for which the contributing drainage area exceeds 100 square miles and with a 100-year design flow in excess of 20,000 cfs;

(iv) Discharges from infill redevelopment projects that meet criteria to be established in the Permittees' HMPs; or

(v) In-stream flood control and restoration projects.

(vi) Discharges storm water runoff into other areas identified by the San Diego Water Board as exempt from the requirements of Provisions E.3.c.(3)(a)-(c).

(4) Alternative Compliance for Technical Infeasibility

At the discretion of each Copermittee, alternative compliance may be allowed for certain Priority Development Projects to comply with Provisions E.3.c.(2) and E.3.c.(3), subject to the following requirements:

(a) Applicability

Priority Development Projects may be allowed alternative compliance if:

(i) The Copermittee reviews and approves site-specific hydrologic and/or design analysis performed by a registered professional engineer, geologist, architect, or landscape architect;

(ii) The project applicant demonstrates, and the Copermittee determines and documents, that retention LID and/or hydromodification management BMPs per Provisions E.3.c.(2) and E.3.c.(3) were incorporated into the project design to the maximum extent technically feasible given the project site conditions;

(iii) The project applicant is required to perform mitigation described in Provision E.3.c.(4)(c) with a net result of at least the same level of water quality protection as would have been achieved if the Priority Development Project had fully implemented the retention LID and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) onsite; or~~.~~

(iv) The project applicant is required to perform mitigation described in Provision E.3.c.(4)(c) and has the option or ability to contribute to a regionally important mitigation project/program as defined in the Water Quality Improvement Plan that would address strategic high-priority water quality protection and/or more-direct restoration of beneficial uses in receiving waters than if achieved if the Priority Development Project had fully implemented the retention LID and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) onsite.

(b) Criteria For Technical Infeasibility

Each Copermittee must develop, or develop in collaboration with the other Copermittees, criteria to determine technical infeasibility for fully implementing the retention LID and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) and include these requirements in the Treatment control/structural LID~~Permanent~~ BMP Sizing Criteria Design Manual pursuant to Provision E.3.d. Technical infeasibility may result from conditions including, but not limited to:

(i) Locations that cannot meet the infiltration and groundwater protection requirements in Provision E.3.a.(5) due to the presence of shallow bedrock, contaminated soils, contaminated groundwater, near surface groundwater, underground facilities, or utilities;

(ii) Brownfield development sites or other locations where pollutant mobilization is a documented concern;

(iii) The design of the site precludes the use of soil amendments, plantings of vegetation, or other designs that can be used to infiltrate and evapotranspirate runoff;

(iv) Soils cannot be sufficiently amended to provide for the requisite infiltration rates;

(v) Locations with geotechnical hazards;

(vi) Insufficient onsite and/or offsite demand for storm water use;

Formatted: No underline
Formatted: No underline, Font color: Auto
Formatted: No underline, Font color: Auto
Formatted: No underline
Formatted: No underline
Formatted: No underline

(vii) Modifications to an existing building to manage storm water are not feasible due to structural or plumbing constraints; and

(viii) Smart growth and infill or redevelopment locations where the density and/or nature of the project would create significant difficulty for compliance with Provisions E.3.c.(2) and E.3.c.(3) onsite.

(c) Mitigation

Priority Development Projects that meet the Copermittee's technical infeasibility criteria developed pursuant to Provision E.3.c.(4)(b) must be required to mitigate for the increased flow rates, increased flow durations, and/or increased pollutant loads expected to be discharged from the site. ~~For the pollutant load in the volume of storm water~~ Copermittees may establish an offsite mitigation program that requires the developer to mitigate for the water quality equivalence not retained onsite with retention LID BMPs, or increased potential erosion of downstream receiving waters not fully controlled onsite with hydromodification management BMPs, the Copermittee must require the project applicant to either 1) implement an offsite mitigation project, and/or 2) provide sufficient funding for a public or private offsite mitigation project via a mitigation fund.

(i) *Mitigation Project Locations*

Offsite mitigation projects must be implemented within the same hydrologic unit as the Priority Development Project, and preferably within the same hydrologic subarea. Mitigation projects outside of the hydrologic subarea but within the same hydrologic unit may be approved provided that the project applicant demonstrates that mitigation projects within the same hydrologic subarea are infeasible and that the mitigation project will address similar potential impacts expected from the Priority Development Project.

(ii) *Mitigation Project Types*

Offsite mitigation projects ~~must~~ may include, where applicable and feasible, retrofitting opportunities and stream and/or habitat rehabilitation or restoration opportunities identified in the Water Quality Improvement Plans, identified pursuant to Provision B.3.a. Other offsite mitigation projects may include green streets or infrastructure projects, groundwater recharge projects, or regional BMPs upstream of receiving waters. ~~In-stream rehabilitation or restoration measures to protect or prevent adverse physical changes to creek bed and banks must not include the use of non-naturally occurring hardscape material such as concrete, riprap, or gabions.~~ Project applicants seeking to utilize these alternative compliance provisions may propose other offsite mitigation projects, which the Copermittees may approve if they meet the requirements of Provision

E.3.c.(4)(a).

(iii) *Mitigation Project Timing*

The Copermittee and/or project applicant must develop a schedule for the completion of offsite mitigation projects, including milestone dates to identify, fund, design, and construct the projects. PDP implemented o~~O~~ffsite mitigation projects must be completed upon ~~the granting of occupancy for the first project that contributed funds~~completion of the PDP, ~~toward the offsite mitigation project,~~ unless a longer period is authorized by the San Diego Water Board. The timing of mitigation projects associated with a Copermittee offsite mitigation program will be developed by the Copermittees as part of developing -their offsite mitigation program.

(iv) *Mitigation Fund*

A Copermittee may choose to implement additional mitigation programs (e.g., pollutant credit system, mitigation fund) as a means for developing and implementing offsite mitigation projects, provided the projects conform to the requirements for project locations, types, and timing described above.

d. UPDATE ~~PERMANENT~~ TREATMENT CONTROL/STRUCTURAL LID~~STRUCTURAL~~ BMP SIZING CRITERIA DESIGN MANUAL (BMP DESIGN MANUAL)

Each Copermittee must update its ~~Permanent~~ Treatment Control/Structural LID BMP Sizing Criteria Design Manual (BMP Design Manual)[22] pursuant to Provision F.2.b or Provision F.5.a. Until the Copermittee has updated its BMP Design Manual with the requirements of Provision E.3.c, the Copermittee must continue implementing its current BMP Design Manual. Unless directed otherwise by the San Diego Water Board, the Copermittee must implement the BMP Design Manual within 180 days of completing the update. The update of the BMP Design Manual must include the following:

(1) Updated procedures to determine the nature and extent of storm water requirements applicable to a potential development or redevelopment project. These procedures must inform project applicants of the storm water management requirements applicable to their project including, but not limited to, general requirements for all development projects, LID and conventional BMP design procedures and requirements, hydromodification management requirements, requirements specific to phased projects, and procedures specific to private developments and public improvement projects;

(2) Updated procedures to identify pollutants and conditions of concern for selecting the most appropriate ~~permanent~~ treatment control or structural LID

[22] The Permanent BMP Sizing Criteria Design Manual was formerly known as the Standard Storm Water Mitigation Plan under Order Nos. R9-2007-0001, R9-2009-0002, and R9-2010-0016.

BMPs that consider, at a minimum, the following:

(a) Receiving water quality (including pollutants for which receiving waters are listed as impaired under CWA section 303(d));

(b) Priority pollutants or receiving water conditions contributing to the highest water quality priorities identified in the Water Quality Improvement Plan;

(c) Land use type of the project and pollutants associated with that land use type; and

(d) Pollutants expected to be present onsite.

(3) Updated procedures for designing ~~permanent~~ treatment control or structural LID BMPs, including any updated performance and sizing requirements to be consistent with the requirements of Provision E.3.c for all BMPs listed in the BMP Design Manual;

(4) Long-term maintenance criteria for each BMP listed in the BMP Design Manual; and

(5) Criteria and mitigation requirements, in accordance with the requirements under Provision E.3.c.(4), if the Copermittee elects to allow alternative compliance for technical infeasibility within its jurisdiction.

e. PRIORITY DEVELOPMENT PROJECT BMP IMPLEMENTATION AND OVERSIGHT

Each Copermittee must implement a program to ensure ~~permanent~~ treatment control or structural LID BMPs on all Priority Development Projects are designed, constructed, and maintained to remove pollutants in storm water to the MEP.

(1) ~~Permanent~~ Treatment Control/Structural LID BMP Approval and Verification Process

(a) Each Copermittee must ensure that for all Priority Development Project applications that have not received prior lawful approval by the Copermittee by 12 months after the adoption of this Order, or pursuant to Provision F.5.a, the requirements of Provision E.3 are implemented. For project applications that have received prior lawful approval by 12 months after the adoption of this Order, or pursuant to Provision F.5.a, the Copermittee may allow previous land development requirements to apply.

(b) Each Copermittee must identify the roles and responsibilities of various municipal departments in implementing the ~~permanent~~ treatment control/structural LID BMP requirements, including each stage of a project from application review and approval through BMP maintenance and inspections.

(c) Each Copermittee must ensure that appropriate easements and ownerships are properly recorded in public records and the information is conveyed to all appropriate parties when there is a change in project or site ownership.

(d) Each Copermittee must ensure that prior to occupancy and/or intended use of any portion of the Priority Development Project, each ~~permanent~~ treatment control or -structural LID BMP must be inspected to verify that they have been constructed and are operating in compliance with all of its specifications, plans, permits, ordinances, and the requirements of this Order.

(2) Priority Development Project Inventory and Prioritization

(a) Each Copermittee must develop and regularly ~~continuously~~ maintain a watershed-based database to track and inventory all Priority Development Projects and associated ~~permanent~~ treatment control and structural LID BMPs within their jurisdiction. Inventories must be accurate and complete beginning from January 2002 for the San Diego County Copermittees, February 2003 for the Orange County Copermittees, and July 2005 for the Riverside County Copermittees. The database must include, at a minimum, the following information:

(i) Priority Development Project location (address and hydrologic subarea);

(ii) Descriptions of BMP type(s);

(iii) Date(s) of construction;

(iv) Party responsible for treatment control/structural LID~~permanent~~ BMP maintenance;

(v) Dates and findings of treatment control/structural LID~~permanent~~ BMP maintenance verifications; and

(vi) Corrective actions and/or resolutions.

(b) Each Copermittee must prioritize the Priority Development Projects with treatment control/structural LID~~permanent~~ BMPs within its jurisdiction. The designation of Priority Development Projects as high priority must consider the following:

(i) The highest water quality priorities identified in the Water Quality Improvement Plan;

(ii) Receiving water quality;

(iii) Number and sizes of treatment control/structural LID~~permanent~~ BMPs;

(iv) Recommended maintenance frequency of treatment control/structural LID~~permanent~~ BMPs;

(v) Likelihood of operation and maintenance issues of treatment control/structural LID~~permanent~~ BMPs;

(vi) Land use and expected pollutants generated; and

(vii) Compliance record.

(3) Treatment Control Structural LID ~~Permanent~~ BMP Maintenance Verifications and Inspections

Each Copermittee is required to verify that treatment control and structural LID ~~permanent~~ BMPs on each Priority Development Project are adequately maintained, and continue to operate effectively to remove pollutants in storm water to the MEP through inspections, self-certifications, surveys, or other equally effective approaches.

(a) All (100 percent) of the ~~permanent~~ treatment control and structural LID BMPs at Priority Development Projects that are designated as high priority must be inspected directly by the Copermittee annually prior to each rainy season;

(b) For verifications performed through a means other than direct Copermittee inspection, adequate documentation must be required by the Copermittee to provide assurance that the required maintenance of ~~permanent~~ treatment control and structural LID BMPs at each Priority Development Project has been completed; and

(c) Appropriate follow-up measures (including re-inspections, enforcement, etc.) must be conducted to ensure that ~~permanent~~ treatment control and structural LID BMPs at each Priority Development Project continue to reduce pollutants in storm water to the MEP as originally designed.

f. DEVELOPMENT PROJECT ENFORCEMENT

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all development projects, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

4. Construction Management

Each Copermittee must implement a construction management program within their jurisdiction that includes, at a minimum, the following requirements:

a. Project Approval Process

Prior to approval and issuance of any construction, grading, or building permits for a project each Copermittee must:

(1) Require a project-specific storm water pollution prevention plan (SWPPP), or ~~equivalent~~ construction BMP or erosion and sediment control plan, to be submitted by the project applicant for the Copermittee's approval;

(2) Ensure the SWPPP, or ~~equivalent~~ construction BMP or erosion and sediment control plan, complies with the local grading ordinance, other applicable local ordinances, and the requirements of this Order;

(3) Ensure the SWPPP, or ~~equivalent~~ construction BMP or erosion and sediment control plan, includes seasonally appropriate and effective BMPs and management measures described in Provision E.4.c, as applicable to the project; and

~~(4)~~ Verify that the project applicant has obtained coverage under ~~applicable permits, including, but not limited to~~ the Construction General Permit. ~~, Clean Water Act Section 401 Water Quality Certification and Section 404 Permit, and California Department of Fish and Game Streambed Alteration Agreement.~~

~~(5)~~(4)

b. Construction Site Inventory and Tracking

(1) Each Copermittee must maintain, and update at least ~~monthly~~quarterly, a watershed-based inventory of all construction sites requiring construction, grading, or building permits within its jurisdiction. The inventory must include:

(a) Relevant contact information for each site (e.g., name, address, phone, and email for the owner and contractor);

(b) The basic site information including location (address and hydrologic subarea), Waste Discharge Identification (WDID) number (if applicable), size of the site, and approximate area of disturbance;

(c) Whether or not the site is considered a high threat to water quality, as defined in Provision E.4.b.(2) below;

(d) The project start and anticipated completion dates;

(e) Current construction phase;

(f) The required inspection frequency, as defined in the Copermittee's jurisdictional runoff management program document;

(g) The date the Copermittee approved the project-specific SWPPP, or equivalent construction BMP or erosion and sediment control plan; and

(h) Whether or not there are ongoing enforcement actions administered to the site.

(2) Each Copermittee must identify all construction sites within its jurisdiction that represent a high threat to downstream surface water quality. At a minimum, high threat to water quality sites must include:

(a) Sites located within a hydrologic subarea where sediment is known or suspected to contribute to the highest water quality priorities identified in the Water Quality Improvement Plan;

(b) Sites located within the same hydrologic subarea and tributary to a CWA section 303(d) water body segment impaired for sediment;

(c) Sites located within, directly adjacent to, or discharging directly to a receiving water within an ESA; and

(d) Other sites determined by the Copermittees or the San Diego Water Board as a high threat to water quality.

c. Construction Site BMP and Management Measure Implementation

Each Copermittee must implement, or require the implementation of effective

BMPs to reduce discharges of pollutants in storm water from construction sites to the MEP, and prevent non-storm water discharges into the MS4. These BMPs must be site specific, seasonally appropriate, and construction phase appropriate. BMPs and management measures must be implemented at each construction site year round. Dry season BMP implementation must plan for and address unseasonal rain events that may occur during the dry season (May 1 through September 30). Copermittees must implement, or require the implementation of, BMPs and management measures in the following categories:

(1) Project Planning;

(2) Good Site Management "Housekeeping", including waste management;

(3) Non-storm Water Management;

(4) Erosion Control;

(5) Sediment Control;

(6) Run-on and Run-off Control; and

(7) Active/Passive Sediment Treatment Systems, where applicable.

d. CONSTRUCTION SITE INSPECTIONS

Each Copermittee must conduct construction site inspections to ensure compliance with its permits and applicable local ordinances, and the requirements of this Order. Priority for site inspections must consider threat to water quality pursuant to Provision E.4.b as well as the nature of the construction activity, topography, and the characteristics of soils and receiving water quality.

(1) Inspection Frequency

(a) Each Copermittee must conduct inspections at all inventoried sites, including high threat to water quality sites, at an appropriate frequency for each phase of construction to ensure the site reduces the discharge of pollutants in storm water from construction sites to the MEP, and prevents non-storm water discharges from entering the MS4.

(b) Each Copermittee must establish appropriate inspection frequencies for high threat to water quality sites, and all other sites, for each phase of construction. Inspection frequencies appropriate for addressing the highest water quality priorities identified in the Water Quality Improvement Plan, and for complying with the requirements of this Order must be identified in each Copermittee's jurisdictional runoff management program document.

(c) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e., re-inspection, enforcement) necessary to ensure site compliance with its permits and applicable local ordinances, and the requirements of this Order.

(2) Inspection Content

Inspections of construction sites by the Copermittee must include, at a minimum:

(a) Verification of coverage under the Construction General Permit (Notice of Intent (NOI) and/or WDID number) during initial inspections, when applicable;

(b) Assessment of compliance with its permits and applicable local ordinances related to pollution prevention, including the implementation and maintenance of applicable BMPs;

(c) Assessment of BMP adequacy and effectiveness;

(d) Visual observations of actual non-storm water discharges;

(e) Visual observations of actual or potential discharge of sediment and/or construction related materials from the site;

(f) Visual observations of actual or potential illicit connections; and

(g) If any violations are found and BMP enhancements are needed, inspectors must take and document appropriate actions in accordance with the Enforcement Response Plan pursuant to Provision E.6.

(3) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried construction sites. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must include, at a minimum:

(a) Site name, location (address and hydrologic subarea), and WDID number (if applicable);

(b) Inspection date;

(c) Weather conditions during inspection;

(d) Approximate amount of rainfall since last inspection;

(e) Description and photo documentation of problems observed with BMPs and indication of need for BMP addition/repair/replacement and any scheduled re-inspection, and date of re-inspection;

(f) Descriptions of any other specific inspection comments which must, at a minimum, include rationales for longer compliance time~~.~~;

(g) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6; and

(h) Resolution of problems noted and date problems fixed.

e. Construction Site Enforcement

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried construction sites, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

5. Existing Development Management

Comment [A3]: The OC Copermittees are offering alternative language for this section – see attachment for Existing Development. In lieu of the alternative language – the proposed revisions are provided below.

Each Copermittee must implement an existing development management program that includes, at a minimum, the following requirements:

a. Existing Development Inventory and Tracking

Each Copermittee must maintain an updated watershed-based inventory and/or map of ~~all~~ its existing development that has the reasonable potential to discharge ~~may potentially generate~~ a pollutant load into ~~and from~~ the MS4. The map should be ~~A continually~~ regularly updated and identify ~~map showing~~ the locations of inventoried existing development categories listed below, the watershed management area boundaries, the water bodies, and the significant, regional retrofits implemented ~~and pollutants generated~~ at the inventoried existing development~~ ~~and/or significant, regional rehabilitations implemented at channels and/or receiving waters. The use of an automated database system, such as GIS, is highly recommended.

The inventory must, at a minimum, include the following types of facilities:

(1) The following municipal facilities:

(a) Flood management projects and flood control devices ~~and structures~~,

(b) Operating or closed municipal landfills,

(c) Publicly owned treatment works (including water and wastewater treatment plants) and sanitary sewer collection systems,

(d) Corporate yards, including maintenance and storage yards for materials, waste, equipment, and vehicles,

(e) Hazardous waste collection facilities, ~~and~~

(f) ~~Other treatment, storage or disposal facilities for municipal waste~~Solid waste transfer facilities; and

~~(f)~~(g) Land application sites;

(2) Identification of ~~if a business is a~~ mobile businesses;

(3) ~~Identification if an area is a~~ Common Interest Areas (CIAs) / Home Owner Associations (HOAs), ander mobile home parks;

The inventory must, at a minimum, include the following information for each of the facilities, as applicable:

(1) Name, location (address and/or hydrological subarea) of each facility, area, and/or activity;

(2) A description of the facility, area, and/or activity, including classification as municipal, commercial, industrial, or residential;

(3) SIC and/or NAICS Code~~, if applicable~~;

(4) Industrial General Permit ~~NOI and/or~~ WDID number~~, if applicable~~;

(5) Identification of pollutants generated and/or potentially generated by the facility, area, and/or activity;

(6) Status of facility, area, and/or activity as active or inactive;

(7) Whether the facility, area, and/or activity is adjacent to an ESA;

(8) Whether the facility, area, and/or activity is tributary to and within the same hydrologic subarea as a CWA section 303(d) water body segment and generates pollutants for which the water body segment is impaired;

~~(4) Whether the facility, area, and/or activity contributes or potentially contributes to the highest water quality priorities identified in the Water Quality Improvement Plan; and~~

Formatted: Indent: Left: 0.5", Hanging: 0.38", Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.75" + Indent at: 1"

b. RETROFITTING AND CHANNEL REHABILITATION IN AREAS OF EXISTING DEVELOPMENT

Each Copermittee must develop and implement a program to retrofit areas of existing development to reduce the discharge of pollutants in storm water from the MS4 to the MEP and effectively prohibit non-storm water discharges into its MS4, and rehabilitate channels and/or receiving waters to restore impaired beneficial uses of streams within its jurisdiction, as feasible.

(1) Each Copermittee must identify areas of existing development as candidates for retrofitting, and channels and/or receiving waters ~~in areas of existing development~~ as candidates for rehabilitation within its jurisdiction, as feasible. Areas of existing development must be selected based on a likelihood that retrofitting and channel rehabilitation will address the highest water quality priorities identified in the Water Quality Improvement Plan prepared pursuant to Provision B.

(2) Each Copermittee must evaluate and rank the areas of existing development identified pursuant to Provisions E.5.a and E.5.b.(1) for retrofitting and channel rehabilitation. The evaluation must include an assessment of those areas where pollutant removal from storm water and effective prohibition of non-storm water discharges through retrofitting existing development will provide the most benefit to water quality. The evaluation must also include an assessment of the channels and/or receiving waters within its jurisdiction where ~~channel~~ rehabilitation will improve beneficial uses of streams within or immediately downstream of the Copermittee's jurisdiction. Data collected during the implementation of the Water Quality Improvement Plan must be used to inform each area assessment and rank determination.

(3) Each Copermittee must ~~implement~~ prioritize for implementation retrofit and channel rehabilitation projects that address the highest water quality priorities identified in the Water Quality Improvement Plan pursuant to Provision B.3.a. The Copermittee ~~must~~ should encourage private landowners to implement retrofit designs, at a minimum through the use of public education and outreach~~and channel rehabilitation projects whenever practical. Private~~

~~landowners should be encouraged through the Copermittee's use of subsidies, penalties, or other incentives~~.

(4) Each Copermittee must evaluate the flood management and flood control devices and structures in its inventory to determine if it is feasible to retrofit the device or structure, to provide additional pollutant removal from storm water. A Copermittee must consider the highest water quality priorities identified in their Water Quality Improvement Plan as part of each assessment. Evaluation of facilities can occur as a part of routine maintenance of these facilities.

(5) Where retrofitting and channel rehabilitation within specific areas of existing development under the Copermittees jurisdiction are determined to be infeasible to restore and protect receiving waters from the highest water quality priorities identified in the Water Quality Improvement Plan, each Copermittee may~~ust~~ identify, develop, and prioritize for implementation regional retrofitting and channel rehabilitation projects (i.e. projects that can receive and/or treat storm water from one or more areas of existing development and will result in a net benefit to water quality and the environment) adjacent to and/or downstream of the areas of existing development. The Copermittees may collaborate and cooperate with each other to develop regional retrofitting and channel rehabilitation projects. The Copermittees are also encouraged to partner with existing efforts in other Watershed Management Areas, and the Integrated Regional Water Management (IRWM) Groups in San Diego County, South Orange County, and Southwest Riverside County.

(6) Upon Regional Board Executive Officer approval the Copermittees may reallocate resources in the WQIPs for retrofit and rehabilitation project(s).

c. EXISTING DEVELOPMENT BMP IMPLEMENTATION AND MAINTENANCE

(1) Pollution Prevention

Each Copermittee must ~~require~~ promote the use of pollution prevention methods by the inventoried existing development through public outreach.

(2) Designate BMPs

Each Copermittee must designate a minimum set of BMPs required for all inventoried existing development with the reasonable potential to discharge pollutant loads from their MS4, including special event venues~~, that have the potential to generate pollutants~~. The designated minimum BMPs must be specific to facility types and pollutant-generating activities, as appropriate.

(3) BMP Implementation

Each Copermittee must implement, or require the implementation of, designated BMPs at inventoried existing development that have the reasonable potential to ~~generate~~ discharge pollutants loads into~~from~~ the~~ir~~ MS4s. A Copermittee must require additional pollution prevention measures and enhanced BMPs at inventoried existing development that discharges pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan.

(4) BMP Operation and Maintenance

Each Copermittee must operate and maintain, or require the operation and maintenance of designated BMPs at all inventoried existing development that have been identified by the Copermittee as having the reasonable potential to discharge pollutant loads into~~from~~ their~~ir~~ MS4.

(a) Each Copermittee must implement a schedule of operation and maintenance activities for its MS4 and related structures (including but not limited to catch basins, storm drain inlets, detention basins, etc.), and verify proper operation of all its municipal structural treatment controls designed to reduce pollutants (including floatables) in storm water discharges to or from its MS4s and related drainage structures.

(b) Each Copermittee must implement procedures during the operation and maintenance of public streets, unpaved roads, paved roads, and paved highways and freeways, conducted under their authority and within their jurisdiction, that will reduce the contribution of storm water pollutants to the MEP and effectively prohibit the discharge of non-storm water pollutants from the MS4 to receiving water bodies. During maintenance of unpaved roads, each Copermittee must examine the feasibility of replacing existing culverts or designing new culverts/bridge crossings to maintain natural stream geomorphology.

(c) Each Copermittee must implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers. Copermittees that operate both a municipal sanitary sewer system and a MS4 must implement controls and measures to prevent and eliminate seeping sewage from infiltrating the MS4. Copermittees that do not operate both a municipal sanitary sewer system and a MS4 must keep themselves informed of relevant and appropriate maintenance activities and sanitary sewage projects in their jurisdiction that may cause or contribute to seepage of sewage into the MS4.

(5) Pesticides, Herbicides, and Fertilizers BMPs

Each Copermittee must implement procedures, or require the implementation of procedures, to reduce the contribution of pollutants in storm water to the MEP and effectively prohibit non-storm water discharges associated with the application, storage, and disposal of pesticides, herbicides and fertilizers from inventoried existing development ~~into and from the MS4s.~~ identified by the Copermittee as having the reasonable potential to discharge pollutant loads into ~~or from their~~ the MS4. The Copermittee must require additional pollution prevention measures and enhanced BMPs at inventoried existing development that discharges pesticides, herbicides, or fertilizers identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan. Such BMPs must include, as appropriate educational activities, permits, certifications and other measures for applicators and distributors.

d. EXISTING DEVELOPMENT INSPECTIONS

Each Copermittee must conduct inspections of inventoried existing development that have been identified by the Copermittee as having the reasonable potential to discharge pollutant loads ~~from their~~into the MS4 to ensure compliance with applicable local ordinances and permits, and the requirements of this Order.

(1) Inspection Frequency

(a) Each Copermittee must establish appropriate inspection frequencies for inventoried existing development based on the priorities set forth in the Water Quality Improvement Plan, and the potential for discharging pollutants via storm water and non-storm water discharge~~runoff~~. At a minimum, inventoried existing municipal, industrial, commercial, and residential-association development ~~that has been~~ identified by the Copermittee as having the reasonable potential to discharge pollutant loads from their MS4 must be inspected once during the permit term~~every five years~~. Effective self-certification or third-party inspection programs may be utilized for this purpose. Inventoried existing development must also be inspected within ~~six~~ twelve months ~~of any change in property ownership or~~ after any redevelopment or land use change associated with a potential ~~change~~ increase in pollutant generating activity. The frequency of inspection at inventoried existing development must be appropriate to ensure that applied BMPs are sufficient to reduce the discharge of pollutants in storm water from the MS4 to the MEP and effectively prohibit non-storm water discharges to the MS4.

(b) Inventoried existing development must be inspected, as needed, in response to valid public complaints and findings from the Copermittee's municipal and contract staff inspections.

(c) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e. re-inspection, enforcement) necessary to ensure compliance with its applicable local ordinances and permits, the most current jurisdictional runoff management program document, the Water Quality Improvement Plan, and the requirements of this Order.

(2) Inspection Content

Inspections of existing development by the Copermittee must include, at a minimum:

(a) Assessment of compliance with its applicable local ordinances and permits related to non-storm water and storm water discharges and runoff;

(b) Assessment of the implementation, maintenance and effectiveness of the designated minimum and/or enhanced BMPs;

(c) Verification of coverage under the Industrial General Permit (NOI and/or WDID number), when applicable;

(d) Visual observations of actual non-storm water discharges, if present;

(e) Visual observations of actual or potential discharge of pollutants, if present;

(f) Visual observations of actual or potential illicit connections if present; and

(g) If any violations are found and BMP enhancements are needed, inspectors must take and document appropriate actions in accordance with the Enforcement Response Plan pursuant to Provision E.6.

(3) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried existing development. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must be sufficiently detailed in order to determine compliance with the requirements of this Order and any progress made towards addressing the highest water quality priorities identified in the Water Quality Improvement Plan. Inspection records must include, at a minimum:

(a) Existing development name and location (address and hydrologic subarea);

(b) Inspection and re-inspection date(s);

(c) Weather conditions during inspection;

(d) Description and photo documentation of problems observed with BMPs and indication of need for BMP addition/repair/replacement and any scheduled re-inspection, and date of re-inspection;

(e) Verification of compliance with designated BMPs, as applicable~~Description of actions to reduce pollutants in storm water runoff to the MEP and actions to effectively prohibit non-storm discharges into the MS4 at the inventoried existing development~~;

~~(f) Photo documentation of observed actions or BMPs to reduce pollutants in storm water runoff to the MEP and actions to effectively prohibit non-storm~~

~~discharges into the storm drain;~~

~~If the facility, area, and/or activity has been designated or identified as a contributor to the highest water quality priorities identified in the Water Quality Improvement Plan, then the inspection report must include a description of any specific or additional actions taken to reduce or eliminate the contribution of the facility, area, and/or activity to the highest water quality priorities;~~

~~(g)~~(f) Descriptions of any other specific inspection comments which must, at a minimum, include rationales for longer compliance time;

~~(h)~~(g) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6; and

~~(i)~~(h) Resolution of problems noted and date problems fixed.

e. Existing Development Enforcement

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried existing development identified by the Copermittees as having the reasonable potential to discharge pollutant loads from the MS4 within their jurisdiction, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

6. Enforcement Response Plans

Each Copermittee must develop and implement an Enforcement Response Plan as part of its jurisdictional runoff management program document. The Enforcement Response Plan must include the protocols for progressively stricter responses, including timeframes allowed for corrections of problems, and for various field violation scenarios. Copermittees may continue to utilize and implement established, equivalent guidelines and procedures for enforcement . The Enforcement Response Plan must include, at a minimum, the following requirements:

a. Illicit Discharge Detection and Elimination Enforcement Component

The Enforcement Response Plan must describe required enforcement actions to eliminate non-storm water discharges and illicit discharges or connections to the Copermittee's MS4.

(1) The Enforcement Response Plan must include a definition of "high level enforcement" for non-storm water discharges and illicit discharges or connections. "High level enforcement" for non-storm water discharges and illicit discharges or connections may be defined differently for construction

Comment [A4]: The OC Copermittees are offering alternative language for this section – see attachment for Enforcement Response Plans
In lieu of the alternative language – the proposed revisions are provided below.

sites, municipal, commercial, industrial, and residential areas of existing development.

(2) Non-storm water discharges and illicit discharges or connections must be addressed with an escalating series of enforcement actions as follows:

(a) If the non-storm water discharge or~~and~~ illicit discharge or connection is a source of pollutants contributing to the highest water quality priorities identified in the Water Quality Improvement Plan, then ~~high level~~ enforcement actions must begin at a high level ~~immediately issued~~, and subsequent high level enforcement actions must continue to escalate, as necessary, to compel the elimination of the discharge or connection as soon as possible; or

(b) If the non-storm water discharge and illicit discharge or connection is not a source of pollutants contributing to the highest water quality priorities identified in the Water Quality Improvement Plan, then escalating enforcement actions must be issued, and enforcement actions must result in the elimination of the discharge or connection as quickly as the Copermittee's available resources allow.

(3) If the Copermittee identifies the source, and the source is a controllable non-storm water discharge (i.e. anthropogenically influenced) or a controllable illicit discharge or connection, then the Copermittee must implement the following:

(a) Immediately enforce its legal authority, or notify the entity with applicable legal authority, to eliminate controllable sources of non-storm water and illicit discharges or connections upon identifying the source; and

(b) For controllable sources of non-storm water discharges and illicit discharges or connections that cannot be eliminated immediately upon identification, the discharge or connection must be eliminated in a timely manner with the goal of eliminating the discharge or connection within 10 business days after the source is identified. If more than 10 business days are required to eliminate the discharge or connection, a rationale must be recorded in the electronic database or equivalent tabular system used to track the investigations of non-storm water and illicit discharges and connections.

(4) If the Copermittee identifies the source as a non-storm water discharge to or from the MS4 that is in exceedance of NALs developed pursuant to Provision C.1, and in violation or threatened violation of an existing separate NPDES permit (e.g. the groundwater dewatering NPDES permit), then the Copermittee must report, within three business days, the findings to the San Diego Water Board including all pertinent information regarding the

discharger and discharge characteristics.

b. DEVELOPMENT PROJECTS ENFORCEMENT COMPONENT

The Enforcement Response Plan must describe required enforcement actions to compel compliance with the Copermittee's BMP Design Manual requirements for development projects.

(1) The Enforcement Response Plan must include a definition of "high level enforcement" for development projects.

(2) The enforcement process must include appropriate sanctions to compel compliance with requirements of the Copermittee's BMP Design Manual or this Order. Sanctions must include, at a minimum, the following tools or their equivalent:

(a) Non-monetary penalties;

(b) Fines;

(c) Bonding requirements;

(d) Administrative and criminal penalties;

(e) Liens; and

(f) Permit or occupancy denials.

(3) Occupancy must be denied until a development project is in full compliance with the Copermittee's BMP Design Manual requirements. Documentation of full compliance with the Copermittee's BMP Design Manual requirements must be recorded in the electronic database or equivalent tabular system used to track development projects.

(4) Violations or other non-compliance that contribute or potentially contribute to the highest water quality priorities identified in the Water Quality Improvement Plan must be issued high level enforcement actions. High level enforcement actions must continue to escalate, as necessary, to compel compliance as soon as possible.

(5) For violations of ~~permanent~~ treatment control and structural LID BMP maintenance requirements, all violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 3~~1~~0 ~~business~~ calendar days after the violations are discovered. If more than 3~~1~~0 ~~business~~ calendar days are required for compliance, a rationale must be recorded in the electronic database or equivalent tabular system used to track treatment control and structural LID ~~permanent~~ BMP

inspections.

c. Construction / Existing Development Enforcement Component

The Enforcement Response Plan must describe required enforcement actions to compel compliance with its permits and applicable local ordinances, and the requirements of this Order, at construction sites and areas of existing development.

(1) The Enforcement Response Plan must include a definition of “high level enforcement” for construction sites and areas of existing development. “High level enforcement” may be defined differently for construction sites, municipal, commercial, industrial, and residential areas of existing development.

(2) The enforcement process must include, at a minimum, appropriate sanctions to compel compliance, such as:

(a) Verbal and written notices of violation;

(b) Cleanup requirements;

(c) Fines;

(d) Bonding requirements;

(e) Administrative and criminal (if intentional or negligent) penalties;

(f) Liens;

(g) Stop work orders; and

(h) Permit and occupancy denials.

(3) Violations or other non-compliance that contribute or potentially contribute to the highest water quality priorities identified in the Water Quality Improvement Plan must be issued high level enforcement actions. High level enforcement actions must continue to escalate, as necessary, to compel compliance as soon as possible.

(4) All violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 3~~1~~0 ~~business~~ calendar days after the violations are discovered. If more than 3~~1~~0 calendar~~business~~ days are required for compliance, then a rationale must be recorded in the electronic database or equivalent tabular system used to track construction site and existing development inspections.

d. Reporting of Non-Compliant Sites

(1) Each Copermittee must notify the San Diego Water Board in writing within 48 hours of issuing high level enforcement (as defined in the Copermittee's Enforcement Response Plan) to a construction site that significantly impacts ~~poses a significant threat to~~ water quality as a result of violations or other non-compliance with its permits and applicable local ordinances, and the requirements of this Order. Written notification may be provided electronically in email form.

(2) Each Copermittee must notify the San Diego Water Board of non-filers under the Industrial General Permit and Construction General Permit by email to Nonfilers_R9@waterboards.ca.gov.

7. Public Education and Participation

a. Each Copermittee must implement a public education and participation program, as appropriate, to promote and encourage the development of programs, management practices, control techniques and systems, design and engineering methods, and behaviors that reduce the discharge of pollutants in storm water to the MEP, prevent controllable non-storm water discharges from entering the MS4, and protect water quality standards in receiving waters. The public education program must include, at a minimum, the following:

(1) Educational activities, public information activities, and other appropriate outreach activities intended to reduce the pollutants of concern associated with ~~the application of pesticides, herbicides and fertilizer in~~ storm water discharges ~~to and~~ from its MS4 to the MEP. Activities shall be determined and prioritized by the Copermittees by jurisdiction and/or watershed to address the highest water quality issues of concern identified within the corresponding WQIP(s);

~~(2) Educational activities, public information activities, and other appropriate outreach activities to facilitate the proper management and disposal of used oil and toxic materials; and~~

~~(3)~~(2) Appropriate education and training measures for specific ~~construction site operators and other~~ target audiences, as determined and prioritized by the Copermittee(s) by jurisdiction and/or watershed to address the highest water quality issues of concern identified within the corresponding WQIP(s).

b. Each Copermittee must incorporate a mechanism for public participation and where necessary intergovernmental coordination in updating, developing, and implementing its jurisdictional runoff management program.

8. Fiscal Analysis

a. Each Copermittee must secure the resources necessary to meet all the requirements of this Order.

b. Each Copermittee must conduct an annual fiscal analysis of their jurisdictional runoff management programs. ~~following:~~

The Copermittees must identify the various categories of expenditures necessary to implement the requirements of this Order, including a description of the specific items to be accounted for in each category of expenditures. For each category of expenditures, the fiscal analysis must include the following:

(1) The capital and operation and maintenance expenditures necessary to implement the requirements of this Order;
~~(2) The staff resources needed and allocated to meet the requirements of this~~

~~Order, including any development, implementation, and enforcement activities required;~~

~~(3)~~(2) The estimated expenditures ~~for Provisions E.8.b.(1) and E.8.b.(1)(2)~~ during the reporting period~~, the preceding reporting period,~~ and the next reporting period; and

~~(4)~~(3) The source(s) of funds that are proposed to meet the necessary expenditures ~~described in Provisions E.8.b.(1) and E.8.b.(1)(2),~~ including legal restrictions on the use of such funds.

c. Each Copermittee must submit a summary of the annual fiscal analysis with each Annual Report required pursuant to Provision F.3.b.

d. Each Copermittee must provide the documentation used to develop the summary of the annual fiscal analysis upon request by the San Diego Water Board.

F. REPORTING

The purpose of this provision is to determine and document compliance with the requirements set forth in this Order. The goal of this provision is to communicate to the San Diego Water Board and the people of the State of California the implementation status of each jurisdictional runoff management program and compliance with the requirements of this Order. This goal is to be accomplished through the submittal of specific deliverables to the San Diego Water Board by the Copermittees.

1. Water Quality Improvement Plans

The Copermittees for each Watershed Management Area must develop and submit a complete Water Quality Improvement Plan in accordance with the requirements of Provision B, no later than 18~~2~~ months after the adoption of, or enrollment under this Order for a 30 day public review and comment period. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 30 days. Based on the comments received, the San Diego Water Board will determine whether to hold a public hearing or to limit public input to submittal of written comments. If no hearing is held the San Diego Water Board will notify the Copermittees that the Water Quality Improvement Plan has been accepted as complete following its review and determination that the Water Quality Improvement Plan meets the requirements of this Order. The San Diego Water Board shall notify the Copermittees within six (6) months of the submittal date. Water Quality Improvement Plans must be made available as~~on the Regional Clearinghouse~~ required pursuant to Provision F.4.

2. Updates

a. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATES

Each Copermittee must update its jurisdictional runoff management program document to incorporate the requirements of Provision E. The update must be completed no later than 18~~2~~ months after the adoption of, or enrollment under, this Order. Updated jurisdictional runoff management program documents must be made available as ~~on the Regional Clearinghouse~~ required pursuant to Provision F.4. Subsequent updates may be submitted as part of the Annual Reports, and updated jurisdictional runoff management program documents must be made available ~~on the Regional Clearinghouse~~as required pursuant to Provision F.4.

Jurisdictional Runoff Management Program document updates that modify program elements from the requirements of Provision E must provide rationale for the modifications within the update documents.

b. ~~PERMANENT~~ TREATMENT CONTROL/STRUCTURAL LID BMP SIZING CRITERIA DESIGN MANUAL UPDATES

Each Copermittee must update its BMP Design Manual to incorporate the requirements of Provision E.3.d, as needed. The update must be completed no later than 18~~2~~ months after the adoption of, or enrollment under, this Order. Updated BMP Design Manuals must be made available as ~~on the Regional Clearinghouse~~ required pursuant to Provision F.4. Subsequent updates may be submitted as part of the Annual Reports. Updated BMP Design Manuals must be made available as required pursuant to Provision F.4~~on the Regional Clearinghouse~~.

BMP Design Manual updates that modify program elements from the requirements of Provision E must provide rationale for the modifications within the update documents.

c. Water Quality Improvement Plan Updates

The Copermittees for each Watershed Management Area must submit updates to the Water Quality Improvement Plan as part of the Annual Reports. Updated Water Quality Improvement Plans must be made available as ~~on the Regional Clearinghouse~~ required pursuant to Provision F.4.

Water Quality Improvement Plan updates that modify program elements from the requirements of Provision E must provide rationale for the modifications within the update documents.

3. Progress Reporting

a. Progress Report Presentations

The Copermittees for each Watershed Management Area must appear before the San Diego Water Board, as requested by the San Diego Water Board, to provide progress reports on the implementation of the Water Quality Improvement Plan and jurisdictional runoff management programs.

b. Annual Reports

(1) The Copermittees for each Watershed Management Area must submit an Annual Report for each reporting period, which begins July 1 and ends June 30 in the following year, no later than October 31 following the end of the reporting period. The first Annual Report must be prepared for the reporting period beginning July 1 after adoption of the permit, and upon San Diego Water Board's determination that ~~from the date the San Diego Water Board determines that~~ the Water Quality Improvement Plan meets the requirements of this Order to June 30 in the following year. Annual Reports must be made available ~~on the Regional Clearinghouse~~as required pursuant to Provision F.4. Each Annual Report must include the following:

(a) The jurisdictional and watershed monitoring data collected pursuant to Provisions D.1 and D.2, summarized and presented in tabular and graphical form;

(b) Progress of the special studies required pursuant to Provisions D.2 and D.3, and the results or findings when a special study, or each phase of a special study, is completed;

(c) The findings from the assessments required pursuant to Provision D.4;

(d) The progress of implementing the Water Quality Improvement Plan, including, but not limited to, the following:

(i) The progress toward achieving the interim and final numeric ~~targets~~goals for the highest water quality priorities for the Watershed Management Area,

(ii) The water quality improvement strategies that were implemented and/or no longer implemented by each of the Copermittees during the reporting period and previous reporting periods, and are planned to be implemented during the next reporting period,

(iii) Previously proposed modifications or updates incorporated into the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document and implemented by the Copermittees in the Watershed Management Area, and

(iv) Proposed modifications or updates to the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document;

(e) A completed Jurisdictional Runoff Management Program Annual Report Form (Attachment D) for each Copermittee in the Watershed Management Area, certified by a Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative.

(2) Each Copermittee must complete and submit a Jurisdictional Runoff Management Program Annual Report Form (Attachment D) no later than October 31 of each year until the first Annual Report is required to be submitted.

(3) Each Copermittee must provide any data or documentation utilized in developing the Annual Report upon request by the San Diego Water Board. Any monitoring data utilized in developing the Annual Report must be uploaded to the California Environmental Data Exchange Network

(CEDEN).[23] Any monitoring and assessment data utilized in developing the Annual Report must be provided as ~~on the Regional Clearinghouse~~ required pursuant to Provision F.4.

c. **Regional Monitoring and Assessment Report**

(1) The Copermittees must submit a Regional Monitoring and Assessment Report no later than 180 days in advance of the expiration date of this Order. The Regional Monitoring and Assessment Report may be submitted as part of the ROWD required pursuant to Provision F.5.b. The Copermittees must review the jurisdictional and watershed monitoring data, data analyses, and assessments required pursuant to Provision D.4, to assess the following:

(a) The beneficial uses of the receiving waters within the San Diego Region that are protected or must be restored;

[23] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

(b) The progress toward restoring impacted beneficial uses in the receiving waters within the San Diego Region; and

(c) Pollutants or conditions of emerging concern that may impact beneficial uses in the receiving waters within the San Diego Region.

(2) The Regional Monitoring and Assessment Report must include recommendations for improving the implementation and assessment of the Water Quality Improvement Plans and jurisdictional runoff management programs, where feasible.

(3) Each Copermittee must provide any data or documentation utilized in developing the Regional Monitoring and Assessment Report upon request by the San Diego Water Board. Any monitoring and assessment data utilized in developing the Regional Monitoring and Assessment Report must be provided as ~~on the Regional Clearinghouse~~ required pursuant to Provision F.4.

4. ~~Regional Clearinghouse~~ Mechanism for Data and Information Sharing[24]

The Copermittees must identify and implement a mechanism to ~~develop, update, and maintain an internet-based Regional Clearinghouse that can be used to~~ store, disseminate, and share the Copermittees' Water Quality Improvement Plans, Annual Reports, jurisdictional runoff management program documents, monitoring data, special studies, and ~~any~~ other pertinent data or information generated by the Copermittees during the implementation of this Order. Monitoring data collected pursuant to Provision D must be uploaded to CEDEN~~,~~[25] ~~with links to the uploaded data available on the Regional Clearinghouse~~. ~~The Regional Clearinghouse may be linked to other internet-based data portals and databases where the original documents and data are stored.~~ ~~The Regional Clearinghouse~~Copermittees must make this information~~be~~ available and accessible to members of the public. The ~~Regional Clearinghouse~~mechanism for sharing Copermittee data and information must be developed and made available to the public no later than 18~~2~~ months after the adoption of this Order.

5. Report of Waste Discharge

a. The Orange County Copermittees and the Riverside County Copermittees, are required to submit a complete ROWD pursuant to the requirements of their

[24] The Copermittees may elect to develop and maintain the clearinghouse(s) provided by other Copermittees or agencies.

[25] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

current Orders and are enrolled under this Order upon expiration of their current Orders. Upon expiration of their current Orders, the Copermittees in each county must comply with the requirements of this Order by July 1 after enrollment under this Order, unless early enrollment is granted pursuant to Provision F.6 of this Order. The current Orders for the Orange County Copermittees and Riverside County Copermittees are rescinded upon their expiration date except for enforcement purposes.

b. The Copermittees must submit to the San Diego Water Board a complete ROWD as an application for the re-issuance of this NPDES permit. The ROWD must be submitted no later than 180 days in advance of the expiration date of this Order. The Copermittees may elect to develop and submit the ROWD individually or collaboratively. The ROWD must contain the following minimum information:

(1) Names and addresses of the Copermittees;

(2) Names and titles of the primary contacts of the Copermittees;

(3) Proposed changes to the Copermittees' Water Quality Improvement Plans and the supporting justification;

(4) Proposed changes to the Copermittees' jurisdictional runoff management programs and the supporting justification;

(5) Any other information necessary for the re-issuance of this Order; and

(6) Any other information required by federal regulations for NPDES permit reissuance.

6. Application for Early Enrollment

a. The Orange County Copermittees, collectively, or Riverside County Copermittees, collectively, may apply for early enrollment under this Order by submitting a Report of Waste Discharge Form 200 for each individual Copermittee in the respective county, with a written request for early enrollment under this Order that certifies the following conditions have been met:

(1) A Water Quality Improvement Plan has been developed in accordance with the requirements of Provision B, which can and will be implemented immediately upon enrollment under this Order;

(2) Each Copermittee in the county has updated its jurisdictional runoff management program document to incorporate the requirements of Provision E, which can and will be implemented immediately upon enrollment under this Order; and

(3) Each Copermittee in the county has updated its BMP Design Manual to incorporate the requirements of Provision E.3.d, which can and will be implemented immediately upon enrollment under this Order.

b. The San Diego Water Board will review the application for early enrollment and associated documents for completeness. A Notice of Enrollment (NOE) under this Order will be issued to the Copermittees in the respective county by the San Diego Water Board upon completion of the early enrollment application requirements. The effective enrollment date will be specified in the NOE and the Copermittees in the respective county are authorized to have MS4 discharges pursuant to the requirements of this Order starting on the date specified in the NOE. The existing Order for that county is rescinded upon the effective enrollment date specified in the NOE except for enforcement purposes.

7. Reporting Provisions

Each Copermittee must comply with all the reporting and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

G. PRINCIPAL WATERSHED COPERMITTEE RESPONSIBILITIES

1. The Copermittees within each Watershed Management Area must designate a Principal Watershed Copermittee and notify the San Diego Water Board of the name of the Principal Watershed Copermittee. ~~An individual Copermittee should not be designated a Principal Watershed Copermittee for more than two Watershed Management Areas.~~ The notification may be submitted with the Water Quality Improvement Plan required pursuant to Provision F.1 of this Order.

2. The Principal Watershed Copermittee is responsible for, at a minimum, the following:

   a. Serving as liaison between the Copermittees in the Watershed Management Area and the San Diego Water Board on general permit issues, and when necessary and appropriate, representing the Copermittees in the Watershed Management Area before the San Diego Water Board.

   b. Facilitating the development of the Water Quality Improvement Plan in accordance with the requirements of Provision B of this Order

   c. Coordinating the submittal of the deliverables required by Provisions F.1, F.2, F.3.a, and F.3.b of this Order.

   d. Coordinating and developing, with the other ~~Principal Watershed~~ Copermittees, the requirements of Provisions F.3.c, F.4, and F.5.b of this Order.

H. MODIFICATION OF PROGRAMS

1. Modifications of the Order may be initiated by the San Diego Water Board or by the Copermittees. Requests by Copermittees must be made to the San Diego Water Board.

2. Minor modifications to the Order may be made by the San Diego Water Board where the proposed modification complies with all the prohibitions and limitations, and other requirements of this Order.

3. Proposed modifications outside of the WQIP process that are not minor require amendment of this Order in accordance with this Order's rules, policies, and procedures.

I. STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

Each Copermittee must comply with all the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

ADMINISTRATIVE DRAFT

ATTACHMENT A

DISCHARGE PROHIBITIONS

1. Basin Plan Waste Discharge Prohibitions

California Water Code Section 13243 provides that a Regional Water Board, in a water quality control plan, may specify certain conditions or areas where the discharge of waste or certain types of waste is not permitted. The following waste discharge prohibitions in the Water Quality Control Plan for the San Diego Basin (Basin Plan) are applicable to any person, as defined by Section 13050(c) of the California Water Code, who is a citizen, domiciliary, or political agency or entity of California whose activities in California could affect the quality of waters of the state within the boundaries of the San Diego Region.

1. The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination or nuisance as defined in California Water Code Section 13050, is prohibited.

2. The discharge of waste to land, except as authorized by waste discharge requirements or the terms described in California Water Code Section 13264 is prohibited.

3. The discharge of pollutants or dredged or fill material to waters of the United States except as authorized by a National Pollutant Discharge Elimination System (NPDES) permit or a dredged or fill material permit (subject to the exemption described in California Water Code Section 13376) is prohibited.

4. Discharges of recycled water to lakes or reservoirs used for municipal water supply or to inland surface water tributaries thereto are prohibited, unless this San Diego Water Board issues a NPDES permit authorizing such a discharge; the proposed discharge has been approved by the State Department of Health Services (DHS) and the operating agency of the impacted reservoir; and the discharger has an approved fail-safe long-term disposal alternative.

5. The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited. Allowances for dilution may be made at the discretion of the San Diego Water Board. Consideration would include streamflow data, the degree of treatment provided and safety measures to ensure reliability of facility performance. As an example, discharge of secondary effluent would probably be permitted if streamflow provided 100:1 dilution capability.

6. The discharge of waste in a manner causing flow, ponding, or surfacing on lands not owned or under the control of the discharger is prohibited, unless the discharge is authorized by the San Diego Water Board.

7. The dumping, deposition, or discharge of waste directly into waters of the state, or adjacent to such waters in any manner which may permit its being transported into the waters, is prohibited unless authorized by the San Diego Water Board.

8. Any discharge to a storm water conveyance system that is not composed entirely of "*storm water*" is prohibited unless authorized by the San Diego Water Board. [The federal regulations, 40 CFR 122.26(b)(13), define storm water as storm water runoff, snow melt runoff, and surface runoff and drainage. 40 CFR 122.26(b)(2) defines an illicit discharge as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities.] [§122.26 amended at 56 FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992].

9. The unauthorized discharge of treated or untreated sewage to waters of the state or to a storm water conveyance system is prohibited.

10. The discharge of industrial wastes to conventional septic tank/subsurface disposal systems, except as authorized by the terms described in California Water Code Section 13264, is prohibited.

11. The discharge of radioactive wastes amenable to alternative methods of disposal into the waters of the state is prohibited.

12. The discharge of any radiological, chemical, or biological warfare agent into waters of the state is prohibited.

13. The discharge of waste into a natural or excavated site below historic water levels is prohibited unless the discharge is authorized by the San Diego Water Board.

14. The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in waters of the state or which unreasonably affect, or threaten to affect, beneficial uses of such waters is prohibited.

15. The discharge of treated or untreated sewage from vessels to Mission Bay, Oceanside Harbor, Dana Point Harbor, or other small boat harbors is prohibited.

16. The discharge of untreated sewage from vessels to San Diego Bay is prohibited.

17. The discharge of treated sewage from vessels to portions of San Diego Bay that are less than 30 feet deep at mean lower low water (MLLW) is prohibited.

18. The discharge of treated sewage from vessels, which do not have a properly functioning US Coast Guard certified Type I or Type II marine sanitation device, to portions of San Diego Bay that are greater than 30 feet deep at mean lower low water (MLLW) is prohibited.

2. Attachment B to State Water Board Resolution 2012-~~001X~~ 0012

Copermittees that discharge into Areas of Special Biological Significance must comply with State Water Board Resolution No. 2012-0012.

~~**Special Protections for Areas of Special Biological Significance, Governing Point Source Discharges of Storm Water and Nonpoint Source Waste Discharges**~~

~~I. PROVISIONS FOR POINT SOURCE DISCHARGES OF STORM WATER AND NONPOINT SOURCE WASTE DISCHARGES~~

~~The following terms, prohibitions, and special conditions (hereafter collectively referred to as special conditions) are established as limitations on point source storm water and nonpoint source discharges. These special conditions provide Special Protections for marine aquatic life and natural water quality in Areas of Special Biological Significance (ASBS), as required for State Water Quality Protection Areas pursuant to California Public Resources Code Sections 36700(f) and 36710(f). These Special Protections are adopted by the State Water Board as part of the California Ocean Plan (Ocean Plan) General Exception.~~

~~The special conditions are organized by category of discharge. The State Water Resources Control Board (State Water Board) and Regional Water Quality Control Boards (Regional Water Boards) will determine categories and the means of regulation for those categories [e.g., Point Source Storm Water National Pollutant Discharge Elimination System (NPDES) or Nonpoint Source].~~

~~**A. PERMITTED POINT SOURCE DISCHARGES OF STORM WATER**~~

~~1. General Provisions for Permitted Point Source Discharges of Storm Water~~

~~a. Existing storm water discharges into an ASBS are allowed only under the following conditions:~~

~~(1) The discharges are authorized by an NPDES permit issued by the State Water Board or Regional Water Board;~~

~~(2) The discharges comply with all of the applicable terms, prohibitions, and special conditions contained in these Special Protections; and~~

~~(3) The discharges:~~

~~(i) Are essential for flood control or slope stability, including roof, landscape, road, and parking lot drainage;~~

~~(ii) Are designed to prevent soil erosion;~~

~~(iii) Occur only during wet weather;~~

~~(iv) Are composed of only storm water runoff.~~

~~b. Discharges composed of storm water runoff shall not alter natural ocean water quality in an ASBS.~~

ADMINISTRATIVE DRAFT

~~c. The discharge of trash is prohibited. Minimize the discharge of trash to the maximum extent practicable over the course of the permit term.~~

~~d. Only discharges from existing storm water outfalls are allowed. Any proposed or new storm water runoff discharge shall be routed to existing storm water discharge outfalls and shall not result in any new contribution of waste to an ASBS (i.e., no additional pollutant loading). "Existing storm water outfalls" are those that were constructed or under construction prior to January 1, 2005. "New contribution of waste" is defined as any addition of waste beyond what would have occurred as of January 1, 2005. A change to an existing storm water outfall, in terms of re-location or alteration, in order to comply with these special conditions, is allowed and does not constitute a new discharge.~~

~~e. Non-storm water discharges are prohibited except as provided below:~~

~~(1) The term "non-storm water discharges" means any waste discharges from a municipal separate storm sewer system (MS4) or other NPDES permitted storm drain system to an ASBS that are not composed entirely of storm water.~~

~~(2) The following non-storm water discharges are allowed, provided that the discharges are essential for emergency response purposes, structural stability, slope stability or occur naturally:~~

~~(i) Discharges associated with emergency fire fighting operations.~~

~~(ii) Foundation and footing drains.~~

~~(iii) Water from crawl space or basement pumps.~~

~~(iv) Hillside dewatering.~~

~~(v) Naturally occurring groundwater seepage via a storm drain.~~

~~(vi) Non-anthropogenic flows from a naturally occurring stream via a culvert or storm drain, as long as there are no contributions of anthropogenic runoff.~~
~~Rising ground waters.~~
~~Springs.~~
~~Flows from riparian habitats and wetlands.~~
~~Discharges from potable water sources.~~
~~Uncontaminated pumped groundwater.~~
~~Water line flushing.~~
~~Water main breaks.~~

~~(3) Authorized non-storm water discharges shall not have a reasonable potential to cause or contribute to a violation of the water quality objectives in Chapter II of the Ocean Plan nor alter natural ocean water quality in an ASBS.~~

~~2. Compliance Plans for Inclusion in Storm Water Management Plans (SWMP) and Storm Water Pollution Prevention Plans (SWPPP).~~

ADMINISTRATIVE DRAFT

~~The discharger shall specifically address the prohibition of non-storm water runoff and the goal ofrequirement to maintaining natural water quality for storm water discharges to an ASBS in an ASBS Compliance Plan to be included in its SWMP or a SWPPP, as appropriate to permit type. If a statewide permit includes a SWMP, then the discharger shall prepare a stand-alone compliance plan for ASBS discharges . The ASBS Compliance Plan is subject to approval by the Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (for permits issued by Regional Water Boards).~~

~~a. The Compliance Plan shall include a map of surface drainage of storm water runoff, showing areas of sheet runoff, prioritize discharges, and describe any structural Best Management Practices (BMPs) already employed and/or BMPs to be employed in the future. Priority discharges are those that pose the greatest water quality threat and which are identified to require installation of structural, non-structural, and/or source BMPs, as feasible. The map shall also show the storm water conveyances in relation to other features such as service areas, sewage conveyances and treatment facilities, landslides, areas prone to erosion, and waste and hazardous material storage areas, if applicable. The SWMP or SWPPP shall also include a procedure for updating the map and plan when changes are made to the storm water conveyance facilities.~~

~~b. The ASBS Compliance Plan shall describe the measures by which all non-authorized non-storm water runoff (e.g., dry weather flows) has been reduced and/or preventedeliminated, how these measures will be maintained over time, and how these measures are monitored and documented.~~

~~c. For Municipal Separate Storm Sewer System (MS4s), the ASBS Compliance Plan shall require minimum inspection frequencies as follows:~~

~~(1) The minimum inspection frequency for construction sites shall be weekly during rainy season;~~

~~(2) The minimum inspection frequency for industrial facilities shall be monthly during the rainy season;~~

~~(3) The minimum inspection frequency for commercial facilities (e.g., restaurants) shall be twice during the rainy season; and~~

~~(4) Storm water outfall drains equal to or greater than 18 inches (457 mm) in diameter or width shall be inspected once prior to the beginning of the rainy season and once during the rainy season and maintained to remove trash and other anthropogenic debris.~~

~~d. The ASBS Compliance Plan shall address storm water discharges (wet weather flows) and, in particular, describe how pollutant reductions in storm water runoff, that are necessary to comply with these special conditions, will be achieved through BMPs. Structural, non-structural, and/or source control BMPs need not be installed if the discharger can document to the satisfaction of the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that such installation would pose a threat to health or safety. BMPs to control storm water runoff discharges (at the end-of-pipe) during a design storm shall be~~

ADMINISTRATIVE DRAFT

~~designed to the maximum extent practicable. achieve on average the following target levels:~~

~~(1) Table B Instantaneous Maximum Water Quality Objectives in Chapter II of the Ocean Plan; or~~

~~(2) A 90% reduction in pollutant loading during storm events, for the applicant's total discharges. The baseline for the reduction is the effective date of the Exception. The baseline for these determinations is the effective date of the Exception, and the reductions must be achieved and documented within four (4) years of the effective date.~~

~~e. The ASBS Compliance Plan shall address erosion control and the prevention of anthropogenic sedimentation in ASBS. The natural habitat conditions in the ASBS shall not be altered as a result of anthropogenic sedimentation.~~

~~f. The ASBS Compliance Plan shall describe the non-structural BMPs currently employed and planned in the future (including those for construction activities), and include an implementation schedule. The ASBS Compliance Plan shall include non-structural BMPs that address public education and outreach. Education and outreach efforts must adequately inform the public that direct discharges of pollutants from private property not entering an MS4 are prohibited. The ASBS Compliance Plan shall also describe the structural BMPs, including any low impact development (LID) measures, currently employed and planned for higher threat discharges and include an implementation schedule. To control storm water runoff discharges (at the end-of-pipe) during a design storm, permittees must first consider using LID practices to infiltrate, use, or evapotranspirate storm water runoff on-site.~~

~~g. The BMPs and implementation schedule shall be designed to ensurewith the goal that natural water quality conditions in the receiving water are achieved and maintained by either reducing flows from impervious surfaces or reducing pollutant loading, or some combination thereof.~~

~~h. If the results of the receiving water monitoring described in IV.B. of these special conditions indicate that the storm water runoff is causing or contributing to an alteration of natural ocean water quality in the ASBS, the discharger shall submit a report to the State Water Board and Regional Water Board within 30 days of receiving the results.~~

~~(1) The report shall identify the constituents in storm water runoff that alter natural ocean water quality and the sources of these constituents.~~

~~(2) The report shall describe BMPs that are currently being implemented, BMPs that are identified in the SWMP or SWPPP for future implementation, and any additional BMPs that may be added to the SWMP or SWPPP to address the alteration of natural water quality. The report shall include a new or modified implementation schedule for the BMPs.~~

~~(3) Within 30 days of the approval of the report by the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits), the discharger shall revise its ASBS Compliance Plan to incorporate any new or modified BMPs that have been or will be implemented, the implementation schedule, and any additional monitoring required.~~

ADMINISTRATIVE DRAFT

~~(4) As long as the discharger has complied with the procedures described above and is implementing the revised SWMP or SWPPP, the discharger does not have to repeat the same procedure for continuing or recurring exceedances of natural ocean water quality conditions due to the same constituent.~~

~~(5) Compliance with this section does not excuse violations of any term, prohibition, or condition contained in these Special Protections.~~

~~3. Compliance Schedule~~

~~a. On the effective date of the Exception, all Discharger shall obtain the legal authority necessary to prevent and eliminate non-authorized non-storm water discharges (e.g., dry weather flow) are effectively prohibited.~~

~~b. Within one year from the effective date of the Exception, the discharger shall submit a written ASBS Compliance Plan to the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that describes its strategy to comply with these special conditions, including the requirement goal to maintain natural water quality in the affected ASBS. The ASBS Compliance Plan shall include a time schedule to implement appropriate non-structural and structural controls (implementation schedule) to comply with these special conditions for inclusion in the discharger's SWMP or SWPPP, as appropriate to permit type.~~

~~c. Within 18 months of the effective date of the Exception, any non-structural controls that are necessary to comply with these special conditions shall be implemented.~~

~~d. Within four (4) years of the effective date of the Exception, any structural controls identified in the ASBS Compliance Plan that are necessary to comply with these special conditions shall be operational.~~

~~e. Within four (4) years of the effective date of the Exception, all dischargers must implement non-structural and/or structural BMPs to assist in meeting the goal comply with the requirement that their discharges into the affected ASBS maintain natural ocean water quality. If the initial results of post-storm receiving water quality testing indicate levels higher than the 85th percentile threshold of reference water quality data and the pre-storm receiving water levels, then the discharger must re-sample the receiving water, pre- and post-storm. If after re-sampling the post-storm levels are still higher than the 85th percentile threshold of reference water quality data, and the pre-storm receiving water levels, for any constituent, then natural ocean water quality is exceeded. See attached Flowchart.~~

~~f. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may only authorize additional time to comply with the special conditions d. and e., above if good cause exists to do so. Good cause means a physical impossibility or lack of funding.~~

~~If a discharger claims physical impossibility, it shall notify the Board in writing within thirty (30) days of the date that the discharger first knew of the event or circumstance that caused or would cause it to fail to meet the deadline in d. or e. The notice shall describe the reason for the noncompliance or anticipated noncompliance and specifically refer to~~

~~this Section of this Exception. It shall describe the anticipated length of time the delay in compliance may persist, the cause or causes of the delay as well as measures to minimize the impact of the delay on water quality, the measures taken or to be taken by the discharger to prevent or minimize the delay, the schedule by which the measures will be implemented, and the anticipated date of compliance. The discharger shall adopt all reasonable measures to avoid and minimize such delays and their impact on water quality.~~

~~The discharger may request an extension of time for compliance based on lack of funding. The request for an extension shall require:~~

~~(1) for municipalities, a demonstration of significant hardship to discharger ratepayers, by showing the relationship of storm water fees to annual household income for residents within the discharger's jurisdictional area, and the discharger has made timely and complete applications for all available bond and grant funding, and either no bond or grant funding is available, or bond and/or grant funding is inadequate; or~~
~~(2) for other governmental agencies, a demonstration and documentation of a good faith effort to acquire funding through that agency's budgetary process.~~

~~B. NONPOINT SOURCE DISCHARGES~~

~~[NOT INCLUDED]~~
~~[PROVISIONS FOR NONPOINT SOURCE DISCHARGES NOT APPLICABLE]~~

~~II. ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES~~

~~[NOT INCLUDED]~~
~~[ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES NOT APPLICABLE]~~

~~III. ADDITIONAL REQUIREMENTS – WATERFRONT AND MARINE OPERATIONS~~

~~[NOT INCLUDED]~~
~~[ADDITIONAL REQUIREMENTS FOR WATERFRONT AND MARINE OPERATIONS NOT APPLICABLE]~~

~~IV. MONITORING REQUIREMENTS~~

~~Monitoring is mandatory for all dischargers to assure compliance with the Ocean Plan. Monitoring requirements include both: (A) core discharge monitoring, and (B) ocean receiving water monitoring. The State and Regional Water Boards must approve sampling site locations and any adjustments to the monitoring programs. All ocean receiving water and reference area monitoring must be comparable with the Water Boards' Surface Water Ambient Monitoring Program (SWAMP).~~

ADMINISTRATIVE DRAFT

~~Safety concerns: Sample locations and sampling periods must be determined considering safety issues. Sampling may be postponed upon notification to the State and Regional Water Boards if hazardous conditions prevail.~~

~~Analytical Chemistry Methods: All constituents must be analyzed using the lowest minimum detection limits comparable to the Ocean Plan water quality objectives. For metal analysis, all samples, including storm water effluent, reference samples, and ocean receiving water samples, must be analyzed by the approved analytical method with the lowest minimum detection limits (currently Inductively Coupled Plasma/Mass Spectrometry) described in the Ocean Plan.~~

~~A. CORE DISCHARGE MONITORING PROGRAM~~

~~1. General sampling requirements for timing and storm size:~~

~~Runoff must be collected during a storm event that is greater than 0.1 inch and generates runoff, and at least 72 hours from the previously measurable storm event. Runoff samples shall be collected when post-storm receiving water is sampled, and analyzed for the same constituents as receiving water and reference site samples (see section IV B) as described below.~~

~~2. Runoff flow measurements~~

~~a. For municipal/industrial storm water outfalls in existence as of December 31, 2007, 18 inches (457mm) or greater in diameter/width (including multiple outfall pipes in combination having a width of 18 inches, runoff flows must be measured or calculated, using a method acceptable to and approved by the State and Regional Water Boards.~~

~~b. This will be reported annually for each precipitation season to the State and Regional Water Boards.~~

~~3. Runoff samples – storm events~~

~~a. For outfalls equal to or greater than 18 inches (0.46m) in diameter or width:~~

~~(1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and, within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination, ; and~~

~~(2) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS~~

~~(3) If an applicant has no outfall greater than 36 inches, then storm water runoff from the applicant's largest outfall shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates).~~

~~b. For outfalls equal to or greater than 36 inches (0.91m) in diameter or width:~~

ADMINISTRATIVE DRAFT

~~(1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and, within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination; and~~

~~(2) samples of storm water runoff shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates) and~~

~~(3) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS.~~

~~c. For an applicant not participating in a regional monitoring program [see below in Section IV (B)] in addition to (a.) and (b.) above, a minimum of the two largest outfalls or 20 percent of the larger outfalls, whichever is greater, shall be sampled (flow weighted composite samples) at least three times annually during wet weather (storm event) and analyzed for all Ocean Plan Table A constituents, Table B constituents for marine aquatic life protection (except for toxicity, only chronic toxicity for three species shall be required), DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, and Ocean Plan indicator bacteria. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one (the largest) such discharge shall be sampled annually in each Region.~~

~~4. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may reduce or suspend core monitoring once the storm runoff is fully characterized. This determination may be made at any point after the discharge is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.~~

~~B. OCEAN RECEIVING WATER AND REFERENCE AREA MONITORING PROGRAM~~

~~In addition to performing the Core Discharge Monitoring Program in Section II.A above, all applicants having authorized discharges must perform ocean receiving water monitoring. In order to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS, dischargers may choose either (1) an individual monitoring program, or (2) participation in a regional integrated monitoring program.~~

~~1. Individual Monitoring Program: The requirements listed below are for those dischargers who elect to perform an individual monitoring program to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within the affected ASBS. In addition to Core Discharge Monitoring, the following additional monitoring requirements shall be met:~~

~~a. Three times annually, during wet weather (storm events), the receiving water at the point of discharge from the outfalls described in section (IV)(A)(3)(c) above shall be sampled and analyzed for Ocean Plan Table A constituents, Table B constituents for marine~~

ADMINISTRATIVE DRAFT

~~aquatic life, DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, salinity, chronic toxicity (three species), and Ocean Plan indicator bacteria.~~

~~The sample location for the ocean receiving water shall be in the surf zone at the point of discharges; this must be at the same location where storm water runoff is sampled. Receiving water shall be sampled at approximately the same time prior to (pre-storm) and during (or immediately after) the same storm (post storm). Reference water quality shall also be sampled and analyzed for the same constituents pre-storm and post-storm, during the same storms when receiving water is sampled. Reference stations will be determined by the State Water Board's Division of Water Quality and the applicable Regional Water Board(s).~~

~~b. Sediment sampling shall occur at least three times during every five (5) year period. The subtidal sediment (sand or finer, if present) at the discharge shall be sampled and analyzed for Ocean Plan Table B constituents for marine aquatic life, DDT, PCBs, PAHs, pyrethroids, and OP pesticides. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed.~~

~~c. A quantitative survey of intertidal benthic marine life shall be performed at the discharge and at a reference site. The survey shall be performed at least once every five (5) year period. The survey design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The results of the survey shall be completed and submitted to the State Water Board and Regional Water Board at least six months prior to the end of the permit cycle.~~

~~d. Once during each five (5) year period, a bioaccumulation study shall be conducted to determine the concentrations of metals and synthetic organic pollutants at representative discharge sites and at representative reference sites. The study design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The bioaccumulation study may include California mussels (Mytilus californianus) and/or sand crabs (Emerita analoga or Blepharipoda occidentalis). Based on the study results, the Regional Water Board and the State Water Board's Division of Water Quality, may adjust the study design in subsequent permits, or add or modify additional test organisms (such as shore crabs or fish), or modify the study design appropriate for the area and best available sensitive measures of contaminant exposure.~~

~~e. Marine Debris: Representative quantitative observations for trash by type and source shall be performed along the coast of the ASBS within the influence of the discharger's outfalls. The design, including locations and frequency, of the marine debris observations is subject to approval by the Regional Water Board and State Water Board's Division of Water Quality.~~

~~f. The monitoring requirements of the Individual Monitoring Program in this section are minimum requirements. After a minimum of one (1) year of continuous water quality monitoring of the discharges and ocean receiving waters, the Executive Director of the State Water Board (statewide permits) or Executive officer of the Regional Water Board (Regional Water Board permits) may require additional monitoring, or adjust, reduce or suspend receiving water and reference station monitoring. This determination may be made at any point after the discharge and receiving water is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.~~

~~2. Regional Integrated Monitoring Program: Dischargers may elect to participate in a regional integrated monitoring program, in lieu of an individual monitoring program, to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS. This regional approach shall characterize natural water quality, pre- and post-storm, in ocean reference areas near the mouths of identified open space watersheds and the effects of the discharges on natural water quality (physical, chemical, and toxicity) in the ASBS receiving waters, and should include benthic marine aquatic life and bioaccumulation components. The design of the ASBS stratum of a regional integrated monitoring program may deviate from the otherwise prescribed individual monitoring approach (in Section IV.B.1) if approved by the State Water Board's Division of Water Quality and the Regional Water Boards.~~

~~a. Ocean reference areas shall be located at the drainages of flowing watersheds with minimal development (in no instance more than 10% development), and shall not be located in CWA Section 303(d) listed waterbodies or have tributaries that are 303(d) listed. Reference areas shall be free of wastewater discharges and anthropogenic non-storm water runoff. A minimum of low threat storm runoff discharges (e.g. stream highway overpasses and campgrounds) may be allowed on a case-by-case basis. Reference areas shall be located in the same region as the ASBS receiving water monitoring occurs. The reference areas for each Region are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean reference water samples must be collected from each station, each from a separate storm. A minimum of one reference location shall be sampled for each ASBS receiving water site sampled per responsible party. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.~~

~~b. ASBS ocean receiving water must be sampled in the surf zone at the location where the runoff makes contact with ocean water (i.e. at "point zero"). Ocean receiving water stations must be representative of worst-case discharge conditions (i.e. co-located at a large drain greater than 36 inches, or if drains greater than 36 inches are not present in the ASBS then the largest drain greater than18 inches.) Ocean receiving water stations are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean receiving water samples must be collected during each storm season from each station, each from a separate storm. A minimum of one receiving water location shall be sampled in each ASBS per responsible party in that ASBS. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.~~

~~c. Reference and receiving water sampling shall commence during the first full storm season following the adoption of these special conditions, and post-storm samples shall be collected when annual storm water runoff is sampled. Sampling shall occur in a minimum of two storm seasons. For those ASBS dischargers that have already participated in the Southern California Bight 2008 ASBS regional monitoring effort, sampling may be limited to only one storm season.~~

~~d. Receiving water and reference samples shall be analyzed for the same constituents as storm water runoff samples. At a minimum, constituents to be sampled and analyzed in~~

ADMINISTRATIVE DRAFT

~~reference and discharge receiving waters must include oil and grease, total suspended solids, Ocean Plan Table B metals for protection of marine life, Ocean Plan PAHs, pyrethroids, OP pesticides, ammonia, nitrate, phosphates, and critical life stage chronic toxicity for three species. In addition, within the range of the southern sea otter, indicator bacteria or some other measure of fecal contamination shall be analyzed.~~

~~3. Waterfront and Marine Operations: In addition to the above requirements for ocean receiving water monitoring, additional monitoring must be performed for marinas and boat launch and pier facilities:~~

~~a. For all marina or mooring field operators, in mooring fields with 10 or more occupied moorings, the ocean receiving water must be sampled for Ocean Plan indicator bacteria, residual chlorine, copper, zinc, grease and oil, methylene blue active substances (MBAS), and ammonia nitrogen.~~

~~(1) For mooring field operators opting for an individual monitoring program (Section IV.B.1 above), this sampling must occur weekly (on the weekend) from May through October.~~

~~(2) For mooring field operators opting to participate in a regional integrated monitoring program (Section IV.B.2 above), this sampling must occur monthly from May through October on a high use weekend in each month. The Water Boards may allow a reduction in the frequency of sampling, through the regional monitoring program, after the first year of monitoring.~~

~~b. For all mooring field operators, the subtidal sediment (sand or finer, if present) within mooring fields and below piers shall be sampled and analyzed for Ocean Plan Table B metals (for marine aquatic life beneficial use), acute toxicity, PAHs, and tributyltin. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed. This sampling shall occur at least three times during a five (5) year period. For mooring field operators opting to participate in a regional integrated monitoring program, the Water Boards may allow a reduction in the frequency of sampling after the first sampling effort's results are assessed.~~

ADMINISTRATIVE DRAFT

ATTACHMENT B

STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

1. Standard Permit Provisions

Code of Federal Regulations Title 40 Section 122.41 (40 CFR 122.41) includes conditions, or provisions, that apply to all National Pollutant Discharge Elimination System (NPDES) permits. Additional provisions applicable to NPDES permits are in 40 CFR 122.42. All applicable provisions in 40 CFR 122.41 and 40 CFR 122.42 must be incorporated into this Order and NPDES permit. The applicable 40 CFR 122.41 and 40 CFR 122.42 provisions are as follows:

a. DUTY TO COMPLY [40 CFR 122.41(a)]

The Copermittee must comply with all of the provisions of this permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application.

(1) The Copermittee must comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if the permit has not yet been modified to incorporate the requirement. [40 CFR 122.41(a)(1)]

(2) The CWA provides that any person who violates Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any such sections in a permit issued under Section 402, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to a civil penalty not to exceed $25,000 per day for each violation. The CWA provides that any person who *negligently* violates Section 301, 302, 306, 307, 308, 318, or 405 of the CWA, or any condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to criminal penalties of $2,500 to $25,000 per day of violation, or imprisonment of not more than 1 year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than $50,000 per day of violation, or by imprisonment of not more than 2 years, or both. Any person who *knowingly* violates such sections, or such conditions or limitations is subject to criminal penalties of $5,000 to $50,000 per day of violation, or imprisonment for not more than 3 years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than $100,000 per day of violation, or imprisonment of not more than 6 years, or both. Any person who knowingly violates Section 301, 302, 303, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of

not more than $250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than $500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in Section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than $1,000,000 and can be fined up to $2,000,000 for second or subsequent convictions.
[40 CFR 122.41(a)(2)]

(3) Any person may be assessed an administrative penalty by the San Diego Regional Water Quality Control Board (San Diego Water Board), State Water Resources Control Board (State Water Board), or United States Environmental Protection Agency (USEPA) for violating Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed $10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed $25,000. Penalties for Class II violations are not to exceed $10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed $125,000.
[40 CFR 122.41(a)(3)]

b. DUTY TO REAPPLY [40 CFR 122.41(b)]

If a Copermittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the Copermittee must apply for and obtain a new permit.

c. NEED TO HALT OR REDUCE ACTIVITY NOT A DEFENSE [40 CFR 122.41(c)]

It shall not be a defense for a Copermittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

d. DUTY TO MITIGATE [40 CFR 122.41(d)]

The Copermittee must take all reasonable steps to minimize or prevent any discharge or prevent any discharge or sludge use or disposal in violation of this permit that has a reasonable likelihood of adversely affecting human health or the environment.

e. PROPER OPERATION AND MAINTENANCE [40 CFR 122.41(e)]

The Copermittee must at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Copermittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems that are installed by a Copermittee only when the operation is necessary to achieve compliance with the conditions of this permit.

ADMINISTRATIVE DRAFT

f. PERMIT ACTIONS [40 CFR 122.41(f)]

This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Copermittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

g. PROPERTY RIGHTS [40 CFR 122.41(g)]

This permit does not convey any property rights of any sort, or any exclusive privilege.

h. DUTY TO PROVIDE INFORMATION [40 CFR 122.41(h)]

The Copermittee must furnish to the San Diego Water Board, State Water Board, or USEPA within a reasonable time, any information which the San Diego Water Board, State Water Board, or USPEA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit or to determine compliance with this permit. The Copermittee must also furnish to the San Diego Water Board, State Water Board, or USPEA upon request, copies of records required to be kept by this permit.

i. INSPECTION AND ENTRY [40 CFR 122.41(i)]

The Copermittee must allow the San Diego Water Board, State Water Board, USEPA, and/or their authorized representative (including an authorized contractor acting as their representative), upon presentation of credentials and other documents as may be required by law, to:

(1) Enter upon the Copermittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit; [40 CFR 122.41(i)(1)]

(2) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit; [40 CFR 122.41(i)(2)]

(3) Inspect and photograph at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; [40 CFR 122.41(i)(3)] and

(4) Sample or monitor at reasonable times, for the purpose of assuring permit compliance or as otherwise authorized by the CWA, any substances or parameters at any location. [40 CFR 122.41(i)(4)]

j. MONITORING AND RECORDS [40 CFR 122.41(j)]

(1) Samples and measurements taken for the purpose of monitoring must be representative of the monitored activity. [40 CFR 122.41(j)(1)]

(2) Except for records of monitoring information required by this permit related to the Copermittee's sewage sludge use and disposal activities, which shall be retained for a period of at least five (5) years (or longer as required by 40 CFR Part 503), the

Copermittee must retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board at any time. [40 CFR 122.41(j)(2)]

(3) Records for monitoring information must include: [40 CFR 122.41(j)(3)]

(a) The date, exact place, and time of sampling or measurements; [40 CFR 122.41(j)(3)(i)]
(b) The individual(s) who performed the sampling or measurements; [40 CFR 122.41(j)(3)(ii)]
(c) The date(s) analyses were performed; [40 CFR 122.41(j)(3)(iii)]
(d) The individual(s) who performed the analyses; [40 CFR 122.41(j)(3)(iv)]
(e) The analytical techniques or methods used; [40 CFR 122.41(j)(3)(v)] and
(f) The results of such analyses. [40 CFR 122.41(j)(3)(vi)]

(4) Monitoring must be conducted according to test procedures under 40 CFR Part 136 unless another method is required under 40 CFR Subchapters N or O. [40 CFR 122.41(j)(4)]

In the case of pollutants for which there are no approved methods under 40 CFR Part 136 or otherwise required under 40 CFR Subchapters N and O, monitoring must be conducted according to a test procedure specified in the permit for such pollutants. [40 CFR 122.44(i)(1)(iv)]

(5) The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or both. [40 CFR 122.41(j)(5)]

k. SIGNATORY REQUIREMENT [40 CFR 122.41(k)]

(1) All applications, reports, or information submitted to the San Diego Water Board, State Water Board, or USEPA must be signed and certified. (See 40 CFR 122.22) [40 CFR 122.41(k)(1)]

(a) *For a municipality, State, Federal, or other public agency.* [All applications must be signed] [b]y either a principal executive officer or ranking elected official. [40 CFR 122.22(a)(3)]

(b) All reports required by permits, and other information requested by the San Diego Water Board, State Water Board, or USEPA must be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if: [40 CFR 122.22(b)]

ADMINISTRATIVE DRAFT

(i) The authorization is made in writing by a person described in paragraph (a) of this section; [40 CFR 122.22(b)(1)]

(ii) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company, (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) [40 CFR 122.22(b)(2)] and,

(iii) The written authorization is submitted to the San Diego Water Board and State Water Board. [40 CFR 122.22(b)(3)]

(c) *Changes to authorization.* If an authorization under paragraph (b) of this section is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (b) of this section must be submitted to the San Diego Water Board prior to or together with any reports, information, or applications to be signed by an authorized representative. [40 CFR 122.22(c)]

(d) *Certification.* Any person signing a document under paragraph (a) or (b) of this section shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." [40 CFR 122.22(d)]

(2) The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than 6 months per violation, or by both. [40 CFR 122.41(k)(2)]

I. REPORTING REQUIREMENTS [40 CFR 122.41(l)]

(1) *Planned changes.* The Copermittee must give notice to the San Diego Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required only when: [40 CFR 122.41(l)(1)]

(a) The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR 122.29(b); [40 CFR 122.41(l)(1)(i)] or

(b) The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which

are subject neither to effluent limitations in the permit, nor to notification requirements under 40 CFR 122.42(a)(1).
[40 CFR 122.41(l)(1)(ii)]

(c) The alteration or addition results in a significant change in the Copermittee's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. [40 CFR 122.41(l)(1)(iii)]

(2) *Anticipated noncompliance*. The Copermittee must give advance notice to the San Diego Water Board or State Water Board of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements.
[40 CFR 122.41(l)(2)]

(3) *Transfers*. This permit is not transferable to any person except after notice to the San Diego Water Board. The San Diego Water Board may require modification or revocation and reissuance of the permit to change the name of the Copermittee and incorporate such other requirements as may be necessary under the CWA.
[40 CFR 122.41(l)(3)]

(4) *Monitoring reports.* Monitoring results must be reported at the intervals specified elsewhere in this permit. [40 CFR 122.41(l)(4)]

(a) Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the San Diego Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. [40 CFR 122.41(l)(4)(i)]

(b) If the Copermittee monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR Part 136 or another method required for an industry-specific waste stream under 40 CFR Subchapters N or O, the results of this monitoring must be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the San Diego Water Board or State Water Board.
[40 CFR 122.41(l)(4)(ii)]

(c) Calculations for all limitations which require averaging of measurements must utilize an arithmetic mean unless otherwise specified in the permit.
[40 CFR 122.41(l)(4)(iii)]

(5) *Compliance schedules*. Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit must be submitted no later than 14 days following each schedule date. [40 CFR 122.41(l)(5)]

(6) *Twenty-four hour reporting.*

(a) The Copermittee must report any noncompliance that may endanger health or the environment. Any information must be provided orally within 24 hours from the time the Copermittee becomes aware of the circumstances. A written submission must also be provided within five (5) days of the time the Copermittee becomes aware of the circumstances. The written submission must contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. [40 CFR 122.41(l)(6)(i)]

(b) The following must be included as information which must be reported within 24 hours under this paragraph: [40 CFR 122.41(l)(6)(ii)]

(i) Any unanticipated bypass that exceeds any effluent limitation in the permit (See 40 CFR 122.41(g)). [40 CFR 122.41(l)(6)(ii)(A)]
(ii) Any upset which exceeds any effluent limitation in the permit. [40 CFR 122.41(l)(6)(ii)(B)] and,
(iii) Violation of a maximum daily discharge limitation for any of the pollutants listed by the San Diego Water Board in the permit to be reported within 24 hours. (See 40 CFR 122.44(g)) [40 CFR 122.41(l)(6)(ii)(C)]

(c) The San Diego Water Board may waive the above-required written report on a case-by-case basis if the oral report has been received within 24 hours. [40 CFR 122.41(l)(6)(iii)]

(7) *Other noncompliance.* The Copermittee must report all instances of noncompliance not reported in accordance with the standard provisions required under 40 CFR 122.41(l)(4), (5), and (6), at the time monitoring reports are submitted. The reports must contain the information listed in the standard provisions required under 40 CFR 122.41(l)(6). [40 CFR 122.41(l)(7))]

(8) *Other information.* When the Copermittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the San Diego Water Board, State Water Board, or USEPA, the Copermittee must promptly submit such facts or information. [40 CFR 122.41(l)(8)]

~~**m. BYPASS** [40 CFR 122.41(m)]~~

~~(1) *Definitions.*~~

~~(a) "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. [40 CFR 122.41(m)(1)(i)] or~~

~~(b) "Severe property damage" means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. [40 CFR 122.41(m)(1)(ii)]~~

ADMINISTRATIVE DRAFT

~~(2) *Bypass not exceeding limitations.* The Copermittee may allow any bypass to occur which does not cause effluent limitations to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the standard provisions required under 40 CFR 122.41(m)(3) and (4). [40 CFR 122.41(m)(2)]~~

~~(3) *Notice.*~~

~~(a) *Anticipated bypass.* If the Copermittee knows in advance of the need for a bypass, it must submit a notice, if possible at least ten days before the date of the bypass. [40 CFR 122.41(m)(3)(i)] or~~

~~(b) *Unanticipated bypass.* The Copermittee must submit notice of an unanticipated bypass in accordance with the standard provisions required under 40 CFR 122.41(l)(6) (24-hour notice). [40 CFR 122.41(m)(3)(ii)]~~

~~(4) *Prohibition of Bypass.*~~

~~(a) Bypass is prohibited, and the San Diego Water Board may take enforcement action against a Copermittee for bypass, unless: [40 CFR 122.41(m)(4)(i)]~~

~~(i) Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage; [40 CFR 122.41(m)(4)(i)(A)]~~
~~(ii) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; [40 CFR 122.41(m)(4)(i)(B)] and,~~
~~(iii) The Copermittee submitted notice in accordance with the standard provisions required under 40 CFR 122.41(m)(3). [40 CFR 122.41(m)(4)(i)(C)]~~

~~(b) The San Diego Water Board may approve an anticipated bypass, after considering its adverse effects, if the San Diego Water Board determines that it will meet the three conditions listed above. [40 CFR 122.41(m)(4)(ii)]~~

~~n.~~m. **UPSET** [40 CFR 122.41(n)]

(1) *Definition.* "Upset" means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Copermittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. [40 CFR 122.41(n)(1)]

(2) *Effect of an upset*. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the standard provisions required under 40 CFR 122.41(n)(3) are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. [40 CFR 122.41(n)(2)]

(3) *Conditions necessary for a demonstration of upset*. A Copermittee who wishes to establish the affirmative defense of upset must demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that: [40 CFR 122.41(n)(3)]

(a) An upset occurred and that the Copermittee can identify the cause(s) of the upset; [40 CFR 122.41(n)(3)(i)]
(b) The permitted facility was at the time being properly operated; [40 CFR 122.41(n)(3)(ii)] and
(c) The Copermittee submitted notice of the upset in accordance with the standard provisions required under 40 CFR 122.41(l)(6)(ii)(B) (24-hour notice). [40 CFR 122.41(n)(3)(iii)]
(d) The Copermittee complied with any remedial measures pursuant to the standard provisions required under 40 CFR 122.41(d). [40 CFR 122.41(n)(3)(iii)]

(4) *Burden of proof*. In any enforcement proceeding, the Copermittee seeking to establish the occurrence of an upset has the burden of proof. [40 CFR 122.41(n)(4)]

~~o.~~n. **STANDARD PERMIT PROVISIONS FOR MUNICIPAL SEPARATE STORM SEWER SYSTEMS**
[40 CFR 122.42(c)]

The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the San Diego Water Board or State Water Board under 40 CFR 122.26(a)(1)(v) must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report must include:

(1) The status of implementing the components of the storm water management program that are established as permit conditions; [40 CFR 122.42(c)(1)]

(2) Proposed changes to the storm water management programs that are established as permit conditions. Such proposed changes must be consistent with 40 CFR 122.26(d)(2)(iii); [40 CFR 122.42(c)(2)] and

(3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under 40 CFR 122.26(d)(2)(iv) and (v); [40 CFR 122.42(c)(3)]

(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year; [40 CFR 122.42(c)(4)]

(5) Annual expenditures and budget for year following each annual report;

[40 CFR 122.42(c)(5)]

(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; [40 CFR 122.42(c)(6)]

(7) Identification of water quality improvements or degradation. [40 CFR 122.42(c)(7)]

~~p.~~o. **STANDARD PERMIT PROVISIONS FOR STORM WATER DISCHARGES** [40 CFR 122.42(d)]

The initial permits for discharges composed entirely of storm water issued pursuant to 40 CFR 122.26(e)(7) must require compliance with the conditions of the permit as expeditiously as practicable, but in no event later than three years after the date of issuance of the permit.

2. General Provisions

In addition to the standard provisions required to be incorporated into the Order and NPDES permit pursuant to 40 CFR 122.41 and 40 CFR 122.42, several other general provisions apply to this Order. The general provisions applicable to this Order and NPDES permit are as follows:

a. DISCHARGE OF WASTE IS A PRIVILEGE

No discharge of waste into the waters of the State, whether or not such discharge is made pursuant to waste discharge requirements, shall create a vested right to continue such discharge. All discharges of waste into waters of the State are privileges, not rights. [CWC Section 13263(g)]

b. DURATION OF ORDER AND NPDES PERMIT

(1) *Effective date*. This Order and NPDES permit becomes effective on the date of its adoption provided the USEPA has no objection. If the USEPA objects to its issuance, this Order shall not become effective until such objection is withdrawn. This Order supersedes Order No. R9-2007-0001 upon the effective date of this Order, and supercedes Order Nos. R9-2009-0002 and R9-2010-0016 upon their expiration.

(2) *Expiration*. This Order and NPDES permit expires five years after adoption. [40 CFR 122.46(a)]

(3) *Continuation of expired order*. After this Order and NPDES permit expires, the terms and conditions of this Order and NPDES permit are automatically continued pending issuance of a new permit if all requirements of the federal NPDES regulations on the continuation of expired permits (40 CFR 122.6) are complied with.

c. AVAILABILITY

A copy of this Order must be kept at a readily accessible location and must be available to on-site personnel at all times.

ADMINISTRATIVE DRAFT

d. CONFIDENTIALITY OF INFORMATION

Except as provided for in 40 CFR 122.7, no information or documents submitted in accordance with or in application for this Order will be considered confidential, and all such information and documents shall be available for review by the public at the San Diego Water Board office.

Claims of confidentiality for the following information will be denied:
[40 CFR 122.7(b)]

(1) The name and address of any permit applicant or Copermittee;
[40 CFR 122.7(b)(1)] and

(2) Permit applications and attachments, permits, and effluent data.
[40 CFR 122.7(b)(2)]

e. EFFLUENT LIMITATIONS

(1) *Interim effluent limitations*. The Copermittee must comply with any interim effluent limitations as established by addendum, enforcement action, or revised waste discharge requirements which have been, or may be, adopted by the San Diego Water Board.

(2) *Other effluent limitations and standards*. If any applicable toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant and that standard or prohibition is more stringent than any limitation on the pollutant in the permit, the San Diego Water Board shall institute proceedings under these regulations to modify or revoke and reissue the permit to conform to the toxic effluent standard or prohibition. [40 CFR 122.44(b)(1)]

f. DUTY TO MINIMIZE OR CORRECT ADVERSE IMPACTS

The Copermittee must take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this Order, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncompliance.

g. PERMIT ACTIONS

The filing of a request by the Copermittee for modification, revocation and reissuance, or termination of this Order, or a notification of planned change in or anticipated noncompliance with this Order does not stay any condition of this Order. (See 40 CFR 122.41(f)) In addition, the following provisions apply to this Order:

(1) Upon application by any affected person, or on its own motion, the San Diego Water Board may review and revise the requirements in this Order. All requirements must be reviewed periodically. [CWC Section 13263(e)]

(2) This Order may be terminated or modified for cause, including, but not limited to, all of the following: [CWC Section 13381]

(a) Violation of any condition contained in the requirements of this Order. [CWC Section 13381(a)]

(b) Obtaining the requirements in this Order by misrepresentation, or failure to disclose fully all relevant facts. [CWC Section 13381(b)]

(c) A change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge. [CWC Section 13381(c)]

(3) When this Order is transferred to a new owner or operator, such requirements as may be necessary under the CWC may be incorporated into this Order.

h. NPDES PERMITTED NON-STORM WATER DISCHARGES

The San Diego Water Board has, in prior years, issued a limited number of individual NPDES permits for non-storm water discharges to MS4s. The San Diego Water Board or State Water Board may in the future, upon prior notice to the Copermittee(s), issue an NPDES permit for any non-storm water discharge (or class of non-storm water discharges) to an MS4.

i. MONITORING

In addition to the standard provisions required under 40 CFR 122.41(j) and (l)(4), the following general monitoring provisions apply to this Order:

(1) Where procedures are not otherwise specified in Order, sampling, analysis and quality assurance/quality control must be conducted in accordance with the Quality Assurance Management Plan (QAMP) for the State of California's Surface Water Ambient Monitoring Program (SWAMP), adopted by the State Water Resources Control Board (State Water Board).

(2) Pursuant to 40 CFR 122.41(j)(2) and CWC Section 13383(a), each Copermittee must retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least five (5) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board at any time.

(3) All chemical, bacteriological, and toxicity analyses must be conducted at a laboratory certified for such analyses by the California Department of Public Health or a laboratory approved by the San Diego Water Board.

(4) For priority toxic pollutants that are identified in the California Toxics Rule (CTR) (65 Fed. Reg. 31682), the Copermittees must instruct their laboratories to establish calibration standards that are equivalent to or lower than the Minimum Levels (MLs) published in Appendix 4 of the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). If a Copermittee can demonstrate that a particular ML is not attainable, in accordance

with procedures set forth in 40 CFR Part 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Copermittee must submit documentation from the laboratory to the San Diego Water Board for approval prior to raising the ML for any priority toxic pollutant.

j. ENFORCEMENT

(1) The San Diego Water Board is authorized to enforce the terms of this Order under several provisions of the CWC, including, but not limited to, CWC Sections 13385, 13386, and 13387.

(2) Nothing in this Order shall be construed to protect the Copermittee from its liabilities under federal, state, or local laws.

(3) The CWC provides for civil and criminal penalties comparable to, and in some cases greater than, those provided for under the CWA.

(4) Except as provided in the standard conditions required under 40 CFR 122.41(m) and (n), nothing in this Order shall be construed to relieve the Copermittee from civil or criminal penalties for noncompliance.

(5) Nothing in this Order shall be construed to preclude the institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties to which the Copermittee is or may be subject to under Section 311 of the CWA.

(6) Nothing in this Order shall be construed to preclude institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties established pursuant to any applicable state law or regulation under authoring preserved by Section 510 of the CWA.

k. SEVERABILITY

The provisions of this Order are severable, and if any provision of this Order, or the application of any provisions of this Order to any circumstance, is held invalid, the application of such provision to other circumstances and the remainder of this Order shall not be affected thereby.

l. APPLICATIONS

Any application submitted by a Copermittee for reissuance or modification of this Order must satisfy all applicable requirements specified in federal regulations as well as any additional requirements for submittal of a Report of Waste Discharge specified in the CWC and the California Code of Regulations.

m. IMPLEMENTATION

All plans, reports and subsequent amendments submitted in compliance with this Order must be implemented immediately (or as otherwise specified). All submittals by Copermittees must be adequate to implement the requirements of this Order.

n. REPORT SUBMITTALS

(1) All report submittals must include an executive summary, introduction, conclusion, recommendations, and signed certified statement.

(2) Each Copermittee must submit a signed certified statement covering its responsibilities for each applicable submittal.

(3) The Principal Watershed Copermittee(s) must submit a signed certified statement covering its responsibilities for each applicable submittal and the sections of the submittals for which it is responsible.

(4) Unless otherwise directed, the Copermittees must submit one hard copy and one electronic copy of each report required under this Order to the San Diego Water Board, and one electronic copy to the USEPA.

(5) The Copermittees must submit reports and provide notifications as required by this Order to the following:

WQBEL	Water Quality Based Effluent Limitation

DEFINITIONS

Active/Passive Sediment Treatment - Using mechanical, electrical or chemical means to flocculate or coagulate suspended sediment for removal from runoff from construction sites prior to discharge.

Anthropogenic Litter – Trash generated from human activities, not including sediment.

Average Monthly Action Level – The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month or the geometric mean for bacteria, as applicable.

Beneficial Uses - The uses of water necessary for the survival or well being of man, plants, and wildlife. These uses of water serve to promote tangible and intangible economic, social, and environmental goals. "Beneficial Uses" of the waters of the State that may be protected include, but are not limited to, domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves. Existing beneficial uses are uses that were attained in the surface or ground water on or after November 28, 1975; and potential beneficial uses are uses that would probably develop in future years through the implementation of various control measures. "Beneficial Uses" are equivalent to "Designated Uses" under federal law. [California Water Code Section 13050(f)].

Best Management Practices (BMPs) - Defined in 40 CFR 122.2 as schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. ~~-~~In the case of municipal ~~storm water~~discharge permits, BMPs may be used in place of numeric effluent limits.

Bioassessment - The use of biological community information to evaluate the biological integrity of a water body and its watershed. With respect to aquatic ecosystems, bioassessment is the collection and analysis of samples of the benthic macroinvertebrate community together with physical/habitat quality measurements associated with the sampling site and the watershed to evaluate the biological condition (i.e. biotic integrity) of a water body.

Biocriteria - Under the CWA, numerical values or narrative expressions that define a desired biological condition for a water body that are legally enforceable. The USEPA defines biocriteria as: "numerical values or narrative expressions that describe the reference biological integrity of aquatic communities inhabiting waters of a given designated aquatic life use… (that)…describe the characteristics of water body segments least impaired by human activities."

Biofiltration - Practices that use vegetation and amended soils to detain and treat runoff from impervious areas. Treatment is through filtration, infiltration, adsorption, ion exchange, and biological uptake of pollutants.

Biological Integrity - Defined in Karr J.R. and D.R. Dudley. 1981. Ecological perspective on water quality goals. *Environmental Management* 5:55-68 as: "A balanced, integrated, adaptive community of organisms having a species composition, diversity, and functional organization comparable to that of natural habitat of the region." Also referred to as ecosystem health.

BMP Design Manual – A plan developed to eliminate, reduce, or mitigate the impacts of runoff from development projects, including Priority Development Projects.

Channel Rehabilitation and Improvement –Remedial measures or activities for the purpose of improving or restoring the environmental health of streams, channels or river systems. Techniques may vary from in-stream restoration techniques to off-line stormwater management practices installed in the system corridor or upland areas. Rehabilitation techniques may include, but are not limited to the following: riparian zone restoration, constructed wetlands, bank stabilization, channel modifications, and daylighting of drainage systems. Effectiveness may be measured in various manners, including: assessments of habitat, reduced streambank erosion, and restoration of water and sediment transport balance.

Clean Water Act Section 303(d) Water Body - An impaired water body in which water quality does not meet applicable water quality standards and/or is not expected to meet water quality standards, even after the application of technology based pollution controls required by the CWA. The discharge of runoff to these water bodies by the Copermittees is significant because these discharges can cause or contribute to violations of applicable water quality standards.

Construction Site – Any project, including projects requiring coverage under the Construction General Permit, that involves soil disturbing activities including, but not limited to, clearing, grading, disturbances to ground such as stockpiling, and excavation.

Contamination - As defined in the Porter-Cologne Water Quality Control Act, contamination is "an impairment of the quality of waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of disease. 'Contamination' includes any equivalent effect resulting from the disposal of waste whether or not waters of the State are affected."

Copermittee – An incorporated city within the County of Orange, County of Riverside, or County of San Diego in the San Diego Region (Region 9), the County of Orange, the County of Riverside, the County of San Diego, the Orange County Flood Control District, the Riverside County Water Conservation and Flood Control District, the San Diego Regional Airport Authority, or the Unified Port District of San Diego.

Copermittees – All of the individual Copermittees, collectively.

Critical Channel Flow (Qc) – The channel flow that produces the critical shear stress that initiates bed movement or that erodes the toe of channel banks. When measuring Qc, it should be based on the weakest boundary material – either bed or bank.

Daily Discharge – Defined as either: (1) the total mass of the constituent discharged over the calendar day or any 24 hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g. concentration.)

The Daily Discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day, or other 24 hour period other than a day), or by the arithmetic mean of analytical results from one or more grab samples taken over the course of a day.

Development Projects - Construction, rehabilitation, redevelopment, or reconstruction of any public or private ~~residential project, industrial, commercial, or any other~~ projects involving land disturbance activities.

Dry Season – The period of time from May 1 to September 30 ~~when rainfall is not expected to occur the San Diego~~.

Dry Weather – Weather is considered dry if the preceding 72 hours has been without measurable precipitation (> 0.1 inch).

Enclosed Bays – Enclosed bays are indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost bay works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays do not include inland surface waters or ocean waters.

Erosion – When land is diminished or worn away due to wind, water, or glacial ice. Often the eroded debris (silt or sediment) becomes a pollutant via storm water runoff. Erosion occurs naturally but can be intensified by land clearing activities such as farming, development, road building, and timber harvesting.

Environmentally Sensitive Areas (ESAs) - Areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Board and San Diego Water Board; State Water Quality Protected Areas; water bodies designated with the RARE beneficial use by the State Water Board and San Diego Water Board; areas designated as preserves or their equivalent under the Natural Communities Conservation Program within the Cities and County of Orange; and any other equivalent environmentally sensitive areas which have been identified by the Copermittees.

Estuaries – Waters, including coastal lagoons, located at the mouth of streams that serve as areas of mixing fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and ocean water. Estuaries do not include inland surface waters or ocean waters.

Existing Development – Any area that has been developed and exists for municipal, commercial, industrial, or residential purposes, uses, or activities. May include areas that are not actively used for its originally developed purpose, but may be re-purposed or redeveloped for another use or activity.

Flow Duration – The long-term period of time that flows occur above a threshold that causes significant sediment transport and may cause excessive erosion damage to creeks and streams (not a single storm event duration). The simplest way to visualize this is to consider a histogram of pre- and post-project flows using long-term records of hourly data. To maintain pre-development flow duration means that the total number of hours (counts) within each range of flows in a flow-duration histogram cannot increase between the pre- and post-development condition. Flow duration within the range of geomorphologically significant flows is important for managing erosion.

Grading - The cutting and/or filling of the land surface to a desired slope or elevation.

Hazardous Material – Any substance that poses a threat to human health or the environment due to its toxicity, corrosiveness, ignitability, explosive nature or chemical reactivity. These also include materials named by the USEPA in 40 CFR 116 to be reported if a designated quantity of the material is spilled into the waters of the U.S. or emitted into the environment.

Hazardous Waste - Hazardous waste is defined as "any waste which, under Section 600 of Title 22 of this code, is required to be managed according to Chapter 30 of Division 4.5 of Title 22 of this code" [CCR Title 22, Division 4.5, Chapter 11, Article 1].

Household Hazardous Waste – Paints, cleaning products, and other wastes generated during home improvement or maintenance activities.

Hydromodification – The change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, interflow and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport. In addition, alteration of stream and river channels, such as stream channelization, concrete lining, installation of dams and water impoundments, and excessive streambank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

Illicit Connection – Any connection to the MS4 that conveys an illicit discharge.

Illicit Discharge - Any discharge to the MS4 that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities [40 CFR 122.26(b)(2)].

Inactive Areas – Areas of construction activity that are not active and those that have been active and are not scheduled to be re-disturbed for at least 14 days.

Infiltration – Water other than wastewater that enters a sewer system (including sewer service connections and foundation drains) from the ground through such means as defective pipes, pipe joints, connections, or manholes. Infiltration does not include, and is distinguished from, inflow [40 CFR 35.2005(20)]. In the context of low impact development, infiltration may also be defined as the percolation of water into the ground. Infiltration is often expressed as a rate (inches per hour), which is determined through an infiltration test.

Inland Surface Waters – Includes all surface waters of the ~~State~~ U.S. that do not include the ocean, enclosed bays, or estuaries.

Jurisdictional Runoff Management Program Document – A written description of the specific jurisdictional runoff management measures and programs that each Copermittee will implement to comply with this Order and ensure that storm water pollutant discharges in runoff are reduced to the MEP and do not cause or contribute to a violation of water quality standards.

Low Impact Development (LID) – A storm water management and land development strategy that emphasizes conservation and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.

Low Impact Development Best Management Practices (LID BMPs) – LID BMPs include schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States through storm water management and land development strategies that emphasize conservation ~~s~~and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions. LID BMPs include retention practices that do not allow runoff, such as infiltration, rain water harvesting and reuse, and evapotranspiration. LID BMPs also include flow-through practices such as biofiltration that may have some discharge of storm water following pollutant reduction.

Major Outfall – As defined in the Code of Federal Regulations, a major outfall is a MS4 outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (i.e. discharge from a single conveyance other than a circular pipe which is associated with a drainage area of more than 50 acres); or, for MS4s that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or equivalent), a MS4 outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (i.e. discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

Maximum Daily Action Level (MDAL) –The highest allowable daily discharge of a pollutant, over a calendar day (or 24 hour period). For pollutants with action levels expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with action levels expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Maximum Extent Practicable (MEP) – The technology-based standard established by Congress in CWA section 402(p)(3)(B)(iii) for storm water that operators of MS4s must meet. Technology-based standards establish the level of pollutant reductions that dischargers must achieve, typically by treatment or by a combination of source control and treatment control BMPs. MEP generally emphasizes pollution prevention and source control BMPs primarily (as the first line of defense) in combination with treatment methods serving as a backup (additional line of defense). MEP considers economics and is generally, but not necessarily, less stringent than BAT. A definition for MEP is not provided either in the statute or in the regulations. Instead the definition of MEP is dynamic and will be defined by the following process over time: municipalities propose their definition of MEP by way of their runoff management programs. Their total collective and individual activities conducted pursuant to the runoff management programs becomes their proposal for MEP as it applies both to their overall effort, as well as to specific activities (e.g., MEP for street sweeping, or MEP for MS4 maintenance). In the absence of a proposal acceptable to the San Diego Water Board, the San Diego Water Board defines MEP.

In a memo dated February 11, 1993, entitled "Definition of Maximum Extent Practicable," Elizabeth Jennings, Senior Staff Counsel, SWRCB addressed the achievement of the MEP standard as follows:

> "*To achieve the MEP standard, municipalities must employ whatever Best Management Practices (BMPs) are technically feasible (i.e., are likely to be effective) and are not cost prohibitive. The major emphasis is on technical feasibility. Reducing pollutants to the MEP means choosing effective BMPs, and rejecting applicable BMPs only where other effective*

BMPs will serve the same purpose, or the BMPs would not be technically feasible, or the cost would be prohibitive. In selecting BMPs to achieve the MEP standard, the following factors may be useful to consider:

a. Effectiveness: Will the BMPs address a pollutant (or pollutant source) of concern?
b. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?
c. Public Acceptance: Does the BMP have public support?
d. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?
e. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc.?

The final determination regarding whether a municipality has reduced pollutants to the maximum extent practicable can only be made by the Regional or State Water Boards, and not by the municipal discharger. If a municipality reviews a lengthy menu of BMPs and chooses to select only a few of the least expensive, it is likely that MEP has not been met. On the other hand, if a municipal discharger employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit derived, it would have met the standard. Where a choice may be made between two BMPs that should provide generally comparable effectiveness, the discharger may choose the least expensive alternative and exclude the more expensive BMP. However, it would not be acceptable either to reject all BMPs that would address a pollutant source, or to pick a BMP based solely on cost, which would be clearly less effective. In selecting BMPs the municipality must make a serious attempt to comply and practical solutions may not be lightly rejected. In any case, the burden would be on the municipal discharger to show compliance with its permit. After selecting a menu of BMPs, it is the responsibility of the discharger to ensure that all BMPs are implemented."

Monitoring Year – The monitoring year begins annually on July 1st and ends on June 30th.

Municipal Separate Storm Sewer System (MS4) – A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or designated and approved management agency under section 208 of the CWA that discharges to waters of the United States; (ii) Designated or used for collecting or conveying storm water; (iii) Which is not a combined sewer; (iv) Which is not part of the Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.26. Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators." 40 CFR §122.21(a)(vi).

National Pollutant Discharge Elimination System (NPDES) - The national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under Sections 307, 318, 402, and 405 of the CWA.

Non-Storm Water - All discharges to and from a MS4 that do not originate from precipitation events (i.e., all discharges from a MS4 other than storm water). Non-storm water includes illicit discharges and NPDES permitted discharges.

Nuisance - As defined in the Porter-Cologne Water Quality Control Act, a nuisance is "anything which meets all of the following requirements: 1) Is injurious to health, or is indecent, or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property. 2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal. 3) Occurs during~~,~~ or as a result of~~,~~ the treatment or disposal of wastes."

Ocean Waters – the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Board's California Ocean Plan.

Order – Unless otherwise specified, refers to this Order, Order No. R9-2012-0011 (NPDES No. CAS0109266)

~~**Permanent BMP Sizing Criteria Design Manual** – A plan developed to eliminate, reduce, or mitigate the impacts of runoff from development projects, including Priority Development Projects.~~

Person - A person is defined as an individual, association, partnership, corporation, municipality, State or Federal agency, or an agent or employee thereof [40 CFR 122.2].

Point Source - Any discernible, confined, and discrete conveyance, including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operations, landfill leachate collection systems, vessel, or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

Pollutant - Any agent that may cause or contribute to the degradation of water quality such that a condition of pollution or contamination is created or aggravated.

Pollution - As defined in the Porter-Cologne Water Quality Control Act, pollution is "the alteration of the quality of the waters of the State by waste, to a degree that unreasonably affects the either of the following: 1) The waters for beneficial uses; or 2) Facilities that serve these beneficial uses." Pollution may include contamination.

Pollution Prevention - Pollution prevention is defined as practices and processes that reduce or eliminate the generation of pollutants, in contrast to source control BMPs, treatment control BMPs, or disposal.

Permanent BMPs - A subset of BMPs including structural and non-structural controls which detain, retain, filter, remove, or educate to prevent the release of pollutants to surface waters from development projects in perpetuity, after construction of a project is completed.

Pre-Development Runoff Conditions (Discharge Rates, Durations, Etc.) – Runoff conditions that existed onsite before the existing development was constructed, or exists onsite before planned development activities occur. ~~This definition includes natural watershed hydrology before any human induced land alterations.~~

ADMINISTRATIVE DRAFT

Priority Development Projects - New development and redevelopment projects defined under Provision E.3.b of Order No. R9-2012-0011.

Properly Designed – Designed in accordance with the Copermittee's BMP design manual and/or any appropriate design requirements set forth by the Copermittee and based on widely accepted design criteria.

Rainy Season (aka Wet Season) – The period of time from October 1 to April 30~~ when the San Diego Region experiences the most rainfall~~.

Receiving Waters – Waters of the United States.

Receiving Water Limitations - Waste discharge requirements issued by the San Diego Water Board typically include both: (1) "Effluent Limitations" (or "Discharge Limitations") that specify the technology-based or water-quality-based effluent limitations; and (2) "Receiving Water Limitations" that specify the water quality objectives in the Basin Plan as well as any other limitations necessary to attain those objectives. In summary, the "Receiving Water Limitations" provision is the provision used to implement the requirement of CWA section 301(b)(1)(C) that NPDES permits must include any more stringent limitations necessary to meet water quality standards.

Redevelopment - The creation, addition, and or replacement of impervious surface on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces. Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include trenching and resurfacing associated with utility work; parking lots; resurfacing existing roadways; cutting and reconfiguring of surface parking lots; new sidewalk construction, pedestrian ramps, or bike lane on existing roads; and routine replacement of damaged pavement, such as pothole repair.

Retain –Keep or hold in a particular place, condition, or position without discharge to surface waters.

Retrofit – Retrofit is defined as a stormwater management practice (usually structural) put into place after development has occurred in watersheds where practices previously did not exist or are ineffective. The purpose of retrofits is to improve water quality, protect downstream channels, reduce flooding, or meet other specific objectives. Some examples of retrofits include, but are not limited to the following: green roofs, downspout and impervious cover disconnection, permeable pavement, bioretention, rain barrels, rain gardens, vacant lot stabilization, trash area enclosures, additional trash and waste disposal containers.

Runoff - All flows in a storm water conveyance system that consists of the following components: (1) storm water (wet weather flows) and (2) non-storm water including dry weather flows.

San Diego Water Board – As used in this document the term "San Diego Water Board" is synonymous with the term "Regional Board" as defined in Water Code section 13050(b) and is intended to refer to the California Regional Water Quality Control Board for the San Diego

Region as specified in Water Code Section 13200.

Sediment - Soil, sand, and minerals washed from land into water. Sediment resulting from anthropogenic sources (i.e. human induced land disturbance activities) is considered a pollutant. This Order regulates only the discharges of sediment from anthropogenic sources and does not regulate naturally occurring sources of sediment. Sediment can destroy fish-nesting areas, clog animal habitats, and cloud waters so that sunlight does not reach aquatic plants.

Shared Treatment Control BMP - BMPs used by multiple developments to infiltrate, filter, or treat the required volume or flow prior to discharge to a receiving water. This could include, for example, a treatment BMP at the end of an enclosed storm drain that collects runoff from several commercial developments.

Source Control BMP – Land use or site planning practices, or structural or nonstructural measures that aim to prevent runoff pollution by reducing the potential for contamination at the source of pollution. Source control BMPs minimize the contact between pollutants and runoff.

State Water Quality Protection Area – A nonterrestrial marine or estuarine area designated to protect marine species or biological communities from an undesirable alteration in natural water quality, including, but not limited to, areas of special biological significance that have been designated by the State Water Board through its water quality control planning process. Areas of special biological significance are a subset of State Water Quality Protection Areas, and require special protection as determined by the State Water Resources Control Board pursuant to the California Ocean Plan adopted and reviewed pursuant to Article 4 (commencing with Section 13160) of Chapter 3 of Division 7 of the California Water Code and pursuant to the Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California (California Thermal Plan) adopted by the State Water Board.

Storm Water – Per 40 CFR 122.26(b)(13), means storm water runoff, snowmelt runoff and surface runoff and drainage. ~~Surface runoff and drainage pertains to runoff and drainage resulting from precipitation events.~~

Structural BMP – Any structural control which detains, retains, or filters, to reduce the release of pollutants to surface waters from development projects (e.g. treatment control BMPs) which remains after construction.

Total Maximum Daily Load (TMDL) - The maximum amount of a pollutant that can be discharged into a water body from all sources (point and non-point) and still maintain water quality standards. Under CWA section 303(d), TMDLs must be developed for all water bodies that do not meet water quality standards after application of technology-based controls.

Toxicity - Adverse responses of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies). The water quality objectives for toxicity provided in the Basin Plan, state in part…"All waters shall be free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life….The survival of aquatic life in surface waters subjected to a waste discharge or other controllable water quality factors, shall not be less than that for the same water body in areas unaffected by the waste discharge".

Treatment Control BMP – Any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

Unpaved Road – Any long, narrow stretch without pavement used for traveling by motor passenger vehicles between two or more points. Unpaved roads are generally constructed of dirt, gravel, aggregate or macadam and may be improved or unimproved.

Waste - As defined in CWC Section 13050(d), “waste includes sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for purposes of, disposal.”

Article 2 of CCR Title 23, Chapter 15 (Chapter 15) contains a waste classification system that applies to solid and semi-solid waste, which cannot be discharged directly or indirectly to water of the state and which therefore must be discharged to land for treatment, storage, or disposal in accordance with Chapter 15. There are four classifications of waste (listed in order of highest to lowest threat to water quality): hazardous waste, designated waste, non-hazardous solid waste, and inert waste.

Water Quality Objective - Numerical or narrative limits on constituents or characteristics of water designated to protect designated beneficial uses of the water. [California Water Code Section 13050 (h)]. California’s water quality objectives are established by the State and Regional Water Boards in the Water Quality Control Plans. Numeric or narrative limits for pollutants or characteristics of water designed to protect the beneficial uses of the water. In other words, a water quality objective is the maximum concentration of a pollutant that can exist in a receiving water and still generally ensure that the beneficial uses of the receiving water remain protected (i.e., not impaired). Since water quality objectives are designed specifically to protect the beneficial uses, when the objectives are violated the beneficial uses are, by definition, no longer protected and become impaired. This is a fundamental concept under the Porter Cologne Act. Equally fundamental is Porter Cologne’s definition of pollution. A condition of pollution exists when the water quality needed to support designated beneficial uses has become unreasonably affected or impaired; in other words, when the water quality objectives have been violated. These underlying definitions (regarding beneficial use protection) are the reason why all waste discharge requirements implementing the federal NPDES regulations require compliance with water quality objectives. (Water quality objectives are also called water quality criteria in the CWA.)

Water Quality Standards - Water quality standards, as defined in Clean Water Act section 303(c) consist of the beneficial uses (e.g., swimming, fishing, municipal drinking water supply, etc.,) of a water body and criteria (referred to as water quality objectives in the California Water Code) necessary to protect those uses. Under the Water Code, the water boards establish beneficial uses and water quality objectives in water quality control or basin plans. Together with an anti-degradation policy, these beneficial uses and water quality objectives serve as water quality standards under the Clean Water Act. In Clean Water Act parlance, state beneficial uses are called “designated uses” and state water quality objectives are called “criteria.” Throughout this Order, the relevant term is used depending on the statutory scheme.

Waters of the State - Any water, surface or underground, including saline waters within the boundaries of the State [CWC section 13050 (e)]. The definition of the Waters of the State is

ADMINISTRATIVE DRAFT

broader than that for the Waters of the United States in that all water in the State is considered to be a Waters of the State ~~regardless of circumstances or condition~~. Under this definition, a portions of the MS4 may ~~is always considered~~be considered to be a Waters of the State. However, man-made portions of the MS4 constructed for the sole purpose flow and/or pollutant reduction are not considered waters of the state.

Waters of the United States - As defined in the 40 CFR 122.2, the Waters of the U.S. are defined as: "(a) All waters, which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters, including interstate "wetlands;" (c) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation or destruction of which would affect or could affect interstate or foreign commerce including any such waters: (1) Which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) Which are used or could be used for industrial purposes by industries in interstate commerce; (d) All impoundments of waters otherwise defined as waters of the United States under this definition: (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial seas; and (g) "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with the EPA."

Watershed - That geographical area which drains to a specified point on a water course, usually a confluence of streams or rivers (also known as drainage area, catchment, or river basin).

Wet Season (aka Rainy Season) – The period of time from October 1 to April 30 when the San Diego Region experiences the most rainfall.

Wet Weather – Weather is considered wet if there is a storm event of 0.1 inches and greater and ~~the following~~ preceded by 72 hours of dry weather, unless defined in another manner within another regulatory mechanism such as a TMDL.

I. COPERMITTEE INFORMATION		
Copermittee Name:		
Copermittee Primary Contact Name:		
Copermittee Primary Contact Information: Address: City: County: State: Zip: Telephone: Fax: Email:		
II. LEGAL AUTHORITY		
Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES NO	☐ ☐
III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE		
Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES NO	☐ ☐
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES NO	☐ ☐
IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM		
Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
Number of non-storm water discharges reported by the public		
Number of non-storm water discharges detected by Copermittee staff or contractors		
Number of non-storm water discharges investigated by the Copermittee		
Number of sources of non-storm water discharges identified		
Number of non-storm water discharges eliminated		
Number of sources of illicit discharges or connections identified		
Number of illicit discharges or connections eliminated		
Number of enforcement actions issued		
Number of high level enforcement actions issued		
V. DEVELOPMENT PLANNING PROGRAM		
Has the Copermittee implemented a development planning program that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
Was an update to the ~~Permanent~~ BMP ~~Sizing Criteria~~ Design Manual required or recommended by the San Diego Water Board?	YES NO	☐ ☐
If YES to the question above, did the Copermittee update its ~~Permanent~~ BMP ~~Sizing Criteria~~ Design Manual and make it available on the Regional Clearinghouse?	YES NO	☐ ☐
Number of proposed development projects in review		
Number of Priority Development Projects in review		
Number of Priority Development Projects approved		
Number of approved Priority Development Projects exempt from any BMP requirements		
Number of approved Priority Development Projects requiring mitigation		
Number of Priority Development Projects granted occupancy		
Number of completed Priority Development Projects in inventory		
Number of high priority Priority Development Project ~~permanent~~ structural BMP inspections		
Number of Priority Development Project ~~permanent~~ structural BMP violations		
Number of enforcement actions issued

VI. CONSTRUCTION MANAGEMENT PROGRAM		
Has the Copermittee implemented a construction management program that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
Number of construction sites in inventory		
Number of active construction sites in inventory		
Number of inactive construction sites in inventory		
Number of construction sites closed/completed during reporting period		
Number of construction site inspections		
Number of construction site violations		
Number of enforcement actions issued		
Number of high level enforcement actions issued		

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM		
Has the Copermittee implemented an existing development management program that complies with Order No. R9-2012-0011?	YES NO	☐ ☐

	Municipal	Commercial	Industrial	Residential
Number of existing developments in inventory				
Number of existing development inspections				
Number of follow-up inspections				
Number of existing development violations				
Number of enforcement actions issued				
Number of high level enforcement actions issued				

VIII. PUBLIC EDUCATION AND PARTICIPATION		
Has the Copermittee implemented a public education program that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
Has the Copermittee implemented a mechanism for public participation and where necessary intergovernmental coordination that complies with Order No. R9-2012-0011?	YES NO	☐ ☐
IX. FISCAL ANALYSIS		
Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2012-0011?	YES NO	☐ ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☐ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

ADMINISTRATIVE DRAFT

ATTACHMENT E

SPECIFIC PROVISIONS FOR TOTAL MAXIMUM DAILY LOADS APPLICABLE TO ORDER NO. R9-2012-0011

These provisions implement Total Maximum Daily Loads (TMDLs), adopted by the San Diego Water Board and approved by USEPA under Clean Water Act section 303(c), which are applicable to discharges regulated under this Order. The provisions and schedules for implementation of the TMDLs described below must be incorporated into the Water Quality Improvement Plans and monitoring requirements, required pursuant to Provisions B and D of this Order, respectively, for the specified Watershed Management Areas.

1. Total Maximum Daily Load for Diazinon in Chollas Creek Watershed Resolution No. R9-2002-0123
2. Total Maximum Daily Loads for Dissolved Copper in Shelter Island Yacht Basin Resolution No. R9-2005-0019
3. ~~Total Maximum Daily Loads for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed Resolution No. R9-2005-0036~~
4. ~~4.~~3. Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek Resolution No. R9-2007-0043
5. ~~5.~~4. Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay Resolution No. R9-2008-0027
6. ~~6.~~5. Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek) Resolution No. R9-2010-0001

1. Total Maximum Daily Load for Diazinon in Chollas Creek Watershed

a. Applicability

(1) TMDL Basin Plan Amendment: Resolution No. R9-2002-0123

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date: August 14, 2002
State Water Board Approval Date: July 16, 2003
Office of Administrative Law Approval Date: September 11, 2003
US EPA Approval Date: November 3, 2003

(3) TMDL Effective Date: September 11, 2003

(4) Watershed Management Area: San Diego Bay

(5) Water Body: Chollas Creek

(6) Responsible Copermittees: City of La Mesa, City of Lemon Grove, City of San Diego, County of San Diego, Unified Port District of San Diego

b. Water Quality Based Effluent Limitations

The WQBELs for Chollas Creek consist of the following:

(1) Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedule under Specific Provision 1.c:

Table 1.1
Receiving Water Limitations as Concentrations in Chollas Creek

Constituent	Exposure Duration	Receiving Water Limitation	Averaging Period
Diazinon	Acute	0.08 µg/L	1 hour
	Chronic	0.05 µg/L	4 days

(2) Effluent Limitations

Discharges from the MS4s must not contain concentrations that exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 1.c:

Table 1.2
Effluent Limitations as Concentrations in MS4 Discharges to Chollas Creek

Constituent	Exposure Duration	Effluent Limitation	Averaging Period
Diazinon	Acute	0.072 µg/L	1 hour
	Chronic	0.045 µg/L	4 days

(3) Best Management Practices

~~The following~~BMPs for Chollas Creek may~~must~~ be incorporated into the Water Quality Improvement Plan for the San Diego Bay Watershed Management Area and implemented by the Responsible Copermittees:

~~(a) The Responsible Copermittees must implement BMPs capable of achieving the WQBELs under Specific Provision 1.b for Chollas Creek.~~

~~(b) The Responsible Copermittees must implement the Diazinon Toxicity Control Plan and Diazinon Public Outreach/Education Program as described in the report titled, *Technical Report for Total Maximum Daily Load for Diazinon in Chollas Creek Watershed, San Diego County*, dated August 14, 2002, including subsequent modifications, in order to achieve the WQBELs under Specific Provision 1.b.~~

~~(c)~~(a) The Responsible Copermittees should coordinate any implemented~~the~~ BMPs to address this TMDL with Caltrans ~~wherever and whenever~~as possible.

c. Compliance Schedule

The Responsible Copermittees were required to achieve their WLA by December 31, 2010. The Responsible Copermittees must be in compliance with the WQBELs under Specific Provision 1.b.

d. Compliance Determination

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(1) There is no discharge from the MS4, or
(2) Applicable effluent limitations are met, or
(3) Receiving waters meet the applicable receiving water limitations or water quality objective, or
(4) Loading from the MS4 is such that it does not cause water quality objective exceedances, or
(5) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision II.A as described in Provision II.A.4.

~~d.~~e. Specific Monitoring and Assessment Requirements

(a) The Responsible Copermittees must implement the monitoring and assessment requirements issued under Investigation Order No. R9-2004-0277, *California Department of Transportation and San Diego Municipal Separate Storm Sewer System Copermittees Responsible for the Discharge of Diazinon into the Chollas Creek Watershed*. The monitoring reports required under Investigation Order No. R9-2004-0277 must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~(b) The Responsible Copermittees must monitor the effluent of the MS4 outfalls for diazinon within the Chollas Creek watershed, and calculate or estimate the monthly and annual diazinon loads, in accordance with the requirements of Provisions D.1, D.4.a.(1)(b), and D.4.a.(3)(b) of this Order. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.~~

ADMINISTRATIVE DRAFT

2. Total Maximum Daily Loads for Dissolved Copper in Shelter Island Yacht Basin

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2005-0019

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date:	February 9, 2005
State Water Board Approval Date:	September 22, 2005
Office of Administrative Law Approval Date:	December 2, 2005
US EPA Approval Date:	February 8, 2006

(3) TMDL Effective Date: December 2, 2005

(4) Watershed Management Area: San Diego Bay

(5) Water Body: Shelter Island Yacht Basin

(6) Responsible Copermittees: City of San Diego, San Diego Unified Port District

b. WATER QUALITY BASED EFFLUENT LIMITATIONS

The WQBELs for Shelter Island Shoreline Park consist of the following:

(1) Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedule under Specific Provision 2.c:

Table 2.1
Receiving Water Limitations as Concentrations in Shelter Island Yacht Basin

Constituent	Exposure Duration	Effluent Limitation	Averaging Period
Dissolved Copper	Acute	4.8 µg/L	1 hour
	Chronic	3.1 µg/L	4 days

(2) Effluent Limitations

Discharges from the MS4s must not contain pollutant loads that exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 2.c:

Table 2.2
Effluent Limitations as Annual Loads in MS4 Discharges to Shelter Island Yacht Basin

Constituent	Effluent Limitation
Dissolved Copper	30 kg/yr

(3) Best Management Practices

The Responsible Copermittees may~~ust~~ implement BMPs to support the achievement of ~~capable of achieving~~ the WQBELs under Specific Provision 2.b for Shelter Island Yacht Basin

c. COMPLIANCE SCHEDULE

The Responsible Copermittees are ~~was~~ required to achieve the respective ~~its~~ WLAs ~~upon the effective date of the TMDL, December 2, 2005~~by December 2, 2022. The Responsible Copermittees must be in compliance with the WQBELs under Specific Provision 2.b.

d. COMPLIANCE DETERMINATION

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(6) There is no discharge from the MS4, or
(7) Applicable effluent limitations are met, or
(8) Receiving waters meet the applicable receiving water limitations or water quality objective, or
(9) Loading from the MS4 is such that it does not cause water quality objective exceedances, or
(10) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision II.A as described in Provision II.A.4.

~~d.~~e. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

The Responsible Copermittees must implement the monitoring and assessment requirements issued under Order No. R9-2005-0019. ~~monitor the effluent of its MS4 outfalls for dissolved copper, and calculate or estimate the monthly and annual dissolved copper loads, in accordance with the requirements of Provisions D.1, D.4.a.(1)(b), and D.4.a.(3)(b) of this Order.~~ The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~3. Total Maximum Daily Loads for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed~~

~~a. APPLICABILITY~~

~~(1) TMDL Basin Plan Amendment: Resolution No. R9-2005-0036~~

~~(2) TMDL Adoption and Approval Dates:~~

~~San Diego Water Board Adoption Date: February 9, 2005~~
~~State Water Board Approval Date: November 16, 2005~~
~~Office of Administrative Law Approval Date: February 1, 2006~~
~~US EPA Approval Date: March 22, 2006~~

~~(3) TMDL Effective Date: February 1, 2006~~

~~(4) Watershed Management Area: Santa Margarita River~~

~~(5) Water Body: Rainbow Creek~~

~~(6) Responsible Copermittee: County of San Diego~~

~~b. WATER QUALITY BASED EFFLUENT LIMITATIONS~~

~~The WQBELs for Rainbow Creek consist of the following~~

~~(1) Receiving Water Limitations~~

~~Discharges from the MS4s must not have a reasonable potential to cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedule under Specific Provision 3.c.(1):~~

Formatted: No underline

~~**Table 3.1**~~
~~*Receiving Water Limitations as Concentrations in Rainbow Creek*~~

~~Constituent~~	~~Receiving Water Limitation~~
~~Nitrate (as N)~~	~~10 mg/L~~
~~Total Nitrogen~~	~~1 mg/L~~
~~Total Phosphorus~~	~~0.1 mg/L~~

~~(2) Effluent Limitations~~

~~(a) Discharges from the MS4s must not contain concentrations that exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 3.c.(1):~~

~~**Table 3.2**~~
~~*Effluent Limitations as Concentrations in MS4 Discharges to Rainbow Creek*~~

~~Constituent~~	~~Effluent Limitation~~
~~Nitrate (as N)~~	~~10 mg/L~~
~~Total Nitrogen~~	~~1 mg/L~~
~~Total Phosphorus~~	~~0.1 mg/L~~

~~(b) Pollutant loads from given land uses discharging to and from the MS4s must not exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 3.c.(1):~~

~~**Table 3.3**~~
~~*Effluent Limitations as Annual Loads in MS4 Discharges to Rainbow Creek*~~

~~Land Use~~	~~Total N~~	~~Total P~~
~~Commercial nurseries~~	~~116 kg/yr~~	~~3 kg/yr~~
~~Park~~	~~3 kg/yr~~	~~0.1 kg/yr~~
~~Residential areas~~	~~149 kg/yr~~	~~12 kg/yr~~
~~Urban areas~~	~~27 kg/yr~~	~~6 kg/yr~~

~~Interim effluent limitations expressed as pollutant loads are given in the compliance schedule under Specific Provision 3.0.~~

~~(3) Best Management Practices~~

~~(a) The Responsible Copermittee must implement BMPs capable of achieving the WQBELs under Specific Provision 3.b for Rainbow Creek.~~

~~(b) The Responsible Copermittee should coordinate the BMPs to address this TMDL with Caltrans and other sources wherever and whenever possible.~~

~~c. COMPLIANCE SCHEDULE~~

~~(1) WLA Compliance Date~~

~~The Responsible Copermittee is required to achieve its WLAs, thus must be in compliance with the WQBELs under Specific Provision 3.b, by December 31, 2021.~~

~~(2) Interim Compliance Requirements~~

~~**Table 3.4**~~
~~*Interim Effluent Limitations as Annual Loads in MS4 Discharges from Specific Land Uses to Rainbow Creek*~~

	~~Total N Interim Effluent Limitations (kg/yr)~~			~~Total P Interim Effluent Limitations (kg/yr)~~		
	~~Interim Compliance Date~~			~~Interim Compliance Date~~		
~~Land Use~~	~~2009~~	~~2013~~	~~2017~~	~~2009~~	~~2013~~	~~2017~~
~~Commercial nurseries~~	~~399~~	~~299~~	~~196~~	~~20~~	~~16~~	~~10~~
~~Park~~	~~5~~	~~3~~	~~3~~	~~0.15~~	~~0.10~~	~~0.10~~
~~Residential areas~~	~~507~~	~~390~~	~~260~~	~~99~~	~~74~~	~~47~~
~~Urban areas~~	~~40~~	~~27~~	~~27~~	~~9~~	~~6~~	~~6~~

~~COMPLIANCE DETERMINATION~~

~~Compliance may be demonstrated via any one of the following methods:~~

- ~~There is no discharge from the MS4, or~~
- ~~Applicable effluent limitations are met, or~~
- ~~Receiving waters meet the applicable receiving water limitations or water quality objective, or~~
- ~~Loading from the MS4 is such that it does not cause water quality objective exceedances, or~~
- ~~For Permittee(s) that are implementing a Regional Board-approved WQIP, WQBELs will be implemented as BMPs and compliance will be based upon implementing all provisions of the WQIP in accordance with the approved milestones and schedule.~~

~~d. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS~~

~~The Responsible Copermittee must implement the Sampling and Analysis Plan for Rainbow Creek Nutrient Reduction TMDL Implementation Water Quality Monitoring, dated January 2010. The results of any monitoring conducted during the reporting period, and assessment of whether the interim and final WQBELs have been achieved must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.~~

~~4.~~3. Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2007-0043

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date: June 13, 2007
State Water Board Approval Date: July 15, 2008
Office of Administrative Law Approval Date: October 22, 2008
US EPA Approval Date: December 18, 2008

(3) TMDL Effective Date: October 22, 2008

(4) Watershed Management Area: San Diego Bay

(5) Water Body: Chollas Creek

(6) Responsible Copermittees: City of La Mesa, City of Lemon Grove, City of San Diego, County of San Diego, San Diego Unified Port District ~~of San Diego~~

b. WATER QUALITY BASED EFFLUENT LIMITATIONS

The WQBELsfor Chollas Creek consist of the following:

(1) Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedule under Specific Provision 4.c.(1):

Table 4.1
Receiving Water Limitations as Concentrations in Chollas Creek

Constituent	Exposure Duration	Effluent Limitation (µg/L)	Averaging Period
Dissolved Copper	Acute	$(0.96) \times e^{[0.9422 \times \ln(\text{hardness}) - 1.700]} \times \text{WER*}$	1 hour
	Chronic	$(0.96) \times e^{[0.8545 \times \ln(\text{hardness}) - 1.702]} \times \text{WER*}$	4 days
Dissolved Lead	Acute	$[1.46203 - 0.145712 \times \ln(\text{hardness})] \times e^{[1.273 \times \ln(\text{hardness}) - 1.460]} \times \text{WER*}$	1 hour
	Chronic	$[1.46203 - 0.145712 \times \ln(\text{hardness})] \times e^{[1.273 \times \ln(\text{hardness}) - 4.705]} \times \text{WER*}$	4 days
Dissolved Zinc	Acute	$(0.978) \times e^{[0.8473 \times \ln(\text{hardness}) + 0.884]} \times \text{WER*}$	1 hour
	Chronic	$(0.986) \times e^{[0.8473 \times \ln (\text{hardness}) + 0.884]} \times \text{WER*}$	4 days

Formatted: No underline
Formatted: No underline

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

(2) Effluent Limitations

Discharges from the MS4s must not contain pollutant loads that exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 4.c.(1):

Table 4.2
Effluent Limitations as Concentrations in MS4 Discharges to Chollas Creek

Constituent	Exposure Duration	Effluent Limitation (µg/L)	Averaging Period
Dissolved Copper	Acute	90% x (0.96) x $e^{[0.9422 \times \ln(hardness) - 1.700]}$ x WER*	1 hour
	Chronic	90% x (0.96) x $e^{[0.8545 \times \ln(hardness) - 1.702]}$ x WER*	4 days
Dissolved Lead	Acute	90% x [1.46203 – 0.145712 x ln(hardness)] x $e^{[1.273 \times \ln(hardness) - 1.460]}$ x WER*	1 hour
	Chronic	90% x [1.46203 – 0.145712 x ln(hardness)] x $e^{[1.273 \times \ln(hardness) - 4.705]}$ x WER*	4 days
Dissolved Zinc	Acute	90% x (0.978) x $e^{[0.8473 \times \ln(hardness) + 0.884]}$ x WER*	1 hour
	Chronic	90% x (0.986) x $e^{[0.8473 \times \ln(hardness) + 0.884]}$ x WER*	4 days

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

(3) Best Management Practices

(a) The Responsible Copermittees may ~~must~~ implement BMPs to support the achievement of ~~capable of achieving the~~ WQBELs under Specific Provision 4.b for Chollas Creek.

(b) The Responsible Copermittees should coordinate the BMPs to address this TMDL with Caltrans and the U.S. Navy ~~wherever and whenever~~as possible.

c. COMPLIANCE SCHEDULE

(1) WLA Compliance Date

The Responsible Copermittee is required to achieve the WLA, thus must be in compliance with the WQBELs under Specific Provision 4.b, by October 22, 2028.

(2) Interim Compliance Requirements

The Responsible Copermittee must comply with the following interim WQBELs by the interim compliance date:

Table 4.3
Interim Effluent Limitations as Concentrations in MS4 Discharges to Chollas Creek

Interim Compliance Date	Constituent	Exposure Duration	Effluent Limitation (µg/L)	Averaging Period
October 22, 2018	Dissolved Copper	Acute	1.2 x 90% x (0.96) x $e^{[0.9422 \times \ln(\text{hardness}) - 1.700]}$ x WER*	1 hour
		Chronic	1.2 x 90% x (0.96) x $e^{[0.8545 \times \ln(\text{hardness}) - 1.702]}$ x WER*	4 days
	Dissolved Lead	Acute	1.2 x 90% x [1.46203 – 0.145712 x ln(hardness)] x $e^{[1.273 \times \ln(\text{hardness}) - 1.460]}$ x WER*	1 hour
		Chronic	1.2 x 90% x [1.46203 – 0.145712 x ln(hardness)] x $e^{[1.273 \times \ln(\text{hardness}) - 4.705]}$ x WER*	4 days
	Dissolved Zinc	Acute	1.2 x 90% x (0.978) x $e^{[0.8473 \times \ln(\text{hardness}) + 0.884]}$ x WER*	1 hour
		Chronic	1.2 x 90% x (0.986) x $e^{[0.8473 \times \ln(\text{hardness}) + 0.884]}$ x WER*	4 days

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

d. COMPLIANCE DETERMINATION

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(1) There is no discharge from the MS4, or
(2) Applicable effluent limitations are met, or
(3) Receiving waters meet the applicable receiving water limitations or water quality objective, or
(4) Loading from the MS4 is such that it does not cause water quality objective exceedances, or
(5) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision II.A as described in Provision II.A.4.

~~d.~~e. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

(a) The Responsible Copermittees must implement the monitoring and assessment requirements issued under Investigation Order No. R9-2004-0277, *California Department of Transportation and San Diego Municipal Separate Storm Sewer System Copermittees Responsible for the Discharge of Diazinon into the Chollas Creek Watershed*, when it is amended to include monitoring requirements for the Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek. The monitoring reports required

ADMINISTRATIVE DRAFT

under Investigation Order No. R9-2004-0277 must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

(b) The Responsible Copermittees must ~~monitor the effluent of the MS4 outfalls discharging to Chollas Creek for dissolved copper, lead, and zinc, and calculate or estimate the monthly and annual dissolved copper, lead, and zinc loads, in accordance with the requirements of Provisions D.1, D.4.a.(1)(b), and D.4.a.(3)(b) of this Order~~implement the monitoring and assessment requirements issued under Order No. R9-2007-0043, as consistent with this Order. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~5.~~4. Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay

a. Applicability

(1) TMDL Basin Plan Amendment: Resolution No. R9-2008-0027

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date: June 11, 2008
State Water Board Approval Date: June 16, 2009
Office of Administrative Law Approval Date: September 15, 2009
US EPA Approval Date: October 26, 2009

(3) TMDL Effective Date: September 15, 2009

(4) Watershed Management Areas: See Table 5.0

(5) Water Bodies: See Table 5.0

(6) Responsible Copermittees: See Table 5.0

Table 5.0
Applicability of Total Maximum Daily Loads for Indicator Bacteria Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay

Watershed Management Area	Water Body	Segment or Area	Responsible Copermittees
South Orange County	Dana Point Harbor	Baby Beach	-City of Dana Point -County of Orange
San Diego Bay	San Diego Bay	Shelter Island Shoreline Park	-Unified Port of San Diego

b. WATER QUALITY BASED EFFLUENT LIMITATIONS

The WQBELs for segments or areas of the water bodies listed in Table 5.0 consist of the following:

(1) Receiving Water Limitations

(a) Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedules under Specific Provisions 5.c.(1)(a) and 5.c.(2):

Table 5.1
Receiving Water Limitations as Bacteria Densities in the Water Body

Constituent	Receiving Water Limitations: Single Sample Maximum[1,2]	Receiving Water Limitations: 30-Day Geometric Mean[2]
Total Coliform	10,000 MPN/100mL	1,000 MPN/100mL
Fecal Coliform	400 MPN/100mL	200 MPN/100mL
Enterococcus	104 MPN/100mL	35 MPN/100mL

Notes:
1. During wet weather days, only the single sample maximum receiving water limitations are required to be achieved.
2. During dry weather days, the single sample maximum and 30-day geometric mean receiving water limitations are required to be achieved.

(b) If the above receiving water limitations are not met in the receiving water, the Responsible Copermittees must demonstrate that the discharges from the MS4s are not causing or contributing to the violation of receiving water limitations. ~~The Copermittee must provide data that demonstrate the discharges from the MS4s are meeting the effluent limitations under Specific Provision 5.b.(2)~~.

For both (a) and (b) above, if the REC-1 water quality objectives cannot be met in the receiving waters, and if the natural and background sources appear to be the sole source of the continued impairment, the natural sources exclusion approach (NSEA) may be applied. The Municipal Dischargers are responsible for collection of the data to support the application of the NSEA to recalculate the TMDL.

~~(2) Effluent Limitations~~

~~Discharges from the MS4s must not contain densities that exceed the following effluent limitations by the end of the compliance schedules under Specific Provisions 5.c.(1)(a) and 5.c.(2) to demonstrate the discharge is not causing or contributing to a violation of receiving water quality standards:~~

~~**Table 5.2**~~
~~*Effluent Limitations as Bacteria Densities in MS4 Discharges to the Water Body*~~

~~Constituent~~	~~Effluent Limitations: Single Sample Maximum[1,2]~~	~~Effluent Limitations: 30-Day Geometric Mean[2]~~
~~Total Coliform~~	~~10,000 MPN/100mL~~	~~1,000 MPN/100mL~~
~~Fecal Coliform~~	~~400 MPN/100mL~~	~~200 MPN/100mL~~
~~*Enterococcus*~~	~~104 MPN/100mL~~	~~35 MPN/100mL~~

~~Notes:~~
~~1. During wet weather days, only the single sample maximum effluent limitations are required to be achieved.~~
~~2. During dry weather days, the single sample maximum and 30-day geometric mean effluent limitations are required to be achieved.~~

~~Interim effluent limitations expressed as pollutant loads are given in the compliance schedule under Specific Provision 5.c.~~

~~(3)~~(2) Best Management Practices

(a) The Water Quality Improvement Plans for the applicable Watershed Management Areas in Table 5.0 fulfill the Bacteria Load Reduction Plan (BLRP) requirements in Resolution No. R9-2008-0027.

(b) The Responsible Copermittee must implement BMPs capable of achieving the WQBELs under Specific Provision 5.0 for the segments or areas of the water bodies listed in Table 5.0

c. COMPLIANCE SCHEDULE

(1) Baby Beach in Dana Point Harbor

(a) ~~WLA~~ Waste Load Reduction Compliance Dates

The Responsible Copermittees for MS4 discharges to Baby Beach shall implement BMPs capable of achieving the following Waste Load Reduction Milestones.~~are required to achieve the WLA, thus must be in compliance with the WQBELs under Specific Provision 5.0, according to the following compliance schedule:~~

Table 5.3
TMDL Waste Load Reduction Milestones

Action	Dry Weather	Wet Weather
Meet 50% wasteload reductions	December 2012*	December, 2016*
Meet 100% wasteload reductions	December, 2014*	December, 2019*

~~*Compliance Schedule Dates to Achieve Baby Beach WLAs*~~

~~Constituent~~	~~Dry Weather WLA Compliance Date~~	~~Wet Weather WLA Compliance Date~~
~~Total Coliform~~	~~September 15, 2014~~	~~September 15, 2009~~
~~Fecal Coliform~~		~~September 15, 2009~~
~~*Enterococcus*~~		~~September 15, 2019~~

~~(b) Interim Compliance Requirements~~

~~The Responsible Copermittees for MS4 discharges to Baby Beach must comply with the following interim WQBELs by the interim compliance date:~~

~~**Table 5.4**~~
~~*Interim Effluent Limitations as Loads in MS4 Discharges to Baby Beach*~~

~~Constituent~~	~~Interim Compliance Date~~	~~Dry Weather Interim Effluent Limitation~~	~~Wet Weather Interim Effluent Limitation~~
~~Total Coliform~~	~~September 15, 2012~~	~~$5.32x10^9$ MPN/day~~	~~NA*~~
~~Fecal Coliform~~	~~September 15, 2012~~	~~$0.59x10^9$ MPN/day~~	~~NA*~~
~~*Enterococcus*~~	~~September 15, 2012~~	~~$0.42x10^9$ MPN/day~~	~~NA**~~
	~~September 15, 2016~~	~~NA*~~	~~$207x10^9$ MPN/30days~~

~~Notes:~~
~~* The WQBELs under Specific Provision 5.b must already be achieved by the given interim compliance date.~~
~~** There is no corresponding interim WQBEL for the given interim compliance date.~~

(2) Shelter Island Shoreline Park in San Diego Bay

The Responsible Copermittee for MS4 discharges to Shelter Island Shoreline Park is required to achieve the WLA, thus must be in compliance with the WQBELs under Specific Provision 5.0, by December 31, 2012.

d. COMPLIANCE DETERMINATION

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(1) There is no discharge from the MS4, or
(2) Applicable effluent limitations are met, or
(3) Receiving waters meet the applicable receiving water limitations or water quality objective, or
(4) Loading from the MS4 is such that it does not cause water quality objective

Formatted: Not Highlight

exceedances, or

(5) Demonstration of elimination of controllable sources of indicator bacteria loading and application of Natural Source Exclusion Approach (NSEA), if applicable, or

(6) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision II.A as described in Provision II.A.4.

~~d.~~e. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

(1) Monitoring Stations and Procedures

~~(a)~~ The Responsible Copermittees must implement the monitoring requirements issued under Order No. R9-2008-0027. ~~designate the MS4 outfalls within their jurisdiction discharging to the segments or areas of the water bodies listed in Table 5.0 as high priority non-storm water MS4 monitoring stations, in accordance with the requirements of Provision D.1.~~

~~(b) The Responsible Copermittees must establish at least one monitoring station within the receiving water body.~~

~~(2) Monitoring Procedures~~

~~(a) The Responsible Copermittees must monitor the effluent of the designated MS4 outfalls within their jurisdiction discharging during dry weather conditions to the segments or areas of the water bodies listed in Table 5.0 in accordance with the dry weather jurisdictional monitoring requirements of Provision D.1.a.(1)(b). Samples required to be submitted to a laboratory for analysis must include analysis for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.~~

~~(b) The Responsible Copermittees must monitor, within the first 24 hours of each storm event,[26] the effluent of the designated MS4 outfalls within their jurisdiction discharging to the segments or areas of the water bodies listed in Table 5.0 in accordance with the wet weather jurisdictional monitoring requirements of Provision D.1.b.(1)(b) of this Order. Samples required to be submitted to a laboratory for analysis must include analysis for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.~~

~~(c) The Responsible Copermittees must collect samples from the monitoring stations within the receiving water body for each dry weather and wet~~

~~[26] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].~~

~~weather MS4 outfall monitoring event. Samples must be analyzed for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.~~

~~(d)~~(a)

~~(3)~~(2) Assessment and Reporting Requirements

(a) The Responsible Copermittees must analyze the dry weather and wet weather monitoring data to assess whether the interim and final WQBELs have been achieved.

(b) The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~6.~~5. Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2010-0001

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date:	February 10, 2010
State Water Board Approval Date:	December 14, 2010
Office of Administrative Law Approval Date:	April 4, 2011
US EPA Approval Date:	June 22, 2011

(3) TMDL Effective Date: April 4, 2011

(4) Watershed Management Areas: See Table 6.0

(5) Water Bodies: See Table 6.0

Subsequent to TMDL adoption, the Regional Board determined that the following water bodies are not subject to further action under Resolution No. R9-2010-001, and therefore are not subject to Bacteria TMDL requirements described herein and are not included in Table 6.0:

Watershed Management Area	Water Body	Segment or Area
Carlsbad	Pacific Ocean Shoreline	at Moonlight State Beach
San Dieguito River	Pacific Ocean Shoreline	at San Dieguito Lagoon mouth
Penasquitos	Pacific Ocean Shoreline	Torrey Pines State Beach at Del Mar (Anderson Canyon)

~~(5)~~(6) Responsible Copermittees: See Table 6.0

Table 6.0
Applicability of Total Maximum Daily Loads for Indicator Bacteria

San Diego River	Forrester Creek	lower 1 mile	-City of El Cajon ~~-City of La Mesa~~ -City of Santee -County of San Diego
	San Diego River	lower 6 miles	-City of El Cajon -City of La Mesa -City of San Diego -City of Santee -County of San Diego
	Pacific Ocean Shoreline	at San Diego River mouth at Dog Beach	
San Diego Bay	Chollas Creek	lower 1.2 miles	-City of La Mesa -City of Lemon Grove -City of San Diego -County of San Diego - San Diego Unified Port District

The TMDLs that have been developed for the Pacific Ocean shorelines are applicable to all the beaches located on the shorelines of the hydrologic subareas (HSAs), hydrologic areas (HAs), and hydrologic units (HUs) listed above. Beginning with the 2008 303(d) List, specific beach segments of the Pacific Ocean shoreline are listed individually. Specific beach segments from some of the Pacific Ocean shorelines listed in the above table have been delisted from the 2008 303(d) list that was approved by the San Diego Board on December 16, 2009, and therefore are not subject to any further action as long as monitoring data continues to support compliance with water quality standards.

b. WATER QUALITY BASED EFFLUENT LIMITATIONS

The WQBELs for segments or areas of the water bodies listed in Table 6.0 consist of the following:

(1) Receiving Water Limitations

(a) Discharges from the MS4s must not cause or contribute to the violation of the following receiving water limitations by the end of the compliance schedules under Specific Provision 6.c.(1):

Table 6.1
Receiving Water Limitations for Beaches as Bacteria Densities and Allowable Exceedance Frequencies in the Water Body

Indicator Bacteria	Wet Weather Days [a]		Dry Weather Days [b]	
	Wet Weather Numeric Objective [c] (MPN/100mL)	Wet Weather Allowable Exceedance [d] Frequency	Dry Weather Numeric Objective [e] (MPN/100mL)	Dry Weather Allowable Exceedance Frequency
Fecal Coliform	400	22%	200	0%
Total Coliform	10,000	22%	1,000	0%
Enterococcus	104	22%	35	0%

a. Wet weather days defined as days with rainfall events of 0.2 inches or greater and the following 72 hours.
b. Dry weather days defined as days with less than 0.2 inch of rainfall observed on each of the previous 3 days.
c. Wet weather numeric objectives based on the single sample maximum water quality objectives in the California Ocean Plan (2005). Compliance with the wet weather TMDLs in the receiving water is based on the frequency that the wet weather days in any given year exceed the wet weather numeric objective, but 30-day geometric mean must also be met.
d. The wet weather allowable exceedance frequency is set at 22%. In the calculation of the wet weather TMDLs, the San Diego Regional Board chose to apply the 22 percent allowable exceedance frequency as determined for Leo Carillo Beach in Los Angeles County. At the time the wet weather watershed model was developed, the 22 percent exceedance frequency from Los Angeles County was the only reference beach exceedance frequency available. The 22 percent allowable exceedance frequency used to calculate the wet weather TMDLs is justified because the San Diego Region watersheds' exceedance frequencies will likely be close to the value calculated for Leo Carillo Beach, and is consistent with the exceedance frequency that was applied by the Los Angeles Regional Board.
e. Dry weather numeric objectives based on the 30-day geometric mean water quality objectives in the California Ocean Plan (2005). Compliance with the dry weather TMDLs in the receiving water is based on the frequency that the dry weather days in any given year exceed the dry weather numeric objective.

Table 6.2 *Receiving Water Limitations for Creeks as Bacteria Densities and Allowable Exceedance Frequencies in the Water Body*

Indicator Bacteria	Wet Weather Days [a]		Dry Weather Days [b]	
	Wet Weather Numeric Objective [c] (MPN/100mL)	Wet Weather Allowable Exceedance [d] Frequency	Dry Weather Numeric Objective [e] (MPN/100mL)	Dry Weather Allowable Exceedance Frequency
Fecal Coliform	400	22%	200	0%
Enterococcus	61 (104) [f]	22%	33	0%

a. Wet weather days defined as days with rainfall events of 0.2 inches or greater and the following 72 hours.
b. Dry weather days defined as days with less than 0.2 inch of rainfall observed on each of the previous 3 days.
c. Wet weather numeric objectives based on the single sample maximum (or equivalent) water quality objectives in the Water Quality Control Plan for the San Diego Basin (1994). Compliance with the wet weather TMDLs in the receiving water is based on the frequency that the wet weather days in any given year exceed the wet weather numeric objective, but 30-day geometric mean must also be met.
d. The wet weather allowable exceedance frequency is set at 22%. In the calculation of the wet weather TMDLs, the San Diego Regional Board chose to apply the 22 percent allowable exceedance frequency as determined for Leo Carillo Beach in Los Angeles County. At the time the wet weather watershed model was developed, the 22 percent exceedance frequency from Los Angeles County was the only reference beach exceedance frequency available. The 22 percent allowable exceedance frequency used to calculate the wet weather TMDLs is justified because the San Diego Region watersheds' exceedance frequencies will likely be close to the value calculated for Leo Carillo Beach, and is consistent with the exceedance frequency that was applied by the Los Angeles Regional Board.
e. Dry weather numeric objectives based on the 30-day geometric mean (or equivalent) water quality objectives in Water Quality Control Plan for the San Diego Basin (1994). Compliance with the dry weather TMDLs in the receiving water is based on the frequency that the dry weather days in any given year exceed the dry weather numeric objective.
f. A wet weather numeric objective for *Enterococcus* of 104 MPN/100mL may be applied as a receiving water limitation for creeks, instead of 61 MPN/100mL, if one or more of the creeks addressed by these TMDLs (San Juan Creek, Aliso Creek, Tecolote Creek, Forrester Creek, San Diego River, and/or Chollas Creek) is designated with a "moderately to lightly used area" or less frequent usage frequency in the Basin Plan. Otherwise, the wet weather numeric objective of 61 MPN/100mL for Enterococcus will be used to assess compliance with the wet weather allowable exceedance frequency.

	~~Receiving Water Limitations~~			
~~Constituent~~	~~Single Sample Maximum[1,2] (MPN/100mL)~~	~~Single Sample Maximum Allowable Exceedance Frequency[3]~~	~~30-Day Geometric Mean[2] (MPN/100mL)~~	~~30-Day Geometric Mean Allowable Exceedance Frequency~~
~~Total Coliform~~	~~10,000~~	~~22% / 0%~~	~~1,000~~	~~0%~~

Formatted: No underline, Font color: Auto

Formatted: No underline, Font color: Auto

~~Fecal Coliform~~	~~400~~	~~22% / 0%~~	~~200~~	~~0%~~
~~*Enterococcus*~~	~~104[4] / 61[5]~~	~~22% / 0%~~	~~35[4] / 33[5]~~	~~0%~~

~~Notes:~~

~~1. During wet weather days, only the single sample maximum receiving water limitations are required to be achieved.~~
~~2. During dry weather days, the single sample maximum and 30-day geometric mean receiving water limitations are required to be achieved.~~
~~3. The 22% single sample maximum allowable exceedance frequency only applies to wet weather days. The 0% single sample maximum allowable exceedance frequency applies to dry weather days.~~
~~4. This *Enterococcus* receiving water limitation applies to segments of areas of Pacific Ocean Shoreline listed in Table 6.0.~~
~~5. This *Enterococcus* receiving water limitations applies to segments or areas of creeks or creek mouths listed in Table 6.0.~~

Interim receiving water limitations expressed as allowable receiving water exceedance frequencies are ~~given~~ presented in ~~the compliance schedule under~~ Specific Provision 6.c (2).

The allowable exceedance frequencies in Table 6.1 and Table 6.2 can be updated by the Regional Board Executive Officer if sufficient data is provided regarding reference systems in the San Diego Region.

(b) If the above receiving water limitations are not met in the receiving water, the Responsible Copermittees must demonstrate that the discharges from the MS4s are not causing or contributing to the violation of receiving water limitations. ~~The Copermittee may incorporate follow-up investigations and monitoring into the WQIP, as consistent with Provisions D and E.2 of this Order.~~ ~~must provide data that demonstrate the discharges from the MS4s are meeting the effluent limitations under Specific Provision 6.b.(2).~~

(2) Effluent Limitations

Discharges from the MS4s must not cause or contribute ~~contain densities that exceed the following effluent limitations by the end of the compliance schedules under Specific Provision 6.c.(1) to demonstrate the discharge is not causing or contributing~~ to a violation of receiving water ~~quality standards~~limitations. The mass-based waste load allocations presented in Resolution No. R9-2010-0001 can be used to demonstrate that loading from the MS4 is such that it does not cause water quality objective exceedances, as described in bullet (4) under Specific Provision 6.d.

~~**Table 6.2**~~
~~*Effluent Limitations as Bacteria Densities and Allowable Exceedance Frequencies in MS4 Discharges to the Water Body*~~

	~~Effluent Limitations~~			
~~Constituent~~	~~Single Sample Maximum[1,2] (MPN/100mL)~~	~~Single Sample Maximum Allowable Exceedance Frequency[3]~~	~~30-Day Geometric Mean[2] (MPN/100mL)~~	~~30-Day Geometric Mean Allowable Exceedance Frequency~~
~~Total Coliform~~	~~10,000~~	~~22% / 0%~~	~~1,000~~	~~0%~~
~~Fecal Coliform~~	~~400~~	~~22% / 0%~~	~~200~~	~~0%~~
~~*Enterococcus*~~	~~104[4] / 61[5]~~	~~22% / 0%~~	~~35[4] / 33[5]~~	~~0%~~

~~Notes:~~

ADMINISTRATIVE DRAFT

~~1. During wet weather days, only the single sample maximum effluent limitations are required to be achieved.~~
~~2. During dry weather days, the single sample maximum and 30-day geometric mean effluent limitations are required to be achieved.~~
~~3. The 22% single sample maximum allowable exceedance frequency only applies to wet weather days. The 0% single sample maximum allowable exceedance frequency applies to dry weather days~~
~~4. This *Enterococcus* effluent limitation applies to MS4 discharges to segments of areas of Pacific Ocean Shoreline listed in Table 6.0.~~
~~5. This *Enterococcus* effluent limitation applies to MS4 discharges to segments or areas of creeks or creek mouths listed in Table 6.0.~~

~~Interim effluent limitations expressed as allowable exceedance frequencies are given in the compliance schedule under Specific Provision 6.c.~~

(3) Best Management Practices

(a) The Water Quality Improvement Plans for the applicable Watershed Management Areas in Table 6.0 that continue to have 303(d) listings for RED-1 indicator bacteria will incorporate ~~fulfill the Comprehensive~~ Load Reduction Plans ~~(CLRPs)~~ drafted pursuant to ~~requirements in~~ Resolution No. R9-2010-0001.

(b) The Responsible Copermittee ~~must~~ may implement BMPs to support the achievement of ~~capable of achieving the~~ WQBELs under Specific Provision 6.b for the segments or areas of the water bodies listed in Table 6.0.

(c) The Responsible Copermittees may implement ~~should coordinate the~~ BMPs to support the achievement of ~~address~~ this TMDL with Caltrans and owners/operators of small MS4s ~~wherever and whenever~~as possible.

c. Compliance Schedule

(1) ~~WLA~~ Waste Load Reduction Compliance Dates

The Responsible Copermittees for MS4 discharges to a segment or area of the water bodies listed in Table 6.0 are required to achieve the ~~WLA~~Waste Load Reductions, thus must be in compliance with the WQBELs under Specific Provision 6.b, according to the following compliance schedule:

Table 6.3
Compliance Schedule Dates to Achieve Indicator Bacteria ~~WLAs~~Waste Load Reductions

Constituent	Dry Weather WLA Compliance Date	Wet Weather WLA Compliance Date
Total Coliform	April 4, 2021	April 4, 2031
Fecal Coliform		
Enterococcus		

1 - Total coliform receiving water limitations apply only to segments of areas of Pacific Ocean Shoreline listed in Table 6.0.

(2) Interim Compliance Requirements

The Responsible Copermittees must comply with the following interim WQBELs by the interim compliance dates supported by Order No. R9-2010-0001.

(a) Interim Dry Weather WQBELs

The Responsible Copermittees must comply with dry weather interim WQBELs demonstrating 50% exceedance frequency reductions by the interim compliance dates presented in Table 6.5. Data from year(s) between 1996-2002 (as available) may be used to characterize the "existing" dry weather exceedances frequency as the baseline from which interim reductions in exceedances frequency must be measured.

~~Interim dry weather WQBELS are expressed as receiving water limitations. The Responsible Copermittee must calculate the "existing" exceedance frequencies of the 30-day geometric mean water quality objectives for each of the indicator bacteria by analyzing the monitoring data collected between January 1, 2002 and April 4, 2011.~~ "Existing" exceedance frequencies may be calculated by segment or area of a water body, or by water body, and/or by Watershed Management Area listed in Table 6.0. Separate "existing" exceedance frequencies must be calculated for beaches and creeks/creek mouths, where applicable.

The Responsible Copermittees must achieve a 50 percent reduction in each~~the~~ "existing" exceedance frequency, or otherwise demonstrate 50% reduction progress toward the final allowable exceedances frequency or compliance metric, by the interim compliance dates for dry weather givenin Table 6.5. Metric(s) expressing the 50 percent reduction in ~~of the 30-day geometric mean WQBELs for the segments or areas of the water bodies listed in Table 6.0 by the interim compliance dates for achieving the interim dry weather WQBELs given in Table 6.5. A 50 percent reduction in the "existing" exceedance frequency is equivalent to half of the "existing" exceedance frequency of the 30-day geometric mean WQBELs~~dry weather exceedances frequency (i.e. interim dry weather WQBLs, which may be expressed as receiving water limitations) calculated by the Responsible Copermittees must be included in the Water Quality Improvement Plans for the applicable Watershed Management Areas.
~~The "existing" exceedance frequencies and the interim dry weather allowable exceedance frequencies (i.e. interim dry weather WQBELs) calculated by the Responsible Copermittees must be included in the Water Quality Improvement Plans for the applicable Watershed Management Areas.~~

(b) Interim Wet Weather WQBELs

The Responsible Copermittees must achieve the interim allowable wet weather exceedances frequencies identified in ~~WQBELs in~~ Table 6.4, or otherwise demonstrate 50% progress towards the final wet weather compliance metric, ~~expressed as interim allowable exceedance frequencies,~~ by the interim compliance dates for achieving the interim wet weather WQBELs given in Table 6.5, unless an alternative interim

ADMINISTRATIVE DRAFT

compliance schedule is identified in the applicable LRP.

(1) Submittals to Support TMDL Basin Plan Amendment

The Responsible Copermittees are encouraged to submit data to support the TMDL reopener scheduled for April 2016 including but not limited to data related to reference watershed monitoring and beneficial use usage frequency.

For the watersheds where there are no longer any impairments listed on the 2008 303(d) List, the Phase I MS4s and Caltrans are not required to submit a load reduction plan as part of the TMDL.

d. COMPLIANCE DETERMINATION

Compliance with WQBELs or WLAs may be demonstrated via any one of the following methods:

(1) There is no discharge from the MS4, or
(2) Applicable effluent limitations are met, or
(3) Receiving waters meet the applicable receiving water limitations or water quality objective, or
(4) Loading from the MS4 is such that it does not cause water quality objective exceedances, or
(5) Demonstration of elimination of controllable sources of indicator bacteria loading and application of Natural Source Exclusion Approach (NSEA), if applicable, or
(6) Implementation of a Water Quality Improvement Plan determined by the Regional Board Executive Officer to comply with Provision II.A as described in Provision II.A.4.

The Phase I MS4s may demonstrate that their discharges are not causing the exceedances in the receiving waters by providing data from their discharge points to the receiving waters, by providing data collected at jurisdictional boundaries, and/or by using other methods accepted by the San Diego Water Board. Otherwise, at the end of the dry weather TMDL compliance schedule, the municipal Phase I MS4s will be held responsible and considered out of compliance unless other information or evidence indicates another controllable or uncontrollable source is responsible for the exceedances in the receiving waters. If controllable sources other than discharges from the municipal Phase I MS4s are identified before or after the end of the dry weather TMDL Compliance Schedule as causing the exceedances, those controllable sources will be responsible for reducing their bacteria loads and/or demonstrating that discharges from those sources are not causing the exceedances. The San Diego Water Board shall implement additional actions (e.g., issue enforcement actions, amend existing NPDES requirements or conditional waivers), as needed, to bring all controllable sources into compliance with the dry weather TMDLs.

Formatted: No underline, Font color: Auto

Formatted: No underline, Font color: Auto

~~d.~~e. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

The Bacteria Load Reduction Plans (BLRPs) and/or CLRPs to be submitted by the Copermittees and approved by the Regional Board Executive Officer contain monitoring programs. Implementation of those Regional Board-approved monitoring programs constitutes compliance with the Monitoring Station and Monitoring Procedure requirements, described below.

(1) Monitoring and Assessment Requirements for Beaches

(a) Monitoring Stations

For beaches addressed by these TMDLs, monitoring locations should consist of, at a minimum, the same locations used to collect data required under MS4 NPDES monitoring requirements and beach monitoring for Health and Safety Code section 115880.[75] If exceedances of the receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations and/or other source identification methods must also be used to demonstrate that the bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters.

Formatted: No underline, Font color: Auto

Formatted: No underline, Font color: Auto

~~(i) The Responsible Copermittees maymust designate the MS4 outfalls within their jurisdiction discharging to the Pacific Ocean Shoreline segments or areas listed in Table 6.0 as high priority non-storm water MS4 monitoring stations, in accordance with the requirements of Provision D.1 of this Order. Monitoring stations may be selected based on stations utilized under other monitoring programs. Outfalls may be monitored for follow up source identification, at minimum, as consistent with this Order.~~

~~(ii) For the Pacific Ocean Shoreline segments or areas listed in Table 6.0 with MS4 outfalls, the Responsible Copermittees must establish at least one monitoring station within the receiving water. Monitoring stations may be selected based on stations utilized under other monitoring programs.~~

(b) Monitoring Procedures

(i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations at least monthly.

The Responsible Copermittees must collect wet weather monitoring samples from the receiving water monitoring stations for an adequate number of storm events that occur during the rainy season (i.e., October 1 through April 20) to represent wet weather conditions. At least one sample must be collected within the first 24 hours of the end of a storm event[27].

~~(i) The Responsible Copermittees must monitor receiving waters the effluent of the designated MS4 outfalls within their jurisdiction discharging during dry weather to the Pacific Ocean Shoreline segments or areasas listed in Table 6.0 in accordance with the dry weather jurisdictional monitoring set forth in the WQIP.requirements of Provision D.1.a.(1)(b) of this Order. Samples required to be submitted to a laboratory for analysis must include analysis for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.~~

~~(ii) The Responsible Copermittees must monitor, within the first 24 hours of each monitored storm event,[28] the receiving water effluent of the designated MS4 outfalls within their jurisdiction as discharging to the Pacific Ocean Shoreline segments or areas listed in Table 6.0 in accordance with the wet weather jurisdictional monitoring requirements of Provision D.1.b.(1)(b) of this Order. Samples required to be submitted to a laboratory for analysis must include analysis for total coliform, fecal coliform, and *Enterococcus* indicator bacteriamonitoring requirements set forth in the WQIP.~~

~~(iii)~~(ii) ~~The Responsible Copermittees must collect samples from the~~

[27] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].

~~[28] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].~~

~~monitoring stations within the receiving water body for each dry weather and wet weather MS4 outfall monitoring event monitored.~~ Samples must be analyzed for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.

(c) Assessment and Reporting Requirements

(i) The Responsible Copermittees must analyze the dry weather and wet weather monitoring data to assess whether the interim and final WQBELs for the Pacific Ocean Shoreline segments or areas listed in Table 6.0 have been achieved.

[a] Commonly referred to as AB 411 monitoring

Formatted: No underline, Font color: Auto

~~(i)~~(ii) The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

(2) Monitoring and Assessment Requirements for Creeks and Creek Mouths

(a) Monitoring Stations

For creeks addressed by these TMDLs, monitoring locations should consist of, at a minimum, a location at or near the mouth of the creek (e.g., Mass Loading Station or Mass Emission Station) and one or more locations upstream of the mouth (e.g., Watershed Assessment Stations). If exceedances of the receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations and/or other source identification methods must also be used to demonstrate that the bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters.

Formatted: No underline, Font color: Auto

~~(i) The Responsible Copermittees must establish at least one receiving water monitoring station at or near the mouth of the creeks listed in Table 6.0. Monitoring stations may be selected based on stations utilized under other monitoring programs. Outfalls may be monitored for follow-up source identification, at minimum, as consistent with this Order.~~

~~(ii) The Responsible Copermittees must establish at least one receiving water monitoring station upstream of the station established for Specific Provision 6.d.(2)(a)(i). At least one monitoring station must be established for each Responsible Copermittee at the most downstream location within its jurisdiction, and one monitoring station at the most upstream location within its jurisdiction.~~

~~(iii) The Responsible Copermittees may must identify the MS4 outfalls discharging to the segments or areas of the creeks and creek mouths listed in Table 6.0. The Responsible Copermittees must may identify the MS4 outfalls that are monitored in accordance with the dry weather jurisdictional monitoring requirements of Provision D.1.a.(1)(b) of this Order and the wet weather jurisdictional monitoring requirements of Provision D.1.b.(1)(a) of this Orderunder other monitoring programs and in accordance with the WQIP.~~

(b) Monitoring Procedures

(i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations ~~at least monthly~~according to the WQIP.

(i) The Responsible Copermittees must collect wet weather monitoring samples from the receiving water monitoring stations for an adequate number of storm events that occur during the rainy season (i.e., October 1 through April 20) to represent wet weather conditions. At least one sample must be collected within the first 24 hours of the end of a storm event[29].
~~each storm event monitored, according to the WQIP.~~[30]

(ii) Samples collected from receiving water monitoring stations must be analyzed for ~~total coliform,~~ fecal coliform, and *Enterococcus* indicator bacteria.

(c) Assessment and Reporting Requirements

(i) The Responsible Copermittees must analyze the receiving water monitoring data to assess whether the interim and final receiving water WQBELs for the creeks and creek mouths listed in Table 6.0 have been achieved.

~~(ii) If the receiving water WQBELs for the creeks and creek mouths listed in Table 6.0 have not been achieved, the Responsible Copermittees must review the MS4 outfall monitoring data to assess whether the interim and final effluent WQBELs have been achievedfollow the process set forth in the WQIP.~~

[29] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].

~~[30] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].~~

~~(iii) If receiving water WQBELs for the creeks and creek mouths listed in Table 6.0 have not been achieved, tThe Responsible Copermittee must identify and incorporate additional MS4 outfall and receiving water monitoring stations and/or adjust monitoring frequencies to identify sources causing exceedances of the receiving water WQBELs.actions to be implemented in the WQIP.~~

~~(iv)~~(ii) The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

6. Enforcement Response Plans [Alternative to Provision E.6]

Each Copermittee must develop and implement an Enforcement Response Plan as part of its jurisdictional runoff management program document. The Enforcement Response Plan must describe the applicable protocols and options for enforcing compliance with the provisions of this Order. The Copermittees may continue to utilize and implement established, equivalent guidelines and procedures for enforcement.

The Enforcement Response Plan must include the following:

a. Enforcement Response Plan Components
The Enforcement Response Plans shall include the following individual components:

i. The Illicit Discharge Detection and Elimination Enforcement Components provided in Provision E.2.
ii. The Development Projects Enforcement Component provided in provision E.3.

Existing enforcement plans or procedures may be used to partially or wholly satisfy the requirements of any Enforcement Response Plan component.

a. Enforcement Approaches and Options
Each Enforcement Response Plan component must describe the Copermittee's approach to correcting noncompliance with its permits, applicable local ordinances, and this Order. It must describe protocols for progressively stricter responses, including, as applicable, timeframes allowed to bring areas or facilities into compliance. The enforcement process must include appropriate sanctions to compel compliance, such as:

1) Verbal and written notices of violation;
2) Cleanup requirements;
3) Fines
4) Bonding requirements;
5) Administrative and criminal penalties;
6) Liens;
7) Stop work orders; and
8) Permit and occupancy denials.

c. **Correction of Violations**

1) Violations must be corrected in a timely manner with the goal of correcting them within 30 calendar days after the violations are discovered and prior to the next predicted rain event, when possible.
2) If more than 30 calendar days are required for compliance, then a

rationale must be recorded in the applicable electronic database or tabular system used to track compliance.

d. **ESCALATED ENFORCEMENT PRIORITIES**

1) Each Enforcement Response Plan must include a definition of “escalated enforcement priorities”. Escalated enforcement priorities shall be defined to include any enforcement scenario where a violation or other non-compliance is determined to constitute a significant contribution to any of the highest water quality priorities identified in the Water Quality Improvement Plan. Escalated enforcement priorities may be defined differently for development planning; construction sites; commercial, industrial, and municipal sources; and residential management areas.

2) Where a violation involving a pollutant or stressor that has been identified as a highest water quality priority is not determined to represent an escalated enforcement priority, a rationale must be recorded in the applicable electronic database or tabular system used to track compliance.

3) High level enforcement actions must continue to escalate, as necessary, to compel compliance as soon as possible.

e. Reporting of Non-Compliant Sites

(1) Each Copermittee must notify the San Diego Water Board in writing within 48 hours of issuing escalated enforcement (as defined in the Copermittee’s Enforcement Response Plan) to a construction site that poses a significant threat to water quality as a result of violations or other non-compliance with its permits and applicable local ordinances, and the requirements of this Order. Written notification may be provided electronically in email form.

(2) Each Copermittee must notify the San Diego Water Board of non-filers under the Industrial General Permit and Construction General Permit by email to Nonfilers_R9@waterboards.ca.gov.

ADMINISTRATIVE DRAFT

5. Existing Development Management [Alternative to Provision E.5]

Each Copermittee must implement an existing development management program that includes the following requirements:

a. Industrial, Commercial, and Municipal Sources

(1) Source Identification and Prioritization

Each Copermittee must identify known sources and maintain an updated watershed-based inventory of its existing industrial, commercial, and municipal development that has the reasonable potential to discharge a pollutant load to and from the MS4. The use of an automated database system, such as GIS, is highly recommended. The inventory must, at a minimum, include:

(a) Name, location (address and/or hydrological subarea) of each source;

(b) A designation of the source as municipal, commercial, or industrial;

(c) SIC Code or NAICS Code, if applicable;

(d) Industrial General Permit NOI and/or WDID number, if applicable;

(e) Identification of pollutants generated or potentially generated by the source;

(f) Whether the source is adjacent to an ESA;

(g) Whether the source is tributary to and within the same hydrologic subarea as a CWA section 303(d) water body segment and generates or potentially generates pollutants for which the water body segment is impaired; and

(h) Whether the source contributes or potentially contributes to the highest water quality priorities identified in the Water Quality Improvement Plan;

(2) BMP Implementation and Maintenance

Each Copermittee must designate a minimum set of BMPs required for all inventoried existing development with the reasonable potential to discharge pollutant loads from their MS4, including special event venues. The designated minimum BMPs must be specific to facility types and pollutant-generating activities, as appropriate.

(a) Pollution Prevention

Each Copermittee must promote the use of pollution prevention methods, where appropriate.

(b) BMP Operation and Maintenance

(i) Each Copermittee must properly operate and maintain, or require the proper operation and maintenance of designated BMPs at sources within its jurisdiction.

(ii) Each Copermittee must implement a schedule of operation and maintenance activities for its MS4 and related structures (including but not limited to catch basins, storm drain inlets, detention basins, etc.), and verify proper operation of all its municipal structural treatment controls. Operations and maintenance activities may include:

[a] Inspections of MS4 and related structures;

[b] Cleaning of MS4 and related structures; and

[c] Proper disposal of materials removed from cleaning of MS4 and related structures.

(iii) Each Copermittee must implement a schedule of operation and maintenance activities for public: streets, unpaved roads, paved roads, and paved highways and freeways within its jurisdiction.

(iv) Each Copermittee must implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers. Copermittees that operate both a municipal sanitary sewer system and a MS4 must implement controls and measures to prevent and eliminate seeping sewage from infiltrating the MS4. Copermittees that do not operate both a municipal sanitary sewer system and a MS4 are encouraged to coordinate with sewering agencies to keep themselves informed of relevant and appropriate maintenance activities and capital projects in their jurisdiction.

(c) Pesticides, Herbicides, and Fertilizers BMPs

Each Copermittee must implement procedures, or require the implementation of procedures, as appropriate, to reduce discharges of pollutants associated with the application, storage, and disposal of pesticides, herbicides and fertilizers at sources within its jurisdiction.

(3) Measures to Address Highest Water Quality Priorities

Each Copermittee must conduct or require measures as necessary to address sources or areas that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan. These measures must be identified as applicable in each WQIP strategy, and may include any of the following:

(a) Copermittee Program Activities

Each Copermittee may make modifications to its program activities (e.g. increased or focused education, inspections, etc.) to address sources that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan.

(b) Additional Control Measures

Each Copermittee may require additional pollution prevention measures and control measures at sources that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan, including consideration of retrofit and channel rehabilitation and improvement opportunities, as identified in Provision 5.a.2.(c)

(c) Retrofit

Each Copermittee must develop a strategy to facilitate the implementation of retrofit projects. Existing development in high priority areas should be assessed for inclusion in the retrofit plan. Retrofit plans should focus on pollutants and areas identified as high priority within the Water Quality Improvement Plans, with the highest priority projects included in the Water Quality Improvement Plans.

(i) Retrofit projects may be prioritized based on their relative benefit to water quality, feasibility, cost effectiveness, and community acceptance.

(ii) Retrofit projects in the highest priority areas should be included in the review for the Water Quality Improvement Plan to provide additional pollutant removal from storm water discharges.

(d) Channel Rehabilitation and Improvement

Each Copermittee must develop a strategy to facilitate the implementation of channel rehabilitation and improvement projects within their jurisdiction. Existing channels in high priority areas should be assessed for inclusion in the channel rehabilitation and improvement plan. Channel rehabilitation and improvement plans should focus on pollutants and areas identified as high priority within the Water Quality Improvement Plans.

(i) Channel rehabilitation and improvement projects may be selected to address hydromodification, restore wetland and riparian habitat, or to address other water quality issues prioritized in the Water Quality Improvement Plan.

(ii) Channel rehabilitation and improvement projects may be prioritized based on their relative benefit to water quality, feasibility, cost effectiveness, and community acceptance.

(iii) Channel rehabilitation and improvement projects in the highest priority areas should be included in the review for the Water Quality Improvement Plan to provide additional pollutant removal from storm water discharges.

(4) Inspection Requirements:

(a) Inspection Frequency

(i) Each Copermittee must establish appropriate inspection frequencies for inventoried industrial, commercial, and municipal sources based on the potential for discharging pollutants via storm water and non-storm water discharges, and should reflect the priorities set forth in the Water Quality Improvement Plan.

(ii) Each Copermittee must conduct inspections annually with a level of effort equivalent to 20% of their industrial, commercial, and municipal inventory combined[12]. If facilities require multiple inspections during any given year, those additional inspections may count towards this total.

(iii) Inventoried existing development must be inspected, as needed, in response to valid public complaints and findings from the Copermittee's municipal and contract staff inspections.

(iv) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e. education and outreach, re-inspection,

[1] Excludes linear facilities (MS4 and roads).

enforcement) as necessary to confirm compliance in accordance with its enforcement response plan pursuant to Provision E.6.

(b) Inspection Content

Inspections of industrial, commercial, and municipal facilities by the Copermittee may include the following:

(i) Industrial, commercial, and municipal facilities name and location (address and hydrologic subarea);

(ii) Inspection and re-inspection date(s);

(iii) Assessment of compliance with its applicable local ordinances and permits related to non-storm water and storm water discharges and runoff;

(iv) Assessment of BMPs implementation;

(v) Verification of coverage under the Industrial General Permit (NOI and/or WDID number), when applicable;

(vi)

(vii) Visual observations of actual non-storm water discharges, if present;

(viii) Visual observations of actual or potential discharge of pollutants, if present; and

(ix) Visual observations of actual or potential illicit connections, if present.

(c) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried industrial, commercial, and municipal facilities. The Copermittee must maintain all inspection records in an electronic database or tabular format, either in paper or electronic inspection records files, which must be made available to the San Diego Water Board upon request.

Inspection records must include the information necessary to effectively manage and implement the industrial, commercial, and municipal facilities inspection program, as described in each Copermittee's jurisdictional runoff management plan

b. Residential Sources

(1) Source Identification and Prioritization:

An inventory of residential sources within each Copermittees jurisdiction must be developed as follows:

(a) Designation of Residential Management Areas

Each Copermittee must divide areas of residential development into Residential Management Areas. Residential Management Areas may be designated by one or more of the following: Hydrologic Sub Area, land use (e.g. single family, multi family, rural, Common Interest Areas, or Home Owner Associations), or other accepted methods to be included in each Copermittee-approved jurisdictional runoff management plan.

(b) Prioritization of Residential Management Areas

Copermittees must prioritize Residential Management Areas for the purposes of prioritizing and directing their residential programs. Prioritization must consider whether the Residential Management Area contributes or potentially contributes to the highest water quality priorities identified in the Water Quality Improvement Plan, and consideration of other program information or information from other relevant programs:

(c) A regularly updated map must be developed showing the locations of inventoried Residential Management Areas, watershed boundaries, and water bodies at or near them.

(2) BMP Implementation and Maintenance

(a) Designate BMPs

Each Copermittee must designate and require the implementation of a minimum set of BMPs for all residential sources or target audiences with the reasonable potential to discharge significant pollutant loads from their MS4.The designated minimum BMPs must be source-specific, and must address each of the following as appropriate.

(i) Pollution Prevention

Each Copermittee must promote the use of pollution prevention

ADMINISTRATIVE DRAFT

methods, where appropriate.

(ii) BMP Operation and Maintenance

Each Copermittee must operate and maintain, or require the operation and maintenance of designated BMPs for sources within its jurisdiction.

(iii) Pesticides, Herbicides, and Fertilizers BMPs

Each Copermittee must require and encourage, as appropriate, the implementation of practices to reduce discharges of pollutants associated with the application, storage, and disposal of pesticides, herbicides and fertilizers at residential sources within its jurisdiction.

(3) Measures to Address Highest Water Quality Priorities

Each Copermittee must conduct or require measures as necessary to address sources or areas that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan. These measures must be identified as applicable in each WQIP strategy, and may include any of the following:

(a) Copermittee Program Activities

Each Copermittee may make modifications to its program activities (e.g. increased or focused education, inspections, etc.) to address sources that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan.

(b) Additional Control Measures

Each Copermittee may require additional pollution prevention and control measures at sources that discharge pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan.

(c) Retrofit

Each Copermittee must encourage through education or other means the implementation of retrofit projects at residential sources or areas.

(4) Residential Management Area Oversight:

(a) Residential Area Assessment

Each Copermittee must conduct representative evaluations (e.g. visual observations, surveys, water use analysis, if available, and other data) of its prioritized RMAs to update implementation strategies.

(b) Residential Program Update

Within two years, each Copermittee must develop and submit for Regional Board approval an updated residential program strategy based on assessment findings. Until Copermittees implement an updated residential program, they must continue performing their existing programs.

(c) Follow up Actions

Each Copermittee must prioritize and implement its follow up actions (e.g. education and outreach, re-assessment, enforcement) in accordance with its Enforcement Response Plan pursuant to Provision E.6.

(d) Assessment Tracking and Records

Assessment records must be tracked and sufficiently detailed in order to determine compliance with the requirements of this Order and any progress made toward the modification of residential management strategies, or addressing the highest water quality priorities identified in the Water Quality Improvement Plan.

c. Existing Development Enforcement

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried existing development identified by the Copermittee as having the reasonable potential to discharge pollutant loads from the MS4 within their jurisdiction, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

ORANGE COUNTY PERMITTEES

ATTACHMENT C

MONITORING PRINCIPLES

Orange County Monitoring Principles

The Permittees from San Diego County have developed an alternative monitoring program from the one identified in the Draft Administrative Order. While we agree in many cases with the alternative approach, the Orange County Permittees do not believe that this proposal represents a model for the permit that would be appropriate for Orange County, and think any monitoring program should reflect the following principles:

1. Support the question-driven monitoring and assessment program using the SMC model stormwater monitoring program as guidance. The WQIP should be the vehicle for establishing the monitoring program to support the watershed priorities. As such the proposed monitoring program should include:
   a. Wet Weather and Dry Weather Monitoring
   b. Receiving Water and Outfall Monitoring
   c. Supplemental Monitoring as appropriate
   d. Scope and schedule for monitoring
2. Monitoring should focus on the watershed and constituents of concern. Therefore initial monitoring should focus on the receiving water condition to identify the critical water quality issues (both dry and wet weather) and from there move to outfall monitoring to better support the stormwater program to address the critical water quality issues.
3. Monitoring should provide the opportunity to measure the overall watershed condition while being supported by a focused and complimentary outfall monitoring program that evaluates the sources and stressors affecting watershed condition. The assessment and feedback approach using a question driven framework would follow this general framework:
   a. Provide a comprehensive regional assessment of receiving waters in years 1 of the permit term (assessment).
   b. Conduct intensive outfall monitoring within each watershed or hydrologic subarea on an annual basis or rotating basis in the intervening years (sources and stressors).
   c. Conduct a comprehensive re-assessment of receiving water conditions in year 5 of the permit term to measure progress in addressing outfall discharges (feedback).
4. Dry weather monitoring should have the following objectives:
   a. As a diagnostic tool to support the Illegal Discharge / Illicit Connection (ID/IC) program
      i. Develop action levels that reflect a probabilistic and targeted sampling program.
      ii. Conduct investigation to identify the discharge.
   b. As an assessment tool to effectively prohibit non-stormwater discharges.
      i. Develop action levels that reflect protection of beneficial uses and watershed water quality issues.
      ii. Conduct investigation to identify the source(s).
5. Wet weather monitoring should have the following objectives:
   a. Assess the long term changes in the receiving water
      i. Conduct comprehensive monitoring at Mass Load Stations (MLS) every five years
   b. Assess the impacts of stormwater discharges on the receiving water
      i. Conduct outfall monitoring on an annual basis.

Although we have not provided specific comments on the monitoring provision of the Draft Adminstrative Order our assessment of the future Tentative Order will be based on these principles.

Dear Ms. Walsh:

On September 14, the County provided you with comments on the subject Permit. Since that time, the County has been provided with the comment letter prepared by Rancho Mission Viejo. This comment letter requests inclusion of language from current Order No. R9-2009-0002, specifically, *Provision F.1.d.(11) Where a development project……*

The County supports the inclusion of this provision in the future Tentative Order. Attached is an Addendum modifying our comments to include a provision that would continue the current alternative compliance option for watershed-based planning approaches for land development.

					that such controls are located upstream of receiving waters. Any volume that is not retained by the LID BMPs, up to the design capture volume, must be treated using LID biofiltration sized for the design capture volume that has not been retained. Where regional LID implementation has been shown to be technically infeasible (per Section E.3.c.(4)(b)) any volume up to and including the design capture volume, not retained by LID BMPs, not treated by LID biolfiltration, must be treated using conventional treatment control BMPs in accordance with Section E.3.c.(2)(d) and participation in the mitigation program in Section D.3.c.(4)(c).

for the completion of offsite mitigation projects, including milestone dates to identify, fund, design, and construct the projects. PDP implemented offsite mitigation projects must be completed upon completion of the PDP, unless a longer period is authorized by the San Diego Water Board. The timing of mitigation projects associated with a Copermittee offsite mitigation program will be developed by the Copermittees as part of developing their offsite mitigation program.

(iv) *Mitigation Fund*

A Copermittee may choose to implement additional mitigation programs (e.g., pollutant credit system, mitigation fund) as a means for developing and implementing offsite mitigation projects, provided the projects conform to the requirements for project locations, types, and timing described above.

(5) Alternative Compliance for Watershed-Based Planning

Where a development project, greater than 100 acres in total project size or smaller than 100 acres in size yet part of a larger common plan of development that is over 100 acres, has been prepared using watershed and/or sub-watershed based water quality, hydrologic, and fluvial geomorphologic planning principles that implement regional LID BMPs in accordance with the sizing and location criteria of this Order and acceptable to the Regional Board, such standards shall govern review of projects with respect to Provision E.3 of this Order and shall be deemed to satisfy this Order's requirements for LID site design, buffer zone, infiltration and groundwater protection standards, source control, treatment control and hydromodification control standards. Regional BMPs must clearly exhibit that they will not result in a net impact from pollutant loadings over and above the impact caused by capture and retention of the design storm. Regional BMPs may be used provided that the BMPs capture and retain the volume of runoff produced from the 24-hour 85th percentile storm event as defined in Provision E.3.c. and that such controls are located upstream of receiving waters. Any volume that is not retained by the LID BMPs, up to the design capture volume, must be treated using LID biofiltration sized for the design capture volume that has not been retained. Where regional LID implementation has been shown to be technically infeasible (per Section E.3.c.(4)(b)) any volume up to and including the design capture volume, not retained by LID BMPs, nor treated by LID biofiltration, must be treated using conventional treatment control BMPs in accordance with Section E.3.c.(2)(d) and participation in the mitigation program in Section E.3.c.(4)(c).

SUBJECT: COUNTY OF SAN DIEGO COMMENT SUBMITTAL ON THE ADMINISTRATIVE DRAFT MUNICIPAL SEPARATE STORM SEWER (MS4) PERMIT (TENTATIVE ORDER NO. R9-2012-0011)

Dear Ms. Walsh,

Thank you for the opportunity to comment on *Tentative Order No. R9-2012-0011 -- National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region* (Administrative Draft Permit).

The comments provided herein are offered by the County of San Diego in addition to those that the County has submitted separately on behalf of the 21 Copermittees subject to Order 2007-0001. While the Copermittee comments represent a general consensus developed since the release of the Administrative Draft Permit in April 2012, we believe that additional input is needed to reflect the unique perspective of the County as Regional Principal Permittee and as a large jurisdiction covering portions of eight watershed management areas.

Below we have identified several additional issues for Regional Board consideration. We believe in particular that the first three issues warrant additional discussion, and we are anxious to continue dialoguing with Regional Board staff, representatives of the Orange and Riverside permit regions, and other parties as appropriate. We would also like to emphasize that the comment letters submitted by both of these counties provide suggested principles that we agree are both useful and appropriate as a basis for much of this discussion.

1. Relationship of WQIP and JRMP Requirements.

The relationship of Water Quality Improvement Plan (WQIP) and Jurisdictional Runoff Management Plan (JRMP) requirements must be clarified. In spite of the extensive discussion that has already occurred on this issue, there appears to be a considerable variety of opinions on the specific content to be addressed in each plan, how these plans are related, and how each supports compliance with applicable permit performance standards. We suggest that the following questions be considered as a basis for continued discussion:

- What is the required content, relationship, and phasing of all submittals under the permit?
- Must a WQIP contain all jurisdictional commitments within a WMA or only those related to the highest priority water quality issues?
- Is the JRMP intended to be a procedural document generally describing Copermittee programs? Or should it contain specific watershed and/or jurisdictional commitments?
- Will implementation of a publicly vetted and Regional Board-approved WQIP constitute compliance with the permit?
- What specific content should be contained in WQIP Annual Reports? Are these reports sufficient to describe jurisdictional compliance as a whole?
- What are appropriate timeframes for reporting various data, information, and results?

2. Adaptive Management Provisions.

Adaptive management provisions of the Administrative Draft Permit should be fleshed out to ensure that they support meaningful program improvement over time. In particular, the County believes that a clear distinction should be made between normal iterative management processes (i.e., ongoing adjustments to programs and plans in response to experience obtained during routine implementation) and adaptive management (a structured process of identifying and addressing specific knowledge gaps with an aim toward resolving them over time). We believe that the two processes are fundamentally different in their aims, and with respect to the planning and resource commitments needed to sustain them. The best permit will be one that recognizes these distinctions, and that ensures the proper application of both processes. We suggest that the following questions be considered as a basis for continued discussion:

- Where are iterative and adaptive management processes most needed?
- Where do Copermittees have the discretion to make modifications? Where are approvals needed?
- Are there specific permit provisions that can or cannot be modified?
- Are there standards, criteria, other conditions that must be met to allow modification?
- Where approvals are needed for modifications, what is the process for obtaining them? What is the role of public review in this process?

Adaptive management provisions in the Administrative Draft Permit are currently consolidated under Section II.B.5. The Copermittees have suggested the addition of clarifying text in the introduction to Section II.E, as well as other specific edits throughout Section II.B. The County supports these changes, but additionally proposes that a separate section be established in the permit to consolidate, clarify, and emphasize iterative and adaptive management provisions.

3. Offsite Mitigation Programs.

Section II.E.3 of the Administrative Draft Permit requires the imposition of onsite retention and HMP controls for Priority Development Projects (PDPs). During discussions, Copermittees and industry representatives have emphasized the impracticability of meeting the proposed retention standard for all PDP sites. As an alternative that would provide greater flexibility in achieving compliance onsite, the Copermittees have proposed that a second tier of LID treatment options be added to the permit. The County strongly supports this proposal. However, even assuming acceptance of this proposed modification it's likely that PDPs will in some instances be unable to meet all applicable standards onsite. Therefore, we view the development of a mitigation program as an eventual necessity. Given this, it's critical that any limitations or constraints on the development or application of such programs be fully vetted prior to permit adoption. In particular, the County remains concerned that the mitigation project timing requirements contained in the Administrative Draft Permit would make regional controls infeasible in some cases or impose unrealistic and unacceptable liabilities on Copermittees for their completion and performance. Likewise, the use of mitigation funds, either internal or private, must be further explored to better understand their potential role. The required use of mitigation programs is new to this permit, and it's pragmatic to approach their imposition with caution. Unless the potential difficulties associated with such an undertaking are met up front, it's possible that the County will have little incentive to actively pursue them.

4. Attachment E, Total Maximum Daily Load for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed.

The Rainbow Creek TMDL for Total Nitrogen and Phosphorous assigns a Load Allocation (LA) to the County MS4. The Administrative Draft Permit incorporates this Load Allocation as Wasteload Allocation (WLA). We are aware of no legal basis for such a change, and therefore believe it was made in error. We request that the Regional Board strike the Rainbow Creek TMDL from Attachment E of the Administrative Draft Permit.

5. Provision E.2.A, Non-Storm Water Discharge of Irrigation Runoff.

Section B.2 of Order R9-2007-0001 requires that discharges from irrigation water, lawn watering, and landscape irrigation be prohibited only where they have been identified as a significant source of pollutants to waters of the U.S. Section E.2.a of the Administrative Draft Permit categorically defines each of these discharge types as illicit discharges. Since an accompanying Technical Report has not been provided with the Administrative Draft Permit, the County is unaware of any rationale for the removal of these exemptions. We request that this rationale be provided as part of the public record. If not, we respectfully request that irrigation water, lawn watering, and landscape irrigation be added to Section E.2.a.(3) of the Administrative Draft Permit. If sufficient rationale is provided for their removal, we alternatively request that they be added to Section E.2.a.(4) since their control through statute, ordinance, permit, contract, order, or similar means would seem to constitute an appropriate management response.

Again, thank you for the opportunity to participate in the development of a new for the San Diego Region. We look forward to continued discussion of the issues raised above. Please contact Jon Van Rhyn (858) 495-5133 if you have any questions.

Sincerely,

CID TESORO, LUEG Program Manager
Watershed Protection Program,
Department of Public Works
County of San Diego

RE: Comments from Environmental Groups on Tentative Order Number: R9-2012-0011

Dear Ms. Walsh:

San Diego Coastkeeper, Orange County Coastkeeper, Inland Empire Waterkeeper, Surfrider Foundation—San Diego Chapter, Surfrider Foundation—South Orange County Chapter, Environmental Health Coalition, Preserve Wild Santee, Friends of Rose Canyon, Coastal Environmental Rights Foundation, Laguna Bluebelt Coalition, South Laguna Civic Association, and Save Hobo Aliso (the "Environmental Groups") respectfully submit the following comments on the administrative draft of the San Diego Regional Municipal Separate Storm Sewer System permit, Tentative Order No. R9-2012-0011 ("Administrative Draft Permit").

EXECUTIVE SUMMARY

The Environmental Groups appreciate the opportunity to provide exhaustive comments on the pre-public notice draft of the San Diego Region's municipal stormwater permit. The focused meeting approach has provided the Environmental Groups an opportunity to work collaboratively with Regional Board staff, Copermittees, and other stakeholder groups. While the Administrative Draft

Permit is step in the right direction, there are several areas of concern remaining. Moreover, these concerns are not necessarily the same throughout the region. The priority issues list below is meant to assist the Regional Board staff in identifying the highest priority issues for environmentalists in each county.

SAN DIEGO COUNTY PRIORITY ISSUES:

1. The adaptive management process should not provide a safe harbor for enforcement action where discharges from the MS4 cause or contribute to violation of receiving water standards. (§ II.)
2. The Permit should demand water quality improvements within the permit term. (§II.)
3. The public should be included in developing Water Quality Improvement Plans and adaptive management. (§ V.B.)
4. Each Copermittee should be accountable for meeting watershed goals. (§V.F. at 14)
5. The Permit should require aggressive action to effectively prohibit non-stormwater discharges, particularly from overwatering, car washing, and swimming pool discharges. (§ III.)
6. The Permit should encourage collaboration between Copermittees and stakeholders. (§§ V.B, VI.C, VI.J.)

ORANGE COUNTY PRIORITY ISSUES:

1. The Permit should promote regular inspections of inventoried existing development to ensure compliance with applicable local ordinances and permits. (§ L.)
2. The Administrative Draft Permit fails to property incorporate adopted Total Maximum Daily Loads. (§ IV.)
3. The adaptive management process should not provide a safe harbor for enforcement action where discharges from the MS4 cause or contribute to violation of receiving water standards. (§ II.)

RIVERSIDE COUNTY PRORITIY ISSUES:

1. The Administrative Draft Permit fails to property incorporate adopted Total Maximum Daily Loads. (§ IV.)
2. The Regional Clearinghouse could become an important tool to increase transparency. (§ X.C.)

BACKGROUND

Southern California's unique, breathtaking beaches are one of the area's main attractions, with tourism contributing to approximately 75% of California's ocean-related jobs. The San Diego tourism industry is the third largest industry in the county, and is critical to the region's economy supporting businesses and jobs.[1] Hosting more than 31 million visitors each year, the industry employs over 160,000 San Diegans directly and indirectly and generates an economic impact of over $17 billion new dollars generated for the regional economy and hundreds of millions in statute and local taxes each year.[2]

[1] *See* http://www.sandiego.org/industry-research.aspx.
[2] *See* http://www.sandiego.org/industry-research.aspx.

Southern California's ocean-based tourism economy hinges on people being able to access the water. But polluted runoff keeps people out of the water and off the beaches for at least 72 hours after a rain event. Even in dry weather, recreational beach users are told to avoid runoff discharge locations by at least 75 feet. People ignoring these warnings often get sick. To safeguard our region's tourism economy and keep people healthy, the San Diego Regional Water Quality Control Board ("Regional Board") must adopt stringent requirements in this permit.

The current draft permit is unique in California in that it abandons the county-by-county permitting process and proposes a regional MS4 permit covering three counties. That being said, the draft permit undoubtedly addresses pollution and runoff concerns more progressively than any previous permit to date keeping in mind that it should implement the goals of the Clean Water Act to "restore and maintain the chemical, physical and biological integrity of the nation's waters" by "eliminating the discharges of pollutants by 1985, and to enhance water quality nationally to a 'fishable/swimmable' level by 1983." (33 U.S.C. § 1251(a)(1-2)(2012).

We have failed to achieve the Clean Water Act's goals in the San Diego Region. To achieve the Clean Water Act's goals, we must recognize the effects storm water runoff has on our shores and waterways. Twenty seven years after we should have eliminated pollutant discharges, beaches are still being closed after rainfalls because the water is too contaminated for us to safely swim. This is simply unacceptable. In a community that relies on tourism, in a time of economic hardship, in an area growing exponentially, the San Diego region must re-evaluate our its interests and implement measures strong enough to protect what is arguably our single greatest asset.

COMMENTS

I. An Expanded Regional MS4 Permit is both Legal and Appropriate.

A. The Regional Board Has Legal Authority to Issue a Regional Permit.

The Regional Board has the legal authority to issue an expanded region-wide permit.[3] The legislature directed regional boards to "coordinate their respective activities so as to achieve a unified and effective water quality control program."[4] In order to achieve this, the Regional Board has the authority to "formulate and adopt water quality control plans for all areas within the region."[5] Most importantly, the statutory language assumes Regional Boards may enact plans which include multiple counties; "regional boards shall not adopt any water quality control plan unless a public hearing is first held…in the affected county or ***counties***."[6] The Regional Board has the statutory authority to use a regional permit instead of county specific permits.

[3] *See* Cal. Water Code §§ 13000, 13001, 13140, 13240, 13370, 13377.
[4] Cal. Water Code § 13001.
[5] Cal. Water Code § 13040.
[6] *See* Cal. Water Code § 13244 (emphasis added).

B. The Regional Board Should Issue a Regional Permit.

The Regional Board has taken an important step in bringing together the permits for all three of the counties under the jurisdiction of Region 9. Having all of Region 9 governed by one MS4 permit promotes efficiency and consistency, allowing Regional Board staff the opportunity to focus on compliance and enforcement issues. As staff would have more time to work with Copermittees on specific compliance issues, the region would likely benefit with improved water quality. Further, uniform requirements across all of Region 9 will clarify expectations regarding work plans and budget allocations, and encourage watershed-based cooperation to address water quality problems.

II. THE ADMINISTRATIVE DRAFT PERMIT PROTECTS RECEIVING WATERS.

The Administrative Draft Permit includes receiving water limitations that prohibit discharges from the MS4s from causing or contributing to water quality standard violations.[7] This prohibition is appropriate to achieve Clean Water Act mandates.

While the Administrative Draft Permit directs the Copermittees to strive to improve water quality through the adaptive management process, engaging in adaptive management does not provide Copermittees a "safe harbor" from enforcement action for water quality violations.[8] This approach is appropriate and complies with the Clean Water Act.[9]

However, the Administrative Draft Permit fails to aggressively seek water quality improvements. Indeed, the Administrative Draft Permit suggests that, because water quality degradation in the San Diego region occurred over several decades, "a decade or more may be necessary to realize demonstrable improvement to the quality of waters in the Region."[10]

Our region deserves better. Just because it may be difficult to see water quality improvements does not mean that we cannot and should not demand aggressive action to see water quality improvements for at least some pollutants in some portions of our watersheds. Region 9 had 274 water body segments on the 2008 303(d) list for some type of pollution—156 of these requiring a TMDL. If you count the impairment per pollutant for each water body, the number of listed segments skyrockets from 274 to 1570.[11]

The Permit should not bow to Copermittee pessimism that measurable water quality improvements will take decades to achieve. Instead, the Permit should demand that we significant water quality improvement within the permit term.

---

[8] *See* Tentative Order No. R9-2012-0011 § II.A.4.(c) at 12.
[9] The Clean Water Act regulations specify that permit-holders have a duty to "comply with all conditions of th[e] permit. Any permit noncompliance constitutes a violation of the Clean Water Act and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application." 40 C.F.R. § 122.41(a).
[10] *See* Tentative Order No. R9-2012-0011 § I. at 4.
[11] *See* http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/TMDLs/303dlist.shtml.

III. THE ADMINISTRATIVE DRAFT PERMIT'S TOUGH STANCE ON NON-STORMWATER DISCHARGES IS APPROPRIATE.

A. The Administrative Draft Permit Properly Tightened Non-Storm Water Exemptions.

The Administrative Draft Permit takes an important step by ratcheting down exemptions for non-storm water discharges. The Clean Water Act requires that municipal stormwater permits "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."[12] The Administrative Draft Permit fulfills this requirement by prohibiting non-stormwater discharges into the MS4 unless they are "authorized by a separate NPDES permit" or the discharge falls within a category of non-stormwater discharges that must be addressed under the permit's illicit discharge detection and elimination provisions.[13] This wording meets the Clean Water Act requirements of "effectively prohibiting" non-stormwater discharges while providing clarity regarding how a Copermittee can meet the "effectively prohibit" standard.[14]

This more specific language is necessary because the Copermittees have done a poor job "effectively prohibiting" non-stormwater discharges under the current permit language.[15] Non-stormwater discharges are rampant throughout the region and municipalities have failed to take reasonable steps to effectively prohibit non-stormwater discharges. The Administrative Draft Permit's language prohibiting non-stormwater discharges except in limited situations emphasizes the importance of eliminating non-stormwater discharges and forces the Copermittees to take real action to effectively prohibit non-stormwater discharges. The Environmental Groups urge the Regional Board to leave the Administrative Draft Permit language prohibiting non-stormwater discharges

B. The Administrative Draft Permit Properly Prohibits Non-Stormwater Discharges that are Easily Preventable or Likely to be A Significant Source of Pollutants to Receiving Waters.

The Administrative Draft Permit properly prohibits discharges of pumped ground water, discharges from fountain drains, water from crawl space pumps, and water from footing drains.[16] Likewise, the Administrative Draft Permit properly prohibits water line flushing and water main breaks.[17] While the Administrative Draft Permit does not specifically address landscape irrigation, it has removed the non-stormwater exemption included in the current MS4 permit. These prohibitions are appropriate because they are discharges that can be controlled relatively easily and are likely to be significant sources of pollutants. These provisions therefore meet the Clean Water Act requirements that municipalities effectively prohibit non-stormwater discharges.

---

[13] *See* Tentative Order No. R9-2012-0011 § II.A.1(b) at 9.
[14] 33 U.S.C. § 1342(p)(3)(B)(ii).
[15] 33 U.S.C. § 1342(p)(3)(B)(ii).
[16] *See* Tentative Order No. R9-2012-0011 § II.E.2(a)(1) at 56.
[17] *See* Tentative Order No. R9-2012-0011 § II.E.2(a)(2) at 56.

C. The Permit Should Not Allow Non-Stormwater Discharges into San Diego Bay.

The Administrative Draft Permit carves out an exception when it prohibits discharges of pumped ground water, discharges from fountain drains, water from crawl space pumps, and water from footing drains.[18] The Administrative Draft Permit prohibits these non-stormwater discharges, except if those discharges drain to San Diego Bay.[19] The Regional Board has failed to justify why San Diego Bay does not deserve the same protection provided to other surface waters in San Diego, Orange, and Riverside Counties. The Clean Water Act requires the MS4 permit to "effectively prohibit" non-stormwater discharges and does not carve out or sacrifice certain water bodies.[20] The Permit should remove the carve-out allowing pumped groundwater, discharges from foundation drains, water from crawl spaces and water from footing drains to flow unrestricted to San Diego Bay.

D. In Order to Effectively Prohibit Non-Stormwater Discharges, the Copermittees' Legal Authority Must Authorize the Copermittees to Control the Contribution of Pollutants in Discharges of Runoff from Residential and Commercial Properties.

The Administrative Draft Permit requires that Copermittees must establish, maintain, and enforce adequate legal authority to "control the contribution of pollutants in discharges of runoff associated with industrial and construction activity to its MS4…."[21] Residential and commercial properties are also likely causing or contributing to water quality problems throughout the region. Therefore, the Copermittees must likewise establish legal authority to address those problems. Without legal authority to address pollution problems stemming from residential and commercial properties, Copermittees will never be able to address the full range of pollution sources within its jurisdiction.

E. The Permit Should Take a More Aggressive Stance on Vehicle Washing.

The Administrative Draft Permit addresses individual residential vehicle washing as a non-stormwater discharges that "must be controlled… through statute, ordinance, permit, contract, order or similar means."[22] But these "requirements" provide so much flexibility that they are meaningless. To address vehicle washing as a non-stormwater discharge that Copermittees must "effectively prohibit," the Permit must take a more aggressive stance on vehicle washing.

1. <u>The Permit should prohibit wash water from vehicle washing from leaving the residential property.</u>

The Administrative Draft Permit states that wash water from residential vehicle washing must be "directed to landscaped areas or other pervious surfaces where feasible" and that residents should "minimize the use of water for vehicle washing, use as little detergent… as possible, wash vehicles at

[18] *See* Tentative Order No. R9-2012-0011 § II.E.2.a.(2) at 54.
[19] *See id.*
[20] 33 U.S.C. § 1342(p)(3)(B)(ii).
[21] *See* Tentative Order R9-2012-0011 § II.E.1.a.(2) at 54.
[22] *See* Tentative Order R9-2012-0011 § II.E.2.a.(4) at 57.

commercial facilities, and implement other practices of behaviors" to prevent pollutants from residential car washing from entering the stormdrain.[23]

To effectively address residential vehicle washing as a source of non-stormwater discharges, which Copermittees must "effectively prohibit," the Permit should tighten requirements related to residential vehicle washing. The Permit should "effectively prohibit" non-stormwater discharges from residential vehicle washing by prohibiting residents from allowing wash water to leave their property.

2. <u>The Permit should prohibit fundraising or group car washes unless water is directed to landscaped areas or other pervious surfaces.</u>

The Administrative Draft Permit fails to address fundraising or group car washes as a source of non-stormwater discharges. Because of the volume of cars washed within a short time period and the fact that car washes are often held at gas stations or drugstores on a highly-trafficked corner—places with lots of pavement, sources of trash, oil and gas, and a nearby stormdrain—these car washes are sources of problematic non-stormwater discharges. The Permit should require Copermittees to prohibit fundraising or group car washes unless water is directed to landscaped areas or other pervious surfaces.

F. The Permit Should Require All Dechlorinated Swimming Pool Discharges be Directed to the Sanitary Sewer, Landscaped Areas, or Other Pervious Surfaces.

The Administrative Draft Permit allows residents to dump dechlorinated swimming pool discharges to storm drains.[24] This requirement should apply to all pool discharges because of the threat to water quality from extremely large discharges entering storm drains. Unless the discharges directly enter the storm drain, they will gather significant amounts of pollutants along roads, sidewalks, and other impervious surfaces before entering the storm drain. Therefore, the Permit should require all discharges of dechlorinated pool water be directed to the sanitary sewer, landscaped areas, or other pervious surfaces that can handle the volume of water.

G. The Permit Should Require that Exempted Sources of Non-Storm Water be Reduced Whenever Feasible.

The Permit should require that Copermittees take steps to reduce exempted sources of non-storm water when feasible. Even if the exempted category of non-storm waters poses little threat of containing contaminants on its own, all non-storm waters gather additional pollutants as they travel along impervious surfaces to storm drains. Without such a requirement, Copermittees are free to rely on exemptions and do nothing about discharges even when they can be easily prevented. For example, San Diego Coastkeeper recently reported a leaking pipe to the City of San Diego that had been identified by a resident living nearby. In response to the complaint, the City of San Diego reported that, because the pipe was leaking potable water, the discharge was not illegal. The City

---

[23] *See id.*
[24] *See* Tentative Order R9-2012-0011 § II.E.2.a.(4)(c) at 57.

failed to identify whether it was possible to fix the leak, instead it took the easy route and relied on an exemption in the current Stormwater permit.

This flies in the face of the Clean Water Act, which requires that all non-storm water discharges be effectively prohibited.[25] The Regional Board should include language to compel Copermittees to reduce or eliminate ***all*** non-stormwater discharges, where possible. There is no acceptable reason that easily preventable non-storm water discharges should be allowed to go unattended.

H. The Permit Should Require Copermittees to Maintain a Hotline and Online Pollution Reporting System as Part of Their Illicit Discharge Detection and Elimination Programs.

The Administrative Draft Permit recognizes that public hotline reports can provide valuable information to help Copermittees identify and eliminate illicit discharges.[26] However, the Administrative Draft Permit fails to require Copermittees to maintain telephone and online reporting hotlines. By not explicitly requiring methods for the public to formally contact the Copermittees to report illicit discharges and pollution problems, the Administrative Draft Permit invites Copermittees to eliminate this portion of their jurisdictional program.

Instead, the Permit should require that each Copermittee must maintain a telephone hotline to accept stormwater complaints from the public. The Permit should also require Copermittees to maintain an email address (not just an online form) to allow e-mail reporting of stormwater complaints. As part of these requirements, Copermittees should be required to make this information available prominently on the Copermittee's webpage, and all the contacts should be listed on one page of the regional clearinghouse.

1. <u>The Permit should require Copermittees to provide follow up information to those who request it.</u>

Further, the Permit should require Copermittees to respond with follow-up or complaint resolution information to any person using the telephone or e-mail complaint reporting system. San Diego Coastkeeper often passes on to local jurisdictions pollution reports that the organization receives from individuals wishing to remain anonymous. San Diego Coastkeeper always asks for follow-up after the complaint has been investigated, and while some jurisdictions are good about providing the information, others are inconsistent or resistant. Providing the public and interested environmental groups with information about the resolution of pollution complaints, when requested, is important to foster public buy-in to the stormwater program and to encourage citizens to report pollution problems when they see them.

---

[25] *See* 33 U.S.C. § 1342.
[26] *See* Tentative Order R9-2012-0011 at § II.E.2.d.(2)(a) at 60.

2. The Permit should require the Copermittees to make their hotline response databases publicly available.

The Permit should require that the Copermittees make their hotline response databases publicly available on the Regional Clearinghouse. This will increase transparency regarding Copermittee response to hotline complaints. It will also help environmental groups and stakeholders to work with Copermittees to educate the public so that hotline calls and reports become more effective.

IV. THE ADMINISTRATIVE DRAFT PERMIT FAILS TO PROPERLY INCORPORATE ADOPTED TOTAL MAXIMUM DAILY LOADS.

A. The Permit Must Include Mass Limits In Order to Comply with the Total Maximum Daily Loads That Include Mass Limits.

The Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay (adopted June 11, 2008) and the Total Maximum Daily Loads for Indicator Bacteria, Project I—Twenty Beaches and Creeks in the San Diego Region (adopted February 10, 2010) include both effluent limitations and wasteload allocations. However, the Administrative Draft Permit excludes the wasteload allocations. Not only are wasteload allocations a requirement of a valid Total Maximum Daily Load (TMDL),[27] but a large amount of time and effort went into developing the wasteload allocations to limit the total amount of bacteria loading into local waters. Weight-based wasteload allocations included in the TMDLs must be included in the Permit.

B. The Administrative Draft Permit Properly Prohibits Exceedances for Diazinon in Chollas Creek and Dissolved Copper in the Shelter Island Yacht Basin.

The Administrative Draft Permit properly removed allowable exceedances from the Diazinon TMDL in Chollas Creek and the Dissolved Copper TMDL in the Shelter Island Yacht Basin.[28] It is proper for the Regional Board to prohibit exceedances for Diazinon in Chollas Creek and Dissolved Copper in Shelter Island Yacht Basin because this will result in better water quality for Chollas Creek and San Diego Bay.

C. The Administrative Draft Permit Should Reflect the Correct Limit for Total Nitrogen in Rainbow Creek.

The TMDL for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed states that as of 2009, Total Nitrogen load allocation for Commercial Nurseries is 390 kg/yr. However, the Administrative Draft Permit states the total Nitrogen load allocation for Commercial Nurseries is 399 kg/yr.[29] The Permit must reflect the 390 kg/yr value in the Rainbow Creek Watershed Nitrogen and Phosphorus TMDL.

---

[27] *See* 40 C.F.R. 130.2(i).
[28] *See* Tentative Order R9-2012-0011 Attachment E at E-2 and E-4.
[29] *See* Tentative Order R9-2012-0011 Attachment E, Table 3.4 at E-8.

D. The Administrative Draft Permit Improperly Calculates the Limit for Total Coliform at Baby Beach in Dana Point Harbor.

The dry weather interim effluent limitation for Total Coliform is incorrect.[30] According to the TMDL for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay, the City of Dana Point and the County of Orange must achieve a 50% reduction of indicator bacteria at Baby Beach by the 3rd year after approval, which is 2012. The dry weather municipal MS4 existing wasteload for Total Coliform at the time the TMDL was completed was 9.0 billion MPN/day. The wasteload allocation outlined by the TMDL is 0.86 billion MPN/day. Therefore, a 50% reduction means the City of Dana Point and the County of Orange must meet an interim allocation by 2012 of 4.93 billion MPN/day. However, the Administrative Draft Permit lists this interim limitation as 5.32 billion MPN/day. To comply with the TMDL, the Permit must reflect the TMDL's requirement, which is 4.93 billion MPN/day by 2012.[31]

E. The Permit Should List Previous Wet Weather Interim Effluent Limits to Maintain Compliance.

The Administrative Draft Permit does not list numeric values for wet weather interim effluent limitations to be reached by 2012 for any TMDL that includes them. Even if the Copermittees have already complied with the interim limits, the Permit should include these values to maintain compliance with the loading limits.

V. WATER QUALITY IMPROVEMENT PLANS HAVE THE POTENTIAL TO ENCOURAGE COPERMITTEES WITHIN A WATERSHED TO WORK TOGETHER TO IMPROVE WATER QUALITY.

The Water Quality Improvement Plans are the focal point of the Administrative Draft Permit. Their goal, to "guide Copermittees' jurisdictional runoff management program implementation efforts towards achieving the outcome of improved water quality in MS4 discharges and receiving waters," is proper. This approach recognizes that watersheds span multiple jurisdictions and that water quality will not improve unless all jurisdictions in a watershed work together. However, the Water Quality Improvement Plan process has room for improvement.

A. The Water Quality Improvement Plans Should Best Protect, Preserve, Enhance, and Restore Waters of the State.

The Administrative Draft Permit states that the goal of the Water Quality Improvement Plans is "to attain ***reasonable*** protection, preservation, enhancement, and restoration of water quality and

---

30 *See* Tentative Order No. R9-2012-0011 at Attachment E, Table 5.4 at E-14.

31 Calculation:

9.0 billion MPD/day – 0.86 billion MPD/day = 8.14 (Total to be reduced)

8.14 billion MPD/day / 2 = 4.07 billion MPD/day (50% of reduction)

9.0 billion MPD/day – 4.07 billion MPD/day = 4.93 billion MPD/day (2012 Interim Target) designated beneficial uses of waters of the state."[32] "Reasonable" protection, preservation, and restoration of our waters is not enough. The State Water Board's mission is to "preserve, enhance, and restore the quality of California's water resources."[33] The Regional Board's mission is to "develop and enforce water quality objectives and implementations plans that will ***best protect*** the state's waters…."[34]

To properly reflect the goals of the Water Quality Improvement Plans and to bring them in line with the State Water Board's and the Regional Board's mission, the goal of the Water Quality Improvement Plans should be "to ***best*** protect, preserve, enhance, and restore water quality and designated beneficial uses of waters of the state."[35]

B. The Public Should Be Included in Developing Water Quality Improvement Plans.

The Administrative Draft Permit relegates public participation in Water Quality Improvement Plans to a lone 30 day public review and comment period after the Copermittees have spent an entire year developing Water Quality Improvement Plans.[36] Not only is there only one 30-day public review period, but it is likely that each of the nine Water Quality Improvement Plans will be subject to concurrent public review periods. For organizations like San Diego Coastkeeper and Orange County Coastkeeper that would review Water Quality Improvement Plans for multiple watersheds, concurrent 30-day review periods for all 9 plans will preclude meaningful participation or comments.

1. <u>The Permit should encourage Copermittees to involve stakeholders throughout the Water Quality Improvement Plan development process.</u>

Too often Copermittees and environmental groups view each other as adversaries instead of potential partners and resources. But environmental groups and other stakeholders have key information, data, knowledge, and resources that can assist Copermittees in developing a robust Water Quality Improvement Plan. The Permit should encourage Copermittees to identify key stakeholders in each watershed and involve those stakeholders either formally or informally throughout the Water Quality Improvement Plan development process. Involving key stakeholders early and often as Water Quality Improvement Plans are developed will ensure that Copermittees hear and address stakeholder concerns and suggestions early in the process and avoid a situation where completed plans would need to be completely revised in response to comments received after Water Quality Improvement Plans are completed.

2. <u>The Permit should include more public review and comment points and stagger the review periods.</u>

To ensure meaningful public participation in the Water Quality Improvement Plan development

---

32 Tentative Order No. R9-2012-0011§ II.B. at 13 (emphasis added).
33 State Water Board Website http://www.waterboards.ca.gov/about_us/water_boards_structure/mission.shtml
34State Water Board Website (emphasis added)
http://www.waterboards.ca.gov/about_us/water_boards_structure/mission.shtml.
35 Tentative Order No. R9-2012-0011 § II.B. at 13 (emphasis added).
36 *See* Tentative Order No. R9-2012-0011 § II.F.1 at 91.

process, the Permit should include additional public review periods and stagger the final review of Water Quality Improvement Plans so not all 9 plans are reviewable concurrently. Formal public review and comment periods should be incorporated at each major decision step in the Water Quality Improvement Plan process. To allow the watershed groups maximum flexibility, the Permit could require watershed groups to submit a public involvement plan setting a schedule for public review of each main component of the plan as it is developed. This approach could also facilitate a staggering of Water Quality Improvement Plan review periods.

3. The Permit should include language explicitly involving the public in setting water quality priorities.

Water quality priorities are the foundation of Water Quality Improvement Plans. Because the entire Water Quality Improvement Plan will be based on the watershed's water quality priorities, the public must be actively involved in identifying priority pollutants or receiving water conditions within each watershed.

To facilitate public participation in identifying a watershed's priority pollutants, the Permit should:

- Specify that "all available physical, chemical, and biological receiving water monitoring data" includes data collected by third parties.

- Mandate that watershed groups make a "call for data" and allow interested third parties 30 days to submit data to the watershed groups for consideration.

- Require watershed groups to submit a preliminary priority pollutant list for Regional Board and public review and comment, along with a case for support identifying data and information relied on to select the priority pollutants or receiving water conditions. This review and comment period should be held prior to identifying pollutant sources, developing numeric targets and schedules, or selecting water quality improvement strategies.

4. The Permit should involve the public in identifying pollutant sources and stressors.

Environmental Groups and other key stakeholders often have specific information regarding pollutant sources within a watershed. Groups like San Diego Coastkeeper and Orange County Coastkeeper frequently receive calls from concerned citizens about facilities, neighborhoods, or activities that may be generating pollutants. These groups and others also have the capacity to reach out to their members and volunteers to specifically solicit information about potential pollutant sources.

To facilitate public participation in identifying pollutant sources, the Draft Permit should:

- Specify that "review of available data" includes complaints received through stormwater hotlines or reported by citizens or environmental groups.

- Mandate that watershed groups make a "call for data" and allow interested third parties 90 days to submit pollutant source data to the watershed groups for consideration.

- Emphasize that pollutant source identification is an ongoing process and does not only occur during the development of the Water Quality Improvement Plan.

- Specifically allow that Copermittees or stakeholder groups may perform special studies to further refine pollutant source identification, and that such information will be considered during the adaptive management process.

- Require watershed groups to submit a preliminary pollutant source list for Regional Board and public review and comment, along with a case for support identifying data and information relied on to select the priority pollutants or receiving water conditions. This review and comment period should be held prior to developing numeric targets and schedules, or selecting water quality improvement strategies.

5. The Permit must require hearings for proposed Water Quality Improvement Plans.

California law requires the Regional Board hold a public hearing before adopting any water quality control plan.[37] Water Quality Improvement Plans qualify as "water quality control plans" and therefore are subject to public hearing requirements.[38] The criteria to be considered a "water quality control plan" subject to a public hearing are that the plan: *(1)* is created for a specific area or region; *(2)* protects the beneficial uses of waters; *(3)* sets limits to protect beneficial uses; *(4)* includes an implementation program designed to meet water quality objectives.[39] The Water Quality Improvement Plans meet all the criteria of a water quality control plan.[40] Therefore, the permit must require, not merely allow, public hearings for Water Quality Improvement Plans.[41]

C. The Permit Should Specify the Regional Board Staff's Role in Developing Water Quality Improvement Plans.

Just as involving key stakeholders early and often as Water Quality Improvement Plans are developed will avoid the potential for having to start from scratch on the plans, Regional Board staff participation throughout the Water Quality Improvement Plan process is imperative. The Draft Permit should reflect when and how the Regional Board staff intends to be involved in Water Quality Improvement Plan development. At a minimum, the Regional Board should receive monthly updates from watershed groups and should provide formal review of water quality priorities, pollutant sources identified, numeric targets and schedules, strategies and schedules, and monitoring and assessment plans as they are developed.

---

[37] *See* Cal. Water Code § 13244.
[38] *See* Cal. Water Code § 13050(j).
[39] *See id.*
[40] *See* Tentative Order No. R9-2012-0011 §§ II. B.1., B.2(a) & (d), B.3 at 13-18.
[41] *See* Tentative Order No. R9-2012-0011 § II. F.1.

D. Copermittees Should Implement Water Quality Improvement Plans as Soon as the Plans are Approved.

The Administrative Draft Permit contains inconsistent deadline requirements for Water Quality Improvement Plans. Administrative Draft Permit requires Copermittees "to implement" all the requirements in Provision B, related to the Water Quality Improvement Plans, within one year of the permit's adoption.[42] But the Administrative Draft Permit also allows Copermittees 180 days after submission "to commence with implementation of the Water Quality Improvement Plan."[43] Copermittees should begin implementing Water Quality Improvement Plans as soon as they are approved.

E. The Permit Should Require Interim and Final Numeric Targets and Schedules Based on Applicable Water Quality Standards.

The Administrative Draft Permit states that Copermittees must develop and incorporate interim and final numeric targets into their Water Quality Improvement Plans.[44] The permit should direct Copermittees that final targets must be compliance with applicable water quality standards. Interim targets should reflect incremental, yet demonstrable, progress towards improving water quality. Interim targets will allow the Copermittees, the Regional Board, and the public to fully assess Copermittees' progress towards compliance with final targets.

F. Each Copermittee Should Be Held Accountable For Achieving Watershed Numeric Targets.

During the focused meeting process, some Copermittees indicated that they intended to focus jurisdictional program efforts on one watershed and effectively ignore water quality priorities in other watersheds that are also within its jurisdiction. While this approach may be consistent with jurisdictions focusing resources where they can have the most impact, it also presents the potential that watershed priorities will be "orphaned" or that one jurisdiction will carry the primary or sole burden of implementing water quality improvement strategies within the watershed.

In order to help identify this problem, the Water Quality Improvement Plan schedules for implementing water quality improvement strategies must indicate which jurisdiction(s) is responsible for each strategy and cross-reference the section and page in the jurisdictional plan where each Copermittee commits to implementing the strategy.[45]

To avoid this potential problem and ensure that each jurisdiction remains actively involved in ensuring that each watershed within its jurisdiction achieves its interim and numeric targets, the Permit should reflect that each jurisdiction will be held accountable for achieving the watershed numeric targets.[46] Further, the Permit should specify that the Regional Board will reject any Water

---

[42] *See* Tentative Order No. R9-2012-0011 § II.B. at 13.
[43] Tentative Order No. R9-2012-0011 § II.B.6 at 21 and § F.1 at 91.
[44] *See* Tentative Order No. R9-2012-0011 § II.B.2.d at 17.
[45] *See* Tentative Order No. R9-2012-0011 § II.B.3.b(1) at 19.
[46] *See* Tentative Order No. R9-2012-0011 § II.B.2.d at 18.

Quality Improvement Plan including orphaned priorities.[47]

These proposed changes are consistent with the Administrative Draft Permit's special study requirements. The Administrative Draft Permit requires Copermittees to implement at least three special studies within each Watershed Management Area, and the special studies require some form of participation by all Copermittees within the Watershed Management Area.[48] This requirement demonstrates the Regional Board's commitment to avoiding "orphaned" water quality priorities or having the primary responsibility for watershed strategy implementation fall to only Copermittee.

G. The Adaptive Management Process Should Include a Formal Public Participation Process.

The Administrative Draft Permit recognizes that public participation is an important element in the adaptive management process.[49] However, the Administrative Draft Permit fails to detail how and when the Copermittees are to solicit recommendations for modifications to the Water Quality Improvement Plans or Jurisdictional Runoff Management Plans as part of a public participation process.

For Water Quality Improvement Plans, the permit should include a process during which the Copermittees in each Watershed Management Area prepare a progress report, akin to a Report of Waste Discharge, that details the water quality improvement strategies completed or in progress, along with water quality data (from the Copermittees and third parties) and an assessment of progress towards interim and final numeric targets. Before revising the Water Quality Improvement Plan, the Copermittees must solicit comments from the Regional Board and public. The revised Water Quality Improvement Plan should be subject to public comment and a public hearing.

The Administrative Draft requires Copermittees to create a means "for public participation…in updating, developing, and implementing [their] jurisdictional runoff management program."[50] Part of the adaptive management process for Jurisdictional Runoff Management Programs requires Copermittees to take into account recommendations they receive.[51] To involve the public in the adaptive management process for jurisdictional runoff management programs, the Permit should require each Copermittee to solicit public comment on its initial findings and proposed changes before changes to the jurisdictional runoff management program is finalized.

H. The Adaptive Management Process for Water Quality Improvement Plans Should Occur More Frequently Than Every Three Years.

The Administrative Draft Permit currently requires Copermittees to implement the iterative process at least once every three years.[52] The Copermittees should be required to implement the iterative

---

[52] *See* Tentative Order No. R9-2012-0011 § II.B.5.a.(1) at 20.

process at least every two years. More frequent adaptive management encourages the Copermittees to modify programs to address new information as it becomes available. It also compels the Copermittees to develop an adaptive management process that is nimble and can quickly incorporate change as needed.

Further, the proposed three year requirement will effectively cause the Copermittees to engage in one long and one short adaptive management process within a permit cycle instead of two equally spaced processes.

The sample calendar below illustrates the challenge with the current schedule:

Activity	**Frequency/Timing**	**Hypothetical Date**
Permit issued		January 1, 2013
Water Quality Improvement Plan Submitted	Within 12 months of permit issuance *§ B*	December 31, 2013
Public process	30 days after submittal *§F.1.*	January 2-31, 2014
Water Quality Improvement Plan Implemented	Within 180 days after submittal *§B.6.*	May 30, 2014
Adaptive Management	At least once every three years *§B.5.a.*	May 30, 2017
Report of Waste Discharge including proposed changes to Water Quality Improvement Plans	180 days before permit expires *§F.5.b.*	May 30, 2018
Permit Expires	5 years from issuance	December 31, 2018

I. Interim Numeric Targets Should Align With the Adaptive Management Process Schedule.

The Administrative Draft Permit requires watershed groups to set final and interim numeric targets and schedules.[53] While the Administrative Draft Permit provides some guidance that "interim numeric targets must be based on measurable criteria or indicators that can demonstrate incremental progress toward achieving the final numeric targets," there is no guidance regarding the scheduling of the interim numeric targets. The Permit should specify that the interim numeric targets should be set on the same schedule as the adaptive management process. This will provide the Copermittees with concrete goals to evaluate during the adaptive management process and require the Copermittees to collect sufficient data to evaluate progress to those goals by the time the adaptive management process occurs.

53 *See* Tentative Order No. R9-2012-0011 § II.B.2.d. at 17-18.

VI. ACTION LEVELS ARE ONLY SUFFICIENT IF THE REGIONAL BOARD DETERMINES NUMERIC EFFLUENT LIMITS ARE INFEASIBLE.

A. The Clean Water Act Requires the Regional Board to Assess Whether Numeric Effluent Limits are Feasible.

The Clean Water Act, its regulations, and case law all require that NPDES permits contain numeric effluent limitations when feasible. The Regional Board has failed to assess whether any numeric effluent limitations are feasible for this permit. Numeric effluent limitations are not *de facto* infeasible in stormwater permits, nor are they limited to end-of-pipe limits.

Numeric effluent limitations can be expressed as: *(1)* pollutant reduction levels for parameters that are applied system-wide rather than to individual discharge locations; *(2)* requirements to meet performance standards for specific pollutant parameters or *(3)* in-stream targets for specific pollutant parameters.[54]

The Regional Board must make a good faith effort to assess the feasibility of including numeric effluent limits within this permit in order to comply with the Clean Water Act's technology-forcing provisions.

B. Non-Storm Water Numeric Action Levels Should Be Numeric Effluent Limits.

The Clean Water Act requires that all municipal stormwater permits "effectively prohibit" no-stormwater discharges.[55] Yet the Administrative Draft Permit includes detailed "Non-Storm Water Action Levels" to set water-quality based goals for non-stormwater discharges.[56] Because Copermittees are responsible for "effectively prohibiting" non-stormwater discharges within their jurisdictions, mere "action levels" for non-stormwater discharges are inappropriate. These levels should be included as enforceable numeric effluent limits. By allowing non-stormwater discharges that fall within the numeric effluent limits and do not cause or contribute to a violation of water quality standards, the permit would provide an effective mechanism to determine whether or not Copermittees are effectively prohibiting non-stormwater discharges within their jurisdiction. Further, these numeric effluent limits are feasible because the Clean Water Act recognizes that non-stormwater discharges should be eliminated.

VII. MONITORING AND ASSESSMENT REQUIREMENTS MUST ENSURE THAT COPERMITTEES IDENTIFY PROGRESS TOWARDS WATERSHED GOALS AND TRACK THE HEALTH OF THE WATERSHEDS.

The Administrative Draft Permit sets out a comprehensive system of monitoring and assessment procedures that will ensure Copermittees are able to detect and eliminate illicit discharges and connections. The Regional Board must recognize the importance of extensive monitoring in

---

[55] *See* 33 U.S.C. § 1342; Clean Water Act § 402(p)(3)(B)(ii).
[56] *See* Tentative Order No. R9-2012-0011 § II.C.1. at 22-24.

making continued progress towards clean waters in the San Diego Region. If the Permit does not include enough monitoring, the watersheds in Region 9 will be in danger of increased pollutant discharges that Copermittees will not be able to detect.

A. The Permit Must Include Sufficient General Monitoring Requirements to Detect Changing Conditions Within Watersheds.

During the focused meeting process, some Copermittees proposed drastically reducing the amount of monitoring required in the Administrative Draft Permit. One Copermittee representative even likened routine watershed monitoring to a colonoscopy.

The permit must continue to require the Copermittees to not just monitor areas with known pollution problems, but also to track areas currently meeting water quality standards to ensure that they do not become impaired or impacted. Environmental Groups seek to avoid a monitoring program that fails to provide relevant information to the public and regulators as to actual water quality impairments.

Copermittees should be encouraged to partner with local environmental groups to assist in monitoring areas to track general trends of watershed health. Many local groups already sample water quality and would be interested in partnering with Copermittees and watershed groups to ensure that baseline water quality data for the whole watershed is collected. For example, San Diego Coastkeeper has a state-certified water quality laboratory and has been using volunteers to collect water quality data and assess the health of our watersheds for years.

B. The Permit Should Allow Visual Observations to Be Included within Copermittees' Inspection Programs.

The Administrative Draft Permit does not explicitly allow Copermittees to create an inspection program that relies on visual observations. While visual observations alone should not comprise the Copermittees' entire inspection program, the Permit should allow Copermittees to include visual inspections as a key component of inspection programs.

Further, to assist Copermittees in completing visual inspections, particularly in residential areas or shopping centers, the Permit should explicitly allow Copermittees to use information gathered from volunteer monitoring or patrol programs. Such programs could be operated by the Copermittees or environmental groups and would be subject to a training program to ensure volunteers are able to spot potential violations and avoid trespassing or confronting property owners.

C. The Permit Should Specify that Copermittees Must Accept Quality-Controlled Data Received from Third Parties.

The Administrative Draft Permit and the Regional Board staff have indicated that Copermittees should use third party water quality monitoring data to assist in assessing our watersheds and the

Copermittees' progress towards achieving water quality standards.[57] However, some Copermittees are reluctant to use data collected by third parties. One Copermittee articulated its distaste for third party-collected data by saying that third party data is not as rigorous as data collected by the Copermittees and therefore trying to compare third party data to Copermittee data is "like comparing apples and oranges."

The Permit should specify that Copermittees must use third party data that meets particular criteria. These criteria should require third parties to maintain and make available for review the following information: *(1)* a quality assurance project plan; *(2)* a list of methods used; and *(3)* standard operating procedures.

Additionally, the Administrative Draft Permit's "Assessment Requirements" should specify that Copermittees must evaluate not just "the data collected pursuant to Provisions D.1, D.2, and D.3" to identify causes of exceedances, but must also solicit and evaluate third party data that meets that permit criteria to identify causes of water quality problems.

D. If the Permit Allows Copermittees to Use Modeling to Determine Water Quality Conditions, the Permit Must Include Safeguards to Ensure Reliable Modeling Results.

The Administrative Draft Permit does not contemplate Copermittees using modeling as a tool to monitor and assess water quality. During the focused meeting process, the Copermittees have asked to use modeling to assess water quality, and the Regional Board staff appeared receptive to the idea.

Modeling can be an important predictive tool, or it can be meaningless garbage. The quality of the modeling hinges on the quality and quantity of the data on which the model is based, along with the skill of the modeler. To ensure that any water quality modeling completed in conjunction with the permit produces robust results, the permit must include stringent safeguards. These safeguards must include: *(1)* requiring the input data to include recent (no older than five years) water quality information from within the watershed, *(2)* requiring Copermittees to use an experienced and qualified water quality modeling professional to complete the model, *(3)* requiring Regional Board oversight to assess whether the monitoring results are in line with common-sense predictions of water quality, and (4) quality control hindcasting in certain segments to validate the model for use in subsequent years.

E. The Monitoring and Assessment Requirements Should Begin Immediately Upon Enrollment Under the Order.

The Administrative Draft Permit 's monitoring and assessment requirements appear to go into effect immediately upon adoption, but it does not say so explicitly. This could create confusion amongst Copermittees because other provisions of the Administrative Draft Permit state specific time frames for implementation.[58] The Regional Board should explicitly say in the Permit that Provision D's requirements go into effect immediately upon enrollment to avoid ambiguity.

---

[57] *See* Tentative Order No. R9-2012-0011 § II.B.2 at 15.
[58] *See* Tentative Order R9-2012-0011 at §§ II.B, B.5, B.6, C, E, F.1, and F.3.

F. The Permit Should Not Allow Historical Data to Excuse Copermittees from Analyzing Non-Stormwater Discharges.

The Clean Water Act requires that Copermittees effectively prohibit non-stormwater discharges. Therefore, it is inappropriate for the permit to allow Copermittees to skip analyzing non-stormwater discharges that it fails to eliminate.[59] The Copermittees must analyze all non-stormwater discharges and demonstrate that those discharges comply with the non-stormwater numeric effluent limits.

If the Permit allows Copermittees to avoid analyzing constituents if historical data indicates analysis is not needed, the Permit should limit "historical data" to that collected within the past ten years. Technology has increased by leaps and bounds in recent years (i.e. minimum detection limits,) and more accurately detects pollutants.

G. The Permit Must Clarify the Dry Weather Watershed Monitoring Frequency Requirements.

Several sections of the Dry Weather Watershed Monitoring section have seemingly contradictory timing requirements. The Administrative Draft Permit states:

> Dry weather watershed monitoring is required at least every two years for each monitoring station. At least two dry weather watershed monitoring events must be scheduled for each watershed monitoring station per monitoring year. One monitoring event is required during the dry season (May-September) and one monitoring event is required on a dry weather day during the wet season (October-April), after the first storm event. *See* Tentative Order No. R9-2012-0011 at D.2(b)(3).

This language is unclear and implies that monitoring must occur at least once every two years but also twice per year. Similar language can be found in sections D.2(b)(4), and (5), as well as parts (1) and (4) from section D.2.c. The Permit must resolve these seemingly contradictory statements to ensure the Copermittees are able to fully understand and meet their requirements.

H. To Detect Illicit Flows, the Permit Should Require Copermittees to Install a Network of Flow Meters.

Many Copermittees have taken issue with the Administrative Draft Permit's dry weather monitoring requirements. The Copermittees argue that the proposed program is cumbersome, costly, and would not result in identifying illicit flows.

To replace the dry weather monitoring scheme in the Administrative Draft Permit with an approach that will identify illicit flows, the Permit should require Copermittees to install a network of flow meters. The flow meters could constantly monitor flows and alert Copermittees when flow peaks.

---

[59] *See* Tentative Order R9-2012-0011 § II.D.1.a(1)(c)(iii) at 30.

This will more accurately allow Copermittees to identify illicit dry weather flows than the dry weather monitoring program as currently proposed.

I. The Permit Should Require Additional Information for Claims that Non-Stormwater Discharges Originate Outside a Copermittee's Jurisdiction.

The Administrative Draft Permit currently requires Copermittees to screen discharges entering their systems and to identify those discharges from sources outside the control of the Copermittee.[60] The Permit should require Copermittees to explain from what jurisdiction the discharge is entering their system and the evidence supporting that conclusion. This will increase accountability and transparency in the Permit by making sure those responsible for violations are easily identified.

J. The Permit Should Allow Third Party Participations in Special Studies.

The Administrative Draft Permit requires Copermittees to implement at least three special studies within each Watershed Management Area and at least two regional special studies for the San Diego Region.[61] These studies are important to ensure that the Copermittees work together to identify sources of high priority pollutants and assess the efficiency of various best management practices within a watershed to achieve watershed goals. The Administrative Draft Permit's approach properly requires each Copermittee within a watershed to participate in each of the watershed's special studies. However, the Permit should also specifically allow Copermittees to partner with environmental groups or other third parties to complete regional special studies.

For example, Copermittees within the Peñasquitos watershed group might partner with San Diego Coastkeeper to complete a pilot project combining GPS-based water quality data and volunteer patrols to track pollution up a watershed to identify a pollution problem's source. Or perhaps Copermittees within the Carlsbad watershed might work with the Building Industry Alliance and the Escondido Creek Watershed Conservancy to create a pilot Escondido Creek restoration project and assess the feasibility of using such restoration as a regional mitigation project for development within the Carlsbad watershed.

By encouraging the Copermittees to partner with third parties to complete special studies, the Permit could foster watershed-based collaboration and leverage efficiencies and additional resources that third parties bring to the table.

K. The Permit Should Designate County of San Diego as the Lead Copermittee for San Diego County.

The current San Diego Regional MS4 permit designates the County of San Diego as the lead copermittee. This process has ensured that the Copermittees coordinate their reporting, monitoring, assessment, and programs. It has also led to regular public meetings where the San Diego Copermittees meet and discuss the permit, compliance and reporting. These meetings provided Regional Board staff, environmental groups, consultants, and other interested parties and

---

[60] *See* Tentative Order R9-2012-0011 § II.D.4.a(1)(a)(iii) at 46.
[61] *See* Tentative Order R9-2012-0011 §§ II.D.2.e, D.3 at 46.

opportunity and venue to connect with all the San Diego Copermittees at the same time. This regional coordination was also a great asset to the focused meeting process, with the San Diego Copermittees bringing organized and coordinated suggestions for improving the permit.

As the region moves forward with a new permit, the Copermittees, Regional Board staff, and interested parties could greatly benefit from continued coordination and regular public meetings among the Copermittees. Further, the Administrative Draft Permit requires Copermittees to develop two special studies for the entire San Diego Region "related to a water quality priority issue or potential water quality concern identified by the Copermittees for the entire San Diego Region."[62] It will be difficult, if not impossible, for the San Diego Copermittees to identify water quality priority issues for the entire region without collaboration. That collaboration should involve the public, particularly when identifying water quality priority issues for the entire region. Therefore, the permit should require continued Copermittee collaboration for the San Diego Copermittees that includes meetings open to the public.

VIII. THE PERMIT'S DEVELOPMENT PLANNING PROVISIONS MUST AGGRESSIVELY PROMOTE PRACTICES TO ELIMINATE DEVELOPMENT AS A POLLUTANT SOURCE CAUSING OR CONTRIBUTING TO WATER QUALITY PROBLEMS.

Low Impact Development ("LID") is an acknowledged and proven Best Management Practice ("BMP") for effective storm water management for new and significant redevelopment projects. LID BMPs are often less expensive to install, require less maintenance and provide ecosystem benefits that conventional stormwater controls cannot offer. For example, a recent analysis of the economics of LID found the benefits to include reduced flooding, improved water quality, increased ground water recharge, reduced public expenditures on stormwater infrastructure, reduced energy use, improved air quality, and enhanced aesthetics and property value.[63]

The report goes on to describe American Forests' CITYgreen model as it applies to San Diego. The model calculates the volume of stormwater absorbed by San Diego's existing tree canopy and estimates the amount of cost-avoided in stormwater management this canopy allows. The study concludes that San Diego would have to expend $0.16 billion to expand their existing stormwater infrastructure to treat the amount the cities trees already manage. Studies and analyzes like these help explain the myriad benefits of LID as a system the Copermittees can use to effectively manage stormwater while also ensuring the wise expenditure of funds.

The Administrative Draft Permit fails to underscore the key role LID plays in achieving the region's water quality goals. Other nearby MS4 permits contain language reflecting that recent studies have found LID best management practices to be effective storm water management tools that minimize adverse impacts on storm water runoff quality and quantity resulting from urban developments.[64] The Permit should include this language in order to clarify and reinforce that LID BMPs are

---

[62] *See* Tentative Order R9-2012-0011 at § II.D.3 at 46.
[63] MacMullen, Ed, The Economics of Low-Impact Development: A Literature Review, ECONorthwest 19 (November 2007).
[64] *See* Orange County Permit, Order No. R8-2009-0033 at L.61.

preferred over any other non-LID method.

A. The Permit Should Stress Low-Impact Development Best Management Practices as the Preferred Best Management Practices for Use in Water Quality Improvement Strategies.

The Administrative Draft Permit requires Copermittees to develop water quality improvement strategies that prioritize measures that can be taken to reduce pollutants.[65] Rather than giving Copermittees the ability to equally prioritize structural and non-structural Best Management Practices, the Permit should clearly state that LID BMPs are the preferred method and should receive the highest priority. The Administrative Draft Permit fails to mention of LID in the Water Quality Improvement Strategies section. At the very least, the Water Quality Improvement Strategies section should reference section II.E.3(a)(3) where LID definitions and examples are given. The Permit should include a chart which prioritizes LID, similar to the structure of the North Orange County permit.

B. The Permit Should Prioritize Various Low-Impact Development Best Management Practices and Include Examples of these Best Management Practices.

The Administrative Draft Permit fails to incorporate an LID BMP prioritization regime similar to existing MS4 permits in Orange and Riverside counties.[66] Although the Administrative Draft Permit defines LID BMPs to include retention practices such as "infiltration, rainwater harvesting and reuse, evapotranspiration" and flow-through practices such as biofiltration. However, it leaves much of the judgment as to which LID BMPs would be utilized onsite to the proponent of the project.[67]

The Orange County MS4 permit adopted by the Santa Ana Regional Board prioritized LID principles by first instituting preventative measures (mostly non-structural measures, e.g., preservation of natural features to a level consistent with MEP; reducing impervious areas, etc.) and second, requiring mitigation. Mitigation is generally structural measures, such as infiltration, harvest and reuse, and biotreatment. However, even the LID BMPs required under the mitigation section were prioritized. If a party could not satisfy permit requirements to the MEP by utilizing preventative measures, then the party would be required to determine whether it was feasible to infiltrate, harvest and re-use and bio-filter/bio-retain, in that order. In so doing, the Regional Board provided guidance and certainty to those engaged in new or significant redevelopment rather than a mechanism that requires LID BMPs without stating a clear preference. As such, the Administrative Draft Permit should be modified to include a prioritization of LID BMPs.

C. The Permit Should De-Emphasize Biofiltration as a Low-Impact Development Best Management Practice.

The Administrative Draft Permit's definitions section lists biofiltration as a flow-through LID BMP

---

[65] *See* Tentative Order No. R9-2012-0011 at § II.B.3. at18.
[66] *See* Orange County Permit, Order No. R8-2009-0033 at XII.C.4
[67] *See* Tentative Order R9-2012-0011 at Attachment C "Definitions."

that may have discharge storm water following pollutant reduction.[68] The Permit should de-emphasize biofiltration and other flow-through practices as LID BMPs because retention Best Management Practices are environmentally preferable due to their ability to prevent discharges. Including "biofiltration" in the definition of LID BMP, without including a LID BMP prioritization schedule, may create unnecessary reliance on "biofiltration" methods when other LID options would be preferable.

D. The Permit Should Require Biofiltration to Reach Equivalent Water Quality Standards as Other Best Management Practices.

The Administrative Draft Permit includes "biofiltration" as an available Low Impact Development Best Management Practice without requiring verifiable standards that effective biofiltration BMPs must satisfy. Without standards, developers are free to include biofiltration systems that do not guarantee onsite retention of pollutants. Additionally, the permit contains no oversight of any proposed biofiltration device to guarantee that it is properly sized and designed. While the Administrative Draft Permit requires that flow-through treatment control BMPs must "be ranked with high or medium pollutant removal efficiency for the project's most significant pollutants of concern," the Administrative Draft Permit fails to specify what those efficiency rates are or how they are to be calculated.[69]

Structural, proprietary, and/or engineered biofiltration devices should be permitted where appropriate. However, the Permit should hold those biofiltration devices to equivalent water quality standards and require proper monitoring to prove their initial and continued effectiveness as pollution control devices. For example, the Permit should require a four to five year post-construction monitoring regimen with at least annual reporting that includes data on wet and dry seasons to analyze biofiltration effectiveness for major developments.

E. The Permit Must Have More Stringent Post-Development Hydromodification Requirements for Flow Rates and Durations to be Consistent with the Riverside County Hydromodification Requirements, to Maintain Progress in Managing Development Storm Water Runoff, and to Comply with Anti-Backsliding Requirements.

The Administrative Draft Permit requires Copermittees to achieve post-development flow rates and durations that "do not exceed pre-development (naturally occurring) runoff flow rates and durations by more than 10 percent."[70]

However, Riverside County's MS4 permit does not allow 10% leeway for hydromodification post-development flow rates and durations. Instead, the Riverside County permit requires that "estimated post-project runoff discharge rates and durations must not exceed pre-development discharge rates and durations."[71] The Riverside County permit justified its hydromodification

---

[68] *See* Tentative Order R9-2012-0011 at Attachment C "Definitions."
[69] *See* Tentative Order R9-2012-0011 § II.D.3.c.(2)(d)(iii) at 67.
[70] Tentative Order R9-2012-0011 § II.E.3(c)(3)(a).
[71] *See* Order R9-2010-0016 at F.1.h.

requirement, stating:

> The increased volume, velocity, frequency and discharge duration of storm water runoff from developed areas has the potential to greatly accelerate downstream erosion, impair stream habitat in natural drainages, and negatively impact beneficial uses.[72]

In light of this statement, and no such finding to the contrary in the Administrative Draft Permit , the Regional Board should not allow a 10% increase in flow rates or duration post-development.

The Permit cannot allow priority development projects to exceed naturally occurring runoff flow rates by 10 percent. The 10 percent exception would introduce inconsistent requirements within the Region and constitute illegal backsliding from Riverside County's MS4 permit. The Riverside County permit is currently the most recently enacted MS4 permit in Region 9 and represents the MEP standard that must be applied to the Permit.

More importantly, easing Riverside County's hydromodification requirements in favor of a 10 percent exception violates the Clean Water Act's anti-backsliding provisions. By allowing Riverside County to comply with a less stringent standard in a subsequent permit, the new Permit violates provisions enacted to ensure that permit standards continue to get increasingly more stringent instead of bowing to political pressure to ease standards.

F. The Permit Should Not Include Likelihood of Increased Erosion as a Criterion for Hydromodification Because Erosion is Not the Only Purpose of Hydromodification Requirements.

The Administrative Draft Permit currently allows Copermittees to achieve post-development flow rate and duration that is 10% above "the range of flows that result in increased potential for erosion or degraded channel conditions."[73] But erosion is not the only purpose of hydromodification requirements. As the Riverside County permit recognized, increased flow volume and duration can lead to erosion, as well as "impair stream habitat in natural drainages, and negatively impact beneficial uses."[74]

Developers should not be excused from complying with hydromodification requirements merely because the immediate channel into which a developments discharges would be entering are likely to erode. If the Permit provides an exception for developments that discharge into concrete channels or other channels not subject to erosion, the Regional Board will send the message that it has no interest in possibly reclaiming those creeks as natural drainages. Further, the exception fails to recognize that while the immediate receiving water may not be easily eroded, the discharges may impact downstream channels and habitat.

---

[72] Order R9-2010-0016 at Findings D.2(g).
[73] *See* Tentative Order R9-2012-0011 § II.E.3(c)(3)(a).
[74] *See* Order R9-2010-0016 at Findings D.2(g).

G. The Permit Must Include Priority Development Requirements for Restaurants that are Less than 5000 Square Feet to be Consistent with Previous Permits.

The Riverside, Orange County and San Diego MS4 permits require restaurants where land development is less than 5,000 square feet to meet all SSMP requirements except for structural treatment BMP, numeric sizing criteria requirements and hydromodification requirement.[75] The Administrative Draft Permit fails to include this MEP provision. The Permit should include this language to be consistent with other MS4 permits and to make certain that all restaurant development projects are properly covered under the Permit.

H. The Permit Should Include a Water Quality Credit System.

The Administrative Draft Permit does not include any provisions or requirements for a water quality credit system. The only mention of a credit system is an example of a mitigation fund that Copermittees may implement as part of a mitigation plan under alternative compliance.[76] The Permit should include a requirement for water quality credits similar to what has been adopted in the Orange County permit: a "credit system clearly exhibits that it will not allow PDPs to result in a new impact from pollutant loadings over and above the impact cause by projects meeting LID requirements."[77] Including this language in the Permit will ensure water quality credits will be allocated to specific projects that actually offer a water quality benefit and will clarify the requirements of a water quality credit system.

I. The Permit Should Define "Infeasible" or Require Developers to Examine the Range of Feasible Projects and Select the Projects with the Greatest Water Quality Benefits.

The Administrative Draft Permit uses the term "feasible" and "infeasible" throughout the permit. For example, the Administrative Draft Permit requires LID BMPs to be implemented at all development projects where applicable and feasible.[78] The Administrative Draft Permit also allows Priority Development Projects to pursue "alternative compliance" with hydromodification requirements where fully implementation of hydromodification projects is "technically infeasible." The Administrative Draft Permit does not define "feasible" and specifically tasks Copermittees with defining "technical infeasibility."[79]

Allowing Copermittees to develop their own criteria as to what is "technically infeasible" runs the risk of Copermittees bowing to political pressure from building industry lobbyists and incorporating economic factors into the infeasibility standard. To ensure a robust and consistent standard of "technical infeasibility," the Regional Board should define a standard and explicitly direct that "technical infeasibility" cannot consider financial or economic factors.

---

[75] *See, e.g.*, Riverside Permit, F.1(d)(2)(c); Orange County Permit, F.1(d)(2)(c); San Diego Permit, D.1(d)(2)(e).
[76] *See* Tentative Order R9-2012-0011 § II.E.3(c)(4)(c)(iv).
[77] *See* Order No. R9-2009-0002 at F.1(d)(7)(g).
[78] *See* Tentative Order R9-2012-0011 § II.E.3(a)(3).
[79] *See* Tentative Order R9-2012-0011 § II.E.3(c)(4)(b).

Further, the development community has consistently articulated engineers' and geotechnical experts' concerns that forcing infiltration could compromise the structural integrity of development projects and expose developers to liability. While the Environmental Groups recognize the development community's concerns, the answer is not to eliminate hydromodification requirements in San Diego County. Instead, the answer is for the Regional Board to articulate, in conjunction with Copermittees, Environmental Groups, the development community, and the green building community, a fair definition of technical infeasibility that maximizes environmental protection and public safety.

J. The Permit Could Incorporate Hydromodification Requirements to Prioritize On-site Measures while Recognizing Hydromodification's Watershed Impacts.

As an alternative to the current hydromodification scheme, the Permit could adopt an approach to hydromodification that would both prioritize on-site infiltration measures while recognizing that hydromodification "disrupts… natural watershed hydrologic processes."[80]

Some Copermittees and the development community have been urging the Regional Board staff to allow developers to proceed directly to regional mitigation projects instead of on-site measures, where the regional mitigation projects would have at least the same water quality benefits. While regional mitigation projects may have great benefits for the watershed, they should only be allowed in limited circumstances and with certain safeguards in place. First, the regional mitigation project should have ***greater*** water quality benefits than full-implementation of on-site infiltration. Second, the mitigation projects must have safeguards to ensure there is sufficient funding to complete the project before any individual developer is off the hook for on-site mitigation. This is important to avoid the situation where a developer "pays in" a few thousand dollars to a multi-million dollar restoration project, but not enough funds are ultimately raised and the project viability is compromised—and hence, the development has never mitigated its impact.

To avoid this, there should be a time-limit on restoration projects, perhaps through a "Kickstarter" approach. Under this approach, there is a limited amount of time for investors to pledge money for a project. If the monetary goal is raised, the project goes forward and all investors contribute their money. If the project raises insufficient funds, the investors keep their money and must find another project to serve as their mitigation. This approach could also allow Copermittees to pledge money toward the project and then operate the project as a quasi-mitigation bank for developments within the watershed. Another alternative would be for Copermittees to pre-identify and fund regional mitigation opportunities themselves, and then hold these assets in a mitigation bank for sale to developers of future projects.

Also, the Permit could include a requirement to focus not on what is "infeasible," but what is feasible. This approach could foster creativity and get developers, Copermittees, and environmental groups working together on projects to benefit the entire watershed.

[80] *See* Tentative Order R9-2012-0011 at Attachment C-4.

K. The Permit Should Require the Incorporation of USEPA Green Street Implementation for New or Significant Re-Development throughout the Region.

The Environmental Groups encourages the Regional Board to modify the Permit's Priority Development Program to require the adoption of USEPA Green Streets. As written, the Administrative Draft Permit's Jurisdictional Runoff Management Program Priority Development Project Section states that streets, roads, highways, freeways, and residential driveways with an impervious area greater than 5,000 square feet and is used for transportation purposes is a priority area.[81] The north Orange County MS4 permit adopted by the Santa Ana Regional Board explicitly incorporates USEPA guidance, "Managing Wet Weather with Green Infrastructure: Green Streets."[82] This USEPA guidance is required to be implemented to the MEP.[83]

L. The Permit Should Promote Regular Inspections of Inventoried Existing Development to Ensure Compliance with Applicable Local Ordinances and Permits.

The Administrative Draft Permit establishes a five-year minimum inspection cycle for inventoried existing development along with a requirement of an inspection within six months of any change in property ownership.[84] Copermittees have argued for a weakening of those minimum requirements and indicated a system that would allow for a focusing of resources on those facilities which may be of a higher priority.

The Environmental Groups do not oppose the focusing of scarce resources towards higher priority pollutants or areas, so long as each facility in a Copermittee's jurisdiction is inspected at least once during this Permit term. State Water Resources Control Board audits and private consultants have concluded that industrial and commercial inspections are a necessary component of stormwater permitting. A 2006 Tetra Tech report assessing California's Industrial Storm Water Program contained a central finding stating that "*compliance improves with field inspector presence*."[85] The report goes onto state, "[r]egulatory presence (1) shows the facility representatives that the [regulator] takes the program seriously and (2) keeps stormwater compliance in the minds of facility representatives."[86]

The proven benefit of a robust inspection program and the relatively modest requirement that each facility is inspected no less than once every five years is not a regulatory burden on the Copermittees. Therefore, the Environmental Groups oppose any material modification to lessen inspection frequency.

M. The Permit Should Promote Retrofitting Existing Development as a Primary Strategy to Achieve Water Quality Improvement.

The Administrative Draft Permit appropriately requires each Copermittee to develop a program to retrofit existing development.[87] However, the retrofit sections could be improved by avoiding "orphan" areas and including environmental groups and other stakeholders in retrofit program.

1. <u>Identifying "high priority" areas for implementation runs the risk of abandoning other areas.</u>

Identifying areas that will address high priority water quality concerns seems like a reasonable start. However, as in other sections of the Permit, and consistent with our comments in this letter,[88] we have concerns that this will leave other areas as "orphans" and not result in comprehensive adoption of rebates and other incentives, nor an equitable distribution of the requirements and the resulting benefits to all affected jurisdictions.

2. <u>Environmental groups and other stakeholders should be actively involved in retrofit implementation</u>.

Much like our comments on including environmental organizations and citizen monitoring,[89] we strongly recommend additional language in the Permit to encourage partnerships with non-governmental organizations working on pollution prevention programs for existing development. In other areas of the State, as well as locally, this type of cooperative effort between government and non-government results in reduced costs and increased benefits.

IX. THE ADMINISTRATIVE DRAFT PERMIT'S ENFORCEMENT APPROACH IS APPROPRIATE.

A. The Permit Must Include Enforcement Response Plans to Ensure Improved Water Quality in the Region.

The Administrative Draft Permit's substantive enforcement requirements assist Copermittees to hold accountable dischargers who contribute to water quality standards violations. These enforcement requirements outlined in are appropriate should be retained as-is in the Permit.[90] Strong enforcement provisions are appropriate to encourage Copermittees, industrial and construction dischargers, and the development community to find better and more cost-effective BMPs and alternative methods for achieving water quality standards. The Permit should further strengthen these requirements to address facilities which could fall through the cracks under the Administrative Draft Permit's language.

[88] See eg, Section IV B (5) (F) of this letter.
[89] See eg, Section IV B (1), (2) and (3) of this letter.
[90] *See* Tentative Order No. R9-2010-0016 at § II.E.6

B. The Permit Must Maintain Escalating Enforcement Actions to Ensure Violators of Water Quality Standards Stop Unauthorized Practices.

Increasing enforcement action, like the provisions in E.6, help deter dischargers from compromising water quality.[91] The Permit should retain these requirements; however in our experience Copermittees are too lenient on repeat offenders. Failure to appropriately "ratchet up" enforcement should be considered a failure to comply with these provisions of the Permit.

C. The Permit Should Include Reporting Requirements for Sites Which are Repeatedly Subject to Low Level Enforcement.

The Administrative Draft Permit requires Copermittees to notify the Regional Board after issuing any "high level enforcement action" to a construction site, but there is no similar requirement for sites that receive multiple low level enforcement actions.[92] The Regional Board should be aware of repeat violators not associated with the highest water quality priorities. The Permit should require Copermittees to notify the Regional Board of such dischargers.

D. The Permit Should Require Board Notification for All Violators Subject to High Level Enforcement Actions, Not Only Construction Sites.

The Administrative Draft Permit requires Copermittees to inform the Regional Board after issuing any "high level enforcement action" to a construction site.[93] There is no reason this requirement should only apply to construction sites. The Regional Board should be notified of any discharger subject to high level enforcement. The Regional Board should remove the word "construction" from Provision E.6(d)(1) to correct this issue and include all sites.

E. The Permit Should Require Copermittees to Automatically Notify the Regional Board of Non-Compliant Sites Threatening the Highest Water Quality Priorities Because These Violations are Already Significant.

The Administrative Draft Permit requires Copermittees to report to the Regional Board issuance of a high level enforcement action to a site that poses a "significant threat to water quality."[94] When the site threatens the highest water quality priorities, violations requiring the issuance of high level enforcement actions are already significant because Copermittees have identified these waters as their highest water quality priorities. Therefore, the Regional Board should require Copermittees to automatically notify the Regional Board of any high level enforcement action issued that affects the highest water quality priorities.

[92] *See* Tentative Order No. R9-2010-0016 at E.6(d).
[93] *See* Tentative Order No. R9-2010-0016 at E.6(d)(1).
[94] *See* Tentative Order No. R9-2010-0016 at E.6(d)(1).

F. The Permit Must Preserve the Enforcement Requirements for Violations of Highest Water Quality Priorities.

It is proper for the permit to require Copermittees to automatically start enforcement at high level for any violation that threatens or potentially threatens the highest water quality priorities.[95]

G. The Permit Should Modify Reporting Requirements for Continued Exceedances of Water Quality Standards to Encourage Copermittees to Take Initiative in Finding Exceedances.

The Administrative Draft Permit currently requires Copermittees to submit updates on their Water Quality Improvement Plans when either the Copermittee or the Regional Board determines that discharges from the facility are causing or contributing to an exceedance.[96] The Permit could facilitate better practices by the Copermittees if this requirement were changed to reward the efforts of Copermittees that seek out troublesome discharges on their own.

X. THE PERMIT'S REPORTING PROVISIONS MUST BE STRENGTHENED TO ENSURE MEANINGFUL PUBLIC PARTICIPATION.

A. The Permit Must Require More Detailed Annual Reporting than Proposed in the Administrative Draft Permit.

The Administrative Draft Permit modifies the existing reporting standards for Copermittees' and significantly reduced the volume of data that must be disclosed to a double-sided, single page form.[97] For many of the Copermittees' actions, the form only requires the disclosure of the number of times an action occurred (e.g. number of non-storm water discharges eliminated), without any details regarding the discharges or what actions were taken to fix them.

The Regional Board, Copermittees and the Environmental Groups agree that valuable and scarce resources should not be spent on the completion and submission of reports that do not provide value equal to the amount of time spent in preparing the reports. However, Annual Reports provide a mechanism to public agencies to reflect on their performance over the past twelve months and a shortened report may negatively impact the ability of these agencies to fully calculate the effectiveness of their programs. The Environmental Groups encourage the Regional Board to revise the Annual Report requirements to include a more robust analysis of the Copermittees' programs. This modification may allow Copermittees to incorporate cross-references to other documents to avoid additional costs of Annual Report preparation.

B. The Permit Should Require Copermittees to Submit Water Quality Data to CEDEN.

The Administrative Draft Permit requires Copermittees to submit their water quality monitoring data to the California Environmental Data Exchange Network (CEDEN). This requirement is

[95] *See* Tentative Order No. R9-2012-0011 at E.6(a)(2)(a) and (c)(3).
[96] *See* Tentative Order R9-2012-0011 § II.A.4(a)(1).
[97] *See* Tentative Order No. R9-2010-0016 at F.3(b)(2).

important because it ensures that CEDEN will become a comprehensive source of water quality data for the region.

C. The Regional Clearinghouse Could Become an Important Tool To Increase Transparency.

The Administrative Draft Permit requires the Copermittees to develop, update and maintain an internet-based Regional Clearinghouse to serve as a collection point for Water Quality Improvement Plans, Annual Reports, jurisdictional runoff management program document, monitoring data, and any other edata or information generated through this process.[98] The Regional Clearinghouse has the potential to become a powerful tool to increase transparency and facilitate public participation in developing Water Quality Improvement Plans and jurisdictional programs.

However, the Regional Clearinghouse needs to be set up in a way so that reports and data are easy to locate. The allocation of scarce financial resources dedicated towards collecting information and providing it to the public via a system that is difficult to navigate fails to satisfy the purpose of this or any other permit. The San Diego Copermittees' current website, Project Clean Water, is difficult to navigate and tends to obscure information, rather than make it accessible. Furthermore, unless the public has been made aware of the availability of this tool, few should be expected to access it. Therefore, the Regional Clearinghouse should be prominently displayed on Copermittee's water quality websites and the Regional Board should encourage distribution of information relating to this tool as well as how-to recommendations on reducing water usage to residents. Any and all public information should have contact information, including e-mail and phone numbers, for stormwater program managers for each Copermittee.

D. The Regional Clearinghouse Should Include a Database for Mobile Sources, Along with Each Copermittee's Industrial, Commercial, and Municipal Inventories.

The San Diego Copermittees had been developing a mobile sources database to help track mobile sources across jurisdictions. San Diego Coastkeeper was particularly interested in making that information publicly accessible in order to assist jurisdictions in holding mobile sources accountable. Unfortunately, the San Diego Copermittees refused to make the database publicly accessible.

In order to ensure an accurate picture of the potential sources of water quality impairments the Regional Board must provide a comprehensive procedure that allows for concerned members of the public, and the non-profit community that represents them, the ability to assist Copermittees in resolving chronic water quality problems. One of the most effective means of achieving improved water quality are regulations that encourage public involvement in their enforcement.[99] In this instance, the Environmental Groups seek the access to data compiled by public agencies, likely without the financial resources to comprehensively review their data, in order to ensure compliance with this Permit and its stated goal of improved water quality. Therefore, this Permit should require

---

[98] *See* Tentative Order No. R9-2012-0011 § II.F.4.

[99] *See* State Water Resources Control Board, Office of Enforcement, Citizen Suit Enforcement under the Federal Clean Water Act: A Snapshot of the California Experience Based on Notices of Intent to Sue March 2009 through June 2010. 7 (May 2011).

the Regional Clearinghouse to include a publicly accessible mobile sources inventory and tracking system as well as each Copermittee's industrial, commercial, and municipal inventories.

E. The Permit Should Require a Best Management Practices Database.

The Clean Water Act requires Copermittees to reduce pollutants in waters discharged to and from the MS4 to the Maximum Extent Practicable ("MEP"). Because the Clean Water Act is a technology-forcing statute, MEP is an ever-evolving standard, forcing better technology and new approaches over time. In order for the Regional Board to assess MEP, the Permit should require the Copermittees to create a publicly accessible BMP database. This will allow Copermittees to share innovative techniques, technology, and practices and help the Regional Board staff and environmental groups to push the Copermittees to "raise the bar" and pursue ever-improving strategies to achieve water quality standards

XI. THE PERMIT MUST ADJUST EARLY ENROLLMENT REQUIREMENTS FOR ORANGE AND RIVERSIDE COUNTIES.

The previous permits from Orange and Riverside counties were not on the same time schedule as the San Diego permit and were not set to expire until 2014 and 2015 respectively. These currently effective permits had requirements for the Copermittees to complete several special studies in addition to the core monitoring requirements. Some of the special studies had implementation dates that have not yet passed.

The Riverside County permit outlines requirements for a Trash and Litter Investigation, and an Agricultural, Federal, and Tribal Input Study which both must be submitted by September 1, 2012, and also an Intermittent and Ephemeral Stream Perennial Conversion Study which must be submitted by April 1, 2013. The current Administrative Draft Permit requires Copermittees to conduct special studies but makes no reference to the past studies that are still pending implementation.

Will these studies no longer be required? Or will this portion of the superseded permits still be in effect? The Permit must adjust the early enrollment requirements for Orange and Riverside counties to ensure these studies are completed even if they undergo early enrollment.

XII. THE PERMIT SHOULD REQUIRE A NARRATIVE FISCAL ANALYSIS.

The Administrative Draft Permit does not require Copermittees to include a narrative description of causes of a 25 percent or greater annual change in any budget line item in the annual reports. The current permits for Riverside and Orange Counties include such a provision.[100] This provision holds Copermittees to a higher standard in their annual analysis while creating accountability to such increases in their budgets. The Permit should include a similar standard.

XIII. THE ENVIRONMENTAL GROUPS REQUEST NOTICE.

The Environmental Groups request notice of any further documentation, decisions, findings or actions taken in regards to this matter.

CONCLUSION

In conclusion, the Environmental Groups appreciate the effort the Regional Board and its staff have put towards developing an MS4 permit for the San Diego Region which effectively and efficiently addresses the environmental concerns of the watershed in a transparent and comprehensive approach. We look forward to a constructive relationship with the Regional Board and hope our comments will assist in the development of a thoughtful and progressive permit.

City of Mission Viejo	

ADMINISTRATIVE DRAFT

The Riverside County Copermittees in Table 1c are subject to waste discharge requirements set forth in this Order upon expiration of Order No. R9-2010-0016, NPDES No. CAS0108766 on November 10, 2015.

Table 1c. Riverside County Copermittees

City of Murrieta	County of Riverside
City of Temecula	Riverside County Flood Control and Water Conservation District
City of Wildomar	

The Orange County Copermittees and Riverside County Copermittees may enroll under this Order at a date earlier than the expiration date of their current Orders subject to the conditions described in Provision F.6 of this Order and the Copermittees in the respective county receive a Notice of Enrollment (NOE) from the San Diego Water Board.

The term Copermittee in this Order refers to any San Diego County, Orange County, or Riverside County Copermittee enrolled under this Order, unless specified otherwise.

This Order provides permit coverage for the Copermittee discharges described in Table 2.

Table 2. Discharge Locations and Receiving Waters

Discharge Points	Locations throughout San Diego Region
Discharge Description	Municipal Separate Storm Sewer System (MS4) Discharges
Receiving Waters	Inland Surface Waters, Enclosed Bays and Estuaries, and Coastal Ocean Waters of the San Diego Region

Table 3. Administrative Information

This Order was adopted by the San Diego Water Board on:	**Month Day, 2012**
This Order will become effective on:	**Month Day, 2012**
This Order will expire on:	**Month Day, 2017**
The Copermittees must file a Report of Waste Discharge (ROWD) in accordance with Title 23, California Code of Regulations, as application for issuance of new waste discharge requirements no later than 180 days in advance of the Order expiration date.	

I, David W. Gibson, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on Month Day, 2012.

TENTATIVE

David W. Gibson
Executive Officer

ADMINISTRATIVE DRAFT

TABLE OF CONTENTS

ADMINISTRATIVE DRAFT

TABLE OF CONTENTS
(Cont'd)

I. FINDINGS

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board), finds that:

JURISDICTION

1. **MS4 Ownership or Operation.** Each of the Copermittees owns or operates an MS4, through which it discharges storm water and non-storm water into waters of the U.S. within the San Diego Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is "interrelated" to a medium or large MS4; or (3) an MS4 which contributes to a violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the U.S.

2. **Legal and Regulatory Authority.** This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations (Code of Federal Regulations [CFR] Title 40, Part 122 [40 CFR 122]) adopted by the United States Environmental Protection Agency (USEPA), and chapter 5.5, division 7 of the California Water Code (CWC) (commencing with section 13370). This Order serves as an NPDES permit for discharges from MS4s to surface waters. This Order also serves as waste discharge requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the CWC (commencing with section 13260).

3. **CWA Technology Based Standards and Prohibitions.** Pursuant to CWA section 402(p)(3)(B), NPDES permits for storm water discharges from MS4s must include requirements to effectively prohibit non-storm water discharges into MS4s, and require controls to reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP).

4. **CWA NPDES Permit Conditions.** Pursuant to CWA section 402(a)(2), NPDES permits must prescribe conditions to assure compliance with CWA section 402(p)(3)(B) and 40 CFR 122.26(d)(2)(iv)(B). This Order prescribes conditions to assure compliance with the CWA requirements for owners and operators of MS4s to effectively prohibit non-storm water discharges in to the MS4s, and require controls to reduce the discharge of pollutants in storm water from the MS4s to the MEP.

5. **CWA and CWC Monitoring Requirements.** Pursuant to 40 CFR 122.48, NPDES permits must specify requirements for recording and reporting monitoring results. In addition, CWC sections 13267 and 13383 authorize the San Diego Water Board to require technical and monitoring reports. This Order establishes monitoring and reporting requirements to implement federal and State requirements.

6. **Total Maximum Daily Loads.** CWA section 303(d)(1)(A) requires that "[e]ach state shall identify those waters within its boundaries for which the effluent limitations…are not stringent enough to implement any water quality standard applicable to such waters." The CWA also requires states to establish a priority ranking of impaired water bodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired water bodies is called the Clean Water Act Section 303(d) List of Water Quality Limited Segments, commonly referred to as the 303(d) List. The CWA requires the 303(d) List to be updated every two years. Requirements of this Order implement the TMDLs adopted by the San Diego Water Board and approved by USEPA.

7. **Non-Storm Water Discharges.** Pursuant to CWA section 402(p)(3)(B)(ii), this Order requires each Copermittee to effectively prohibit discharges of non-storm water into its MS4. Nevertheless, non-storm water discharges into and from the MS4s continue to be reported to the San Diego Water Board by the Copermittees and other persons. Monitoring conducted by the Copermittees, as well as the 303(d) List, have identified dry weather, non-storm water discharges from the MS4s as a source of pollutants causing or contributing to receiving water quality impairments in the San Diego Region. The federal regulations [40 CFR 122.26(d)(2)(iv)(B)] require the Copermittees to have a program to prevent all types of non-storm water discharges, or illicit discharges, from entering the MS4. The federal regulations, however, allow for specific categories of non-storm water discharges or flows to be addressed as illicit discharges only where such discharges are identified as sources of pollutants to waters of the U.S.

8. **In-Stream Treatment Systems.** Pursuant to federal regulations [40 CFR 131.10(a)], in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Authorizing the construction of a runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Runoff treatment must occur prior to the discharge of runoff into receiving waters. Treatment control best management practices (BMPs) must not be constructed in waters of the U.S. or state. Construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body.

DISCHARGE CHARACTERISTICS AND RUNOFF MANAGEMENT

9. **Point Source Discharges of Pollutants.** Discharges from the MS4s contain waste, as defined in the CWC, and pollutants that adversely affect the quality of the waters of the state. A discharge from an MS4 is a "discharge of pollutants from a point source" into waters of the U.S. as defined in the CWA. Storm water and non-storm water discharges from the MS4s contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the Basin Plan. Storm water and non-storm water discharges from the MS4s are subject to the conditions and requirements established in the Basin Plan for point source discharges.

10. **Potential Beneficial Use Impairment.** The discharge of pollutants and/or increased flows from MS4s may cause or threaten to cause the concentration of pollutants to exceed applicable receiving water quality objectives and impair or threaten to impair designated beneficial uses resulting in a condition of pollution, contamination, or nuisance.

11. **Pollutants Generated by Land Development.** Land development has created and continues to create new sources of non-storm water discharges and pollutants in storm water discharges as human population density increases. This brings higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, and trash. Pollutants from these sources are dumped or washed off the surface by non-storm water or storm water flows into and from the MS4s. When development converts natural vegetated pervious ground cover to impervious surfaces such as paved highways, streets, rooftops, and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving a developed area contains greater pollutant loads and is significantly greater in runoff volume, velocity, and peak flow rate than pre-development runoff from the same area.

12. **Runoff Discharges to Receiving Waters.** The MS4s discharge runoff into lakes, drinking water reservoirs, rivers, streams, creeks, bays, estuaries, coastal lagoons, the Pacific Ocean, and tributaries thereto within the eleven hydrologic units comprising the San Diego Region. Numerous receiving water bodies and water body segments have been designated as impaired by the San Diego Water Board pursuant to CWA section 303(d).

13. **Pollutants in Runoff.** The most common pollutants in runoff discharged from the MS4s include total suspended solids, sediment, pathogens (e.g., bacteria, viruses, protozoa), heavy metals (e.g., cadmium, copper, lead, and zinc), petroleum products and polynuclear aromatic hydrocarbons, synthetic organics (e.g., pesticides, herbicides, and PCBs), nutrients (e.g., nitrogen and phosphorus), oxygen-demanding substances (decaying vegetation, animal waste), detergents, and trash.

14. **Human Health and Aquatic Life Impairment.** Pollutants in runoff discharges from the MS4s can threaten and adversely affect human health and aquatic organisms. Adverse responses of organisms to chemicals or physical agents in runoff range from physiological responses such as impaired reproduction or growth anomalies to mortality. Increased volume, velocity, rate, and duration of storm water runoff greatly accelerate the erosion of downstream natural channels. This alters stream channels and habitats and can adversely affect aquatic and terrestrial organisms.

15. **Water Quality Effects.** The Copermittees' water quality monitoring data submitted to date documents persistent exceedances of Basin Plan water quality objectives for runoff-related pollutants at various watershed monitoring stations. Persistent toxicity has also been observed at several watershed monitoring stations. In addition, bioassessment data indicate that the majority of the monitored receiving waters have

Poor to Very Poor Index of Biotic Integrity (IBI) ratings. These findings indicate that runoff discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in the San Diego Region. Non-storm water discharges from the MS4s have been shown to contribute significant levels of pollutants and flow in arid, developed Southern California watersheds, and contribute significantly to exceedances of applicable receiving water quality objectives.

16. **Non-Storm Water Discharges.** Non-storm water discharges from the MS4s are not considered storm water discharges and therefore are not subject to the MEP standard from CWA 402(p)(3)(B)(iii), which is explicitly for "Municipal … *Stormwater Discharges* (emphasis added)" from the MS4s. Pursuant to CWA 402(p)(3)(B)(ii), non-storm water discharges into the MS4s must be effectively prohibited.

17. **Best Management Practices.** Pollutants can be effectively reduced in runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Pollution prevention is the reduction or elimination of pollutant generation at its source and is the best "first line of defense". Source control BMPs (both structural and non-structural) minimize the contact between pollutants and runoff, therefore keeping pollutants onsite and out of receiving waters. Treatment control BMPs remove pollutants that have been mobilized by storm water or non-storm water flows.

18. **BMP Implementation.** Runoff needs to be addressed during the three major phases of development (planning, construction, and use) in order to reduce the discharge of storm water pollutants to the MEP, effectively prohibit non-storm water discharges, and protect receiving waters. Development which is not guided by water quality planning policies and principles can result in increased pollutant load discharges, flow rates, and flow durations which can negatively affect receiving water beneficial uses. Construction sites without adequate BMP implementation result in sediment runoff rates which greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. Existing development can generate substantial pollutant loads which are discharged in runoff to receiving waters.

19. **Long Term Planning and Implementation.** Federal regulations require municipal storm water permits to expire 5 years from adoption, after which the permit must be renewed and reissued. The San Diego Water Board recognizes that the degradation of water quality and impacts to beneficial uses of the waters in the San Diego Region occurred over several decades. The San Diego Water Board ~~further recognizes that a decade or more may be necessary to realize~~ expects to see demonstrable improvement to the quality of waters in the Region once Copermittees are given the flexibility to focus resources on addressing priority issues first. This Order includes a long term planning and implementation approach that will require more than a single permit term to ~~complete.~~achieve comprehensive water quality improvements throughout the Region.

FINDINGS

WATER QUALITY STANDARDS

20. Basin Plan. The San Diego Water Board adopted a Water Quality Control Plan for the San Diego Basin (Basin Plan) on September 8, 1994 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for receiving waters addressed through the plan. The Basin Plan was subsequently approved by the State Water Resources Control Board (State Water Board) on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the San Diego Water Board and approved by the State Water Board. Requirements of this Order implement the Basin Plan.

The Basin Plan identifies the following existing and potential beneficial uses for inland surface waters in the San Diego Region: Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1), Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), Rare, Threatened, or Endangered Species (RARE), Freshwater Replenishment (FRSH), Hydropower Generation (POW), and Preservation of Biological Habitats of Special Significance (BIOL). The following additional existing and potential beneficial uses are identified for coastal waters of the San Diego Region: Navigation (NAV), Commercial and Sport Fishing (COMM), Estuarine Habitat (EST), Marine Habitat (MAR), Aquaculture (AQUA), Migration of Aquatic Organisms (MIGR), Spawning, Reproduction, and/or Early Development (SPWN), and Shellfish Harvesting (SHELL).

21. Ocean Plan. The State Water Board adopted the Water Quality Control Plan for Ocean Waters of California, California Ocean Plan (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005 and it became effective on February 14, 2006. The Ocean Plan is applicable, in its entirety, to point source discharges to the ocean. Requirements of this Order implement the Ocean Plan.

The Ocean Plan identifies the following beneficial uses of ocean waters of the state to be protected: Industrial water supply; water contact and non-contact recreation, including aesthetic enjoyment; navigation; commercial and sport fishing; mariculture; preservation and enhancement of designated Areas of Special Biological Significance; rare and endangered species; marine habitat; fish spawning and shellfish harvesting

22. Sediment Quality Control Plan. On September 16, 2008, the State Water Board adopted the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality (Sediment Quality Control Plan). The Sediment Quality Control Plan became effective on August 25, 2009. The Sediment Quality Control Plan establishes 1) narrative sediment quality objectives for benthic community protection from exposure to contaminants in sediment and to protect human health, and 2) a program of implementation using a multiple lines of evidence approach to interpret

the narrative sediment quality objectives. Requirements of this Order implement the Sediment Quality Control Plan.

23. **National Toxics Rule and California Toxics Rule.** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the National toxics Rule (NTR) applied in California. On May 18, 2000, USEPA adopted the California Toxics Rule (CTR). The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants

24. **Antidegradation Policy.** This Order is in conformance with the federal Antidegradation Policy described in 40 CFR 131.12, and State Water Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality Waters in California*. Federal regulations at 40 CFR 131.12 require that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The San Diego Water Board's Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies.

CONSIDERATIONS UNDER FEDERAL LAW

25. **Coastal Zone Act Reauthorization Amendments.** Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA addresses five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This Order addresses the management measures required for the urban category, with the exception of septic systems. The runoff management programs developed pursuant to this Order fulfill the need for coastal cities to develop a runoff non-point source plan identified in the Non-Point Source Program Strategy and Implementation Plan. The San Diego Water Board addresses septic systems through the administration of other programs.

26. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the Federal Endangered Species Act (16 USCA sections 1531 to 1544). This Order requires compliance with receiving water limits, and other requirements to protect the beneficial uses of waters of the State. The Copermittees are responsible for meeting all requirements of the applicable Endangered Species Act.

CONSIDERATIONS UNDER STATE LAW

27. **Unfunded Mandates.** This Order does not constitute an unfunded local government mandate subject to subvention under Article XIIIB, Section (6) of the California Constitution for several reasons, including, but not limited to, the following:

    a. This Order implements federally mandated requirements under CWA section 402. (33 USC 1342(p)(3)(B).)

    b. The local agency Copermittees' obligations under this Order are similar to, and in many respects less stringent than, the obligations of non-governmental and new dischargers who are issued NPDES permits for storm water and non-storm water discharges.

    c. The local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order.

    d. The Copermittees have requested permit coverage in lieu of compliance with the complete prohibition against the discharge of pollutants contained in CWA section 301(a) (33 USC 1311(a)) and in lieu of numeric restrictions on their MS4 discharges (i.e. effluent limitations).

    e. The local agencies' responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under State law predates the enactment of Article XIIIB, Section (6) of the California Constitution.

    f. The provisions of this Order to implement TMDLs are federal mandates. The CWA requires TMDLs to be developed for water bodies that do not meet federal water quality standards. (33 USC 1313(d).) Once the USEPA or a state develops a TMDL, federal law requires that permits must contain effluent limitations consistent with the assumptions and requirements of any applicable wasteload allocation. (40 CFR 122.44(d)(1)(vii)(B).)

28. **California Environmental Quality Act.** The issuance of WDRs and an NPDES permit for the discharge of runoff from MS4s to waters of the U.S. is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (CEQA) (Public Resources Code, Division 13, Chapter 3, section 21000 et seq.) in accordance with CWC section 13389.

STATE WATER BOARD DECISIONS

29. **Compliance with Prohibitions and Limitations.** The receiving water limitation language specified in this Order is consistent with language recommended by the USEPA and established in State Water Board Order WQ-99-05, *Own Motion Review of the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03, NPDES Permit No. CAS0108740*, adopted by the State Water Board on June 17, 1999. The receiving water limitation language in this Order requires compliance with water quality standards, which for storm water discharges is to be achieved through an iterative approach requiring the

implementation of improved and better-tailored BMPs over time. Implementation of the iterative approach to comply with receiving water limitations based on applicable water quality standards is necessary to ensure that storm water discharges from the MS4 ultimately will not cause or contribute to violations of water quality standards and the creation of conditions of pollution, contamination, or nuisance.

30. **Special Conditions for Areas of Special Biological Significance.** On March 20, 2012, the State Water Board approved Resolution No. 2012-001**X** approving an exception to the Ocean Plan prohibition against discharges to Areas of Special Biological Significance (ASBS) for certain nonpoint source discharges and NPDES permitted municipal storm water discharges. The Resolution requires monitoring and testing of marine aquatic life and water quality in several ASBS to protect California's coastline during storms when rain water overflows into coastal waters. Specific terms, prohibitions, and special conditions were adopted to provide special protections for marine aquatic life and natural water quality in ASBSs. The City of San Diego's municipal storm water discharges to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's municipal storm water discharges to the Heisler Park ASBS are subject terms and conditions of the Resolution. The Special Protections contained in Attachment B to the Resolution applicable to these discharges are hereby incorporated in this Order as if fully set forth herein.

ADMINISTRATIVE FINDINGS

31. **Executive Officer Delegation of Authority.** The San Diego Water Board by prior resolution has delegated all matters that may legally be delegated to its Executive Officer to act on its behalf pursuant to CWC section 13223. Therefore, the Executive Officer is authorized to act on the San Diego Water Board's behalf on any matter within this Order unless such delegation is unlawful under CWC section 13223 or this Order explicitly states otherwise.

32. **Standard Provisions.** Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR 122.42, are provided in Attachment B to this Order.

33. **Fact Sheet.** The Fact Sheet for this Order contains background information, regulatory and legal citations, references and additional explanatory information and data in support of the requirements of this Order. The Fact Sheet is hereby incorporated into this Order and constitutes part of the Findings of this Order.

34. **Public Notice.** The San Diego Water Board notified the Copermittees, and interested agencies and persons of its intent to prescribe WDRs for MS4 discharges of pollutants to waters of the U.S. and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet.

35. **Public Hearing.** The San Diego Water Board held a public hearing on Month Day, 2012 and heard and considered all comments pertaining to the terms and conditions of this Order. Details of the public hearing are provided in the Fact Sheet.

II. PROVISIONS

THEREFORE, IT IS HEREBY ORDERED that the Copermittees, in order to meet the provisions contained in division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA and regulations adopted thereunder, must each comply with the following:

A. PROHIBITIONS AND LIMITATIONS

The purpose of this provision is to describe the conditions under which storm water and non-storm water discharges into and from MS4s are prohibited or limited. The goal of this provision is to protect, preserve, enhance, and restore the water quality and designated beneficial uses of waters of the state. This goal will be accomplished through implementation of control measures that effectively prohibit non-storm water discharges into and from the Copermittees' MS4s, and reduce pollutants in storm water discharges from the Copermittees' MS4s to the MEP.

1. Discharge Prohibitions

a. Discharges into and from MS4s in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance in receiving waters of the state are prohibited.

b. Non-storm water discharges into and from MS4s are prohibited, unless such discharges are either authorized by a separate NPDES permit, or the discharge is a category of non-storm water discharges or flows that must be addressed pursuant to Provisions E.2.a.(1)-(5) of this Order.

c. Discharges from MS4s are subject to all waste discharge prohibitions in the Basin Plan, included in Attachment A to this Order.

d. Discharges from MS4s to ASBS are prohibited. Storm water discharges from the City of San Diego's MS4 to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's MS4 to the Heisler Park ASBS are authorized under this Order subject to the Special Protections contained in Attachment B to State Water Board Resolution No. 2012-001**X** applicable to these discharges, included in Attachment A to this Order.

2. Receiving Water Limitations

a. Discharges from MS4s must not cause or contribute to the violation of water quality standards in any receiving waters, including but not limited to all applicable provisions contained in:

(1) The San Diego Water Board's Basin Plan, including beneficial uses, water quality objectives, and implementation plans;

ADMINISTRATIVE DRAFT

(2) State Water Board plans for water quality control including the following:

(a) Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries (Thermal Plan), and

(b) The Ocean Plan, including beneficial uses, water quality objectives, and implementation plans;

(3) State Water Board policies for water and sediment quality control including the following:

(a) Water Quality Control Policy for the Enclosed Bays and Estuaries of California,

(b) Sediment Quality Control Plan which includes the following narrative objectives:

(i) Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities, and

(ii) Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health,

(c) The Statement of Policy with Respect to Maintaining High Quality of Waters in California (State Water Board Resolution No. 68-16).

(4) Priority pollutant criteria promulgated by the USEPA through the following:

(a) National Toxics Rule (NTR)[1] (promulgated on December 22, 1992 and amended on May 4, 1995), and

(b) California Toxics Rule (CTR)[2,3]

b. Discharges from MS4s composed of storm water runoff must not alter natural ocean water quality in an ASBS.

c. Discharges from MS4s must not cause or contribute to the violation of any receiving water limitations expressed as water quality based effluent limitations (WQBELs) required to meet the WLAs established for the TMDLs in Attachment E to this Order, pursuant to the applicable TMDL compliance schedules.

---

[1] 40 CFR 131.36
[2] 65 Federal Register 31682-31719 (May 18, 2000), adding Section 131.38 to 40 CFR
[3] If a water quality objective and a CTR criterion are in effect for the same priority pollutant, the more stringent of the two applies.

3. Effluent Limitations

a. Pollutants in storm water discharges from MS4s must be reduced to the MEP.[4]

b. Pollutants in discharges from MS4s must be reduced to comply with any effluent limitations expressed as WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order, pursuant to the applicable TMDL compliance schedules.

4. Compliance with Discharge Prohibitions and Receiving Water Limitations

Each Copermittee must comply with the discharge prohibitions and receiving water limitations of this Order through timely implementation of control measures and other actions as specified in Provisions B and E of this Order, including any modifications.

a. If exceedance(s) of water quality standards persist in receiving waters notwithstanding implementation of this Order, the Copermittees must comply with the following procedures:

(1) Upon a determination by ~~either~~ the Copermittees ~~or the San Diego Water Board~~ that discharges from the MS4 are causing or contributing to an exceedance of an applicable water quality standard, the Copermittees must submit the following updates to the Water Quality Improvement Plan required under Provision B as part of the Annual Report required under Provision F.3.b, unless the San Diego Water Board directs an earlier submittal:

(a) The water quality improvement strategies being implemented that are effective and will continue to be implemented;

(b) Additional water quality improvement strategies (i.e. BMPs, retrofitting projects, stream and/or habitat rehabilitation or restoration projects) that will be implemented to reduce or eliminate any pollutants or conditions that are causing or contributing to the exceedance of water quality standards;

(c) Updates to the schedule for implementation of the existing and additional water quality improvement strategies; and

(d) Updates, when necessary, to the schedule for achieving compliance with the discharge prohibitions and receiving water limitations of this Order;

[4] This does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants in storm water discharges to the MEP prior to entering receiving waters (e.g., low flow diversions to the sanitary sewer). Runoff treatment must occur prior to the discharge of runoff into receiving waters per Finding 8.

(2) Upon a determination by the San Diego Water Board that discharges from the MS4 are causing or contributing to an exceedance of an applicable water quality standard (that was not identified pursuant to A.4(a)(1)), the Copermittees must submit the updates required under Provision A.4(a)(1)(a)-(d) to the Water Quality Improvement Plan required under Provision B within 30 days, unless the San Diego Water Board directs a later submittal:

(3)

~~(2)~~(4) The San Diego Water Board may require the incorporation of additional modifications to the Water Quality Improvement Plan required under Provision B. The applicable Copermittees must submit any modifications to the update to the Water Quality Improvement Plan within 30 days of notification that additional modifications are required by the San Diego Water Board, or as otherwise directed;

~~(3)~~(5) Within 30 days of the San Diego Water Board determination that the update to the Water Quality Improvement Plan meets the requirements of this Order, the Copermittees must revise the jurisdictional runoff management program documents to incorporate the updated water quality improvement strategies that have been and will be implemented, the implementation schedule, and any additional monitoring required; and

~~(4)~~(6) The Copermittees must implement the revised jurisdictional runoff management programs and updated jurisdictional monitoring and assessment component of the Water Quality Improvement Plan.

b. The Copermittees must repeat the procedure set forth above to comply with discharge prohibitions and receiving water limitations of this Order for continuing or recurring exceedances of the same water quality standard(s) following implementation of scheduled actions unless directed to do otherwise by the San Diego Water Board.

c. Nothing in Provisions A.4.a and A.4.b prevents the San Diego Water Board from enforcing any provision of this Order while the applicable Copermittees prepare and implement the above update to the Water Quality Improvement Plan and jurisdictional runoff management programs.

ADMINISTRATIVE DRAFT

B. WATER QUALITY IMPROVEMENT PLANS

The purpose of this provision is to develop Water Quality Improvement Plans that guide the Copermittees' jurisdictional runoff management program implementation efforts towards achieving the outcome of improved water quality in MS4 discharges and receiving waters. The goal of the Water Quality Improvement Plan is to ~~attain the reasonable~~ best protect~~ion~~, preserve~~ation~~, enhance~~ment~~, and restore~~ation of~~ water quality and designated beneficial uses of waters of the state. This goal will be accomplished through an adaptive planning and management process that identifies the highest water quality priorities within a watershed and implements strategies, control measures, and BMPs to achieve improvements in the quality of discharges from the MS4s and receiving waters.

The Copermittees must develop Water Quality Improvement Plans that 1) prioritize water quality issues resulting from discharges to and from the MS4s within each Watershed Management Area, 2) identify pollutant sources and other stressors associated with those water quality priorities, 3) define numeric targets and schedules to achieve improvement of water quality priorities, 4) describe water quality improvement strategies to achieve numeric targets, and 5) execute a coordinated monitoring and assessment program to determine progress towards achieving improved water quality.

The Copermittees must implement all the requirements of Provision B no later than 12 months after the adoption of this Order, or in accordance with Provision F.5.a of this Order.

1. Watershed Management Areas

The Copermittees must develop Water Quality Improvement Plans for each of the Watershed Management Areas in Table B-1. A total of nine Water Quality Improvement Plans must be developed for the San Diego Region.

Table B-1. Watershed Management Areas

Watershed Management Area	Hydrologic Unit(s)	Major Surface Water Bodies	Responsible Copermittees
South Orange County	San Juan (901.00)	Aliso Creek San Juan Creek San Mateo Creek Pacific Ocean	- City of Aliso Viejo[1] - City of Dana Point[1] - City of Laguna Beach[1] - City of Laguna Hills[1] - City of Laguna Niguel[1] - City of Laguna Woods[1] - City of Lake Forest[1] - City of Mission Viejo[1] - City of Rancho Santa Margarita[1] - City of San Clemente[1] - City of San Juan Capistrano[1] - County of Orange[1] - Orange County Flood Control District[1]

Table B-1. Watershed Management Areas

Watershed Management Area	Hydrologic Unit(s)	Major Surface Water Bodies	Responsible Copermittees
Santa Margarita River	Santa Margarita (902.00)	Murrieta Creek Temecula Creek Santa Margarita River Santa Margarita Lagoon Pacific Ocean	- City of Murrieta[2] - City of Temecula[2] - City of Wildomar[2] - County of Riverside[2] - County of San Diego[3] - Riverside County Flood Control and Water Conservation District[2]
San Luis Rey River	San Luis Rey (903.00)	San Luis Rey River San Luis Rey Estuary Pacific Ocean	- City of Escondido - City of Oceanside - City of Vista - County of San Diego
Carlsbad	Carlsbad (904.00)	Buena Vista Lagoon Agua Hedionda Lagoon Batiquitos Lagoon San Elijo Lagoon Pacific Ocean	- City of Carlsbad - City of Encinitas - City of Escondido - City of Oceanside - City of San Marcos - City of Solana Beach - City of Vista - County of San Diego
San Dieguito River	San Dieguito (905.00)	San Dieguito River San Dieguito Lagoon Pacific Ocean	- City of Del Mar - City of Escondido - City of Poway - City of San Diego - City of Solana Beach - County of San Diego
Penasquitos	Penasquitos (906.00)	Los Penasquitos Lagoon Mission Bay Pacific Ocean	- City of Del Mar - City of Poway - City of San Diego - County of San Diego
San Diego River	San Diego (907.00)	San Diego River Pacific Ocean	- City of El Cajon - City of La Mesa - City of Poway - City of San Diego - City of Santee - County of San Diego
San Diego Bay	Pueblo San Diego (908.00) Sweetwater (909.00) Otay (910.00)	Sweetwater River Otay River San Diego Bay Pacific Ocean	- City of Chula Vista - City of Coronado - City of Imperial Beach - City of La Mesa - City of Lemon Grove - City of National City - City of San Diego - County of San Diego - San Diego County Regional Airport Authority - Unified Port of San Diego
Tijuana River	Tijuana (911.00)	Tijuana River Tijuana Estuary Pacific Ocean	- City of Imperial Beach - City of San Diego - County of San Diego

Notes:
1. The Orange County Copermittees will be enrolled under this Order upon expiration of Order No. R9-2009-0002, or earlier if the Orange County Copermittees meet the conditions in Provision F.6.
2. The Riverside County Copermittees will be enrolled under this Order upon expiration of Order No. R9-2010-0016, or earlier if the Riverside County Copermittees meet the conditions in Provision F.6.
3. The County of San Diego will not be required to implement the requirements of Provision B for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees are enrolled under this Order. Until then, the County of San Diego is responsible for implementing and complying with the requirements of Provisions D.1, D.4.a.(1)&(3), E, F.2.a-b, F.3.b, and F.4 for the areas of the Santa Margarita River Watershed Management Area within its jurisdiction.

2. Identification of Water Quality Priorities

The Copermittees must identify the water quality priorities within each Watershed Management Area that will be addressed by the Water Quality Improvement Plan. Where appropriate, Watershed Management Areas may be separated into subwatersheds to focus water quality prioritization and jurisdictional runoff management program implementation efforts by receiving water.

a. ASSESSMENT OF RECEIVING WATER CONDITIONS

The Copermittees must review pollutant sources, discharges, and receiving water conditions and assess the following, at a minimum, to determine the degree of adverse impacts to receiving water beneficial uses:

(1) Receiving waters listed as impaired on the CWA Section 303(d) List of Water Quality Limited Segments (303(d) List);

(2) TMDLs adopted and under development by the San Diego Water Board;

(3) Receiving waters recognized as sensitive or highly valued by the Copermittees, including estuaries designated under the National Estuary Program under CWA section 320, wetlands defined by the State or U.S. Fish and Wildlife Service's National Wetlands Inventory as wetlands, and receiving waters identified as ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-001**X** (Attachment A);

(4) Water quality standards established in the Basin Plan;

(5) Known historical versus current physical, chemical, and biological water quality conditions;

(6) All available physical, chemical, and biological receiving water monitoring data, including data produced by third parties. Data to be considered shall ~~including~~include, but is not limited to, data describing:

(a) Chemical constituents;

(b) Water quality parameters (i.e. pH, temperature, conductivity, etc.);

(c) Toxicity Identification Evaluations for both receiving water column and sediment;

(d) Trash impacts;

(e) Bioassessments; and

(f) Physical habitat.

(7) Available evidence of erosional impacts in receiving waters due to accelerated flows (i.e. hydromodification); and

(8) Available evidence of adverse impacts to the chemical, physical, and biological integrity of receiving waters.

To ensure that Copermittees consider all available data when identifying priorities, Copermittees must make a call for data. The call for data must solicit third party water monitoring data and other evidence from the public regarding available evidence of adverse impacts to the chemical, physical, and biological integrity of receiving waters. The Copermittees must allow the public at least 30 days to submit data and information for consideration.

Formatted: Indent: Left: 0"

b. IDENTIFY PRIORITY POLLUTANTS AND RECEIVING WATER CONDITIONS

The Copermittees must use the information gathered in Provision B.2.a. to develop a list of water quality priorities as pollutants and/or receiving water conditions that are the highest threat to water quality or that most adversely affect the physical, chemical, and biological integrity of receiving waters. The Copermittees must identify the highest water quality priorities to be addressed by the Water Quality Improvement Plan.

After developing the list of water quality priorities, the Copermittees must submit the proposed list, along with data supporting the list, to the Regional Board for a 30 day review and comment period for the public and Regional Board staff.

c. POLLUTANT SOURCE AND/OR STRESSOR IDENTIFICATION

The Copermittees must identify known and suspected storm water and non-storm water pollutant sources and any other stressors causing or contributing to the highest water quality priorities. The identification of known and suspected sources of the highest water quality priorities as identified for Provision B.2.b must consider the following:

(1) Pollutant generating facilities or areas within the Watershed Management Area, including:

(a) Each Copermittee's inventory of construction, municipal, commercial, industrial, and residential facilities, areas, and/or activities,

(b) Publicly owned parks and/or recreational areas,

(c) Open space areas,

(d) All currently operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, and

(e) Areas not within the Copermittees' jurisdictions (e.g., tribal lands, state lands, federal lands) that may be pollutant sources related to the highest water quality priorities within the Watershed Management Area;

(2) Locations of the Copermittees' MS4s, including the following:

(a) All MS4 outfalls that discharge to receiving waters, and

(b) Locations of major structural controls for storm water and non-storm water (e.g., retention basins, detention basins, major infiltration devices, etc.);

(3) Other known and suspected sources of non-storm water or pollutants in storm water discharges to receiving waters within the Watershed Management Area, including the following:

(a) Other MS4 outfalls (e.g., Phase II Municipal and Caltrans),

(b) Other NPDES permitted discharges,

(c) Any other discharges that may be considered point sources (e.g., private outfalls), and

(d) Any other discharges that may be considered non-point sources (e.g., agriculture, wildlife or other natural sources);

(4) Review of available data, including but not limited to:

(a) Findings from the Copermittees' illicit discharge detection and elimination programs,

(b) Findings from the Copermittees' MS4 outfall monitoring,

(c) Findings from the Copermittees' receiving water monitoring,

(d) Findings from the Copermittees' MS4 discharges and receiving water assessments, and

(e) Any other available data, information, or studies related to pollutant sources and conditions that contribute to the highest water quality priorities as identified for Provision B.2.b.

To ensure that Copermittees consider all available information when identifying pollutant sources and stressors, Copermittees must make a call for information. The call for data must solicit information from the public regarding known and suspected sources. The Copermittees must allow the public at least 90 days to submit data and information for

Formatted: List Paragraph, No bullets or numbering, Widow/Orphan control consideration.

After developing the list of pollutant sources, the Copermittees must submit the proposed list, along with data supporting it, to the Regional Board for a 30 day review and comment period for the public and Regional Board staff.

~~(e)~~

Formatted: No bullets or numbering

d. NUMERIC TARGETS AND SCHEDULES

The Copermittees must develop and incorporate interim and final numeric targets[5] and schedules into the Water Quality Improvement Plans. Numeric targets and schedules must be used to measure progress towards addressing the highest water quality priorities and an ultimate outcome of protections, preservation, enhancement, and restoration of receiving water beneficial uses. When developing numeric targets and corresponding schedules, the Copermittees must consider the following:

[5] Interim and final numeric targets may take a variety of forms such as pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric targets are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators. The final goals must be linked to applicable water quality criteria.

(1) Final numeric targets must be based on measureable criteria or indicators, to be achieved in the receiving waters and/or MS4 discharges for the highest water quality priorities which will result in the restoration and/or protection of water quality standards in receiving waters;

(2) Interim numeric targets must be based on measureable criteria or indicators that can demonstrate incremental progress toward achieving the final numeric targets in the receiving waters and/or MS4 discharges; and

(3) Schedules must be adequate for measuring progress toward achieving the interim and final numeric targets required for Provisions B.2.d.(1) and B.2.d.(2). Schedules must incorporate the following:

(a) Interim dates for achieving the interim numeric targets,

(b) Compliance schedules for any applicable TMDLs in Attachment E to this Order,

(c) Compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-001**X** (see Attachment A),

(d) Achievement of the final numeric targets in the receiving waters and/or MS4 discharges for the highest water quality priorities must be as soon as possible, and

(e) Final dates for achieving the final numeric targets must not extend more than 10 years beyond the date this Order is adopted, unless the schedule includes an applicable TMDL in Attachment E to this Order.

After developing the numeric targets, the Copermittees must submit the proposed list to the Regional Board for a 30 day review and comment period for the public and Regional Board staff.

Each Copermittee will be jointly and severally responsible for achieving the numeric targets.

~~(e)~~

Formatted: List Paragraph, No bullets or numbering, Widow/Orphan control

Formatted: No bullets or numbering

3. Water Quality Improvement Strategies and Schedules

The Copermittees must develop specific water quality improvement strategies to address the highest water quality priorities identified within a Watershed Management Area. The water quality improvement strategies must address the highest water quality priorities by preventing or eliminating non-storm water discharges to and from the MS4, reducing pollutants in storm water discharges from the MS4 to the MEP, and restoring and/or protecting the water quality standards of receiving waters.

a. **WATER QUALITY IMPROVEMENT STRATEGIES**

The water quality improvement strategies must prioritize and implement the following measures to achieve the interim and final numeric targets in accordance with the schedules required for Provision B.2.c:

(1) Structural and/or non-structural BMPs that are designed to achieve the interim and final numeric targets in the receiving waters and/or MS4 discharges;

(2) Retrofitting projects for areas of existing development known or suspected to contribute to the highest water quality priorities, and where retrofitting will contribute to reducing or eliminating non-storm water discharges to the MS4 and/or reducing pollutants in storm water discharges from the MS4 to the MEP;

(3) Stream and/or habitat rehabilitation or restoration projects where stream and/or habitat rehabilitation or restoration are necessary for, or will contribute to demonstrable improvements in the physical, chemical, and biological receiving water conditions and restoration and/or protection of water quality standards in receiving waters; and

(4) Other water quality improvement strategies that will result in preventing or eliminating non-storm water discharges to and from the MS4, reducing pollutants in storm water discharges from the MS4 to the MEP, and restoring and/or protecting the water quality standards of receiving waters.

b. **IMPLEMENTATION SCHEDULES**

(1) The Copermittees must develop schedules for implementing the water quality improvement strategies identified under Provision B.3.a to achieve the interim and final numeric targets in the receiving waters and/or MS4 discharges for the highest water quality priorities in the Watershed Management Area. Schedules must be developed for both the water quality improvement strategies implemented by each Copermittee within its jurisdiction and for strategies that will be implemented by multiple Copermittees on a collaborative basis.

(2) The Copermittees must incorporate the implementation compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-001**X** (see Attachment A).

After developing the strategies and schedules, the Copermittees must submit the proposed list to the Regional Board for a 30 day review and comment period for

Formatted: Indent: Left: 0.5", No bullets or numbering, Widow/Orphan control

the public and Regional Board staff.
~~(2)~~

Formatted: Normal, No bullets or numbering

4. Water Quality Improvement Monitoring and Assessment

The Copermittees in each Watershed Management Area must develop an integrated program to assess the progress toward achieving the numeric targets and schedules, and the progress toward addressing the highest water quality priorities for each Watershed Management Area. The water quality improvement monitoring and assessment program must include the monitoring and assessment requirements of Provision D. For Watershed Management Areas with applicable TMDLs, the water quality monitoring and assessment program must incorporate the specific monitoring and assessment requirements of Attachment E. For Watershed Management Areas with any ASBS, the water quality monitoring and assessment program must also incorporate the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-001**X** (see Attachment A).

5. Adaptive Management Process

a. WATER QUALITY IMPROVEMENT PLAN ADAPTIVE MANAGEMENT PROCESS

(1) The Copermittees in each Watershed Management Area must implement the iterative process, at least once every 2~~3~~ years, adapting the Water Quality Improvement Plan to become more effective, based on, but not limited to the following considerations:

(a) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan;

(b) Progress toward achieving interim and final numeric targets in receiving waters and/or MS4 discharges for the highest water quality priorities in the Watershed Management Area,

(c) Appropriateness of the highest water quality priorities identified for the Watershed Management Area;

(d) Progress toward achieving outcomes according to established schedules;

(e) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality problems and implementation measures to address the highest water quality problems;

(f) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees;

(g) San Diego Water Board recommendations; and

(h) Recommendations for modifications to the Water Quality Improvement Plan solicited through a public participation process.

(2) Based on the results of the iterative process required pursuant to Provision B.5.a.(1), the Copermittees must report any modifications necessary to improve the effectiveness of the Water Quality Improvement Plan in the Annual Report required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge (ROWD) required pursuant to Provision F.5.b.

(3) The Copermittees must implement any modifications to the Water Quality Improvement Plan in accordance with the schedules developed pursuant to Provisions B.2.d and B.3.b, unless directed otherwise by the San Diego Water Board.

b. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM ADAPTIVE MANAGEMENT PROCESS

(1) Each Copermittee in the Watershed Management Area must implement the iterative process, at least annually, adapting its jurisdictional runoff management program to become more effective, based on, but not limited to the following:

(a) Measurable or demonstrable reductions of non-storm water discharges to and from each Copermittee's MS4;

(b) Measurable or demonstrable reductions of pollutants in storm water discharges from each Copermittee's MS4 to the MEP;

(c) Efficiency in implementing the Water Quality Improvement Plan;

(d) San Diego Water Board recommendations; and

(e) Recommendations for modifications to each Copermittee's jurisdictional runoff management program solicited through a public participation process.

(2) Based on the results of the iterative process required pursuant to Provision B.5.b.(1), each Copermittee must report any modifications necessary to improve the effectiveness its jurisdictional runoff management program document in the Annual Report required pursuant to Provision F.3.b, or as part of the ROWD required pursuant to Provision F.5.b.

(3) Each Copermittee must implement any modifications to its jurisdictional runoff

management program in accordance with the schedules developed pursuant to Provisions B.2.d and B.3.b, unless directed otherwise by the San Diego Water Board.

6. Water Quality Improvement Plan Implementation

The Copermittees must commence with implementation of the Water Quality Improvement Plan ~~no later than 180 days~~immediately after approval by ~~after submission, unless otherwise directed in writing by~~ the San Diego Water Board after a public hearing.

C. ACTION LEVELS

The purpose of this provision is for the Copermittees to incorporate numeric non-storm water and storm water action levels in the Water Quality Improvement Plans. The action levels will be used to measure progress towards ~~attaining the reasonable~~best ~~protection~~protecting, ~~preservation~~preservating, enhanc~~emen~~ing~~t~~, and restoring ~~ation of~~ water quality and designated beneficial uses of waters of the state. This goal will be accomplished through monitoring and assessing the quality of the MS4 discharges during the implementation of the Water Quality Improvement Plans.

The Copermittees must incorporate numeric action levels in the Water Quality Improvement Plans to direct and focus the Copermittees' jurisdictional runoff management program implementation efforts for addressing MS4 discharges to receiving waters. The numeric action levels will be used as part of the MS4 discharges assessments required under Provision D.4.a, and each Copermittee's program to detect and eliminate non-storm water and illicit discharges to the MS4 required under Provision E.2. Numeric action levels must be developed for non-storm water and storm water MS4 discharges, as follows:

1. Non-Storm Water Action Levels

a. The following non-storm water action levels (NALs) must be incorporated in the Water Quality Improvement Plan:

(1) Non-Storm Water Discharges from MS4s to Ocean Surf Zone

Table C-1. Non-Storm Water Action Levels for Discharges from MS4s to Ocean Surf Zone

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100 ml	1,000	-	10,000/1,000[1]	OP
Fecal Coliform	MPN/100 ml	200[2]	-	400	OP
Enterococci	MPN/100 ml	35	-	104[3]	OP

Abbreviations/Acronyms
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
MPN/100 ml – most probable number per 100 milliliters

Notes:
1. Total coliform density shall not exceed 1,000 MPN/100 ml when the fecal/total coliform ratio exceeds 0.1
2. Fecal coliform density may not exceed 200 MPN per 100 ml during any 30 day period
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas"

(2) Non-Storm Water Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Table C-2. Non-Storm Water Action Levels for Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Turbidity	NTU	75	-	225	OP
pH	Units	Within limit of 6.0 to 9.0 at all times			OP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	35	-	104[3]	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
BP – Basin Plan water quality objective
NTU – Nephelometric Turbidity Units
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period
2. No more than 10 percent of total samples may exceed 400 MPN per 100 ml during any 30 day period
3. This value has been set to the Basin Plan water quality objective for saltwater “designated beach areas”

Table C-3. Non-Storm Water Action Levels for Priority Pollutants

Parameter	Units	Freshwater (CTR) MDAL	Freshwater (CTR) AMAL	Saltwater (CTR) MDAL	Saltwater (CTR) AMAL
Cadmium	ug/L	**	**	16	8
Copper	ug/L	*	*	5.8	2.9
Chromium III	ug/L	**	**	-	-
Chromium VI	ug/L	16	8.1	83	41
Lead	ug/L	*	*	14	2.9
Nickel	ug/L	**	**	14	6.8
Silver	ug/L	*	*	2.2	1.1
Zinc	ug/L	*	*	95	47

Abbreviations/Acronyms:
CTR – California Toxic Rule
ug/L – micrograms per liter
AMAL – average monthly action level
MDAL – maximum daily action level

Notes:
* Action levels developed on a case-by-case basis (see below)
** Action levels developed on a case-by-case basis (see below), but calculated criteria are not to exceed Maximum Contaminant Levels (MCLs) under the California Code of Regulations, Title 22, Division 4, Chapter 15, Article 4, Section 64431

The Cadmium, Copper, Chromium (III), Lead, Nickel, Silver and Zinc NALs for MS4 discharges to freshwater receiving waters will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data (receiving water hardness). For these priority pollutants, the following equations (40 CFR 131.38.b.2) will be required:

Cadmium (Total Recoverable) = exp(0.7852[ln(hardness)] -2.715)
Chromium III (Total Recoverable) = exp(0.8190[ln(hardness)] + .6848)
Copper (Total Recoverable) = exp(0.8545[ln(hardness)] - 1.702)
Lead (Total Recoverable) = exp(1.273[ln(hardness)] - 4.705)
Nickel (Total Recoverable) = exp(.8460[ln(hardness)] + 0.0584)
Silver (Total Recoverable) = exp(1.72[ln(hardness)] - 6.52)
Zinc (Total Recoverable) = exp(0.8473[ln(hardness)] + 0.884)

ADMINISTRATIVE DRAFT

(3) Non-Storm Water Discharges from MS4s to Inland Surface Waters

Table C-4. Non-Storm Water Action Levels for Discharges from MS4s to Inland Surface Waters

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Dissolved Oxygen	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters			BP
Turbidity	NTU	-	20	See MDAL	BP
pH	Units	Within limit of 6.5 to 8.5 at all times			BP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	33	-	61[3]	BP
Total Nitrogen	mg/L	-	1.0	See MDAL	BP
Total Phosphorus	mg/L	-	0.1	See MDAL	BP
MBAS	mg/L	-	0.5	See MDAL	BP
Iron	mg/L	-	0.3	See MDAL	BP
Manganese	mg/L	-	0.05	See MDAL	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
BP – Basin Plan water quality objective
COLD – cold freshwater habitat beneficial use
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
MDAL – maximum daily action level
WARM – warm freshwater habitat beneficial use
MBAS – Methylene Blue Active Substances
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period
2. No more than 10 percent of total samples may exceed 400 MPN per 100 ml during any 30 day period
3. This value has been set to the Basin Plan water quality objective for freshwater "designated beach areas"

b. If not identified in Provision C.1.a, NALs must be identified and incorporated in the Water Quality Improvement Plan for any pollutants or waste constituents causing or contributing, or threatening to cause or contribute to a condition of pollution or nuisance in waters of the state associated with the highest water quality priorities related to non-storm water discharges from the MS4s. NALs must be based on:

(1) Applicable water quality standards which may be dependent upon site-specific or receiving water-specific conditions or assumptions to be identified by the Copermittees; or

(2) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

2. Storm Water Action Levels

a. The following storm water action levels (SALs) for discharges of storm water from the MS4 must be incorporated in the Water Quality Improvement Plan:

Table C-5. Storm Water Action Levels for Discharges from MS4s to Receiving Waters

Parameter	Units	Action Level
Turbidity	NTU	126
Nitrate & Nitrite (Total)	mg/L	2.6
Phosphorus (Total P)	mg/L	1.46
Cadmium (Total Cd)*	µg/L	3.0
Copper (Total Cu)*	µg/L	127
Lead (Total Pb)*	µg/L	250
Zinc (Total Zn)*	µg/L	976

Abbreviations/Acronyms:
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
ug/L – micrograms per liter

Notes:
* The sampling must include a measure of receiving water hardness at each MS4 outfall. If a total metal concentration exceeds the corresponding metals SAL in Table C-5, that concentration must be compared to the California Toxics Rule criteria and the USEPA 1-hour maximum concentration for the detected level of receiving water hardness associated with that sample. If it is determined that the sample's total metal concentration for that specific metal exceeds that SAL, but does not exceed the applicable USEPA 1-hour maximum concentration criterion for the measured level of hardness, then the sample result will not be considered as an excursion above the SAL for that measurement.

b. If not identified in Provision C.2.a, SALs must be identified and incorporated in the Water Quality Improvement Plan for pollutants or waste constituents causing or contributing, or threatening to cause or contribute to a condition of pollution or nuisance in waters of the state associated with the highest water quality priorities related to storm water discharges from the MS4s. SALs must be based on:

(1) Federal and State water quality guidance and/or water quality standards; and

(2) Site-specific or receiving water-specific conditions; or

(3) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. Wet weather monitoring and assessment data from MS4 outfalls collected in accordance with Provision D.1.b may be used to develop or revise SALs based upon watershed-specific data. Revision of SALs is subject to San Diego Water Board approval.

D. MONITORING AND ASSESSMENT REQUIREMENTS

The purpose of this provision is for the Copermittees to monitor and assess the chemical, physical, and biological impact on receiving waters caused by discharges from the Copermittees' MS4s under wet weather and dry weather conditions. The goal of this provision is to inform the Copermittees about the nexus between the health of receiving waters and the water quality condition of the discharges from their MS4s. This goal will be accomplished through implementing and complying with the monitoring and assessment requirements of this Order.

The Copermittees must implement the following minimum monitoring and assessment requirements:

1. Jurisdictional Monitoring Requirements

a. DRY WEATHER JURISDICTIONAL MONITORING [D.1.a]

For dry weather days,[6] each Copermittee must implement the following minimum monitoring requirements within its jurisdiction:

(1) Non-Storm Water MS4 Monitoring Program [D.1.a.(1)]

Each Copermittee must develop and conduct a program to monitor and characterize non-storm water flows and pollutant loads during dry weather conditions within its jurisdiction. The non-storm water MS4 monitoring program must be utilized to detect and eliminate non-storm water discharges and illicit discharges and connections to the Copermittee's MS4. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittee. The non-storm water MS4 monitoring program must meet the following minimum requirements:

(a) Non-Storm Water MS4 Monitoring Stations [D.1.a.(1)(a)]

Each Copermittee must identify the non-storm water MS4 monitoring stations within its jurisdiction that will be screened and monitored during dry weather days to identify non-storm water discharges and illicit discharges and connections to the MS4. Non-storm water MS4 monitoring stations must be selected in accordance with the following guidelines and criteria:

(i) A grid system consisting of perpendicular north-south and east-west lines spaced ¼ mile apart must be overlayed on a map of the Copermittee's MS4. All cells that contain a segment of the Copermittee's MS4 must be identified;

[6] Dry weather day is defined as any day with less than 0.1 inches of rain observed on each of the previous 3 days.

(ii) At least one non-storm water MS4 monitoring station must be selected in each cell containing a segment of the Copermittee's MS4, which must consist of one of the following:

[a] A major outfall,
[b] Other outfall point, or
[c] Other point of access (e.g., manhole);

(iii) Each non-storm water MS4 monitoring station should be located downstream of any areas that are known or suspected to be sources of non-storm water discharges and/or illicit discharges or connections to the MS4;

(iv) Each non-storm water MS4 monitoring station must be located to the degree practicable at the farthest outfall, manhole, or other accessible location downstream in the MS4, within each cell;

(v) In addition to the non-storm water MS4 monitoring stations identified in accordance with Provisions D.1.a.(1)(a)(i)-(iv) above, each Copermittee must identify stations that will be screened and monitored during dry weather days to identify non-storm water discharges from sources not directly under the jurisdiction of the Copermittee.[7] These stations must be selected in accordance with the following guidelines and criteria:

[a] Stations should be located at or prior to the point of discharge into the Copermittee's MS4, but may be located downstream of the source as long as the station remains appropriate for characterizing the discharge from the source not within the authority of the Copermittee to control,
[b] Any non-storm water MS4 monitoring station identified in accordance with Provisions D.1.a.(1)(a)(i)-(iv) and located at the point of discharge or directly downstream of a known or suspected source of non-storm water discharges not within the authority of the Copermittee to control may also be utilized as a station to monitor the source not within the authority of the Copermittee to control;

(vi) The following factors should be considered in determining the location of each non-storm water MS4 monitoring station:

[a] Safety of personnel and accessibility of the location,
[b] Total area draining to the location,
[c] Population density of the area draining to the location,
[d] Traffic density,
[e] Age of the structures or buildings in the area,

[7] Sources not directly under the jurisdiction of and subject to regulation by the Copermittee may include lands or areas under the jurisdiction of other Copermittees, owners or operators of federal and state lands or facilities, tribal lands, special districts, etc.

[f] History of the area,
[g] Land use types draining to the location,
[h] Hydrological conditions, and
[i] Recommendations from the San Diego Water Board; and

(vii) No more than 500 non-storm water MS4 monitoring stations need to be selected by each Copermittee within its jurisdiction for any given year.

(b) Non-Storm Water MS4 Station Prioritization [D.1.a.(1)(b)]

Based on the first year of non-storm water field observations collected consistent with the Provision D.1.a.(1)(c)(i), each Copermittee must identify the high priority non-storm water MS4 monitoring stations. The non-storm water MS4 monitoring stations that meet the following criteria must be identified as high priority:

(i) The Copermittee has not identified and eliminated the source of the non-storm water discharges; or

(ii) The Copermittee has not been able to eliminate the source of an identified illicit discharge, and

(iii) The non-storm water discharges and/or illicit discharges are known or suspected to contribute and/or contain pollutants that cause or contribute, or threaten to cause or contribute to a condition of pollution or nuisance associated with the highest water quality priorities related to discharges from the MS4s.

(iv) The Copermittee may also designate any non-storm water MS4 monitoring stations that do not meet the criteria above as high priority.

(c) Non-Storm Water Monitoring Procedures [D.1.a.(1)(c)]

Each Copermittee must monitor the non-storm water MS4 monitoring stations within its jurisdiction as follows:

(i) *Non-Storm Water Field Observations* [D.1.a.(1)(c)(i)]

[a] Monitoring events for each non-storm water MS4 monitoring station must be scheduled as follows:
[1] During the first year of enrollment under this Order, the Copermittee must record field observations consistent with Table D-1 at each non-storm water MS4 monitoring station within its jurisdiction at least one time per month;

Table D-1. Field Observations for Non-Storm Water MS4 Monitoring Stations

Field Observations
• Station identification and location. • Presence of flow, or pooled or ponded water. • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate), - Flow characteristics (i.e. presence of floatables, surface scum, or sheens, odor, color), - Flow source(s) suspected or identified from non-storm water source investigation, and - Flow source(s) eliminated during non-storm water source identification. • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, or sheens, odor, color), and - Known or suspected source(s) of pooled or ponded water. • Station description (i.e. deposits or stains, vegetation condition, structural condition, observable biology). • Presence and assessment of trash in and around station. • Evidence or signs of illicit connections or illegal dumping.

[2] For any stations monitoring sources not within the authority of the Copermittee to control where flows are observed during the first year of enrollment under this Order, the Copermittee must develop a field screening and monitoring schedule that can characterize the monthly non-storm water discharges and pollutant loads from the sources in or discharging to the Copermittee's MS4;

[3] High priority non-storm water MS4 monitoring stations must be monitored in accordance with the following:

A. Each Copermittee must designate at least 5 high priority non-storm water MS4 monitoring stations that are representative of non-storm water discharges from areas consisting primarily of residential, commercial, and industrial land uses present within and directly under the Copermittee's jurisdiction. Where there are less than 5 non-storm water MS4 monitoring stations within a Copermittee's jurisdiction, all stations must be designated as high priority, and

B. Each Copermittee must develop a monitoring schedule that can characterize the monthly non-storm water discharges and pollutant loads in or discharging from the high priority non-storm water MS4 monitoring stations;

[4] At least 10 percent of the non-storm water MS4 monitoring stations not identified as high priority must be screened and monitored each month. In addition, each non-storm water MS4 monitoring station must be screened and monitored at least once per year. If non-storm water flows are observed at

any non-storm water MS4 monitoring stations not identified as high priority, then they must become high priority pursuant to Provision D.1.a.(1)(b).

[b] For each monitoring events required above, the narrative descriptions and observations in Table D-1 must be recorded at each non-storm water MS4 monitoring station.

(ii) *Non-Storm Water Field Monitoring* [D.1.a.(1)(c)(ii)]

If flows, or pooled or ponded water are present during the field observations required under Provision D.1.a.(1)(c)(i), the Copermittee must monitor and record the parameters in Table D-2:

Table D-2. Field Monitoring Parameters for Non-Storm Water MS4 Monitoring Stations

Parameters
• pH • Temperature • Specific conductivity • Dissolved oxygen • Turbidity • Total chlorine • Total copper* • Total phenol • Detergents (or surfactants)* • Total hardness* • Reactive phosphorus* • Nitrate* • Ammonia as nitrogen*

* Field measurement not required if flow is observed and collection of a sample for analysis is required.

(iii) *Non-Storm Water Analytical Monitoring* [D.1.a.(1)(c)(iii)]

If flows are present during the field observations required under Provision D.1.a.(1)(c)(i), samples must be collected and analyzed as follows:

[a] If the Copermittee identifies and eliminates the source of non-storm water discharge, analysis of the sample is not required, but encouraged;

[b] During the first year of enrollment under this Order, samples must be collected if flows are observed at non-storm water MS4 monitoring stations. Samples must be analyzed for the following constituents~~, unless the Copermittee has historical data that can demonstrate or provide justification that the analysis of the constituent is not necessary~~:

[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,

[2] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection,

[3] Constituents listed in Table D-3;

Table D-3. Analytical Monitoring Constituents for Non-Storm Water MS4 Monitoring Stations

Conventionals, Nutrients, Hydrocarbons	Pesticides	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Total Phosphorus • Dissolved Phosphorus • Nitrite[1] • Nitrate[1] • Total Kjeldhal Nitrogen • Ammonia • Oil and Grease	• Diazinon • Chlorpyrifos • Pyrethroids	• Cadmium • Copper • Lead • Zinc	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

[c] **After** the first year of enrollment under this Order, samples must be collected from all high priority non-storm water MS4 monitoring stations for analysis at least two times per year. Samples must be collected at least once during the dry season (May-September) and at least once after the first storm event of the wet season (October-April). Samples must be analyzed for the following constituents:
[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,
[2] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and
[3] Constituents listed in Table D-3 must be analyzed at least once per year;

[d] Samples must be collected from all non-storm water MS4 monitoring stations not identified as high priority for analysis if flows are observed during required field screening and monitoring events. Samples must be analyzed for the following constituents, unless the Copermittee has historical data that can demonstrate or provide justification that the analysis of the constituent is not necessary:
[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,
[2] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and
[3] Constituents listed in Table D-3.

(2) Dry Weather Ambient Receiving Water Monitoring Program [D.1.a.(2)]

Each Copermittee must develop and conduct a program to monitor and characterize the ambient conditions of the receiving waters utilized for conveying non-storm water within and through its jurisdiction. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittee. The dry weather ambient receiving water monitoring program must meet the following minimum requirements:

(a) Dry Weather Ambient Receiving Water Monitoring Stations [D.1.a.(2)(a)]

Each Copermittee must identify the dry weather ambient receiving water monitoring stations that will be screened and monitored. Any location in a receiving water that is already monitored by the Copermittee or another entity may also be utilized as a dry weather ambient receiving water monitoring station. The monitoring stations must be selected in accordance with the following criteria:

(i) The following factors should be considered in determining the location of each dry weather ambient receiving water monitoring station:

[a] Permission to cross private property and public land,
[b] Safety of personnel and accessibility of the location,
[c] Location can complement or supplement historical ambient receiving water data,
[d] Location should not be in close proximity to any MS4 outfalls or other point source discharges to the receiving water,
[e] Natural or relatively unaltered areas in receiving waters are preferred, and
[f] Recommendations from the San Diego Water Board;

(ii) Locate at least one monitoring station in the lowest part of the Watershed Management Area near the boundary of its jurisdiction;

(iii) Locate at least one monitoring station located in the uppermost part of the Watershed Management Area near the boundary of its jurisdiction; and

(iv) The monitoring stations identified in Provisions D.1.a.(2)(a)(ii) and D.1.a.(2)(a)(iii) must be hydraulically connected.

(b) Dry Weather Ambient Receiving Water Monitoring Procedures [D.1.a.(2)(b)]

Each Copermittee must monitor the dry weather ambient receiving water monitoring stations as follows:

(i) *Dry Weather Ambient Receiving Water Field Observations* [D.1.a.(2)(b)(i)]

Monitoring events for each monitoring station must be scheduled as follows:

[a] During the first year of enrollment under this Order, the Copermittee must record field observations consistent with Table D-4 at each dry weather ambient receiving water monitoring station at least one time per month; and

Table D-4. Field Observations for Dry Weather Ambient Receiving Water Monitoring Stations

Field Observations
• Station identification and location. • Presence of flow, or pooled or ponded water. • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate), - Flow characteristics (i.e. presence of floatables, surface scum, or sheens, odor, color), • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, or sheens, odor, color),. • Station description (i.e. deposits or stains, vegetation condition, structural condition, observable biology). • Presence and assessment of trash in and around station.

[b] For any monitoring stations where flows are observed during the first year of enrollment under this Order, the Copermittee must develop a field screening and monitoring schedule that can characterize the monthly flows and pollutant loads in the receiving water.

(ii) *Dry Weather Ambient Receiving Water Field Monitoring* [D.1.a.(2)(b)(ii)]

If flow, or pooled or ponded water is present during the field observations required under Provision D.1.a.(2)(b)(i), the Copermittee must monitor and record the parameters in Table D-2.

(iii) *Dry Weather Ambient Receiving Water Analytical Monitoring* [D.1.a.(2)(b)(iii)]

If flows are present during the field observations required under Provision D.1.a.(2)(b)(i), samples of the ambient receiving water flows must be collected and analyzed as follows:

[a] During the first year of enrollment under this Order, samples must be collected for each observation of flow in the ambient receiving water monitoring stations for analysis. Samples must be analyzed for the following constituents:

[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,

[2] Any non-storm water pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and

[3] Constituents listed in Table D-3; and

[b] **After** the first year of enrollment under this Order, samples of flows observed at ambient receiving water monitoring stations must be collected for analysis at least two times during the remaining term of this Order. Samples must be collected at least once during the dry season (May-September) and at least once after the first storm event of the wet season (October-April). Samples must be analyzed for the following constituents:

[1] Any pollutants identified as the highest priority for the Watershed Management Area in the Water Quality Improvement Plan,

[2] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection,

[3] Constituents listed in Table D-3 must be analyzed at least once per year.

b. WET WEATHER JURISDICTIONAL MONITORING [D.1.b]

For wet weather days,[8] each Copermittee must implement the following minimum monitoring requirements within its jurisdiction:

(1) Storm Water MS4 Outfall Monitoring Program [D.1.b.(1)]

Each Copermittee must develop and conduct a program to monitor and characterize the storm water flows and pollutant loads from the MS4 outfalls within its jurisdiction during wet weather days. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittee. The monitoring program must meet the following minimum requirements:

(a) Storm Water MS4 Outfall Monitoring Stations [D.1.b.(1)(a)]

Each Copermittee must identify the wet weather MS4 outfall monitoring stations within its jurisdiction that will be monitored and sampled during wet weather days. Any non-storm water MS4 monitoring station identified under Provision D.1.a.(1)(a) may also be utilized as a storm water MS4 outfall monitoring station. Monitoring stations must be selected in accordance with the following guidelines and criteria:

(i) The following factors should be considered in determining the location of each wet weather MS4 outfall monitoring station:

[8] Wet weather day defined as any day with 0.1 inches of rain or greater and the following 3 days.

[a] Safety of personnel and accessibility of the location,
[b] Total area draining to the location,
[c] Population density of the area draining to the location,
[d] Traffic density,
[e] Age of the structures or buildings in the area,
[f] History of the area,
[g] Land use types draining to the location,
[h] Hydrological conditions, and
[i] Recommendations from the San Diego Water Board.

(ii) Each wet weather MS4 outfall monitoring station must consist of one of the following:

[a] A major outfall, or
[b] Other outfall point, or
[c] Other point of access (e.g., manhole), only as an alternate location if safety during wet weather discharge sampling at available outfall locations discharging to receiving waters is a significant concern and limits accessibility;

(iii) Each Copermittee must designate at least 5 monitoring stations that are representative of storm water flows from areas consisting primarily of residential, commercial, and industrial land uses present within the Copermittee's jurisdiction. Where there are less than 5 MS4 outfalls within a Copermittee's jurisdiction, all MS4 outfalls must be designated as wet weather MS4 outfall monitoring stations.

(iv) Any monitoring station that does not have any SAL exceedances for 3 successive years may be replaced with a different monitoring station.

(b) Storm Water MS4 Outfall Monitoring Procedures [D.1.b.(1)(b)]

Each Copermittee must develop monitoring procedures to be consistent with the following criteria:

(i) A narrative description must be provided of the station identification and location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(ii) Flow rates and volumes for each monitoring station must be measured or estimated during each monitoring event in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), sections 3.2.1 or 3.2.2, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board;

(iii) Each Copermittee must develop and implement a monitoring frequency during the wet season to characterize pollutant discharges from the MS4 outfalls within its jurisdiction. At a minimum, storm water samples must be collected from two storm events occurring at least one month apart for each monitoring station. Samples must be collected as follows:

[a] Grab samples may be collected only for pH, temperature, specific conductivity, dissolved oxygen, hardness, oil and grease, and indicator bacteria,
[b] For all other constituents, one of the following methods must be used to collect the samples:
[1] A 24-hour composite sample, using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours. Results of the analyses of individual grab samples may be averaged to obtain the daily average,
[2] A flow-weighted composite sample for either the entire discharge or for the first 3 hours of the discharge. The flow-weighted composite sample for the storm water discharge may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes. Only one analysis of the composite of aliquots is required, or
[3] A minimum of one grab sample may be collected for storm water discharges from holding ponds or other impoundments with a retention period greater than 24 hours;

(iv) Storm water MS4 outfall monitoring stations must be monitored and sampled during the first wet weather event of the wet season. Samples must be analyzed for the following constituents:

[a] Any pollutants contributing to the highest water quality priorities for the Watershed Management Area as identified in the Water Quality Improvement Plan,
[b] Any non-storm water pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and
[c] Constituents listed in Table D-5.

ADMINISTRATIVE DRAFT

Table D-5. Analytical Monitoring Constituents for Wet Weather MS4 Outfall Monitoring Stations

Conventionals, Nutrients, Hydrocarbons	Pesticides	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity[1] • Total Hardness • pH • Specific Conductivity • Temperature • Dissolved Oxygen • Biological Oxygen Demand, 5-day • Chemical Oxygen Demand • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus[1] • Dissolved Phosphorus • Nitrite[1,2] • Nitrate[1,2] • Total Kjeldhal Nitrogen • Ammonia • Oil and Grease	• Diazinon • Chlorpyrifos • Pyrethroids	• Arsenic • Cadmium[1] • Chromium • Copper[1] • Iron • Lead[1] • Manganese • Mercury • Nickel • Selenium • Silver • Thallium • Zinc[1]	• Total Coliform • Fecal Coliform[3] • *Enterococcus*

Notes:
1. Constituent with a storm water action level (SAL) specified under Provision C.2.
2. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
3. *E. Coli* may be substituted for Fecal Coliform.

(v) Samples collected after the first wet weather monitoring event and during the remaining period of the wet season must be analyzed for the following constituents:

[a] Any pollutants contributing to the highest water quality priorities for the Watershed Management Area as identified in the Water Quality Improvement Plan.

[b] Any pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection.

(2) Storm Water Pollutant Source Identification Monitoring Program [D.1.b.(2)]

Each Copermittee must develop and conduct a program within its jurisdiction to identify the sources of pollutants in storm water discharged from the Copermittee's MS4 during wet weather conditions. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittee. The storm water pollutant source identification monitoring program must include focused monitoring which moves upstream into each MS4 outfall drainage area as necessary to identify sources of the highest water quality priorities in the receiving waters. The wet weather source identification monitoring program must begin no later than the wet season following the date the San Diego Water Board determines that the Water Quality Improvement Plan meets the requirements of this Order.

2. Watershed Monitoring Requirements

a. WATERSHED MONITORING STATIONS [D.2.a]

The Copermittees must identify watershed monitoring stations within the Watershed Management Area. The watershed monitoring stations must be selected in accordance with the following criteria:

(1) All mass loading stations (MLSs) previously established by the Copermittees in each Watershed Management Area must continue to be utilized as watershed monitoring stations;

(2) All temporary watershed assessment stations (TWASs), bioassessment stations, and stream assessment stations previously established by the Copermittees must be considered for continued use as watershed monitoring stations;

(3) Any dry weather ambient receiving water monitoring station identified pursuant to Provision D.1.a.(2)(a) may be considered for use as a watershed monitoring station;

(4) At least one reference watershed monitoring station must be selected for each Watershed Management Area; and

(5) At least one watershed monitoring station located between and hydrologically connected to each MLS and each reference station must be selected for each Watershed Management Area.

b. DRY WEATHER WATERSHED MONITORING [D.2.b]

The Copermittees must develop and conduct a program to monitor the condition of the receiving waters in each Watershed Management Area during dry weather conditions. Any available monitoring data not collected specifically to meet these requirements may be utilized by the Copermittees. For dry weather days, the Copermittees must develop and/or update its written dry weather watershed monitoring procedures to be consistent with the following criteria:

(1) Dry Weather Watershed Field Observations [D.2.b.(1)]

For each dry weather watershed monitoring event, the Copermittee must record field observations consistent with Table D-4 at each monitoring station. Dry weather watershed monitoring is required at least every two years for each monitoring station. At least two dry weather watershed monitoring events must be scheduled for each watershed monitoring station per monitoring year. One monitoring event is required during the dry season (May-September) and one monitoring event is required on a dry weather day during the wet season (October-April), after the first storm event.

(2) Dry Weather Watershed Field Monitoring [D.2.b.(2)]

If flow, or pooled or ponded water is present during the dry weather watershed monitoring event required pursuant to Provision D.2.b.(1), and conditions allow the collection of the data, the Copermittee must monitor and record the parameters in Table D-2.

(3) Dry Weather Watershed Analytical Monitoring [D.2.b.(3)]

Samples from each monitoring station must be collected for analysis at least every two years. At least two dry weather watershed analytical monitoring events must be scheduled for each watershed monitoring station per monitoring year. Samples must be collected once during the dry season (May-September) and once on a dry weather day during the wet season (October-April), after the first storm event. Analytical monitoring samples must be collected and analyzed as follows:

(a) Grab samples may be collected only for pH, temperature, specific conductivity, dissolved oxygen, hardness, oil and grease, and indicator bacteria;

(b) For all other constituents, time-weighted composites composed of 24 discrete hourly samples must be collected; and

(c) Analysis for the following constituents is required:

(i) Any other pollutants contributing to the highest water quality priorities for the Watershed Management Area as identified in the Water Quality Improvement Plan,

(ii) Any pollutants that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and

(iii) Constituents listed in Table D-5.

(4) Dry Weather Watershed Toxicity Monitoring [D.2.b.(4)]

Samples from each monitoring station must be collected for toxicity testing at least every two years. At least two dry weather watershed toxicity monitoring events must be scheduled for each watershed monitoring station per monitoring year. Samples must be collected once during the dry season (May-September) and once on a dry weather day during the wet season (October-April), after the first storm event. Toxicity testing must be conducted in accordance with the following table:

Table D-6. Toxicity Testing for Dry Weather Watershed Monitoring Station Flows

Dry Weather Watershed Monitoring Station	Freshwater Organisms	Estuarine and Marine Organisms
Mass Loading Stations[1]	3 acute[2] 3 chronic[2]	1 chronic[3]
Others Stations	3 acute[2] 3 chronic[2]	None

Notes:
1. Dry weather toxicity testing at a mass loading station may be omitted if the channel flows are diverted year-round during dry weather conditions to the sanitary sewer for treatment.
2. The presence of acute toxicity must be determined in accordance with USEPA protocol EPA-821-R-02-012. The presence of chronic toxicity must be determined in accordance with USEPA protocol EPA-821-R-02-013. Toxicity testing must include the use of *Pimephales promelas* (fathead minnow), *Hyalella azteca*, and *Psuedokirchneriella subcapitata* (formerly *Selenastrum capricornutum*, unicellular algae).
3. The presence of chronic marine toxicity must be determined in accordance with USEPA guidance EPA 600/R95/136, except for chronic mysid tests which must be conducted in accordance with USEPA protocol EPA-821-R-02-014. *Americamysis bahia* may be used as a marine test organism if *Holmesimysis costata* cannot be reasonably obtained. The use of, and justification for, *A. bahia* must be clearly reported in the Annual Report.

(5) Dry Weather Watershed Bioassessment Monitoring [D.2.b.(5)]

Bioassessment monitoring for each monitoring station is required at least every two years. Bioassessment monitoring is required to be conducted in May or June for each watershed monitoring station, and must be conducted as follows:

(a) The following bioassessment samples and measurements must be collected:

(i) Macroinvertebrate samples must be collected in accordance with the "Reachwide Benthos (Multihabitat) Procedure" in the most current Surface Water Ambient Monitoring Program (SWAMP) Bioassessment Standard Operating Procedures (SOP), and amendments, as applicable;[9]

[9] Ode, P.R.. 2007. Standard operating procedures for collecting macroinvertebrate samples and associated physical and chemical data for ambient bioassessments in California. California State Water Resources Control Board Surface Water Ambient Monitoring Program (SWAMP) Bioassessment SOP 001. http://www.swrcb.ca.gov/water_issues/programs/swamp/tools.shtml#monitoring

(ii) The “Full” suite of physical habitat characterization measurements must be collected in accordance with the most current SWAMP Bioassessment SOP, and as summarized in the SWAMP Stream Habitat Characterization Form – Full Version;[10] and

(iii) Freshwater algae samples must be collected in accordance with the SWAMP Standard Operating Procedures for Collecting Algae Samples.[11] Analysis of samples must include algal taxonomic composition (diatoms and soft algae) and algal biomass.

(b) The bioassessment samples, measurements, and appropriate water chemistry data must be used to calculate the following:

(i) An Index of Biotic Integrity (IBI) for macroinvertebrates for each monitoring station where bioassessment monitoring was conducted, based on the most current calculation method;[12] and

(ii) An IBI for algae for each monitoring station where bioassessment monitoring was conducted, when a calculation method is developed.[13]

(6) <u>Dry Weather Watershed Hydromodification Monitoring</u> [D.2.b.(6)]

In addition to the hydromodification monitoring conducted as part of the Copermittees' Hydromodification Management Plans, for any year dry weather watershed monitoring is required, hydromodification monitoring is required to be conducted at least once during the dry weather season (May-September) for each monitoring station. The following hydromodification monitoring observations and measurements must be collected within an appropriate domain of analysis for the monitoring station:

(a) Channel conditions, including:

(i) Channel dimensions,

(ii) Hydrologic and geomorphic conditions, and

(iii) Presence and condition of vegetation and habitat;

---

[10] Available at: http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/fieldforms_fullversion052908.pdf
[11] Fetscher et al. 2009. Standard Operating Procedures for Collecting Stream Algae Samples and Associated Physical Habitat and Chemical Data for Ambient Bioassessments in California.
[12] The most current calculation method at the time the Order was adopted is outlined in “A Quantitative Tool for Assessing the Integrity of Southern California Coastal Streams” (Ode, et al. 2005. Environmental Management. Vol. 35, No. 1, pp. 1-13). If an updated or new calculation method is developed, either both (i.e. current and updated/new) methods must be used, or historical IBIs must be recalculated with the updated or new calculation method.
[13] When a calculation method is developed, IBIs must be calculated for all available and appropriate historical data.

(b) Location of discharge points;

(c) Habitat integrity;

(d) Photo documentation of existing erosion and habitat impacts, with location (i.e. latitude and longitude coordinates) where photos were taken;

(e) Measurement or estimate of dimensions of any existing channel bed or bank eroded areas, including length, width, and depth of any incisions; and

(f) Known or suspected cause(s) of existing downstream erosion or habitat impact, including flow, soil, slope, and vegetation conditions, as well as upstream land uses and contributing new and existing development.

(7) Dry Weather Watershed Sediment Quality Monitoring [D.2.b.(7)]

Sediment monitoring must be performed by the Copermittees to assess compliance with sediment quality receiving water limits applicable to MS4 discharges to enclosed bays and estuaries. The monitoring may be performed either by individual or multiple Copermittees to assess compliance with receiving water limits, or through participation in a water body monitoring coalition. The Copermittees must identify sediment sampling stations that are spatially representative of the sediment within the water body segment or region of interest. Sediment quality monitoring must be conducted at least once every two years between June and September. Sediment quality monitoring must be conducted in conformance with the monitoring requirements set forth in the State Water Board Sediment Quality Control Plan.

c. WET WEATHER WATERSHED MONITORING [D.2.c]

The Copermittees in each Watershed Management Area must develop and conduct a program to monitor the condition in receiving waters and characterize storm water flows during wet weather days of the wet season. Any available monitoring data not collected specifically for this Order that meet the monitoring requirements may be utilized by the Copermittee. For wet weather days, the Copermittees must develop and/or update its written wet weather watershed monitoring procedures to be consistent with the following criteria:

(1) Wet Weather Watershed Field Observations [D.2.c.(1)]

Wet weather watershed monitoring events are required at least once every two years for each dry weather watershed monitoring station. Each monitoring station must be monitored during at least two wet weather events in any period (July 1 to June 30) that monitoring is required, including the first wet weather event of the wet season beginning October 1 and ending April 30, and at least one wet weather event after February 1. For each wet weather watershed monitoring event, the following narrative descriptions and observations must be recorded at each monitoring station:

(a) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(b) The flow rates and volumes measured or estimated. Data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board;

(c) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and

(d) Presence and assessment of trash in and around station.

(2) Wet Weather Watershed Field Monitoring [D.2.c.(2)]

For each wet weather watershed monitoring event, the parameters in Table D-2 must be monitored and recorded.

(3) Wet Weather Watershed Analytical Monitoring [D.2.c.(3)]

Samples from each wet weather watershed monitoring station must be collected for analysis at least two times during the term of this Order, at least once for the first wet weather event of the wet season, and at least once for a wet weather event after February 1. Wet weather samples must be collected and analyzed as follows:

(a) Grab samples may be collected only for pH, temperature, specific conductivity, dissolved oxygen, hardness, oil and grease, and indicator bacteria;

(b) For all other constituents, one of the following methods must be used to collect the samples:

(i) A 24-hour composite sample, using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours. Results of the analyses of individual grab samples may be averaged to obtain the daily average, or

ADMINISTRATIVE DRAFT

(ii) A flow-weighted composite sample for either the entire discharge or for the first 3 hours of the discharge. The flow-weighted composite sample for the storm water discharge may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes. Only one analysis of the composite of aliquots is required; and

(c) Analysis for the following constituents is required:

(i) Any other pollutants contributing to the highest water quality priorities for the Watershed Management Area as identified in the Water Quality Improvement Plan,

(ii) Any water pollutants or constituents that the Copermittee has identified as a potential concern to receiving waters requiring additional data collection, and

(iii) Constituents listed in Table D-5.

(4) Wet Weather Watershed Toxicity Monitoring [D.2.c.(4)]

Samples from each wet weather watershed monitoring station must be collected for toxicity testing at least two times during the term of this Order, at least once for the first wet weather event of the wet season, and at least once for a wet weather event after February 1. Toxicity testing must be conducted in accordance with the following table:

Table D-7. Toxicity Testing for Wet Weather Watershed Monitoring Station Flows

Wet Weather Watershed Monitoring Station	Freshwater Organisms	Estuarine and Marine Organisms
Mass Loading Stations	3 acute[1]	1 acute[2] 2 chronic[2]
Others Stations	None	None

Notes:
1. The presence of acute toxicity must be determined in accordance with USEPA protocol EPA-821-R-02-012. Toxicity testing must include the use of *Pimephales promelas* (fathead minnow), *Hyalella azteca*, and *Psuedokirchneriella subcapitata* (formerly *Selenastrum capricornutum*, unicellular algae).
2. The presence of acute toxicity must be determined in accordance with USEPA protocol EPA-821-R-02-012. The presence of chronic marine toxicity must be determined in accordance with USEPA guidance EPA 600/R95/136, except for chronic mysid tests which must be conducted in accordance with USEPA protocol EPA-821-R-02-014. *Americamysis bahia* may be used as a marine test organism if *Holmesimysis costata* cannot be reasonably obtained. The use of, and justification for, *A. bahia* must be clearly reported in the Annual Report.

d. ALTERNATIVE WATERSHED MONITORING REQUIREMENTS [D.2.d]

In lieu of implementing the watershed monitoring requirements under Provisions D.2.a-c, the San Diego Water Board may direct the Copermittees to participate with other regulated entities, other interested parties, and the San Diego Water Board in the development, refinement, implementation, and coordination of regional monitoring and assessment programs to determine the status and trends of water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and 3) streams.

e. WATERSHED MANAGEMENT AREA SPECIAL STUDIES [D.2.e]

(1) Within the term of this Order, the Copermittees must implement at least three special studies in each Watershed Management Area. The Copermittees are to determine which special studies will be developed and implemented in the Watershed Management Area. The monitoring plans for the Watershed Management Area special studies must be submitted with the Water Quality Improvement Plan required pursuant to Provision F.1. The Watershed Management Area special studies must, at a minimum, be in conformance with the following criteria:

(a) The special studies must be related to the highest water quality priorities identified by the Copermittees within the Watershed Management Area;

(b) The special studies must be implemented within the Watershed Management Area;

(c) The special studies must require some form of participation by all Copermittees within the Watershed Management Area; ~~and~~

(d) One of the three required special studies may be implemented as part of a regional special study required pursuant to Provision D.3; and

~~(d)~~(e) The special studies shall include partnerships and cooperation with interested stakeholder groups whenever feasible.

Formatted: Font color: Black

Formatted: List Paragraph, No bullets or numbering, Widow/Orphan control

(2) The Copermittees must report the progress and findings of the Watershed Management Area Special Studies as part of the Annual Report for each Watershed Management Area, as required pursuant to Provision F.3.b.

3. Regional Special Studies

Within the term of this Order, the Copermittees must develop and implement at least two regional special studies for the San Diego Region. The Copermittees must determine which regional special studies will be developed and implemented. The regional special studies must be identified in the Water Quality Improvement Plans required pursuant to Provision F.1. The regional special studies must, at a minimum, be in conformance with the following criteria:

a. The special studies must be related to a water quality priority issue or potential water quality concern identified by the Copermittees for the entire San Diego Region;

b. The special studies must be implemented within the San Diego Region; ~~and~~

c. The special studies must require some form of participation by all Copermittees enrolled under this Order;

d. The special studies shall include partnerships and cooperation with interested stakeholder groups whenever feasible;

~~**c.**~~**e.** The County of San Diego shall be the lead Copermittee for the regional special studies.~~.~~

Formatted: Font color: Auto

Formatted: Indent: Left: 0.5", No bullets or numbering

4. Assessment Requirements

Each Copermittee must evaluate the data collected pursuant to Provisions D.1, D.2 and D.3 to identify causes of exceedances of action levels developed pursuant to Provision C, assess the quality of the discharges into and from the MS4s, and assess the quality of receiving waters. Each Copermittee must also assess the progress of the water quality improvement strategies required pursuant to Provision B.3 in restoring and protecting beneficial uses of receiving waters. Assessments must be performed as described in the following provisions:

a. MS4 Discharges Assessments [D.4.a]

(1) Jurisdictional Non-Storm Water Discharges Reduction Assessment [D.4.a.(1)]

(a) Non-Storm Water Action Levels [D.4.a.(1)(a)]

Each Copermittee must analyze the jurisdictional non-storm water monitoring data collected pursuant to Provision D.1.a and identify causes of NAL exceedances. The analysis must include, but not be limited to, all of the following considerations:

(i) For non-storm water discharges from the Copermittee's MS4 outfalls to receiving waters within the Copermittee's jurisdiction causing exceedances of NALs, the Copermittee must analyze its municipal, commercial, industrial, and residential inventories and activities, and other land use data, and identify sources or potential sources that may have caused or contributed to the NAL exceedances;

(ii) Each Copermittee must provide non-storm water monitoring and analytical data to demonstrate that NAL exceedances were caused by pollutants which are not anthropogenic in origin; and

(iii) Each Copermittee must provide non-storm water monitoring and analytical data to demonstrate that NAL exceedances were caused by pollutants which originate from sources or potential sources not within the authority of the Copermittee to control (e.g. Phase II dischargers or Caltrans).

(b) Calculate Jurisdictional Non-Storm Water Discharges and Pollutant Loads [D.4.a.(1)(b)]

Each Copermittee must analyze the jurisdictional non-storm water monitoring data collected pursuant to Provision D.1.a to calculate non-storm water discharges and pollutant loads from the MS4s and receiving waters in each jurisdiction. These calculations must be updated annually in the Annual Report required per Provision F.3.b. Each Copermittee must calculate:

(i) Monthly non-storm water discharges and pollutant loads from each known or potential source not within the authority of the Copermittee to control to an MS4 or receiving waters within the Copermittee's jurisdiction;

(ii) Monthly non-storm water discharges and pollutant loads from the Copermittee's MS4 outfalls to receiving waters within the Copermittee's jurisdiction, with an estimate of the percent contribution from each land use type within the drainage basin for each MS4 outfall;

(iii) Monthly non-storm water flows and pollutant loads in receiving waters at the downstream boundary of the Copermittee's jurisdiction; and

(iv) Monthly non-storm water flows and pollutant loads in receiving waters from areas or facilities subject to the Copermittee's legal authority that are discharged from the Copermittee's MS4 to downstream receiving waters.

(c) Review Progress and Evaluate Jurisdictional Actions [D.4.a.(1)(c)]

Each Copermittee must review the NAL exceedances, discharge and flow analyses, and pollutant load analyses required pursuant to Provisions D.4.a.(1)(a) and D.4.a.(1)(b) on an annual basis to:

(i) Identify reductions and progress in achieving reductions in non-storm water and illicit discharges and connections from different land uses and/or drainage areas to its MS4;

(ii) Assess the effectiveness of current actions being implemented by the Copermittee toward the reduction or elimination of non-storm water discharges from the MS4 within its jurisdiction; and

(iii) Identify modifications necessary to increase the effectiveness of the jurisdictional runoff management program toward reducing or eliminating non-storm water discharges to and from the MS4 within its jurisdiction.

(2) <u>Watershed Management Area Non-Storm Water Assessment</u> [D.4.a.(2)]

(a) Calculate Watershed Non-Storm Water Flows and Pollutant Loads [D.4.a.(2)(a)]

The Copermittees must analyze the jurisdictional non-storm water and watershed monitoring data collected per Provisions D.1.a and D.2.b to calculate non-storm water flows and pollutant loads in receiving waters for each Watershed Management Area. These calculations must be updated annually in the Annual Report required per Provision F.3.b. The Copermittees must develop or utilize appropriate methods or models to calculate:

(i) Monthly non-storm water runoff flows and pollutant loads at each watershed monitoring station from different land uses and drainage basins;

(ii) Monthly non-storm water flows and pollutant loads at each watershed monitoring station from all the Copermittees' MS4 outfalls to receiving waters, with an estimate of the percent contribution from different land uses; and

(iii) Monthly non-storm water flows and pollutant loads at each watershed monitoring station, with an estimate of the percent contribution from both areas or facilities subject to the Copermittees' legal authority and areas or facilities not subject to the Copermittees' legal authority.

(b) Evaluate Water Quality Improvement Strategies [D.4.a.(2)(b)]

The Copermittees in each Watershed Management Area must review the non-storm water flow and pollutant load analyses required pursuant to Provision D.4.a.(2)(a) on an annual basis to:

(i) Assess the effectiveness of the water quality improvement strategies being implemented within the Watershed Management Area toward reducing or eliminating non-storm water discharges and pollutant loads from entering and discharging from the MS4 to receiving waters; and

(ii) Identify modifications necessary to increase the effectiveness of the water quality improvement strategies toward reducing or eliminating non-storm water discharges and pollutant loads from entering and discharging from the MS4 to receiving waters.

(3) Jurisdictional Storm Water Pollutant Discharges Reduction Assessment [D.4.a.(3)]

(a) Storm Water Action Levels [D.4.a.(3)(a)]

(i) For storm water discharges from the Copermittee's storm water MS4 outfall monitoring stations with analytical monitoring data indicating exceedances of SALs, the Copermittee must analyze its municipal, commercial, industrial, and residential inventories and activities, and other land use data and identify sources or potential sources that may have caused or contributed to the SAL exceedances;

(ii) Each Copermittee must provide storm water monitoring and analytical data to demonstrate that SAL exceedances were caused by the constituents in storm water discharges from the MS4 which are not anthropogenic in origin; and

(iii) Each Copermittee must provide storm water monitoring and analytical data to demonstrate that SAL exceedances were caused by the constituents in storm water discharges from the MS4 which originate from sources or potential sources not within the authority of the Copermittee to control.

(b) Calculate Jurisdictional Storm Water Discharges and Pollutant Loads [D.4.a.(3)(b)]

Each Copermittee must analyze the jurisdictional storm water monitoring data collected pursuant to Provision D.1.b to calculate storm water discharges and pollutant loads from the MS4s in each jurisdiction. These calculations must be updated annually in the Annual Report required per Provision F.3.b. Each Copermittee must calculate or estimate:

(i) The monthly mean rainfall estimates (or summary of weather bureau data) and the monthly average number of storm events;

(ii) The average storm water runoff coefficient for each land use type within the Copermittee's jurisdiction;

(iii) The volume of storm water discharged from each of the Copermittee's MS4 outfalls to receiving waters within its jurisdiction for each storm event;

(iv) The pollutant loads from each of the Copermittee's MS4 outfalls to receiving waters within its jurisdiction for each storm event; and

(v) The percent contribution of pollutant loads from each land use type within the drainage basin to storm water discharges for each MS4 outfall within its jurisdiction, for each storm event.

(c) Review Progress and Evaluate Jurisdictional Actions [D.4.a.(3)(c)]

Each Copermittee must review the SAL exceedances, discharge analyses, and pollutant load analyses required pursuant to Provisions D.4.a.(3)(a) and D.4.a.(3)(b) on an annual basis to:

(i) Identify reductions and progress in achieving reductions in pollutant concentrations and/or pollutant loads from different land uses and/or drainage areas discharging from its MS4;

(ii) Assess the effectiveness of current actions being implemented by the Copermittee toward the reduction of pollutants in storm water discharges from the MS4 within its jurisdiction to the MEP; and

(iii) Identify modifications necessary to increase the effectiveness of the jurisdictional runoff management program toward reducing pollutants in storm water discharges from the MS4 within its jurisdiction to the MEP.

(4) <u>Watershed Management Area Storm Water Assessment</u> [D.4.a.(4)]

(a) Calculate Watershed Storm Water Flows and Pollutant Loads [D.4.a.(4)(a)]

The Copermittees must analyze the jurisdictional storm water and watershed monitoring data collected per Provisions D.1.b and D.2.c to calculate storm water flows and pollutant loads in receiving waters for each Watershed Management Area. These calculations must be updated annually in the Annual Report required per Provision F.3.b. The Copermittees must develop or utilize appropriate methods or models to calculate:

(i) Storm water runoff flows and pollutant loads at each watershed monitoring station from different land uses and drainage basins;

(ii) Storm water flows and pollutant loads at each watershed monitoring station from all the Copermittees' MS4 outfalls, with an estimate of the percent contribution from different land uses; and

(iii) Storm water pollutant loads in receiving waters at each watershed monitoring station, with an estimate of the percent contribution from both areas or facilities subject to the Copermittees' legal authority and areas or facilities not within the authority of the Copermittees to control.

(b) Evaluate Water Quality Improvement Strategies [D.4.a.(4)(b)]

The Copermittees in each Watershed Management Area must review the storm water flow and pollutant load analyses required pursuant to Provision D.4.a.(4)(a) on an annual basis to:

(i) Assess the effectiveness of the water quality improvement strategies being implemented in each Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to the MEP; and

(ii) Identify modifications necessary to increase the effectiveness of the water quality improvement strategies toward reducing pollutants in storm water discharges from the MS4s to the MEP.

b. RECEIVING WATERS ASSESSMENTS [D.4.b]

The Copermittees must annually perform assessments of receiving waters based on data collected pursuant to Provision D.2 and any appropriate receiving water monitoring data available from other sources. The receiving waters assessments must analyze the status and trends of water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and 3) streams under dry weather and wet weather conditions. For each of the three types of receiving waters, the Copermittees in each Watershed Management Area must:

(1) Identify the most critical beneficial uses that must be protected or restored to ensure overall health of the receiving water;

(2) Determine whether or not those critical beneficial uses are being protected or must be restored; and

(3) Identify short-term and/or long-term improvements or degradation of those critical beneficial uses.

c. WATER QUALITY IMPROVEMENT ASSESSMENTS [D.4.c]

The Copermittees in each Watershed Management Area must review the numeric targets in the Water Quality Improvement Plan, the data collected pursuant to Provisions D.1 and D.2, and the findings from the assessments required pursuant to Provisions D.4.a and D.4.b to assess the following:

(1) Beneficial uses of the receiving waters that are protected or must be restored;

(2) Appropriateness of final dry weather and wet weather numeric targets for the highest water quality priorities that will restore the impacted beneficial uses in the receiving waters;

(3) Non-storm water and storm water pollutant load reductions, or other improvements to receiving water or water quality conditions, that are necessary to attain the final numeric targets for restoring impacted beneficial uses in the receiving waters;

(4) Non-storm water and storm water pollutant load reductions necessary for the Copermittees to demonstrate that non-storm water and storm water discharges from their MS4s are not causing or contributing to exceedances of water quality objectives or impacts to beneficial uses in receiving waters;

(5) Non-storm water and storm water pollutant loads from their MS4s and/or receiving water flows that may be attributed to sources or potential sources not within the authority of the Copermittee to control and other non-anthropogenic sources identified by the Copermittees;

(6) Progress of the water quality improvement strategies toward attaining non-storm water and storm water pollutant load reductions or improvements to water quality conditions; and

(7) Progress toward achieving the interim and final numeric targets for restoring impacted beneficial uses in the receiving waters.

5. Monitoring Provisions

Each Copermittee must comply with all the monitoring, reporting, and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

E. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS

The purpose of this provision is for each Copermittee to implement a program to control the contribution of pollutants to and the discharges from the MS4 with its jurisdiction. The goal of this provision is to reduce the discharge of pollutants in storm water to the MEP and effectively prohibit non-storm water discharges to provide the reasonable protection, preservation, enhancement, and restoration of water quality and designated beneficial uses of waters of the state**.** This goal will be accomplished through compliance with the jurisdictional runoff management program requirements.

Each Copermittee must implement all the requirements of Provision E no later than 12 months after the adoption of this Order, or in accordance with Provision F.5.a. Each Copermittee must update its jurisdictional runoff management program document, in accordance with Provision F.2.a, to include all the requirements of Provision E. The jurisdictional runoff management programs implemented by each Copermittee must be consistent with the Water Quality Improvement Plan for the applicable Watershed Management Area required by Provision B. Until the Copermittee has updated its jurisdictional runoff management program document with the requirements of Provision E, the Copermittee must continue implementing its current jurisdictional runoff management program.

1. Legal Authority Establishment and Enforcement

a. Each Copermittee must establish, maintain, and enforce adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 through statute, ordinance, permit, contract, order, or similar means. This legal authority must, at a minimum, authorize the Copermittee to:

(1) Prohibit and eliminate all illicit discharges and illicit connections to its MS4;

(2) Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity to its MS4 and control the quality of runoff from industrial and construction sites, including industrial and construction sites which have coverage under the statewide General Permit for Discharges of Storm Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit), as well as to those sites which do not;

(3) Control the contribution of pollutants in discharges of runoff associated with commercial and residential activity to its MS4 and control the quality of runoff from commercial and residential sites.

Formatted: List Paragraph, No bullets or numbering, Widow/Orphan control

~~(3)~~(4) Control the discharge of spills, dumping, or disposal of materials other than storm water into its MS4;

~~(4)~~(5) Control through interagency agreements among Copermittees the contribution of pollutants from one portion MS4 to another portion of the MS4;

~~(5)~~(6) Control through interagency agreements with other owners of the MS4 such as Caltrans, the U.S. federal government, or sovereign Native American Tribes, where possible, the contribution of pollutants from one portion of the MS4 to another portion of the MS4;

~~(6)~~(7) Require compliance with conditions in its statutes, ordinances, permits, contracts, orders, or similar means to hold dischargers to its MS4 accountable for their contributions of pollutants and flows;

~~(7)~~(8) Require the use of BMPs to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;

~~(8)~~(9) Require documentation on the effectiveness of BMPs implemented to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;

~~(9)~~(10) Utilize enforcement mechanisms to require compliance with its statutes, ordinances, permits, contracts, orders, or similar means; and

~~(10)~~(11) Carry out all inspections, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with its statutes, ordinances, permits, contracts, orders, or similar means and with the requirements of this Order, including the prohibition of illicit discharges and connections to its MS4; the Copermittee must also have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from industrial facilities, including construction sites, discharging into its MS4.

b. With the first Annual Report required by Provision F.3.b, each Copermittee must submit a statement certified by its Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative that the Copermittee has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in this Order.

2. Illicit Discharge Detection and Elimination

Each Copermittee must implement a program to actively detect and eliminate illicit discharges and improper disposal into the MS4, or otherwise require the discharger to apply for and obtain a separate NPDES permit. The illicit discharge detection and elimination program must include, at a minimum, the following requirements:

a. NON-STORM WATER DISCHARGES

Each Copermittee must address all non-storm water discharges as illicit discharges, unless a non-storm water discharge is either identified as a discharge authorized by a separate NPDES permit, or identified as a category of non-storm water discharges or flows that must be addressed pursuant to the following requirements:

(1) Discharges of non-storm water to the MS4 from the following categories must be addressed as illicit discharges unless the discharge has coverage under NPDES Permit No. CAG919001 (Order No. R9-2007-0034, or subsequent order) for discharges to San Diego Bay, or NPDES Permit No. CAG919002 (Order No. R9-2008-0002, or subsequent order) for discharges to surface waters ~~other than San Diego Bay~~:

(a) Uncontaminated pumped ground water;

(b) Discharges from foundation drains;

(c) Water from crawl space pumps; and

(d) Water from footing drains.

(2) Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges unless the discharge has coverage under NPDES Permit No. CAG 679001 (Order No. R9-2010-0003, or subsequent order). This includes water line flushing and water main break discharges from water purveyors issued a water supply permit by the California Department of Public Health or federal military installations. Discharges from recycled or reclaimed water lines to the MS4 must be addressed as illicit discharges, unless the discharges have coverage under a separate NPDES permit.

(3) Discharges of non-storm water to the MS4 from the following categories must be addressed by the Copermittee as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a source of pollutants to receiving waters:

(a) Diverted stream flows;

(b) Rising ground waters;

(c) Uncontaminated ground water infiltration to MS4s;

(d) Springs;

(e) Flows from riparian habitats and wetlands; and

(f) Discharges from potable water sources.

(4) Discharges of non-storm water to the MS4 from the following categories must be controlled by the requirements given below through statute, ordinance, permit, contract, order, or similar means. Discharges of non-storm water to the MS4 from the following categories not controlled by the requirements given below through statute, ordinance, permit, contract, order, or similar means must be addressed by the Copermittee as illicit discharges.

(a) Air conditioning condensation

The discharge of air conditioning condensation must be directed to landscaped areas or other pervious surfaces where feasible;

(b) Individual residential vehicle washing and group or fundraising car washes:

(i) The discharge of wash water must be directed to landscaped areas or other pervious surfaces ~~where feasible~~so that no wash water leaves the property and enters the MS4, and

(ii) ~~Minimize the use of water for vehicle washing, use as little washing detergent and other vehicle wash products as possible,~~ wash vehicles at commercial wash facilities if it is infeasible to direct wash water to landscaped areas or other pervious surfaces so that no wash water leaves the residential property~~,~~ ~~and implement other practices or behaviors that will prevent the discharge of pollutants associated with individual residential vehicle washing from entering the MS4~~; and

(c) Dechlorinated swimming pool discharges

(i) Eliminate residual chlorine, algaecide, filter backwash, or other pollutants from swimming pools prior to discharging to the sanitary sewer, ~~the MS4~~landscaped areas, or other pervious surfaces that can accommodate the volume of water, and

(ii) The discharge of saline swimming pool water to the MS4 must be directed to the sanitary sewer, landscaped areas, or other pervious surfaces that can accommodate the volume of water.

(5) Firefighting discharges to the MS4 must be addressed by the Copermittee as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a significant source of pollutants to receiving waters. Firefighting discharges to the MS4 not identified as a significant source of pollutants to receiving waters, must be addressed, at a minimum, as follows:

(a) Non-emergency firefighting discharges

(i) Building fire suppression system maintenance discharges (e.g. sprinkler line flushing) to the MS4 must be addressed as illicit discharges.

(ii) Non-emergency firefighting discharges (i.e., discharges from controlled or practice blazes, firefighting training, and maintenance activities not associated with building fire suppression systems) must be addressed by a program, to be developed and implemented by the Copermittee, to reduce or eliminate pollutants in such discharges from entering the MS4.

(b) Emergency firefighting discharges

Each Copermittee must develop and encourage implementation of BMPs to reduce or eliminate pollutants in emergency firefighting discharges to the MS4s and receiving waters within its jurisdiction. During emergency situations, priority of efforts should be directed toward life, property, and the environment (in descending order). BMPs should not interfere with immediate emergency response operations or impact public health and safety.

(6) All non-stormwater discharges must be reduced, where feasible, whether or not they are otherwise exempted under Provisions E.2.a (1)- (5).

(7) If the Copermittee or San Diego Water Board identifies any category of non-storm water discharges listed under Provisions E.2.a.(1)-(4) as a source of pollutants to receiving waters, the category must be prohibited through ordinance, order, or similar means and addressed as an illicit discharge.
~~(6)~~

Formatted: Indent: Left: 0.75", No bullets or numbering

b. PREVENT AND DETECT ILLICIT DISCHARGES AND CONNECTIONS

Each Copermittee must include the following measures within its program to prevent and detect illicit discharges to the MS4:

(1) Each Copermittee must maintain an updated map of its entire MS4 and the corresponding drainage areas. The accuracy of the MS4 map must be confirmed during non-storm water MS4 monitoring events. The MS4 map must be included as part of the jurisdictional runoff management program document. Any geographic information system (GIS) layers or files used by the Copermittee to maintain the MS4 map must be made available to the San Diego Water Board upon request. The MS4 map must identify the following:

(a) All segments of the MS4 owned, operated, and maintained by the Copermittee,

(b) All known locations of inlets that discharge and/or collect runoff into the

Copermittee's MS4,

(c) All known locations of connections with other MS4s not owned or operated by the Copermittee (e.g. Caltrans MS4s),

(d) All known locations of MS4 outfalls and private outfalls that discharge runoff collected from areas within the Copermittee's jurisdiction,

(e) All segments of receiving waters within the Copermittee's jurisdiction that receive and convey runoff discharged from the Copermittee's MS4 outfalls (i.e., receiving water segments that are both a receiving water and part of the MS4), and

(f) Locations of the non-storm water MS4 monitoring stations, identified pursuant to Provision D.1.a.(1)(a), within its jurisdiction;

(2) Each Copermittee must use Copermittee personnel and contractors to assist in identifying and reporting illicit discharges and connections during their daily activities;

(3) Each Copermittee must promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges to or from the MS4. Each Copermittee must facilitate public reporting through development and operation of a public hotline. Public hotlines can be Copermittee-specific or shared by the Copermittees. All public hotlines must be capable of receiving reports in both English and Spanish 24 hours per day and seven days per week;

(a) Each Copermittee must designate an e-mail address for receiving e-mail pollution reports. The e-mail address must be prominently displayed on the Regional Clearinghouse and on the Copermittee's webpage.

(b) Each Copermittee must provide follow-up information regarding any public report submitted when the reporting individual specifically requests for follow-up information.

~~(3)~~(c) All Copermittees must make their hotline reporting database information available at least monthly on the regional clearinghouse. Minimum information to be provided shall include date of report, nature of complaint, follow up steps taken, and whether or not the complaint was resolved.

(4) Each Copermittee must implement practices and procedures (including a notification mechanism) to prevent, respond to, contain, and clean up any spills that may discharge into the MS4 from any source. The Copermittee must coordinate with spill response teams to prevent entry of spills into the MS4, and prevent contamination of surface water, ground water, and soil. The Copermittee must coordinate spill prevention, containment, and response activities throughout all appropriate Copermittee departments, programs, and

Formatted: List Paragraph, No bullets or numbering, Widow/Orphan control

Formatted

agencies; and

(5) Each Copermittee must implement practices and procedures to prevent and limit infiltration of seepage from sanitary sewers (including private laterals and failing septic systems) to the MS4.

c. FIELD SCREENING AND MONITORING

Each Copermittee must conduct field screening and monitoring of MS4 outfalls and other portions of its MS4 within its jurisdiction to detect non-storm water and illicit discharges and connections to the MS4 in accordance with the jurisdictional non-storm water MS4 monitoring program requirements in Provision D.1.a.(1).

In lieu of field screening and monitoring, Copermittees may elect to install a network of flow meters to detect illicit flows.

d. INVESTIGATE AND ELIMINATE ILLICIT DISCHARGES AND CONNECTIONS

Each Copermittee must include the following measures within its program to investigate and eliminate illicit discharges to the MS4:

(1) Each Copermittee must prioritize and determine when follow-up investigations will be performed in response to water quality monitoring data collected during an investigation of a detected non-storm water or illicit discharge to or from the MS4. The criteria for follow-up investigations must include the following:

(a) Pollutants identified as causing or contributing to the highest water quality priorities identified in the Water Quality Improvement Plan;

(b) Pollutants identified as causing or contributing, or threatening to cause or contribute to impairments in water bodies on the 303(d) List and/or in environmentally sensitive areas (ESAs), located within its jurisdiction;

(c) Pollutants identified from sources or land uses known to exist within the area, drainage basin, or watershed that discharges to the portion of the MS4 within its jurisdiction included in the investigation;

(d) Pollutants identified as causing or contributing to and exceedance of an NAL described in Provision C.1; and

(e) Pollutants identified as a threat to human health or the environment.

(2) Each Copermittee must implement procedures to investigate and inspect portions of its MS4 that, based on reports or notifications, field screening and monitoring, or other appropriate information, indicate a reasonable potential of receiving, containing, or discharging pollutants due to illicit discharges, illicit connections, or other sources of non-storm water. The procedures must include the following:

(a) Each Copermittee must respond to each report or notification (e.g., public hotline reports, staff or contractor reports and notifications, etc.) of an incident in a timely manner. The Copermittee may develop criteria to assess the validity of, and prioritize the response to, each report or notification received;

(b) Each Copermittee must immediately investigate and seek to identify the source(s) of discharges of non-storm water where flows are observed in and from the MS4 during the field screening and monitoring required pursuant to Provision D.1.a.(1). The investigation must include field investigations to identify sources or potential sources for the discharge, unless the source or potential source has already been identified during previous investigations;

(c) Each Copermittee must investigate and seek to identify the source(s) of non-storm water discharges from the MS4 where there is evidence of non-storm water having been discharged into or from the MS4 (e.g., pooled

ADMINISTRATIVE DRAFT

water). The investigation may include field investigations, reviewing Copermittee inventories, and other land use data to identify potential sources of the discharge; and

(d) Each Copermittee must maintain records and a database of the investigations, including the following information:

(i) Location of incident, including hydrologic subarea, portion of MS4 receiving the non-storm water or illicit discharge, and point of discharge or potential discharge from MS4 to receiving water,

(ii) Source of information initiating the investigation (e.g., public hotline reports, staff or contractor reports and notifications, monitoring data, etc.),

(iii) Date the information used to initiate the investigation was received,

(iv) Date the investigation was initiated,

(v) Dates of follow-up investigations,

(vi) Identified or suspected source of the illicit discharge or connection, if determined,

(vii) Known or suspected related incidents, if any,

(viii) Result of the investigation, and

(ix) If a source cannot be identified and the investigation is not continued, a rationale for why a discharge does not pose a threat to water quality and/or does not require additional investigation.

(3) Each Copermittee must initiate the implementation of procedures, in a timely manner, to eliminate all detected and identified illicit discharges and connections within its jurisdiction. The procedures must include the following:

(a) Each Copermittee must enforce its legal authority, as required under Provision E.1, to eliminate illicit discharges and connections to its MS4. If the Copermittee identifies the source as a controllable source of non-storm water or illicit discharge or connection, the Copermittee must implement its Enforcement Response Plan pursuant to Provision E.6 and enforce its legal authority to prohibit and eliminate illicit discharges and connections to its MS4;

(b) If the Copermittee identifies the source of the discharge as a category of non-storm water discharges in Provision E.2.a, and the discharge to or from the MS4 is in exceedance of NALs developed under Provision C.1, then the Copermittees must determine if this is an isolated incident or set of circumstances, or if the category of discharge must be addressed through the prohibition of that category of discharge as an illicit discharge pursuant to Provision E.2.a.(6);

(c) If the Copermittee suspects the source of the non-storm water discharge as natural in origin (i.e. non-anthropogenically influenced) and in conveyance into the MS4, then the Copermittee must collect the data and evidence necessary to demonstrate to the San Diego Water Board that it is natural in origin; and

(d) If the Copermittee is unable to identify and document the source of a recurring non-storm water discharge to or from the MS4, then the Copermittee must address the discharge as an illicit discharge and update its jurisdictional runoff management program to address the common and suspected sources of the non-storm water discharge within its jurisdiction in accordance with the Copermittee's priorities.

(4) Each Copermittee must submit a summary of the non-storm water discharges and illicit discharges and connections investigated and eliminated within its jurisdiction with each Annual Report required under Provision F.3.b of this Order.

3. Development Planning

Each Copermittee must use their land use/planning authorities to implement a development planning program that includes, at a minimum, the following requirements.

a. Permanent BMP Requirements for All Development Projects

Each Copermittee must prescribe the following BMP requirements during the planning process (i.e. prior to project approval and issuance of grading or building permits) for all development projects (regardless of project type or size), where local permits are issued, including unpaved roads and flood management projects:

(1) General Requirements

(a) All BMPs must be located so as to remove pollutants from runoff prior to its discharge to any receiving waters, and as close to the source as possible;

(b) Multiple development projects may use shared permanent BMPs as long as construction of any shared BMP is completed prior to the use or occupation of any development project from which the BMP will receive runoff; and

(c) Permanent BMPs must not be constructed within a waters of the U.S. or waters of the state.

ADMINISTRATIVE DRAFT

(2) Source Control BMP Requirements

The following source control BMPs must be implemented at all development projects where applicable and feasible:

(a) Prevention of illicit discharges into the MS4;

(b) Storm drain system stenciling or signage;

(c) Properly designed outdoor material storage areas;

(d) Properly designed outdoor work areas;

(e) Properly designed trash storage areas; and

(f) Any additional BMPs necessary to minimize pollutant generation at each project.

(3) Low Impact Development (LID) BMP Requirements

The following LID BMPs must be implemented at all development projects where applicable and feasible:

(a) Maintenance or restoration of natural storage reservoirs and drainage corridors (including topographic depressions, areas of permeable soils, natural swales, and ephemeral and intermittent streams);[14]

(b) Buffer zones for natural water bodies (where buffer zones are technically infeasible, require project applicant to include other buffers such as trees, access restrictions, etc.);

(c) Conservation of natural areas within the project footprint including existing trees, other vegetation, and soils;

(d) Construction of streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided public safety is not compromised;

(e) Minimization of the impervious footprint of the project;

(f) Minimization of soil compaction to landscaped areas;

(g) Disconnection of impervious surfaces through distributed pervious areas;

[14] Development projects proposing to dredge or fill materials in waters of the U.S. must obtain a CWA Section 401 Water Quality Certification. Projects proposing to dredge or fill waters of the State must obtain Waste Discharge Requirements.

ADMINISTRATIVE DRAFT

(h) Landscaped or other pervious areas designed and constructed to effectively receive and infiltrate, retain and/or treat runoff from impervious areas, prior to discharge to the MS4;

(i) Small collection strategies located at, or as close as possible to, the source (i.e. the point where storm water initially meets the ground) to minimize the transport of runoff and pollutants to receiving waters;

(j) Use of permeable materials for projects with low traffic areas and appropriate soil conditions;

(k) Landscaping with native or drought tolerant species; and

(l) Harvesting and using precipitation.

(4) Long-Term Permanent BMP Maintenance

Each Copermittee must require the project applicant to submit proof of the mechanism under which ongoing long-term maintenance of all permanent BMPs will be conducted.

(5) Infiltration and Groundwater Protection

(a) Infiltration and treatment control BMPs designed to primarily function as large, centralized infiltration devices (such as large infiltration trenches and infiltration basins) must not cause or contribute to an exceedance of an applicable groundwater quality objective. At a minimum, such infiltration and treatment control BMPs must be in conformance with the design criteria listed below, unless the development project applicant demonstrates to the Copermittee that one or more of the specific design criteria listed below are not necessary to protect groundwater quality. The design criteria listed below do not apply to small infiltration systems dispersed throughout a development project.

(i) Runoff must undergo pretreatment such as sedimentation or filtration prior to infiltration;

(ii) Pollution prevention and source control BMPs must be implemented at a level appropriate to protect groundwater quality at sites where infiltration treatment control BMPs are to be used;

(iii) Infiltration treatment control BMPs must be adequately maintained to remove pollutants in storm water to the MEP;

(iv) The vertical distance from the base of any infiltration treatment control BMP to the seasonal high groundwater mark must be at least 10 feet. Where groundwater basins do not support beneficial uses, this vertical distance criteria may be reduced, provided groundwater quality is maintained;

(v) The soil through which infiltration is to occur must have physical and chemical characteristics (e.g., appropriate cation exchange capacity, organic content, clay content, and infiltration rate) which are adequate for proper infiltration durations and treatment of runoff for the protection of groundwater beneficial uses;

(vi) Infiltration treatment control BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee, unless first treated or filtered to remove pollutants prior to infiltration; and

(vii) Infiltration treatment control BMPs must be located a minimum of 100 feet horizontally from any water supply wells.

(b) The Copermittees may collectively or individually develop alternative mandatory design criteria to that listed above for infiltration and treatment control BMPs which are designed to primarily function as centralized infiltration devices. Before implementing the alternative design criteria in the development planning process the Copermitee(s) must:

(i) Notify the San Diego Water Board of the intent to implement the alternative design criteria submitted; and

(ii) Comply with any conditions set by the San Diego Water Board.

b. PRIORITY DEVELOPMENT PROJECTS

(1) Definition of Priority Development Project

Priority Development Projects include the following:

(a) All new development projects that fall under the Priority Development Project categories listed under Provision E.3.b.(2). Where a new development project feature, such as a parking lot, falls into a Priority Development Project category, the entire project footprint is subject to Priority Development Project requirements; and

(b) Those redevelopment projects that create, add, or replace at least 5,000 square feet of impervious surfaces on an already developed site, or the redevelopment project is a Priority Development Project category listed under Provision E.3.b.(2). Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to Priority Development Project requirements, the performance and sizing requirements discussed in Provisions E.3.c.(2) and E.3.c.(3) apply only to the addition or replacement, and not to the entire development. Where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development, the performance and sizing requirements apply to the entire development.

(2) Priority Development Project Categories

(a) New development projects that create 10,000 square feet or more of impervious surfaces (collectively over the entire project site). This category includes commercial, industrial, residential, mixed-use, and public development projects on public or private land which fall under the planning and building authority of the Copermittee.

(b) Automotive repair shops. This category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

(c) Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812), where the land area for development is 5,000 square feet or more.

(d) Hillside development projects. This category includes any development which creates 5,000 square feet or more of impervious surface which is located in an area with known erosive soil conditions, where the development will grade on any natural slope that is twenty-five percent or greater.

(e) Environmentally sensitive areas (ESAs). This category includes any development located within, directly adjacent to, or discharging directly to an ESA, which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. “Directly adjacent to” means situated within 200 feet of the ESA. “Discharging directly to” means outflow from a drainage conveyance system that collects runoff from the subject development or redevelopment site and terminates at or in receiving waters within the ESA.

(f) Parking lots. This category is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce that has 5,000 square feet or more of impervious surface.

(g) Streets, roads, highways, freeways, and residential driveways. This category is defined as any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles.

(h) Retail gasoline outlets (RGOs). This category includes RGOs that meet the following criteria: (a) 5,000 square feet or more or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day.

(i) Large development projects. This category includes any post-construction pollutant-generating new development projects that result in the disturbance of one acre or more of land.

(3) Priority Development Project Exemptions

Each Copermittee has the discretion to exempt the following projects from being defined as Priority Development Projects:

(a) Sidewalks constructed as part of new streets or roads and designed to direct storm water runoff to adjacent vegetated areas;

(b) Bicycle lanes that are constructed as part of new streets or roads but are not hydraulically connected to the new streets or roads and designed to direct storm water runoff to adjacent vegetated areas;

(c) Impervious trails constructed and designed to direct storm water runoff to adjacent vegetated areas, or other non-erodible permeable areas;

(d) Sidewalks, bicycle lanes, or trails constructed with permeable surfaces.

c. PRIORITY DEVELOPMENT PROJECT PERMANENT BMP PERFORMANCE AND SIZING REQUIREMENTS

In addition to the BMP requirements listed for all development projects under Provision E.3.a, Priority Development Projects must also implement permanent BMPs that conform to performance and sizing requirements.

(1) Source Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement applicable source control BMPs listed under Provision E.3.a.(2).

(2) Retention and Treatment Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement BMPs to retain and treat pollutants onsite in the following order:

(a) Each Priority Development Project must be required to implement LID BMPs as described in Provision E.3.a.(3);

(b) Each Priority Development Project must be required to implement LID BMPs that are sized and designed to retain the volume equivalent to runoff produced from a 24-hour 85th percentile storm event[15] ("design capture volume");

(c) If onsite retention using LID BMPs is technically infeasible per Provision E.3.c.(4), flow-thru LID and/or conventional treatment control BMPs must be implemented to treat the portion of the design capture volume that is not retained onsite. Flow-thru LID treatment control BMPs must be designed for an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP. Additionally, project applicants must perform mitigation for the portion of the pollutant load in the design capture volume that is not retained onsite, as described in Provision E.3.c.(4)(c).

(d) All onsite treatment control BMPs must:

(i) Be correctly sized and designed so as to remove pollutants from storm water to the MEP;

(ii) Be sized to comply with the following numeric sizing criteria:

[a] Volume-based treatment control BMPs must be designed to mitigate (infiltrate, filter, or treat) the remaining portion of the design capture volume that was not retained onsite; or

[b] Flow-based treatment control BMPs must be designed to mitigate (filter or treat) either: 1) the maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour, for each hour of a storm event; or 2) the maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity (for each hour of a storm event), as determined from the local historical rainfall record, multiplied by a factor of two.

(iii) Be ranked with high or medium pollutant removal efficiency for the project's most significant pollutants of concern. Treatment control BMPs with a low removal efficiency ranking must only be approved by a Copermittee when a feasibility analysis has been conducted

[15] This volume is not a single volume to be applied to all areas covered by this Order. The size of the 85th percentile storm event is different for various parts of the San Diego Region. The Copermittees are encouraged to calculate the 85th percentile storm event for each of its jurisdictions using local rain data pertinent to its particular jurisdiction. In addition, isopluvial maps may be used to extrapolate rainfall data to areas where insufficient data exists in order to determine the volume of the local 85th percentile storm event in such areas. Where the Copermittees will use isopluvial maps to determine the 85th percentile storm event in areas lacking rain data, the Copermittees must describe their method for using isopluvial maps in its BMP Design Manuals.

which exhibits that implementation of treatment control BMPs with high or medium removal efficiency rankings are infeasible for a Priority Development Project or portion of a Priority Development Project.

(3) Hydromodification Management BMP Requirements

Each Copermittee must require each Priority Development Project to implement hydromodification management BMPs so that:

(a) Post-project runoff flow rates and durations do not exceed pre-development (naturally occurring) runoff flow rates and durations ~~by more than 10 percent~~ (for the range of flows that result in increased potential for erosion ~~or~~, degraded channel conditions, impaired stream habitat, or negatively impacted beneficial uses downstream of Priority Development Projects).

~~(i) In evaluating the range of flows that results in increased potential for erosion of natural (non-hardened) channels, the lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or that erodes the toe of channel banks.~~

~~(ii) For artificially hardened channels, analysis to identify the lower boundary must use characteristics of a natural stream segment similar to that found in the watershed. The lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or erodes the toe of the channel banks.~~

~~(iii) The Copermittees may use monitoring results pursuant to Provision D.2.b.(6) to re-define the range of flows resulting in increased potential for erosion or degraded channel conditions, as warranted by the data.~~

(b) Post-project runoff flow rates and durations must compensate for the loss of sediment supply due to the development project, should loss of sediment supply occur as a result of the development project.

(c) If hydromodification management BMPs are technically infeasible per Provision E.3.c.(4), project applicants must perform mitigation for the portion of the runoff volume that is not controlled and will cause or contribute to increased potential for erosion of receiving waters downstream of the Priority Development Project, as described in Provision E.3.c.(4)(c).

(d) Exemptions

Each Copermittee has the discretion to exempt a Priority Development Project from the hydromodification management BMP requirements where the project:

(i) Discharges storm water runoff into underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean;

(ii) Discharges storm water runoff into conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean; or

(iii) Discharges storm water runoff into other areas identified by the San Diego Water Board as exempt from the requirements of Provisions E.3.c.(3)(a)-(c).

(4) Alternative Compliance for Technical Infeasibility

At the discretion of each Copermittee, alternative compliance may be allowed for certain Priority Development Projects to comply with Provisions E.3.c.(2) and E.3.c.(3), subject to the following requirements:

(a) Applicability

Priority Development Projects may be allowed alternative compliance if:

(i) The Copermittee reviews and approves site-specific hydrologic and/or design analysis performed by a registered professional engineer, geologist, architect, or landscape architect;

(ii) The project applicant demonstrates, and the Copermittee determines and documents, that retention LID and/or hydromodification management BMPs per Provisions E.3.c.(2) and E.3.c.(3) were incorporated into the project design to the maximum extent technically feasible given the project site conditions;

(iii) The project applicant is required to perform mitigation described in Provision E.3.c.(4)(c) with a net result of at least the same level of water quality protection as would have been achieved if the Priority Development Project had fully implemented the retention LID and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) onsite.

(b) Criteria For Technical Infeasibility

Each Copermittee must develop, or develop in collaboration with the other Copermittees, criteria to determine technical infeasibility for fully implementing the retention LID and hydromodification management BMP requirements under Provisions E.3.c.(2) and E.3.c.(3) and include these requirements in the Permanent BMP Sizing Criteria Design Manual pursuant to Provision E.3.d. Technical infeasibility may result from conditions including, but not limited to:

(i) Locations that cannot meet the infiltration and groundwater protection requirements in Provision E.3.a.(5) due to the presence of shallow bedrock, contaminated soils, near surface groundwater, underground facilities, or utilities;

(ii) Brownfield development sites or other locations where pollutant mobilization is a documented concern;

(iii) The design of the site precludes the use of soil amendments, plantings of vegetation, or other designs that can be used to infiltrate and evapotranspirate runoff;

(iv) Soils cannot be sufficiently amended to provide for the requisite infiltration rates;

(v) Locations with geotechnical hazards;

(vi) Insufficient onsite and/or offsite demand for storm water use;

(vii) Modifications to an existing building to manage storm water are not feasible due to structural or plumbing constraints; and

(viii) Smart growth and infill or redevelopment locations where the density and/or nature of the project would create significant difficulty for compliance with Provisions E.3.c.(2) and E.3.c.(3) onsite.

(c) Mitigation

Priority Development Projects that meet the Copermittee's technical infeasibility criteria developed pursuant to Provision E.3.c.(4)(b) must be required to mitigate for the increased flow rates, increased flow durations, and/or increased pollutant loads expected to be discharged from the site. For the pollutant load in the volume of storm water not retained onsite with retention LID BMPs, or increased potential erosion of downstream receiving waters not fully controlled onsite with hydromodification management BMPs, the Copermittee must require the project applicant to either 1) implement an offsite mitigation project, and/or 2) provide sufficient funding for a public or private offsite mitigation project via a mitigation fund.

(i) *Mitigation Project Locations*

Offsite mitigation projects must be implemented within the same hydrologic unit as the Priority Development Project, and preferably within the same hydrologic subarea. Mitigation projects outside of the hydrologic subarea but within the same hydrologic unit may be approved provided that the project applicant demonstrates that mitigation projects within the same hydrologic subarea are infeasible and that the mitigation project will address similar potential impacts expected from the Priority Development Project.

(ii) *Mitigation Project Types*

Offsite mitigation projects must include, where applicable and feasible, retrofitting opportunities and stream and/or habitat rehabilitation or restoration opportunities identified in the Water Quality Improvement Plans, identified pursuant to Provision B.3.a. Other offsite mitigation projects may include green streets or infrastructure projects, or regional BMPs upstream of receiving waters. In-stream rehabilitation or restoration measures to protect or prevent adverse physical changes to creek bed and banks must not include the use of non-naturally occurring hardscape material such as concrete, riprap, or gabions. Project applicants seeking to utilize these alternative compliance provisions may propose other offsite mitigation projects, which the Copermittees may approve if they meet the requirements of Provision E.3.c.(4)(a).

(iii) *Mitigation Project Timing*

The Copermittee and/or project applicant must develop a schedule for the completion of offsite mitigation projects, including milestone dates to identify, fund, design, and construct the projects. Offsite mitigation projects must be completed upon the granting of occupancy for the first project that contributed funds toward the offsite mitigation project, unless a longer period is authorized by the San Diego Water Board.

(iv) *Mitigation Fund*

A Copermittee may choose to implement additional mitigation programs (e.g., pollutant credit system, mitigation fund) as a means for developing and implementing offsite mitigation projects, provided the projects conform to the requirements for project locations, types, and timing described above.

d. UPDATE PERMANENT BMP SIZING CRITERIA DESIGN MANUAL (BMP DESIGN MANUAL)

Each Copermittee must update its Permanent BMP Sizing Criteria Design Manual (BMP Design Manual)[16] pursuant to Provision F.2.b or Provision F.5.a. Until the Copermittee has updated its BMP Design Manual with the requirements of Provision E.3.c, the Copermittee must continue implementing its current BMP Design Manual. Unless directed otherwise by the San Diego Water Board, the

[16] The Permanent BMP Sizing Criteria Design Manual was formerly known as the Standard Storm Water Mitigation Plan under Order Nos. R9-2007-0001, R9-2009-0002, and R9-2010-0016.

Copermittee must implement the BMP Design Manual within 180 days of completing the update. The update of the BMP Design Manual must include the following:

(1) Updated procedures to determine the nature and extent of storm water requirements applicable to a potential development or redevelopment project. These procedures must inform project applicants of the storm water management requirements applicable to their project including, but not limited to, general requirements for all development projects, LID and conventional BMP design procedures and requirements, hydromodification management requirements, requirements specific to phased projects, and procedures specific to private developments and public improvement projects;

(2) Updated procedures to identify pollutants and conditions of concern for selecting the most appropriate permanent BMPs that consider, at a minimum, the following:

(a) Receiving water quality (including pollutants for which receiving waters are listed as impaired under CWA section 303(d));

(b) Priority pollutants or receiving water conditions contributing to the highest water quality priorities identified in the Water Quality Improvement Plan;

(c) Land use type of the project and pollutants associated with that land use type; and

(d) Pollutants expected to be present onsite.

(3) Updated procedures for designing permanent BMPs, including any updated performance and sizing requirements to be consistent with the requirements of Provision E.3.c for all BMPs listed in the BMP Design Manual;

(4) Long-term maintenance criteria for each BMP listed in the BMP Design Manual; and

(5) Criteria and mitigation requirements, in accordance with the requirements under Provision E.3.c.(4), if the Copermittee elects to allow alternative compliance for technical infeasibility within its jurisdiction.

e. PRIORITY DEVELOPMENT PROJECT BMP IMPLEMENTATION AND OVERSIGHT

Each Copermittee must implement a program to ensure permanent BMPs on all Priority Development Projects are designed, constructed, and maintained to remove pollutants in storm water to the MEP.

ADMINISTRATIVE DRAFT

(1) Permanent BMP Approval and Verification Process

(a) Each Copermittee must ensure that for all Priority Development Project applications that have not received prior lawful approval by the Copermittee by 12 months after the adoption of this Order, or pursuant to Provision F.5.a, the requirements of Provision E.3 are implemented. For project applications that have received prior lawful approval by 12 months after the adoption of this Order, or pursuant to Provision F.5.a, the Copermittee may allow previous land development requirements to apply.

(b) Each Copermittee must identify the roles and responsibilities of various municipal departments in implementing the permanent BMP requirements, including each stage of a project from application review and approval through BMP maintenance and inspections.

(c) Each Copermittee must ensure that appropriate easements and ownerships are properly recorded in public records and the information is conveyed to all appropriate parties when there is a change in project or site ownership.

(d) Each Copermittee must ensure that prior to occupancy and/or intended use of any portion of the Priority Development Project, each permanent BMP must be inspected to verify that they have been constructed and are operating in compliance with all of its specifications, plans, permits, ordinances, and the requirements of this Order.

(2) Priority Development Project Inventory and Prioritization

(a) Each Copermittee must develop and continuously maintain a watershed-based database to track and inventory all Priority Development Projects and associated permanent BMPs. Inventories must be accurate and complete beginning from January 2002 for the San Diego County Copermittees, February 2003 for the Orange County Copermittees, and July 2005 for the Riverside County Copermittees. The database must include, at a minimum, the following information:

(i) Priority Development Project location (address and hydrologic subarea);

(ii) Descriptions of BMP type(s);

(iii) Date(s) of construction;

(iv) Party responsible for permanent BMP maintenance;

(v) Dates and findings of permanent BMP maintenance verifications; and

(vi) Corrective actions and/or resolutions.

(b) Each Copermittee must prioritize the Priority Development Projects with permanent BMPs within its jurisdiction. The designation of Priority Development Projects as high priority must consider the following:

(i) The highest water quality priorities identified in the Water Quality Improvement Plan;

(ii) Receiving water quality;

(iii) Number and sizes of permanent BMPs;

(iv) Recommended maintenance frequency of permanent BMPs;

(v) Likelihood of operation and maintenance issues of permanent BMPs;

(vi) Land use and expected pollutants generated; and

(vii) Compliance record.

(3) Permanent BMP Maintenance Verifications and Inspections

Each Copermittee is required to verify that permanent BMPs on each Priority Development Project are adequately maintained, and continue to operate effectively to remove pollutants in storm water to the MEP through inspections, self-certifications, surveys, or other equally effective approaches.

(a) All (100 percent) of the permanent BMPs at Priority Development Projects that are designated as high priority must be inspected directly by the Copermittee annually prior to each rainy season;

(b) For verifications performed through a means other than direct Copermittee inspection, adequate documentation must be required by the Copermittee to provide assurance that the required maintenance of permanent BMPs at each Priority Development Project has been completed; and

(c) Appropriate follow-up measures (including re-inspections, enforcement, etc.) must be conducted to ensure that permanent BMPs at each Priority Development Project continue to reduce pollutants in storm water to the MEP as originally designed.

f. DEVELOPMENT PROJECT ENFORCEMENT

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all development projects, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

4. Construction Management

Each Copermittee must implement a construction management program that includes, at a minimum, the following requirements:

a. Project Approval Process

Prior to approval and issuance of any construction, grading, or building permits for a project each Copermittee must:

(1) Require a project-specific storm water pollution prevention plan (SWPPP), or equivalent construction BMP or erosion control plan, to be submitted by the project applicant for the Copermittee's approval;

(2) Ensure the SWPPP, or equivalent construction BMP or erosion control plan, complies with the local grading ordinance, other applicable local ordinances, and the requirements of this Order;

(3) Ensure the SWPPP, or equivalent construction BMP or erosion control plan, includes seasonally appropriate and effective BMPs and management measures described in Provision E.4.c, as applicable to the project; and

(4) Verify that the project applicant has obtained coverage under applicable permits, including, but not limited to the Construction General Permit, Clean Water Act Section 401 Water Quality Certification and Section 404 Permit, and California Department of Fish and Game Streambed Alteration Agreement.

b. Construction Site Inventory and Tracking

(1) Each Copermittee must maintain, and update at least monthly, a watershed-based inventory of all construction sites requiring construction, grading, or building permits within its jurisdiction. The inventory must include:

(a) Relevant contact information for each site (e.g., name, address, phone, and email for the owner and contractor);

(b) The basic site information including location (address and hydrologic subarea), Waste Discharge Identification (WDID) number (if applicable), size of the site, and approximate area of disturbance;

(c) Whether or not the site is considered a high threat to water quality, as defined in Provision E.4.b.(2) below;

(d) The project start and anticipated completion dates;

(e) Current construction phase;

(f) The required inspection frequency, as defined in the Copermittee's jurisdictional runoff management program document;

(g) The date the Copermittee approved the project-specific SWPPP, or equivalent construction BMP or erosion control plan; and

(h) Whether or not there are ongoing enforcement actions administered to the site.

(2) Each Copermittee must identify all construction sites within its jurisdiction that represent a high threat to downstream surface water quality. At a minimum, high threat to water quality sites must include:

(a) Sites located within a hydrologic subarea where sediment is known or suspected to contribute to the highest water quality priorities identified in the Water Quality Improvement Plan;

(b) Sites located within the same hydrologic subarea and tributary to a CWA section 303(d) water body segment impaired for sediment;

(c) Sites located within, directly adjacent to, or discharging directly to a receiving water within an ESA; and

(d) Other sites determined by the Copermittees or the San Diego Water Board as a high threat to water quality.

c. CONSTRUCTION SITE BMP AND MANAGEMENT MEASURE IMPLEMENTATION

Each Copermittee must implement, or require the implementation of effective BMPs to reduce discharges of pollutants in storm water from construction sites to the MEP, and prevent non-storm water discharges into the MS4. These BMPs must be site specific, seasonally appropriate, and construction phase appropriate. BMPs and management measures must be implemented at each construction site year round. Dry season BMP implementation must plan for and address unseasonal rain events that may occur during the dry season (May 1 through September 30). Copermittees must implement, or require the implementation of, BMPs and management measures in the following categories:

(1) Project Planning;

(2) Good Site Management "Housekeeping", including waste management;

(3) Non-storm Water Management;

(4) Erosion Control;

(5) Sediment Control;

(6) Run-on and Run-off Control; and

(7) Active/Passive Sediment Treatment Systems, where applicable.

d. Construction Site Inspections

Each Copermittee must conduct construction site inspections to ensure compliance with its permits and applicable local ordinances, and the requirements of this Order. Priority for site inspections must consider threat to water quality pursuant to Provision E.4.b as well as the nature of the construction activity, topography, and the characteristics of soils and receiving water quality.

(1) Inspection Frequency

(a) Each Copermittee must conduct inspections at all inventoried sites, including high threat to water quality sites, at an appropriate frequency for each phase of construction to ensure the site reduces the discharge of pollutants in storm water from construction sites to the MEP, and prevents non-storm water discharges from entering the MS4.

(b) Each Copermittee must establish appropriate inspection frequencies for high threat to water quality sites, and all other sites, for each phase of construction. Inspection frequencies appropriate for addressing the highest water quality priorities identified in the Water Quality Improvement Plan, and for complying with the requirements of this Order must be identified in each Copermittee's jurisdictional runoff management program document.

(c) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e., re-inspection, enforcement) necessary to ensure site compliance with its permits and applicable local ordinances, and the requirements of this Order.

(2) Inspection Content

Inspections of construction sites by the Copermittee must include, at a minimum:

(a) Verification of coverage under the Construction General Permit (Notice of Intent (NOI) and/or WDID number) during initial inspections, when applicable;

(b) Assessment of compliance with its permits and applicable local ordinances related to pollution prevention, including the implementation and maintenance of applicable BMPs;

(c) Assessment of BMP adequacy and effectiveness;

(d) Visual observations of actual non-storm water discharges;

(e) Visual observations of actual or potential discharge of sediment and/or construction related materials from the site;

(f) Visual observations of actual or potential illicit connections; and

(g) If any violations are found and BMP enhancements are needed, inspectors must take and document appropriate actions in accordance with the Enforcement Response Plan pursuant to Provision E.6.

(3) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried construction sites. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must include, at a minimum:

(a) Site name, location (address and hydrologic subarea), and WDID number (if applicable);

(b) Inspection date;

(c) Weather conditions during inspection;

(d) Approximate amount of rainfall since last inspection;

(e) Description and photo documentation of problems observed with BMPs and indication of need for BMP addition/repair/replacement and any scheduled re-inspection, and date of re-inspection;

(f) Descriptions of any other specific inspection comments which must, at a minimum, include rationales for longer compliance time.;

(g) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6; and

(h) Resolution of problems noted and date problems fixed.

e. CONSTRUCTION SITE ENFORCEMENT

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried construction sites, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

5. Existing Development Management

Each Copermittee must implement an existing development management program that includes, at a minimum, the following requirements:

a. EXISTING DEVELOPMENT INVENTORY AND TRACKING

Each Copermittee must maintain an updated watershed-based inventory of all its existing development that may potentially generate a pollutant load to and from the MS4. The use of an automated database system, such as GIS, is highly recommended. The inventory must, at a minimum, include:

(1) Name, location (address and hydrological subarea) of each facility, area, and/or activity;

(2) A description of the facility, area, and/or activity, including classification as municipal, commercial, industrial, or residential;

(3) The following municipal facilities:

(a) Flood management and flood control devices and structures,

(b) Operating or closed municipal landfills,

(c) Publicly owned treatment works (including water and wastewater treatment plants) and sanitary sewer collection systems,

(d) Corporate yards, including maintenance and storage yards for materials, waste, equipment, and vehicles,

(e) Hazardous waste collection facilities, and

(f) Other treatment, storage or disposal facilities for municipal waste;

(4) Identification if a business is a mobile business;

(5) SIC Code, if applicable;

(6) Industrial General Permit NOI and/or WDID number, if applicable;

(7) Identification if an area is a Common Interest Area (CIA) / Home Owner Association (HOA), or mobile home park;

(8) Identification of pollutants generated and potentially generated by the facility, area, and/or activity;

(9) Status of facility, area, and/or activity as active or inactive;

(10) Whether the facility, area, and/or activity is adjacent to an ESA;

(11) Whether the facility, area, and/or activity is tributary to and within the same hydrologic subarea as a CWA section 303(d) water body segment and generates pollutants for which the water body segment is impaired;

(12) Whether the facility, area, and/or activity contributes or potentially contributes to the highest water quality priorities identified in the Water Quality Improvement Plan; and

(13) A continually updated map showing the location of inventoried existing development, watershed boundaries, water bodies, and pollutants generated at the inventoried existing development.

b. RETROFITTING AND CHANNEL REHABILITATION IN AREAS OF EXISTING DEVELOPMENT

Each Copermittee must develop and implement a program to retrofit areas of existing development to reduce the discharge of pollutants in storm water from the MS4 to the MEP and effectively prohibit non-storm water discharges into its MS4, and rehabilitate channels to restore impaired beneficial uses of streams within its jurisdiction.

(1) Each Copermittee must identify areas of existing development as candidates for retrofitting, and channels in areas of existing development as candidates for rehabilitation within its jurisdiction. Areas of existing development must be selected based on a likelihood that retrofitting and channel rehabilitation will address the highest water quality priorities identified in the Water Quality Improvement Plan prepared pursuant to Provision B.

(2) Each Copermittee must evaluate and rank the areas of existing development identified pursuant to Provisions E.5.a and E.5.b.(1) for retrofitting and channel rehabilitation. The evaluation must include an assessment of those areas where pollutant removal from storm water and effective prohibition of non-storm water discharges through retrofitting existing development will provide the most benefit to water quality. The evaluation must also include an assessment of the channels within its jurisdiction where channel rehabilitation will improve beneficial uses of streams within the Copermittee's jurisdiction. Data collected during the implementation of the Water Quality Improvement Plan must be used to inform each area assessment and rank determination.

(3) Each Copermittee must implement retrofit and channel rehabilitation projects that address the highest water quality priorities identified in the Water Quality Improvement Plan pursuant to Provision B.3.a. The Copermittee must encourage private landowners to implement retrofit and channel rehabilitation projects whenever practical. Private landowners should be encouraged through the Copermittee's use of subsidies, penalties, or other incentives.

(4) Each Copermittee must evaluate the flood management and flood control devices and structures in its inventory to determine if it is feasible to retrofit the device or structure, to provide additional pollutant removal from storm water. A Copermittee must consider the highest water quality priorities identified in their Water Quality Improvement Plan as part of each assessment.

(5) Where retrofitting and channel rehabilitation within specific areas of existing development are determined to be infeasible to restore and protect receiving waters from the highest water quality priorities identified in the Water Quality Improvement Plan, each Copermittee must identify, develop, and implement regional retrofitting and channel rehabilitation projects (i.e. projects that can receive and/or treat storm water from one or more areas of existing development and will result in a net benefit to water quality and the environment) adjacent to and/or downstream of the areas of existing development. The Copermittees may collaborate and cooperate with each other to develop regional retrofitting and channel rehabilitation projects. The Copermittees are also encouraged to partner with existing efforts in other Watershed Management Areas, and the Integrated Regional Water Management (IRWM) Groups in San Diego County, South Orange County, and Southwest Riverside County.

c. EXISTING DEVELOPMENT BMP IMPLEMENTATION AND MAINTENANCE

(1) Pollution Prevention

Each Copermittee must require the use of pollution prevention methods by the inventoried existing development.

(2) Designate BMPs

Each Copermittee must designate a minimum set of BMPs required for all inventoried existing development, including special event venues, that have the potential to generate pollutants. The designated minimum BMPs must be specific to facility types and pollutant-generating activities, as appropriate.

(3) BMP Implementation

Each Copermittee must implement, or require the implementation of, designated BMPs at inventoried existing development that have the potential to generate pollutants. A Copermittee must require additional pollution prevention measures and enhanced BMPs at inventoried existing development that discharges pollutants identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan.

(4) BMP Operation and Maintenance

Each Copermittee must operate and maintain, or require the operation and maintenance of designated BMPs at all inventoried existing development.

(a) Each Copermittee must implement a schedule of operation and maintenance activities for its MS4 and related structures (including but not limited to catch basins, storm drain inlets, detention basins, etc.), and verify proper operation of all its municipal structural treatment controls designed to reduce pollutants (including floatables) in storm water discharges to or from its MS4s and related drainage structures.

(b) Each Copermittee must implement procedures during the operation and maintenance of public streets, unpaved roads, paved roads, and paved highways and freeways that will reduce the contribution of storm water pollutants to the MEP and effectively prohibit non-storm water pollutants from the MS4 to receiving water bodies. During maintenance of unpaved roads, each Copermittee must examine the feasibility of replacing existing culverts or designing new culverts/bridge crossings to maintain natural stream geomorphology.

(c) Each Copermittee must implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers. Copermittees that operate both a municipal sanitary sewer system and a MS4 must implement controls and measures to prevent and eliminate seeping sewage from infiltrating the MS4. Copermittees that do not operate both a municipal sanitary sewer system and a MS4 must keep themselves informed of relevant and appropriate maintenance activities and sanitary sewage projects in their jurisdiction that may cause or contribute to seepage of sewage into the MS4.

(5) Pesticides, Herbicides, and Fertilizers BMPs

Each Copermittee must implement procedures, or require the implementation of procedures, to reduce the contribution of pollutants in storm water to the MEP and effectively prohibit non-storm water discharges associated with the application, storage, and disposal of pesticides, herbicides and fertilizers from inventoried existing development into and from the MS4s. The Copermittee must require additional pollution prevention measures and enhanced BMPs at inventoried existing development that discharges pesticides, herbicides, or fertilizers identified as contributing to the highest water quality priorities in the Water Quality Improvement Plan. Such BMPs must include, as appropriate educational activities, permits, certifications and other measures for applicators and distributors.

d. EXISTING DEVELOPMENT INSPECTIONS

Each Copermittee must conduct inspections of inventoried existing development to ensure compliance with applicable local ordinances and permits, and the requirements of this Order.

(1) Inspection Frequency

(a) Each Copermittee must establish appropriate inspection frequencies for inventoried existing development based on the priorities set forth in the Water Quality Improvement Plan, and the potential for discharging pollutants via storm water and non-storm water runoff. At a minimum, inventoried existing development must be inspected once every five years. Inventoried existing development must also be inspected within six months of any change in property ownership or change in pollutant generating activity. The frequency of inspection at inventoried existing development must be appropriate to ensure that applied BMPs are sufficient to reduce the discharge of pollutants in storm water from the MS4 to the MEP and effectively prohibit non-storm water discharges to the MS4.

(b) Inventoried existing development must be inspected, as needed, in response to valid public complaints and findings from the Copermittee's municipal and contract staff inspections.

(c) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e. re-inspection, enforcement) necessary to ensure compliance with its applicable local ordinances and permits, the most current jurisdictional runoff management program document, the Water Quality Improvement Plan, and the requirements of this Order.

(2) Inspection Content

Inspections of existing development by the Copermittee must include, at a minimum:

(a) Assessment of compliance with its applicable local ordinances and permits related to non-storm water and storm water discharges and runoff;

(b) Assessment of the implementation, maintenance and effectiveness of the designated minimum and/or enhanced BMPs;

(c) Verification of coverage under the Industrial General Permit (NOI and/or WDID number), when applicable;

(d) Visual observations of actual non-storm water discharges;

(e) Visual observations of actual or potential discharge of pollutants;

(f) Visual observations of actual or potential illicit connections; and

(g) If any violations are found and BMP enhancements are needed, inspectors must take and document appropriate actions in accordance with the Enforcement Response Plan pursuant to Provision E.6.

(3) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried existing development. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must be sufficiently detailed in order to determine compliance with the requirements of this Order and any progress made towards addressing the highest water quality priorities identified in the Water Quality Improvement Plan. Inspection records must include, at a minimum:

(a) Existing development name and location (address and hydrologic subarea);

(b) Inspection and re-inspection date(s);

(c) Weather conditions during inspection;

(d) Description and photo documentation of problems observed with BMPs and indication of need for BMP addition/repair/replacement and any scheduled re-inspection, and date of re-inspection;

(e) Description of actions to reduce pollutants in storm water runoff to the MEP and actions to effectively prohibit non-storm discharges into the MS4 at the inventoried existing development;

(f) Photo documentation of observed actions or BMPs to reduce pollutants in storm water runoff to the MEP and actions to effectively prohibit non-storm discharges into the storm drain;

(g) If the facility, area, and/or activity has been designated or identified as a contributor to the highest water quality priorities identified in the Water Quality Improvement Plan, then the inspection report must include a description of any specific or additional actions taken to reduce or eliminate the contribution of the facility, area, and/or activity to the highest water quality priorities;

(h) Descriptions of any other specific inspection comments which must, at a minimum, include rationales for longer compliance time;

(i) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6; and

(j) Resolution of problems noted and date problems fixed.

e. EXISTING DEVELOPMENT ENFORCEMENT

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried existing development, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

6. Enforcement Response Plans

Each Copermittee must develop and implement an Enforcement Response Plan as part of its jurisdictional runoff management program document. The Enforcement Response Plan must include the protocols for progressively stricter responses, including timeframes allowed for corrections of problems, and for various field violation scenarios. The Enforcement Response Plan must include, at a minimum, the following requirements:

a. ILLICIT DISCHARGE DETECTION AND ELIMINATION ENFORCEMENT COMPONENT

The Enforcement Response Plan must describe required enforcement actions to eliminate non-storm water discharges and illicit discharges or connections to the Copermittee's MS4.

(1) The Enforcement Response Plan must include a definition of "high level enforcement" for non-storm water discharges and illicit discharges or connections. "High level enforcement" for non-storm water discharges and illicit discharges or connections may be defined differently for construction sites, municipal, commercial, industrial, and residential areas of existing development.

(2) Non-storm water discharges and illicit discharges or connections must be addressed with an escalating series of enforcement actions as follows:

(a) If the non-storm water discharge and illicit discharge or connection is a source of pollutants contributing to the highest water quality priorities identified in the Water Quality Improvement Plan, then high level enforcement actions must be immediately issued, and subsequent high level enforcement actions must continue to escalate, as necessary, to compel the elimination of the discharge or connection as soon as possible; or

(b) If the non-storm water discharge and illicit discharge or connection is not a source of pollutants contributing to the highest water quality priorities identified in the Water Quality Improvement Plan, then escalating enforcement actions must be issued, and enforcement actions must result in the elimination of the discharge or connection as quickly as the Copermittee's available resources allow.

(3) If the Copermittee identifies the source, and the source is a controllable non-storm water discharge (i.e. anthropogenically influenced) or a controllable illicit discharge or connection, then the Copermittee must implement the following:

(a) Immediately enforce its legal authority to eliminate controllable sources of non-storm water and illicit discharges or connections upon identifying the source; and

(b) For controllable sources of non-storm water discharges and illicit discharges or connections that cannot be eliminated immediately upon identification, the discharge or connection must be eliminated in a timely manner with the goal of eliminating the discharge or connection within 10 business days after the source is identified. If more than 10 business days are required to eliminate the discharge or connection, a rationale must be recorded in the electronic database or equivalent tabular system used to track the investigations of non-storm water and illicit discharges and connections.

(4) If the Copermittee identifies the source as a non-storm water discharge to or from the MS4 that is in exceedance of NALs developed pursuant to Provision C.1, and in violation or threatened violation of an existing separate NPDES permit (e.g. the groundwater dewatering NPDES permit), then the Copermittee must report, within three business days, the findings to the San Diego Water Board including all pertinent information regarding the discharger and discharge characteristics.

b. DEVELOPMENT PROJECTS ENFORCEMENT COMPONENT

The Enforcement Response Plan must describe required enforcement actions to compel compliance with the Copermittee's BMP Design Manual requirements for development projects.

(1) The Enforcement Response Plan must include a definition of "high level enforcement" for development projects.

(2) The enforcement process must include appropriate sanctions to compel compliance with requirements of the Copermittee's BMP Design Manual or this Order. Sanctions must include, at a minimum, the following tools or their equivalent:

(a) Non-monetary penalties;

(b) Fines;

(c) Bonding requirements;

(d) Administrative and criminal penalties;

(e) Liens; and

(f) Permit or occupancy denials.

(3) Occupancy must be denied until a development project is in full compliance with the Copermittee's BMP Design Manual requirements. Documentation of full compliance with the Copermittee's BMP Design Manual requirements must be recorded in the electronic database or equivalent tabular system used to track development projects.

(4) Violations or other non-compliance that contribute or potentially contribute to the highest water quality priorities identified in the Water Quality Improvement Plan must be issued high level enforcement actions. High level enforcement actions must continue to escalate, as necessary, to compel compliance as soon as possible.

(5) For violations of permanent BMP maintenance requirements, all violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 10 business days after the violations are discovered. If more than 10 business days are required for compliance, a rationale must be recorded in the electronic database or equivalent tabular system used to track permanent BMP inspections.

c. Construction / Existing Development Enforcement Component

The Enforcement Response Plan must describe required enforcement actions to compel compliance with its permits and applicable local ordinances, and the requirements of this Order, at construction sites and areas of existing development.

(1) The Enforcement Response Plan must include a definition of "high level enforcement" for construction sites and areas of existing development. "High level enforcement" may be defined differently for construction sites, municipal, commercial, industrial, and residential areas of existing development.

(2) The enforcement process must include, at a minimum, appropriate sanctions to compel compliance, such as:

(a) Verbal and written notices of violation;

(b) Cleanup requirements;

(c) Fines;

(d) Bonding requirements;

(e) Administrative and criminal penalties;

(f) Liens;

(g) Stop work orders; and

(h) Permit and occupancy denials.

(3) Violations or other non-compliance that contribute or potentially contribute to the highest water quality priorities identified in the Water Quality Improvement Plan must be issued high level enforcement actions. High level enforcement actions must continue to escalate, as necessary, to compel compliance as soon as possible.

(4) All violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 10 business days after the violations are discovered. If more than 10 business days are required for compliance, then a rationale must be recorded in the electronic database or equivalent tabular system used to track construction site and existing development inspections.

d. REPORTING OF NON-COMPLIANT SITES

(1) Each Copermittee must notify the San Diego Water Board in writing within 48 hours of issuing high level enforcement (as defined in the Copermittee's Enforcement Response Plan) to an ~~construction~~industrial, commercial, construction, or residential site that poses a significant threat to water quality or poses a threat to the Highest Water Quality Prirorites (as identified in the Water Quality Improvement Plan) as a result of violations or other non-compliance with its permits and applicable local ordinances, and the requirements of this Order.

(2) Each Copermittee must notify the San Diego Water Board in writing within 48 hours of issuing low level enforcement (those enforcement actions not defined as high level in the Copermittee's Enforcement Response Plan) to an industrial, commercial, construction, or residential site that has received at least 5 prior low level enforcement actions within the past 2 years.

~~(2)~~(3) Each Copermittee must notify the San Diego Water Board of non-filers

Formatted: List Paragraph, No bullets or numbering, Widow/Orphan control, Tab stops: Not at 0.83" under the Industrial General Permit and Construction General Permit by email to Nonfilers_R9@waterboards.ca.gov.

7. Public Education and Participation

a. Each Copermittee must implement a public education program, as appropriate, to promote and encourage management practices, control techniques and systems, design and engineering methods, and behaviors that reduce the discharge of pollutants in storm water to the MEP, prevent controllable non-storm water discharges from entering the MS4, and protect water quality standards in receiving waters. The public education program must include, at a minimum, the following:

(1) Educational activities, public information activities, and other appropriate outreach activities to reduce pollutants associated with the application of pesticides, herbicides and fertilizer in storm water discharges to and from its MS4 to the MEP;

(2) Educational activities, public information activities, and other appropriate outreach activities to facilitate the proper management and disposal of used oil and toxic materials; and

(3) Appropriate education and training measures for construction site operators and other target audiences, as determined by the Copermittee(s).

b. Each Copermittee must incorporate a mechanism for public participation and where necessary intergovernmental coordination in updating, developing, and implementing its jurisdictional runoff management program.

8. Fiscal Analysis

a. Each Copermittee must secure the resources necessary to meet all the requirements of this Order.

b. Each Copermittee must conduct an annual fiscal analysis of the following:

(1) The capital and operation and maintenance expenditures necessary to implement the requirements of this Order;

(2) The staff resources needed and allocated to meet the requirements of this Order, including any development, implementation, and enforcement activities required;

(3) The estimated expenditures for Provisions E.8.b.(1) and E.8.b.(2) during the reporting period, the preceding reporting period, and the next reporting period; and

(4) The source of funds that are proposed to meet the necessary expenditures described in Provisions E.8.b.(1) and E.8.b.(2), including legal restrictions on the use of such funds.

c. Each Copermittee must submit a summary of the annual fiscal analysis with each Annual Report required pursuant to Provision F.3.b.

d. Each Copermittee must provide the documentation used to develop the summary of the annual fiscal analysis upon request by the San Diego Water Board.

F. REPORTING

The purpose of this provision is to determine and document compliance with the requirements set forth in this Order. The goal of this provision is to communicate to the San Diego Water Board and the people of the State of California the implementation status of each jurisdictional runoff management program and compliance with the requirements of this Order. This goal is to be accomplished through the submittal of specific deliverables to the San Diego Water Board by the Copermittees.

1. Water Quality Improvement Plans

The Copermittees for each Watershed Management Area must develop and submit a complete Water Quality Improvement Plan in accordance with the requirements of Provision B, no later than 12 months after the adoption of this Order for a 30 day public review and comment period. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 30 days. Based on the comments received, the San Diego Water Board will determine whether to hold a public hearing or to limit public input to submittal of written comments. If no hearing is held the San Diego Water Board will notify the Copermittees that the Water Quality Improvement Plan has been accepted as complete following its review and determination that the Water Quality Improvement Plan meets the requirements of this Order. Water Quality Improvement Plans must be made available on the Regional Clearinghouse required pursuant to Provision F.4.

2. Updates

a. Jurisdictional Runoff Management Program Document Updates

Each Copermittee must update its jurisdictional runoff management program document to incorporate the requirements of Provision E. The update must be completed no later than 12 months after the adoption of this Order. Updated jurisdictional runoff management program documents must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Subsequent updates may be submitted as part of the Annual Reports, and updated jurisdictional runoff management program documents must be made available on the Regional Clearinghouse.

b. Permanent BMP Sizing Criteria Design Manual Updates

Each Copermittee must update its BMP Design Manual to incorporate the requirements of Provision E.3.d. The update must be completed no later than 12 months after the adoption of this Order. Updated BMP Design Manuals must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Subsequent updates may be submitted as part of the Annual Reports. Updated BMP Design Manuals must be made available on the Regional Clearinghouse.

c. Water Quality Improvement Plan Updates

The Copermittees for each Watershed Management Area must submit updates to the Water Quality Improvement Plan as part of the Annual Reports. Updated Water Quality Improvement Plans must be made available on the Regional Clearinghouse required pursuant to Provision F.4.

3. Progress Reporting

a. Progress Report Presentations

The Copermittees for each Watershed Management Area must appear before the San Diego Water Board, as requested by the San Diego Water Board, to provide progress reports on the implementation of the Water Quality Improvement Plan and jurisdictional runoff management programs.

b. Annual Reports

(1) The Copermittees for each Watershed Management Area must submit an Annual Report for each reporting period, which begins July 1 and ends June 30 in the following year, no later than October 31 following the end of the reporting period. The first Annual Report must be prepared for the reporting period beginning from the date the San Diego Water Board determines that the Water Quality Improvement Plan meets the requirements of this Order to June 30 in the following year. Annual Reports must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Each Annual Report must include the following:

(a) The jurisdictional and watershed monitoring data collected pursuant to Provisions D.1 and D.2, summarized and presented in tabular and graphical form;

(b) Progress of the special studies required pursuant to Provisions D.2 and D.3, and the results or findings when a special study, or each phase of a special study, is completed;

(c) The findings from the assessments required pursuant to Provision D.4;

(d) The progress of implementing the Water Quality Improvement Plan, including, but not limited to, the following:

(i) The progress toward achieving the interim and final numeric targets for the highest water quality priorities for the Watershed Management Area,

(ii) The water quality improvement strategies that were implemented and/or no longer implemented by each of the Copermittees during the reporting period and previous reporting periods, and are planned to be implemented during the next reporting period,

(iii) Previously proposed modifications or updates incorporated into the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document and implemented by the Copermittees in the Watershed Management Area, and

(iv) Proposed modifications or updates to the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document;

(e) A completed Jurisdictional Runoff Management Program Annual Report Form (Attachment D) for each Copermittee in the Watershed Management Area, certified by a Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative.

(2) Each Copermittee must complete and submit a Jurisdictional Runoff Management Program Annual Report Form (Attachment D) no later than October 31 of each year until the first Annual Report is required to be submitted.

(3) Each Copermittee must provide any data or documentation utilized in developing the Annual Report upon request by the San Diego Water Board. Any monitoring data utilized in developing the Annual Report must be uploaded to the California Environmental Data Exchange Network (CEDEN).[17] Any monitoring and assessment data utilized in developing the Annual Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.

c. Regional Monitoring and Assessment Report

(1) The Copermittees must submit a Regional Monitoring and Assessment Report no later than 180 days in advance of the expiration date of this Order. The Regional Monitoring and Assessment Report may be submitted as part of the ROWD required pursuant to Provision F.5.b. The Copermittees must review the jurisdictional and watershed monitoring data, data analyses, and assessments required pursuant to Provision D.4, to assess the following:

(a) The beneficial uses of the receiving waters within the San Diego Region that are protected or must be restored;

[17] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

(b) The progress toward restoring impacted beneficial uses in the receiving waters within the San Diego Region; and

(c) Pollutants or conditions of emerging concern that may impact beneficial uses in the receiving waters within the San Diego Region.

(2) The Regional Monitoring and Assessment Report must include recommendations for improving the implementation and assessment of the Water Quality Improvement Plans and jurisdictional runoff management programs.

(3) Each Copermittee must provide any data or documentation utilized in developing the Regional Monitoring and Assessment Report upon request by the San Diego Water Board. Any monitoring and assessment data utilized in developing the Regional Monitoring and Assessment Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.

4. Regional Clearinghouse

The Copermittees must develop, update, and maintain an internet-based Regional Clearinghouse that can be used to store, disseminate, and share the Copermittees' Water Quality Improvement Plans, Annual Reports, jurisdictional runoff management program documents, monitoring data, special studies, and any other data or information generated by the Copermittees during the implementation of this Order. Monitoring data collected pursuant to Provision D must be uploaded to CEDEN,[18] with links to the uploaded data available on the Regional Clearinghouse. The Regional Clearinghouse may be linked to other internet-based data portals and databases where the original documents and data are stored. The Regional Clearinghouse must be available and accessible to members of the public. The Regional Clearinghouse must be developed and made available to the public no later than 12 months after the adoption of this Order.

5. Report of Waste Discharge

a. The Orange County Copermittees and the Riverside County Copermittees, are required to submit a complete ROWD pursuant to the requirements of their current Orders and are enrolled under this Order upon expiration of their current Orders. Upon expiration of their current Orders, the Copermittees in each county must comply with the requirements of this Order by July 1 after enrollment under this Order, unless early enrollment is granted pursuant to Provision F.6 of this

[18] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

Order. The current Orders for the Orange County Copermittees and Riverside County Copermittees are rescinded upon their expiration date except for enforcement purposes.

b. The Copermittees must submit to the San Diego Water Board a complete ROWD as an application for the re-issuance of this NPDES permit. The ROWD must be submitted no later than 180 days in advance of the expiration date of this Order. The ROWD must contain the following minimum information:

(1) Names and addresses of the Copermittees;

(2) Names and titles of the primary contacts of the Copermittees;

(3) Proposed changes to the Copermittees' Water Quality Improvement Plans and the supporting justification;

(4) Proposed changes to the Copermittees' jurisdictional runoff management programs and the supporting justification;

(5) Any other information necessary for the re-issuance of this Order; and

(6) Any other information required by federal regulations for NPDES permit reissuance.

6. Application for Early Enrollment

a. The Orange County Copermittees, collectively, or Riverside County Copermittees, collectively, may apply for early enrollment under this Order by submitting a Report of Waste Discharge Form 200 for each individual Copermittee in the respective county, with a written request for early enrollment under this Order that certifies the following conditions have been met:

(1) A Water Quality Improvement Plan has been developed in accordance with the requirements of Provision B, which can and will be implemented immediately upon enrollment under this Order;

(2) Each Copermittee in the county has updated its jurisdictional runoff management program document to incorporate the requirements of Provision E, which can and will be implemented immediately upon enrollment under this Order; and

(3) Each Copermittee in the county has updated its BMP Design Manual to incorporate the requirements of Provision E.3.d, which can and will be implemented immediately upon enrollment under this Order.

b. The San Diego Water Board will review the application for early enrollment and associated documents for completeness. A Notice of Enrollment (NOE) under this Order will be issued to the Copermittees in the respective county by the San Diego Water Board upon completion of the early enrollment application requirements. The effective enrollment date will be specified in the NOE and the Copermittees in the respective county are authorized to have MS4 discharges pursuant to the requirements of this Order starting on the date specified in the NOE. The existing Order for that county is rescinded upon the effective enrollment date specified in the NOE except for enforcement purposes.

7. Reporting Provisions

Each Copermittee must comply with all the reporting and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

G. PRINCIPAL WATERSHED COPERMITTEE RESPONSIBILITIES

1. The Copermittees within each Watershed Management Area must designate a Principal Watershed Copermittee and notify the San Diego Water Board of the name of the Principal Watershed Copermittee. An individual Copermittee should not be designated a Principal Watershed Copermittee for more than two Watershed Management Areas. The notification may be submitted with the Water Quality Improvement Plan required pursuant to Provision F.1 of this Order.

2. The Principal Watershed Copermittee is responsible for, at a minimum, the following:

a. Serving as liaison between the Copermittees in the Watershed Management Area and the San Diego Water Board on general permit issues, and when necessary and appropriate, representing the Copermittees in the Watershed Management Area before the San Diego Water Board.

b. Facilitating the development of the Water Quality Improvement Plan in accordance with the requirements of Provision B of this Order

c. Coordinating the submittal of the deliverables required by Provisions F.1, F.2, F.3.a, and F.3.b of this Order.

d. Coordinating and developing, with the other Principal Watershed Copermittees, the requirements of Provisions F.3.c, F.4, and F.5.b of this Order.

H. MODIFICATION OF PROGRAMS

1. Modifications of the Order may be initiated by the San Diego Water Board or by the Copermittees. Requests by Copermittees must be made to the San Diego Water Board.

2. Minor modifications to the Order may be made by the San Diego Water Board where the proposed modification complies with all the prohibitions and limitations, and other requirements of this Order.

3. Proposed modifications that are not minor require amendment of this Order in accordance with this Order's rules, policies, and procedures.

I. STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

Each Copermittee must comply with all the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

ADMINISTRATIVE DRAFT

ATTACHMENT A

DISCHARGE PROHIBITIONS

1. Basin Plan Waste Discharge Prohibitions

California Water Code Section 13243 provides that a Regional Water Board, in a water quality control plan, may specify certain conditions or areas where the discharge of waste or certain types of waste is not permitted. The following waste discharge prohibitions in the Water Quality Control Plan for the San Diego Basin (Basin Plan) are applicable to any person, as defined by Section 13050(c) of the California Water Code, who is a citizen, domiciliary, or political agency or entity of California whose activities in California could affect the quality of waters of the state within the boundaries of the San Diego Region.

1. The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination or nuisance as defined in California Water Code Section 13050, is prohibited.

2. The discharge of waste to land, except as authorized by waste discharge requirements or the terms described in California Water Code Section 13264 is prohibited.

3. The discharge of pollutants or dredged or fill material to waters of the United States except as authorized by a National Pollutant Discharge Elimination System (NPDES) permit or a dredged or fill material permit (subject to the exemption described in California Water Code Section 13376) is prohibited.

4. Discharges of recycled water to lakes or reservoirs used for municipal water supply or to inland surface water tributaries thereto are prohibited, unless this San Diego Water Board issues a NPDES permit authorizing such a discharge; the proposed discharge has been approved by the State Department of Health Services (DHS) and the operating agency of the impacted reservoir; and the discharger has an approved fail-safe long-term disposal alternative.

5. The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited. Allowances for dilution may be made at the discretion of the San Diego Water Board. Consideration would include streamflow data, the degree of treatment provided and safety measures to ensure reliability of facility performance. As an example, discharge of secondary effluent would probably be permitted if streamflow provided 100:1 dilution capability.

6. The discharge of waste in a manner causing flow, ponding, or surfacing on lands not owned or under the control of the discharger is prohibited, unless the discharge is authorized by the San Diego Water Board.

ADMINISTRATIVE DRAFT

7. The dumping, deposition, or discharge of waste directly into waters of the state, or adjacent to such waters in any manner which may permit its being transported into the waters, is prohibited unless authorized by the San Diego Water Board.

8. Any discharge to a storm water conveyance system that is not composed entirely of "*storm water*" is prohibited unless authorized by the San Diego Water Board. [The federal regulations, 40 CFR 122.26(b)(13), define storm water as storm water runoff, snow melt runoff, and surface runoff and drainage. 40 CFR 122.26(b)(2) defines an illicit discharge as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities.] [§122.26 amended at 56 FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992].

9. The unauthorized discharge of treated or untreated sewage to waters of the state or to a storm water conveyance system is prohibited.

10. The discharge of industrial wastes to conventional septic tank/subsurface disposal systems, except as authorized by the terms described in California Water Code Section 13264, is prohibited.

11. The discharge of radioactive wastes amenable to alternative methods of disposal into the waters of the state is prohibited.

12. The discharge of any radiological, chemical, or biological warfare agent into waters of the state is prohibited.

13. The discharge of waste into a natural or excavated site below historic water levels is prohibited unless the discharge is authorized by the San Diego Water Board.

14. The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in waters of the state or which unreasonably affect, or threaten to affect, beneficial uses of such waters is prohibited.

15. The discharge of treated or untreated sewage from vessels to Mission Bay, Oceanside Harbor, Dana Point Harbor, or other small boat harbors is prohibited.

16. The discharge of untreated sewage from vessels to San Diego Bay is prohibited.

17. The discharge of treated sewage from vessels to portions of San Diego Bay that are less than 30 feet deep at mean lower low water (MLLW) is prohibited.

18. The discharge of treated sewage from vessels, which do not have a properly functioning US Coast Guard certified Type I or Type II marine sanitation device, to portions of San Diego Bay that are greater than 30 feet deep at mean lower low water (MLLW) is prohibited.

2. Attachment B to State Water Board Resolution 2012-001X

Special Protections for Areas of Special Biological Significance, Governing Point Source Discharges of Storm Water and Nonpoint Source Waste Discharges

I. PROVISIONS FOR POINT SOURCE DISCHARGES OF STORM WATER AND NONPOINT SOURCE WASTE DISCHARGES

The following terms, prohibitions, and special conditions (hereafter collectively referred to as special conditions) are established as limitations on point source storm water and nonpoint source discharges. These special conditions provide Special Protections for marine aquatic life and natural water quality in Areas of Special Biological Significance (ASBS), as required for State Water Quality Protection Areas pursuant to California Public Resources Code Sections 36700(f) and 36710(f). These Special Protections are adopted by the State Water Board as part of the California Ocean Plan (Ocean Plan) General Exception.

The special conditions are organized by category of discharge. The State Water Resources Control Board (State Water Board) and Regional Water Quality Control Boards (Regional Water Boards) will determine categories and the means of regulation for those categories [e.g., Point Source Storm Water National Pollutant Discharge Elimination System (NPDES) or Nonpoint Source].

A. PERMITTED POINT SOURCE DISCHARGES OF STORM WATER

1. General Provisions for Permitted Point Source Discharges of Storm Water

   a. Existing storm water discharges into an ASBS are allowed only under the following conditions:

      (1) The discharges are authorized by an NPDES permit issued by the State Water Board or Regional Water Board;

      (2) The discharges comply with all of the applicable terms, prohibitions, and special conditions contained in these Special Protections; and

      (3) The discharges:

         (i) Are essential for flood control or slope stability, including roof, landscape, road, and parking lot drainage;

         (ii) Are designed to prevent soil erosion;

         (iii) Occur only during wet weather;

         (iv) Are composed of only storm water runoff.

   b. Discharges composed of storm water runoff shall not alter natural ocean water quality in an ASBS.

   c. The discharge of trash is prohibited.

d. Only discharges from existing storm water outfalls are allowed. Any proposed or new storm water runoff discharge shall be routed to existing storm water discharge outfalls and shall not result in any new contribution of waste to an ASBS (i.e., no additional pollutant loading). “Existing storm water outfalls” are those that were constructed or under construction prior to January 1, 2005. “New contribution of waste” is defined as any addition of waste beyond what would have occurred as of January 1, 2005. A change to an existing storm water outfall, in terms of re-location or alteration, in order to comply with these special conditions, is allowed and does not constitute a new discharge.

e. Non-storm water discharges are prohibited except as provided below:

(1) The term “non-storm water discharges” means any waste discharges from a municipal separate storm sewer system (MS4) or other NPDES permitted storm drain system to an ASBS that are not composed entirely of storm water.

(2) The following non-storm water discharges are allowed, provided that the discharges are essential for emergency response purposes, structural stability, slope stability or occur naturally:

(i) Discharges associated with emergency fire fighting operations.

(ii) Foundation and footing drains.

(iii) Water from crawl space or basement pumps.

(iv) Hillside dewatering.

(v) Naturally occurring groundwater seepage via a storm drain.

(vi) Non-anthropogenic flows from a naturally occurring stream via a culvert or storm drain, as long as there are no contributions of anthropogenic runoff.

(3) Authorized non-storm water discharges shall not cause or contribute to a violation of the water quality objectives in Chapter II of the Ocean Plan nor alter natural ocean water quality in an ASBS.

2. Compliance Plans for Inclusion in Storm Water Management Plans (SWMP) and Storm Water Pollution Prevention Plans (SWPPP).

The discharger shall specifically address the prohibition of non-storm water runoff and the requirement to maintain natural water quality for storm water discharges to an ASBS in an ASBS Compliance Plan to be included in its SWMP or a SWPPP, as appropriate to permit type. If a statewide permit includes a SWMP, then the discharger shall prepare a stand-alone compliance plan for ASBS discharges . The ASBS Compliance Plan is subject to approval by the Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (for permits issued by Regional Water Boards).

a. The Compliance Plan shall include a map of surface drainage of storm water runoff, showing areas of sheet runoff, prioritize discharges, and describe any structural Best Management Practices (BMPs) already employed and/or BMPs to be employed in the future. Priority discharges are those that pose the greatest water quality threat and which are identified to require installation of structural BMPs. The map shall also show the storm water conveyances in relation to other features such as service areas, sewage conveyances and treatment facilities, landslides, areas prone to erosion, and waste and hazardous material storage areas, if applicable. The SWMP or SWPPP shall also include a procedure for updating the map and plan when changes are made to the storm water conveyance facilities.

b. The ASBS Compliance Plan shall describe the measures by which all non-authorized non-storm water runoff (e.g., dry weather flows) has been eliminated, how these measures will be maintained over time, and how these measures are monitored and documented.

c. For Municipal Separate Storm Sewer System (MS4s), the ASBS Compliance Plan shall require minimum inspection frequencies as follows:

(1) The minimum inspection frequency for construction sites shall be weekly during rainy season;

(2) The minimum inspection frequency for industrial facilities shall be monthly during the rainy season;

(3) The minimum inspection frequency for commercial facilities (e.g., restaurants) shall be twice during the rainy season; and

(4) Storm water outfall drains equal to or greater than 18 inches (457 mm) in diameter or width shall be inspected once prior to the beginning of the rainy season and once during the rainy season and maintained to remove trash and other anthropogenic debris.

d. The ASBS Compliance Plan shall address storm water discharges (wet weather flows) and, in particular, describe how pollutant reductions in storm water runoff, that are necessary to comply with these special conditions, will be achieved through BMPs. Structural BMPs need not be installed if the discharger can document to the satisfaction of the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that such installation would pose a threat to health or safety. BMPs to control storm water runoff discharges (at the end-of-pipe) during a design storm shall be designed to achieve on average the following target levels:

(1) Table B Instantaneous Maximum Water Quality Objectives in Chapter II of the Ocean Plan; or

(2) A 90% reduction in pollutant loading during storm events, for the applicant's total discharges. The baseline for the reduction is the effective date of the Exception. The baseline for these determinations is the effective date of the Exception, and the reductions must be achieved and documented within four (4) years of the effective date.

e. The ASBS Compliance Plan shall address erosion control and the prevention of anthropogenic sedimentation in ASBS. The natural habitat conditions in the ASBS shall not be altered as a result of anthropogenic sedimentation.

ADMINISTRATIVE DRAFT

f. The ASBS Compliance Plan shall describe the non-structural BMPs currently employed and planned in the future (including those for construction activities), and include an implementation schedule. The ASBS Compliance Plan shall include non-structural BMPs that address public education and outreach. Education and outreach efforts must adequately inform the public that direct discharges of pollutants from private property not entering an MS4 are prohibited. The ASBS Compliance Plan shall also describe the structural BMPs, including any low impact development (LID) measures, currently employed and planned for higher threat discharges and include an implementation schedule. To control storm water runoff discharges (at the end-of-pipe) during a design storm, permittees must first consider using LID practices to infiltrate, use, or evapotranspirate storm water runoff on-site.

g. The BMPs and implementation schedule shall be designed to ensure that natural water quality conditions in the receiving water are achieved and maintained by either reducing flows from impervious surfaces or reducing pollutant loading, or some combination thereof.

h. If the results of the receiving water monitoring described in IV.B. of these special conditions indicate that the storm water runoff is causing or contributing to an alteration of natural ocean water quality in the ASBS, the discharger shall submit a report to the State Water Board and Regional Water Board within 30 days of receiving the results.

(1) The report shall identify the constituents in storm water runoff that alter natural ocean water quality and the sources of these constituents.

(2) The report shall describe BMPs that are currently being implemented, BMPs that are identified in the SWMP or SWPPP for future implementation, and any additional BMPs that may be added to the SWMP or SWPPP to address the alteration of natural water quality. The report shall include a new or modified implementation schedule for the BMPs.

(3) Within 30 days of the approval of the report by the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits), the discharger shall revise its ASBS Compliance Plan to incorporate any new or modified BMPs that have been or will be implemented, the implementation schedule, and any additional monitoring required.

(4) As long as the discharger has complied with the procedures described above and is implementing the revised SWMP or SWPPP, the discharger does not have to repeat the same procedure for continuing or recurring exceedances of natural ocean water quality conditions due to the same constituent.

(5) Compliance with this section does not excuse violations of any term, prohibition, or condition contained in these Special Protections.

3. Compliance Schedule

a. On the effective date of the Exception, all non-authorized non-storm water discharges (e.g., dry weather flow) are effectively prohibited.

b. Within one year from the effective date of the Exception, the discharger shall submit a written ASBS Compliance Plan to the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that describes its strategy to comply with these special conditions, including the requirement to maintain natural water quality in the affected ASBS. The ASBS Compliance Plan shall include a time schedule to implement appropriate non-structural and structural controls (implementation schedule) to comply with these special conditions for inclusion in the discharger's SWMP or SWPPP, as appropriate to permit type.

c. Within 18 months of the effective date of the Exception, any non-structural controls that are necessary to comply with these special conditions shall be implemented.

d. Within four (4) years of the effective date of the Exception, any structural controls identified in the ASBS Compliance Plan that are necessary to comply with these special conditions shall be operational.

e. Within four (4) years of the effective date of the Exception, all dischargers must comply with the requirement that their discharges into the affected ASBS maintain natural ocean water quality. If the initial results of post-storm receiving water quality testing indicate levels higher than the 85^{th} percentile threshold of reference water quality data and the pre-storm receiving water levels, then the discharger must re-sample the receiving water, pre- and post-storm. If after re-sampling the post-storm levels are still higher than the 85^{th} percentile threshold of reference water quality data, and the pre-storm receiving water levels, for any constituent, then natural ocean water quality is exceeded. See attached Flowchart.

f. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may only authorize additional time to comply with the special conditions d. and e., above if good cause exists to do so. Good cause means a physical impossibility or lack of funding.

If a discharger claims physical impossibility, it shall notify the Board in writing within thirty (30) days of the date that the discharger first knew of the event or circumstance that caused or would cause it to fail to meet the deadline in d. or e. The notice shall describe the reason for the noncompliance or anticipated noncompliance and specifically refer to this Section of this Exception. It shall describe the anticipated length of time the delay in compliance may persist, the cause or causes of the delay as well as measures to minimize the impact of the delay on water quality, the measures taken or to be taken by the discharger to prevent or minimize the delay, the schedule by which the measures will be implemented, and the anticipated date of compliance. The discharger shall adopt all reasonable measures to avoid and minimize such delays and their impact on water quality.

The discharger may request an extension of time for compliance based on lack of funding. The request for an extension shall require:

(1) for municipalities, a demonstration of significant hardship to discharger ratepayers, by showing the relationship of storm water fees to annual household income for residents within the discharger's jurisdictional area, and the discharger has made timely and complete applications for all available bond and grant funding, and either no bond or grant funding is available, or bond and/or grant funding is inadequate; or

(2) for other governmental agencies, a demonstration and documentation of a good faith effort to acquire funding through that agency's budgetary process.

B. NONPOINT SOURCE DISCHARGES

[NOT INCLUDED]
[PROVISIONS FOR NONPOINT SOURCE DISCHARGES NOT APPLICABLE]

II. ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES

[NOT INCLUDED]
[ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES NOT APPLICABLE]

III. ADDITIONAL REQUIREMENTS – WATERFRONT AND MARINE OPERATIONS

[NOT INCLUDED]
[ADDITIONAL REQUIREMENTS FOR WATERFRONT AND MARINE OPERATIONS NOT APPLICABLE]

IV. MONITORING REQUIREMENTS

Monitoring is mandatory for all dischargers to assure compliance with the Ocean Plan. Monitoring requirements include both: (A) core discharge monitoring, and (B) ocean receiving water monitoring. The State and Regional Water Boards must approve sampling site locations and any adjustments to the monitoring programs. All ocean receiving water and reference area monitoring must be comparable with the Water Boards' Surface Water Ambient Monitoring Program (SWAMP).

Safety concerns: Sample locations and sampling periods must be determined considering safety issues. Sampling may be postponed upon notification to the State and Regional Water Boards if hazardous conditions prevail.

Analytical Chemistry Methods: All constituents must be analyzed using the lowest minimum detection limits comparable to the Ocean Plan water quality objectives. For metal analysis, all samples, including storm water effluent, reference samples, and ocean receiving water samples, must be analyzed by the approved analytical method with the lowest minimum detection limits (currently Inductively Coupled Plasma/Mass Spectrometry) described in the Ocean Plan.

A. CORE DISCHARGE MONITORING PROGRAM

1. General sampling requirements for timing and storm size:

   Runoff must be collected during a storm event that is greater than 0.1 inch and generates runoff, and at least 72 hours from the previously measurable storm event. Runoff samples shall be collected when post-storm receiving water is sampled, and analyzed for the same constituents as receiving water and reference site samples (see section IV B) as described below.

2. Runoff flow measurements

   a. For municipal/industrial storm water outfalls in existence as of December 31, 2007, 18 inches (457mm) or greater in diameter/width (including multiple outfall pipes in combination having a width of 18 inches, runoff flows must be measured or calculated, using a method acceptable to and approved by the State and Regional Water Boards.
   b. This will be reported annually for each precipitation season to the State and Regional Water Boards.

3. Runoff samples – storm events

   a. For outfalls equal to or greater than 18 inches (0.46m) in diameter or width:

      (1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and, within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination, ; and

      (2) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS

      (3) If an applicant has no outfall greater than 36 inches, then storm water runoff from the applicant's largest outfall shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates).

   b. For outfalls equal to or greater than 36 inches (0.91m) in diameter or width:

      (1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and, within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination; and

      (2) samples of storm water runoff shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates) and

      (3) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS.

   c. For an applicant not participating in a regional monitoring program [see below in Section IV (B)] in addition to (a.) and (b.) above, a minimum of the two largest outfalls or 20 percent of the larger outfalls, whichever is greater, shall be sampled (flow weighted composite samples) at least three times annually during wet weather (storm event) and analyzed for all Ocean Plan Table A constituents, Table B constituents for marine aquatic life protection (except for toxicity, only chronic toxicity for three species shall be required), DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, and Ocean Plan indicator bacteria. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one (the largest) such discharge shall be sampled annually in each Region.

4. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may reduce or suspend core monitoring once the storm runoff is fully characterized. This determination may be made at any point after the discharge is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.

B. OCEAN RECEIVING WATER AND REFERENCE AREA MONITORING PROGRAM

In addition to performing the Core Discharge Monitoring Program in Section II.A above, all applicants having authorized discharges must perform ocean receiving water monitoring. In order to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS, dischargers may choose either (1) an individual monitoring program, or (2) participation in a regional integrated monitoring program.

1. Individual Monitoring Program: The requirements listed below are for those dischargers who elect to perform an individual monitoring program to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within the affected ASBS. In addition to Core Discharge Monitoring, the following additional monitoring requirements shall be met:

   a. Three times annually, during wet weather (storm events), the receiving water at the point of discharge from the outfalls described in section (IV)(A)(3)(c) above shall be sampled and analyzed for Ocean Plan Table A constituents, Table B constituents for marine aquatic life, DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, salinity, chronic toxicity (three species), and Ocean Plan indicator bacteria.

      The sample location for the ocean receiving water shall be in the surf zone at the point of discharges; this must be at the same location where storm water runoff is sampled. Receiving water shall be sampled at approximately the same time prior to (pre-storm) and during (or immediately after) the same storm (post storm). Reference water quality shall also be sampled and analyzed for the same constituents pre-storm and post-storm, during the same storms when receiving water is sampled. Reference stations will be determined by the State Water Board's Division of Water Quality and the applicable Regional Water Board(s).

   b. Sediment sampling shall occur at least three times during every five (5) year period. The subtidal sediment (sand or finer, if present) at the discharge shall be sampled and analyzed for Ocean Plan Table B constituents for marine aquatic life, DDT, PCBs, PAHs, pyrethroids, and OP pesticides. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed.

c. A quantitative survey of intertidal benthic marine life shall be performed at the discharge and at a reference site. The survey shall be performed at least once every five (5) year period. The survey design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The results of the survey shall be completed and submitted to the State Water Board and Regional Water Board at least six months prior to the end of the permit cycle.

d. Once during each five (5) year period, a bioaccumulation study shall be conducted to determine the concentrations of metals and synthetic organic pollutants at representative discharge sites and at representative reference sites. The study design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The bioaccumulation study may include California mussels (Mytilus californianus) and/or sand crabs (Emerita analoga or Blepharipoda occidentalis). Based on the study results, the Regional Water Board and the State Water Board's Division of Water Quality, may adjust the study design in subsequent permits, or add or modify additional test organisms (such as shore crabs or fish), or modify the study design appropriate for the area and best available sensitive measures of contaminant exposure.

e. Marine Debris: Representative quantitative observations for trash by type and source shall be performed along the coast of the ASBS within the influence of the discharger's outfalls. The design, including locations and frequency, of the marine debris observations is subject to approval by the Regional Water Board and State Water Board's Division of Water Quality.

f. The monitoring requirements of the Individual Monitoring Program in this section are minimum requirements. After a minimum of one (1) year of continuous water quality monitoring of the discharges and ocean receiving waters, the Executive Director of the State Water Board (statewide permits) or Executive officer of the Regional Water Board (Regional Water Board permits) may require additional monitoring, or adjust, reduce or suspend receiving water and reference station monitoring. This determination may be made at any point after the discharge and receiving water is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.

2. Regional Integrated Monitoring Program: Dischargers may elect to participate in a regional integrated monitoring program, in lieu of an individual monitoring program, to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS. This regional approach shall characterize natural water quality, pre- and post-storm, in ocean reference areas near the mouths of identified open space watersheds and the effects of the discharges on natural water quality (physical, chemical, and toxicity) in the ASBS receiving waters, and should include benthic marine aquatic life and bioaccumulation components. The design of the ASBS stratum of a regional integrated monitoring program may deviate from the otherwise prescribed individual monitoring approach (in Section IV.B.1) if approved by the State Water Board's Division of Water Quality and the Regional Water Boards.

   a. Ocean reference areas shall be located at the drainages of flowing watersheds with minimal development (in no instance more than 10% development), and shall not be located in CWA Section 303(d) listed waterbodies or have tributaries that are 303(d) listed. Reference areas shall be free of wastewater discharges and anthropogenic non-storm water runoff. A minimum of low threat storm runoff discharges (e.g. stream highway overpasses and campgrounds) may be allowed on a case-by-case basis.

ADMINISTRATIVE DRAFT

Reference areas shall be located in the same region as the ASBS receiving water monitoring occurs. The reference areas for each Region are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean reference water samples must be collected from each station, each from a separate storm. A minimum of one reference location shall be sampled for each ASBS receiving water site sampled per responsible party. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.

b. ASBS ocean receiving water must be sampled in the surf zone at the location where the runoff makes contact with ocean water (i.e. at "point zero"). Ocean receiving water stations must be representative of worst-case discharge conditions (i.e. co-located at a large drain greater than 36 inches, or if drains greater than 36 inches are not present in the ASBS then the largest drain greater than18 inches.) Ocean receiving water stations are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean receiving water samples must be collected during each storm season from each station, each from a separate storm. A minimum of one receiving water location shall be sampled in each ASBS per responsible party in that ASBS. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.

c. Reference and receiving water sampling shall commence during the first full storm season following the adoption of these special conditions, and post-storm samples shall be collected when annual storm water runoff is sampled. Sampling shall occur in a minimum of two storm seasons. For those ASBS dischargers that have already participated in the Southern California Bight 2008 ASBS regional monitoring effort, sampling may be limited to only one storm season.

d. Receiving water and reference samples shall be analyzed for the same constituents as storm water runoff samples. At a minimum, constituents to be sampled and analyzed in reference and discharge receiving waters must include oil and grease, total suspended solids, Ocean Plan Table B metals for protection of marine life, Ocean Plan PAHs, pyrethroids, OP pesticides, ammonia, nitrate, phosphates, and critical life stage chronic toxicity for three species. In addition, within the range of the southern sea otter, indicator bacteria or some other measure of fecal contamination shall be analyzed.

3. Waterfront and Marine Operations: In addition to the above requirements for ocean receiving water monitoring, additional monitoring must be performed for marinas and boat launch and pier facilities:

   a. For all marina or mooring field operators, in mooring fields with 10 or more occupied moorings, the ocean receiving water must be sampled for Ocean Plan indicator bacteria, residual chlorine, copper, zinc, grease and oil, methylene blue active substances (MBAS), and ammonia nitrogen.

      (1) For mooring field operators opting for an individual monitoring program (Section IV.B.1 above), this sampling must occur weekly (on the weekend) from May through October.

(2) For mooring field operators opting to participate in a regional integrated monitoring program (Section IV.B.2 above), this sampling must occur monthly from May through October on a high use weekend in each month. The Water Boards may allow a reduction in the frequency of sampling, through the regional monitoring program, after the first year of monitoring.

b. For all mooring field operators, the subtidal sediment (sand or finer, if present) within mooring fields and below piers shall be sampled and analyzed for Ocean Plan Table B metals (for marine aquatic life beneficial use), acute toxicity, PAHs, and tributyltin. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed. This sampling shall occur at least three times during a five (5) year period. For mooring field operators opting to participate in a regional integrated monitoring program, the Water Boards may allow a reduction in the frequency of sampling after the first sampling effort's results are assessed.

ADMINISTRATIVE DRAFT

ATTACHMENT B

STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

1. Standard Permit Provisions

Code of Federal Regulations Title 40 Section 122.41 (40 CFR 122.41) includes conditions, or provisions, that apply to all National Pollutant Discharge Elimination System (NPDES) permits. Additional provisions applicable to NPDES permits are in 40 CFR 122.42. All applicable provisions in 40 CFR 122.41 and 40 CFR 122.42 must be incorporated into this Order and NPDES permit. The applicable 40 CFR 122.41 and 40 CFR 122.42 provisions are as follows:

a. DUTY TO COMPLY [40 CFR 122.41(a)]

The Copermittee must comply with all of the provisions of this permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application.

(1) The Copermittee must comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if the permit has not yet been modified to incorporate the requirement. [40 CFR 122.41(a)(1)]

(2) The CWA provides that any person who violates Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any such sections in a permit issued under Section 402, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to a civil penalty not to exceed $25,000 per day for each violation. The CWA provides that any person who *negligently* violates Section 301, 302, 306, 307, 308, 318, or 405 of the CWA, or any condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to criminal penalties of $2,500 to $25,000 per day of violation, or imprisonment of not more than 1 year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than $50,000 per day of violation, or by imprisonment of not more than 2 years, or both. Any person who *knowingly* violates such sections, or such conditions or limitations is subject to criminal penalties of $5,000 to $50,000 per day of violation, or imprisonment for not more than 3 years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than $100,000 per day of violation, or imprisonment of not more than 6 years, or both. Any person who knowingly violates Section 301, 302, 303, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of

ADMINISTRATIVE DRAFT

not more than $250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than $500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in Section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than $1,000,000 and can be fined up to $2,000,000 for second or subsequent convictions.
[40 CFR 122.41(a)(2)]

(3) Any person may be assessed an administrative penalty by the San Diego Regional Water Quality Control Board (San Diego Water Board), State Water Resources Control Board (State Water Board), or United States Environmental Protection Agency (USEPA) for violating Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed $10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed $25,000. Penalties for Class II violations are not to exceed $10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed $125,000.
[40 CFR 122.41(a)(3)]

b. DUTY TO REAPPLY [40 CFR 122.41(b)]

If a Copermittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the Copermittee must apply for and obtain a new permit.

c. NEED TO HALT OR REDUCE ACTIVITY NOT A DEFENSE [40 CFR 122.41(c)]

It shall not be a defense for a Copermittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

d. DUTY TO MITIGATE [40 CFR 122.41(d)]

The Copermittee must take all reasonable steps to minimize or prevent any discharge or prevent any discharge or sludge use or disposal in violation of this permit that has a reasonable likelihood of adversely affecting human health or the environment.

e. PROPER OPERATION AND MAINTENANCE [40 CFR 122.41(e)]

The Copermittee must at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Copermittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems that are installed by a Copermittee only when the operation is necessary to achieve compliance with the conditions of this permit.

f. PERMIT ACTIONS [40 CFR 122.41(f)]

This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Copermittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

g. PROPERTY RIGHTS [40 CFR 122.41(g)]

This permit does not convey any property rights of any sort, or any exclusive privilege.

h. DUTY TO PROVIDE INFORMATION [40 CFR 122.41(h)]

The Copermittee must furnish to the San Diego Water Board, State Water Board, or USEPA within a reasonable time, any information which the San Diego Water Board, State Water Board, or USPEA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit or to determine compliance with this permit. The Copermittee must also furnish to the San Diego Water Board, State Water Board, or USPEA upon request, copies of records required to be kept by this permit.

i. INSPECTION AND ENTRY [40 CFR 122.41(i)]

The Copermittee must allow the San Diego Water Board, State Water Board, USEPA, and/or their authorized representative (including an authorized contractor acting as their representative), upon presentation of credentials and other documents as may be required by law, to:

(1) Enter upon the Copermittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit; [40 CFR 122.41(i)(1)]

(2) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit; [40 CFR 122.41(i)(2)]

(3) Inspect and photograph at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; [40 CFR 122.41(i)(3)] and

(4) Sample or monitor at reasonable times, for the purpose of assuring permit compliance or as otherwise authorized by the CWA, any substances or parameters at any location. [40 CFR 122.41(i)(4)]

j. MONITORING AND RECORDS [40 CFR 122.41(j)]

(1) Samples and measurements taken for the purpose of monitoring must be representative of the monitored activity. [40 CFR 122.41(j)(1)]

(2) Except for records of monitoring information required by this permit related to the Copermittee's sewage sludge use and disposal activities, which shall be retained for a period of at least five (5) years (or longer as required by 40 CFR Part 503), the

Copermittee must retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board at any time. [40 CFR 122.41(j)(2)]

(3) Records for monitoring information must include: [40 CFR 122.41(j)(3)]

(a) The date, exact place, and time of sampling or measurements; [40 CFR 122.41(j)(3)(i)]
(b) The individual(s) who performed the sampling or measurements; [40 CFR 122.41(j)(3)(ii)]
(c) The date(s) analyses were performed; [40 CFR 122.41(j)(3)(iii)]
(d) The individual(s) who performed the analyses; [40 CFR 122.41(j)(3)(iv)]
(e) The analytical techniques or methods used; [40 CFR 122.41(j)(3)(v)] and
(f) The results of such analyses. [40 CFR 122.41(j)(3)(vi)]

(4) Monitoring must be conducted according to test procedures under 40 CFR Part 136 unless another method is required under 40 CFR Subchapters N or O. [40 CFR 122.41(j)(4)]

In the case of pollutants for which there are no approved methods under 40 CFR Part 136 or otherwise required under 40 CFR Subchapters N and O, monitoring must be conducted according to a test procedure specified in the permit for such pollutants. [40 CFR 122.44(i)(1)(iv)]

(5) The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or both. [40 CFR 122.41(j)(5)]

k. SIGNATORY REQUIREMENT [40 CFR 122.41(k)]

(1) All applications, reports, or information submitted to the San Diego Water Board, State Water Board, or USEPA must be signed and certified. (See 40 CFR 122.22) [40 CFR 122.41(k)(1)]

(a) *For a municipality, State, Federal, or other public agency.* [All applications must be signed] [b]y either a principal executive officer or ranking elected official. [40 CFR 122.22(a)(3)]

(b) All reports required by permits, and other information requested by the San Diego Water Board, State Water Board, or USEPA must be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if: [40 CFR 122.22(b)]

(i) The authorization is made in writing by a person described in paragraph (a) of this section; [40 CFR 122.22(b)(1)]

(ii) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company, (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) [40 CFR 122.22(b)(2)] and,

(iii) The written authorization is submitted to the San Diego Water Board and State Water Board. [40 CFR 122.22(b)(3)]

(c) *Changes to authorization.* If an authorization under paragraph (b) of this section is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (b) of this section must be submitted to the San Diego Water Board prior to or together with any reports, information, or applications to be signed by an authorized representative. [40 CFR 122.22(c)]

(d) *Certification.* Any person signing a document under paragraph (a) or (b) of this section shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." [40 CFR 122.22(d)]
