

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION**

1515 Clay Street, Suite 1400, Oakland, California 94612
waterboards.ca.gov/sanfranciscobay

**ORDER R2-2022-0038
NPDES PERMIT CA0038849**

**WASTE DISCHARGE REQUIREMENTS FOR MERCURY AND PCBs
FROM MUNICIPAL AND INDUSTRIAL WASTEWATER DISCHARGES TO
SAN FRANCISCO BAY**

The following dischargers are subject to waste discharge requirements (WDRs) set forth in this Order, for the purpose of implementing the San Francisco Bay Mercury and PCBs Total Maximum Daily Load (TMDL) wasteload allocations for municipal and industrial wastewater discharges to San Francisco Bay and its contiguous bay segments:

Table 1A. Municipal Discharger Information

Discharger	Facility Name	Facility Address	Minor/Major
American Canyon, City of	American Canyon Water Reclamation Facility	151 Mezzetta Court American Canyon, CA 94503 Napa County	Major
Benicia, City of	City of Benicia Wastewater Treatment Plant	614 East Fifth Street Benicia, CA 94510 Solano County	Major
Burlingame, City of	Burlingame Wastewater Treatment Plant	1103 Airport Boulevard Burlingame, CA 94010 San Mateo County	Major
Calistoga, City of	Calistoga City Dunaweal Wastewater Treatment Plant	1100 Dunaweal Lane Calistoga, CA 94515 Napa County	Minor
Central Contra Costa Sanitary District	Central Contra Costa Sanitary District Wastewater Treatment Plant	5019 Imhoff Place Martinez, CA 94553 Contra Costa County	Major
Central Marin Sanitation Agency	Central Marin Sanitation Agency Wastewater Treatment Plant	1301 Andersen Drive San Rafael, CA 94901 Marin County	Major
Crockett Community Services District	Port Costa Wastewater Treatment Plant	End of Canyon Lake Drive Port Costa, CA 94569 Contra Costa County	Minor
Delta Diablo	Delta Diablo Wastewater Treatment Plant	2500 Pittsburg-Antioch Highway Antioch, CA 94509 Contra Costa County	Major
East Bay Dischargers Authority (EBDA)	EBDA Common Outfall		
City of Hayward	Hayward Water Pollution Control Facility		

Discharger	Facility Name	Facility Address	Minor/Major
City of San Leandro	San Leandro Water Pollution Control Plant	EBDA Common Outfall 14150 Monarch Bay Drive San Leandro, CA 94577 Alameda County	Major
Oro Loma Sanitary District and Castro Valley Sanitary District	Oro Loma/Castro Valley Sanitary Districts Water Pollution Control Plant		
Union Sanitary District	Raymond A. Boege Alvarado Wastewater Treatment Plant		
Livermore-Amador Valley Water Management Agency	Livermore-Amador Valley Water Management Agency Export and Storage Facilities		
Dublin San Ramon Services District	Dublin San Ramon Services District Wastewater Treatment Plant		
City of Livermore	City of Livermore Water Reclamation Plant		
East Bay Municipal Utility District	East Bay Municipal Utility District, Special District No. 1 Wastewater Treatment Plant	2020 Wake Avenue Oakland, CA 94607 Alameda County	Major
Fairfield-Suisun Sewer District	Fairfield-Suisun Wastewater Treatment Plant	1010 Chadbourne Road Fairfield, CA 94534 Solano County	Major
Las Gallinas Valley Sanitary District	Las Gallinas Valley Sanitary District Sewage Treatment Plant	300 Smith Ranch Road San Rafael, CA 94903 Marin County	Major
Marin County (Paradise Cove), Sanitary District No. 5 of	Paradise Cove Treatment Plant	3700 Paradise Drive Tiburon, CA 94920 Marin County	Minor
Marin County (Tiburon), Sanitary District No. 5 of	Wastewater Treatment Plant	2001 Paradise Drive Tiburon, CA 94920 Marin County	Minor
Millbrae, City of	Water Pollution Control Plant	400 East Millbrae Avenue Millbrae, CA 94030 San Mateo County	Major
Mt. View Sanitary District	Mt. View Sanitary District Wastewater Treatment Plant	3800 Arthur Road Martinez, CA 94553 Contra Costa County	Major
Napa Sanitation District	Soscol Water Recycling Facility	1515 Soscol Ferry Road Napa, CA 94558 Napa County	Major
Novato Sanitary District	Novato Sanitary District Wastewater Treatment Plant	500 Davidson Street Novato, CA 94945 Marin County	Major
Palo Alto, City of	Palo Alto Regional Water Quality Control Plant	2501 Embarcadero Way Palo Alto, CA 94303 Santa Clara County	Major

Discharger	Facility Name	Facility Address	Minor/Major
Petaluma, City of	Ellis Creek Water Recycling Facility	3890 Cypress Drive Petaluma, CA 94954 Sonoma County	Major
Pinole, City of	Pinole-Hercules Water Pollution Control Plant	11 Tennent Avenue Pinole, CA, 94564 Contra Costa County	Major
Rodeo Sanitary District	Rodeo Sanitary District Water Pollution Control Facility	800 San Pablo Avenue Rodeo, CA 94572 Contra Costa County	Major
St. Helena, City of	City of St. Helena Wastewater Treatment and Reclamation Plant	1 Chaix Lane St. Helena, CA 94574 Napa County	Minor
San Francisco (San Francisco International Airport), City and County of	Mel Leong Treatment Plant, Sanitary Plant	Bldg. 924 Clearwater Drive San Francisco, CA 94128 San Mateo County	Major
San Francisco (Southeast Plant), City and County of	Southeast Water Pollution Control Plant	750 Phelps Street San Francisco, CA 94124 San Francisco County	Major
San Jose and Santa Clara, Cities of	San Jose/Santa Clara Water Pollution Control Plant	700 Los Esteros Road San Jose, CA 95134 Santa Clara County	Major
San Mateo, City of	Water Quality Control Plant	2050 Detroit Drive San Mateo, CA 94404 San Mateo County	Major
Sausalito-Marin City Sanitary District	Sausalito-Marin City Sanitary District Wastewater Treatment Plant	1 East Road Sausalito, CA 94965 Marin County	Major
Sewerage Agency of Southern Marin	Sewerage Agency of Southern Marin Wastewater Treatment Plant	450 Sycamore Avenue Mill Valley, CA 94941 Marin County	Major
Silicon Valley Clean Water	Silicon Valley Clean Water Wastewater Treatment Plant	1400 Radio Road Redwood City, CA 94065 San Mateo County	Major
Sonoma Valley County Sanitation District	Sonoma Valley County Sanitation District Wastewater Treatment Plant	22675 8th Street East Sonoma, CA 95476 Sonoma County	Major
South San Francisco and San Bruno, Cities of	South San Francisco and San Bruno Water Quality Control Plant	195 Belle Air Road South San Francisco, CA 94080 San Mateo County	Major
Sunnyvale, City of	Sunnyvale Water Pollution Control Plant	1444 Borregas Avenue, Sunnyvale, CA 94089 Santa Clara County	Major
Treasure Island Development Authority	Treasure Island Wastewater Treatment Plant	1220 Avenue M San Francisco, CA 94130 San Francisco County	Major

West County Wastewater District	West County Wastewater District Treatment Plant		
City of Richmond and Richmond Municipal Sewer District	Richmond Municipal Sewer District Water Pollution Control Plant		
Yountville, Town of	Town of Yountville Wastewater Reclamation Facility	7501 Solano Avenue Yountville, CA 94599 Napa County	Minor

Table 1B. Industrial Discharger Information

Discharger	Facility Name	Facility Address	Minor/Major
Non-Petroleum Refineries ^[1]			
C&H Sugar Company, Inc., and Crockett Community Services District, Crockett Sanitary Department	Joint Use Phillip F. Meads Water Treatment Plant	830 Loring Avenue Crockett, CA 94525 Contra Costa County	Major
Crockett Cogeneration, LP	Crockett Cogeneration Plant	550 Loring Avenue Crockett, CA 94525-1232 Contra Costa County	Minor
Eco Services Operations, LLC	Eco Services Martinez Plant	100 Mococo Road Martinez, CA 94553 Contra Costa County	Major
The Pittsburg Owner LPV, LLC ^[2]	Pittsburg Generating Station	696 W. 10th Street Pittsburg, CA 94565 Contra Costa County	Minor
USS-UPI, LLC	Pittsburg Plant	900 Loveridge Road Pittsburg, CA 94565 Contra Costa County	Major
Petroleum Refineries ^[1]			
Chevron Products Company	Richmond Refinery	841 Chevron Way Richmond, CA 94801 Contra Costa County	Major
Phillips 66	San Francisco Refinery	1380 San Pablo Avenue Rodeo, CA 94572-1354 Contra Costa County	Major
Martinez Refining Company, LLC	Martinez Refinery	3485 Pacheco Blvd Martinez CA 94553 Contra Costa County	Major
Tesoro Refining & Marketing Co.	Tesoro Martinez Facility	150 Solano Way Martinez, CA 94553 Contra Costa County	Major
Valero Refining Company	Valero Benicia Refinery	3400 East Second Street Benicia, CA 94510-1005 Solano County	Major

Footnotes:

^[1] Some facilities deemed as petroleum refineries in the Mercury TMDL no longer operate as petroleum refineries. However, this Order retains the previous order's nomenclature to remain consistent with the Mercury TMDL.

^[2] Upon the Regional Water Board's issuance of a notice to rescind The Pittsburg Owner LPV, LLC's individual NPDES permit (NPDES Permit CA0004880), The Pittsburg Owner LPV, LLC may submit a notice of termination of coverage under this Order to the Regional Water Board requesting expedited termination procedures under 40 C.F.R. § 122.64(c).

West County Wastewater District				

Discharger	Discharge Points	Discharge Point Latitude (North-South)	Discharge Point Longitude (East-West)	Receiving Water
City of Richmond and Richmond Municipal Sewer District				
Yountville, Town of	001	38.4065°	-122.3420°	Napa River

Footnotes:

- [1] These Dischargers share the North Bayside System Unit outfall, which serves as combined Discharge Point 002 into San Francisco Bay. However, each Discharger must comply with the requirements of this Order at its individual monitoring location specified in the individual NPDES permit listed in Attachment B of this Order.
- [2] The East Bay Dischargers Authority (EBDA) is a Joint Powers Agency (JPA) whose member agencies are the City of Hayward, City of San Leandro, Oro Loma and Castro Valley sanitary districts, and Union Sanitary District. The Livermore-Amador Valley Water Management Agency (LAVWMA) is another JPA whose member agencies include, in part, the Dublin San Ramon Services District and City of Livermore. The EBDA and LAVWMA member agencies, jointly or individually, own wastewater treatment plants and discharge secondary treated wastewater through the EBDA Common Outfall to Lower San Francisco Bay. Compliance with this Order's effluent limitations and monitoring requirements is measured at the EBDA Common Outfall (Discharge Point 001).
- [3] Discharge Point 002 is to a new San Pablo Bay wetland and will replace Discharge Point 001. The exact location (latitude and longitude) may change from what is indicated in this table.
- [4] The City of Petaluma may relocate its outfall to Discharge Point 002 during this Order term.
- [5] Discharge Point 002 will replace Discharge Point 001 after the Treasure Island Development Authority completes its planned facility.
- [6] The West County Agency is a JPA whose member agencies are the West County Wastewater District, City of Richmond, and Richmond Municipal Sewer District. The West County Wastewater District owns the West County Wastewater District Treatment Plant, and the City of Richmond and the Richmond Municipal Sewer District jointly own the Richmond Municipal Sewer District Water Pollution Control Plant. The member agencies discharge secondary treatment wastewater through the West County Agency Combined Outfall to Central San Francisco Bay. Compliance with this Order's effluent limitations and monitoring requirements is measured at the West County Agency Combined Outfall (Discharge Point 001).

Table 2B. Industrial Discharger Locations

Discharger	Discharge Points	Discharge Point Latitude (North-South)	Discharge Point Longitude (East-West)	Receiving Water
Non-Petroleum Refineries [1]				
C&H Sugar Company, Inc., and Crockett Community Services District, Crockett Sanitary Dept.	002 [2]	38.058333°	-122.224444°	Carquinez Strait
Crockett Cogeneration, LP	001	38.056111°	-122.218056°	Carquinez Strait
Eco Services Operations, LLC	001	38.0381°	-122.1180°	Carquinez Strait
The Pittsburg Owner LPV, LLC	001 [2]	38.0381°	-122.1180°	Suisun Bay
USS-UPI, LLC	001 [2]	38.030000°	-121.86444°	New York Slough
Petroleum Refineries [1]				
Chevron Products Company	001	37.970833°	-122.429167°	San Pablo Bay
Phillips 66 [1]	002	38.056111°	-122.261430°	San Pablo Bay
Martinez Refining Company, LLC	001	38.032222°	-122.128889°	Carquinez Strait
Tesoro Refining & Marketing Co.	001	38.048333°	-122.089444°	Suisun Bay
Valero Refining Company	001 [3]	38.05500°	-122.11980°	Suisun Bay

Footnotes:

- [1] Some facilities deemed as petroleum refineries in the Mercury TMDL no longer operate as petroleum refineries. However, this Order retains the previous order's nomenclature to remain consistent with the Mercury TMDL.
- [2] This Order applies to the mercury discharges from internal waste streams discharged through these discharge points, and not to any once through cooling water discharges.
- [3] Latitude and longitude may change with outfall upgrade as specified in the Discharger's individual NPDES permit listed in Attachment B of this Order.

This Order was adopted on:

December 14, 2022

This Order shall become effective on:

February 1, 2023

This Order shall expire on:

January 31, 2028

I hereby certify that this Order with all attachments is a full, true, and correct copy of the Order adopted by the Regional Water Board on the date indicated above.

Eileen White, Executive Officer

1. FACILITY INFORMATION

Information describing the facilities subject to this Order is summarized in Tables 1A and 1B and in Fact Sheet (Attachment F) sections 1 and 2.

2. FINDINGS

The Regional Water Board finds the following:

- 2.1. Legal Authorities.** This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as an NPDES permit for point source discharges of mercury and PCBs from the Discharger facilities listed in Attachment B to surface waters.
- 2.2. Background and Rationale for Requirements.** The Regional Water Board developed the requirements in this Order based on the detailed technical analyses that provide the foundation for the Mercury and PCBs TMDLs. The Fact Sheet (Attachment F) contains background information and rationale for the requirements in this Order and is hereby incorporated into and constitutes findings for this Order. Attachments A, B, C, and E are also incorporated into this Order.
- 2.3. Notification of Interested Parties.** The Regional Water Board notified the Dischargers and interested agencies and persons of its intent to prescribe these WDRs and has provided an opportunity to submit written comments and recommendations. Fact Sheet section 8.1 provides details regarding the notification.
- 2.4. Consideration of Public Comment.** The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Fact Sheet section 8.3 provides details regarding the public hearing.

THEREFORE, IT IS HEREBY ORDERED that Order R2-2017-0041 (previous order), as amended by Orders R2-2016-0008 and R2-2021-0028, is rescinded upon the effective date of this Order, except for enforcement purposes, and, in order to meet the provisions contained in Water Code division 7 (commencing with § 13000) and regulations adopted thereunder and the provisions of the CWA and regulations and guidelines adopted thereunder, the Dischargers shall comply with the requirements in this Order. This action in no way prevents the Regional Water Board from taking enforcement action for violations of the previous order.

3. DISCHARGE PROHIBITIONS

This Order does not establish additional discharge prohibitions beyond those established in the individual NPDES permits listed in Attachment B of this Order.

4. EFFLUENT LIMITATIONS

4.1. Municipal Discharger Effluent Limitations. Municipal Dischargers shall comply with the following mass and concentration effluent limitations at discharge points and monitoring locations specified in the Monitoring and Reporting Program (MRP) (Attachment E).

Aggregate Mass Emission Limit (kg/yr) ^{[1],[4]}	11	Not Applicable	Not Applicable

Footnotes:

^[1] Compliance with the Average Annual Effluent Limitations is determined annually for each Municipal Discharger each calendar year and is attained if the sum of all individual Municipal Dischargers' mercury mass emissions, calculated as described below, is not greater than the Aggregate Mass Emission Limit of 11 kg/yr. If the sum of all individual Municipal Dischargers' mercury mass emissions is greater than 11 kg/yr, the Municipal Dischargers whose mercury mass emissions exceed their individual limitations in Table 3A shall be deemed to be in violation of their mercury mass limitations. For compliance determination, mass emissions shall be determined as defined below:

- a. The total annual aggregate mass emission shall be the sum of the individual annual mass emissions from each Municipal Discharger. The sum shall be rounded to the nearest kilogram for comparison with the 11 kg/yr limit.
- b. The annual average mass emission for each Discharger shall be computed for the period January 1 through December 31, annually.

- c. The annual average mass emission for each Discharger listed in Table 3A shall be the arithmetic average of available quarterly mass emissions as follows:

$$\text{Annual Mass Emission, kg/year} = \sum (\text{Quarterly Mass Emission Rates, kg/quarter})$$

Or, for Dischargers with less frequent mercury monitoring than quarterly, the Annual Mass Emission shall be computed using the arithmetic average of available quarterly mass emissions as follows:

$$\text{Annual Mass Emission, kg/year} = \left(\frac{\sum \text{Quarterly Mass Emission, kg/quarter}}{\text{Number of Quarterly Mass Emissions Calculated}} \right) * 4 \text{ quarters/year}$$

where:

$$\text{Quarterly Mass Emission, kg/quarter} = \left(\frac{0.003785}{N} \right) * \left(\sum_{i=1}^N Q_i C_i \right) * 91.5 = \frac{0.34633}{N} * \left(\sum_{i=1}^N Q_i C_i \right)$$

and where:

- C_i = mercury concentration of each individual sample, $\mu\text{g/L}$
- Q_i = Discharger flow rate on date of sample, millions of gallons per day (MGD)
- N = number of samples collected during the quarter
- 0.003785 = conversion factor to convert $(\mu\text{g/L}) * (\text{MGD})$ into kg/day
- 91.5 = number of days in a standard quarter
- 0.34633 = product of (conversion factor)*(number of standard days per quarter)

The quarterly mass emission shall be calculated at the end of each quarterly period as defined in the Discharger's individual NPDES permit listed in Attachment B of this Order.

For intermittent Dischargers (Dischargers that do not discharge every day in a calendar quarter, or that have no discharge for an entire quarter [$Q_i = 0$]), Q_i shall be computed as follows:

$$Q_i = \left(\frac{\sum_{d=1}^D Q_d}{91.5} \right)$$

where:

- Q_d = total flow for the day when discharge occurred, million gallons
- D = total number of days where discharge occurred in a quarter
- 91.5 = number of days in a standard quarter

- d. The Quarterly Mass Emission for a Discharger that provides recycled wastewater for industrial supply shall include the effluent discharge adjustment granted to the Industrial Discharger for its recycled wastewater use as described in Provision 6.3.5 of this Order. The quarterly effluent discharge adjustment mass shall be reported in each Self-Monitoring Report due at the end of a quarterly period, as defined in the Discharger's individual permit, and noted in the Annual Report.
- ^[2] Delta Diablo may, as its option, apply a discharge adjustment to its discharge concentrations or mass emission to be subtracted from the final discharge concentrations or mass emission when determining compliance with its limits. The adjustment shall be based on measured mercury and PCBs levels from the reverse osmosis concentrate it receives from the City of Antioch's Brackish Water Desalination Project. The method for calculating and applying the adjustment shall be consistent with Provision 6.3.5 of this Order, where C_i and Q_i correspond to the reverse osmosis concentrate mercury concentration and flow volume.
- ^[3] EBDA's mass emissions shall be calculated using the mercury concentration sampled at the EBDA Common Outfall (Discharge Point 001) times the combined average daily flows discharged from the EBDA Common Outfall and the Oro Loma/Castro Valley Sanitary Districts Water Pollution Control Plant's local outfall (covered under NPDES Permit CA0037559) on the same day as EBDA's mercury sampling.
- ^[4] The total differs slightly from the column sum due to rounding to the nearest kilogram.

Tesoro Refining & Marketing Co.	0.11	0.079	0.12
Valero Refining Company	0.08	0.079	0.12
Aggregate Mass Emission Limit (kg/yr) ^[2]	1.0	Not Applicable	Not Applicable

Footnotes:

^[1] Compliance with the Average Annual Effluent Limitations is determined annually for each Municipal Discharger each calendar year and is attained if the sum of all individual Municipal Dischargers' mercury mass emissions, calculated as described below, is not greater than the Aggregate Mass Emission Limit of 1.0 kg/yr. If the sum of all individual Industrial Dischargers' mercury mass emissions is greater than 1.0 kg/yr, the Industrial Dischargers whose mercury mass emissions exceed their individual limitations in Table 4A shall be deemed to be in violation of their mercury mass limitations. For compliance determination, mass emissions shall be determined as defined below:

- a. The total annual aggregate mass emission shall be the sum of the individual annual mass emissions from each Industrial Discharger. The sum shall be rounded to the nearest kilogram for comparison with the 1.0 kg/yr limit.
- b. The annual average mass emission for each Discharger shall be computed for the period January 1 through December 31, annually.
- c. The annual average mass emission for each Discharger listed in Table 4A shall be the arithmetic average of available quarterly mass emissions as follows:

$$\text{Annual Mass Emission, kg/year} = \sum (\text{Quarterly Mass Emission Rates, kg/quarter})$$

Or, for Dischargers with less frequent mercury monitoring than quarterly, the Annual Mass Emission shall be computed using the arithmetic average of available quarterly mass emissions as follows:

$$\text{Annual Mass Emission, kg/year} = \left(\frac{\sum \text{Quarterly Mass Emission, kg/quarter}}{\text{Number of Quarterly Mass Emissions Calculated}} \right) * 4 \text{ quarters/year}$$

where:

$$\text{Quarterly Mass Emission, kg/quarter} = \left(\frac{0.003785}{N} \right) * \left(\sum_{i=1}^N Q_i C_i \right) * 91.5 = \frac{0.34633}{N} * \left(\sum_{i=1}^N Q_i C_i \right)$$

and where:

- C_i = mercury concentration of each individual sample, µg/L
- Q_i = Discharger flow rate on date of sample, millions of gallons per day (MGD)
- N = number of samples collected during the quarter
- 0.003785 = conversion factor to convert (µg/L)*(MGD) into kg/day
- 91.5 = number of days in a standard quarter
- 0.34633 = product of (conversion factor)*(number of standard days per quarter)

The quarterly mass emission shall be calculated at the end of each quarterly period as defined in the Discharger's individual NPDES permit listed in Attachment B of this Order.

For intermittent Dischargers (Dischargers that do not discharge every day in a calendar quarter, or that have no discharge for an entire quarter [$Q_i = 0$]), Q_i shall be computed as follows:

$$Q_i = \left(\frac{\sum_{d=1}^D Q_d}{91.5} \right)$$

where:

Q_d = total flow for the day when discharge occurred, million gallons

D = total number of days where discharge occurred in a quarter

91.5 = number of days in a standard quarter

Dischargers shall average duplicate samples when reporting a sample result for mass emission calculations (or report the median if one or more of the duplicates is DNQ or ND).

- d. For an Industrial Discharger that uses treated recycled wastewater for industrial supply from a Municipal Discharger named in this Order, the Industrial Discharger shall subtract from its Quarterly Mass Emission in footnote c, above, an adjustment for the recycled water used and discharged through its discharge point as provided in Provision 6.3.5 of this Order. The Industrial Discharger shall report this effluent discharge adjustment mass to the Municipal Discharger that provided the recycled wastewater within 15 days following the end of the calendar quarter for which an adjustment is applied and shall report the adjustment in each Self-Monitoring Report due at the end of a quarterly period, as defined in the Discharger's individual permit, and in its Annual Report.

^[2] The total differs slightly from the column sum due to rounding to the nearest kilogram.

Table 4B. PCBs Effluent Limitations for Industrial Dischargers

Discharger	Average Monthly Effluent Limit (µg/L) ^[1]	Maximum Daily Effluent Limit (µg/L) ^[1]

Footnote:

^[1] Dischargers shall use U.S. EPA Method 608.3 or 625.1 for Aroclor monitoring. These data will be used to assess compliance with the above limits. Non-detected and/or estimated values shall be treated as zeros in the calculation of Total PCBs.

5. RECEIVING WATER LIMITATIONS

This Order does not establish additional receiving water limitations beyond those established in the individual NPDES permits listed in Attachment B of this Order.

6. PROVISIONS

6.1. Standard Provisions

- 6.1.1. The Dischargers shall comply with all “Standard Provisions” in Attachment D (as amended) of their individual NPDES permits listed in Attachment B of this Order.
- 6.1.2. The Dischargers shall comply with all applicable provisions of the “Regional Standard Provisions, and Monitoring and Reporting Requirements for NPDES Wastewater Discharge Permits” in Attachment G (as amended) of their individual NPDES permits listed in Attachment B of this Order.
- 6.1.3. If there is any conflict, duplication, or overlap between provisions in this Order, the more stringent provision shall apply.

6.2. Monitoring and Reporting Provisions

The Dischargers shall comply with the Monitoring and Reporting Program (MRP, Attachment E) and future revisions thereto, and applicable monitoring and reporting requirements in Attachments D and G (as amended) of their individual NPDES permits listed in Attachment B of this Order. Notwithstanding Provision 6.1.3, the MRP in Attachment E of this Order shall apply over any more stringent, conflicting, duplicative, or overlapping requirement in Attachments D and G of the individual NPDES permits listed in Attachment B of this Order. Between the MRP in Attachment E of this Order and the MRP in individual NPDES permits listed in Attachment B of this Order, the more stringent MRP shall apply.

6.3. Special Provisions

6.3.1. Reopener Provision

The Regional Water Board may modify or reopen this Order prior to its expiration date if there is modification of the San Francisco Bay Mercury or PCBs TMDL implementation provisions.

6.3.2. Triggers for Additional Mercury Control

- 6.3.2.1. Each individual Discharger shall comply with the tasks specified in Provision 6.3.2.3 of this Order if its discharge exceeds any of the applicable mercury triggers described in Tables 5 and 6.

Table 5. Mercury Triggers for Municipal Dischargers

Treatment Plant Type	Trigger Type	Average Monthly	Maximum Daily
Secondary	Mercury Concentration	0.041 µg/L	0.065 µg/L
Advanced Secondary	Mercury Concentration	0.011 µg/L	0.021 µg/L

All	Mass Emission	Individual annual mass emission limit, as depicted in Table 3A, above, and computed as a 12-month running average, as shown in Provision 6.3.2.2, below.
-----	---------------	--

Table 6. Mercury Triggers for Industrial Dischargers

Trigger Type	Average Monthly	Maximum Daily
Mercury Concentration	0.037 µg/L	0.062 µg/L
Mass Emission	Individual annual mass emission limit, as depicted in Table 4A, above, and computed as a 12-month running average, as shown in Provision 6.3.2.2, below.	

6.3.2.2. The running 12-month average mercury mass emission shall be calculated at the end of each quarterly period as defined in each Discharger’s individual NPDES permit listed in Attachment B of this Order, as follows:

$$(12\text{-month running average, kg}) = (\text{current quarter's mass emission, kg}) + \sum (\text{Previous 3 quarters' mass emissions, kg})$$

where the current quarter’s mass emission is computed as shown in Section 4 (Effluent Limitations), footnote 1c of Tables 3A and 4A, above.

6.3.2.3. Each Discharger that exceeds any of the applicable triggers for mercury listed in Table 5 or 6, above, shall comply with the following action requirements:

Table 7. Action Plan Required in Response to Mercury Trigger Exceedance

Task ^[1]	Task Description	Deadline
a	Accelerated Sampling. As soon as the Discharger becomes aware of an exceedance of a mercury trigger, re-sample within 48 hours and commence at minimum weekly sampling for a total of at least six new samples. If all six new samples show mercury levels below the triggers, return to routine sampling. If during the accelerated sampling (1) any of the new samples are above the maximum daily trigger, or (2) the monthly average of the new samples is above the monthly trigger, or (3) the 12-month running average mass is above the mass trigger, then proceed with an action plan for mercury reduction and continue sampling monthly until the observed mercury discharge is below the triggers for three consecutive months, at which point the Discharger shall complete the reporting of this exceedance as required by tasks b and d , below, and return to routine monitoring, and discontinue efforts under task c , below.	See deadlines in task description.
b	Trigger Exceedance Reporting. Report to the Regional Water Board any exceedance of mercury triggers in the cover letter of Self-Monitoring Report and the status of plans and actions to accelerate monitoring and/or develop and implement an action plan for mercury reduction.	In Self-Monitoring Report due 30 days after end of monitoring period.
c	Action Plan for Mercury Reduction. Develop, submit, and implement an Action Plan that (1) evaluates the cause ^[2] of trigger exceedances, (2) evaluates the effectiveness of existing pollution prevention or pretreatment programs and methods for preventing future	Within 130 days of initial trigger exceedance.

Task ^[1]	Task Description	Deadline
	exceedances, (3) evaluates the feasibility and effectiveness of technology enhancements to improve treatment plant performance, and (4) evaluates other measures for preventing future exceedances. In addition, identify in the Action Plan mercury reduction measures to be implemented, along with an implementation schedule for those measures, to correct current and prevent future trigger exceedances.	
d	Annual Reporting. Provide a status of its mercury reduction efforts in the annual Self-Monitoring Report. Additionally, as causes and corrective actions are identified, the Discharger shall amend or supplement its Action Plan as appropriate. Such changes shall be reported to the Regional Water Board in the Discharger's Annual Self-Monitoring Report.	February 1 of each year until Discharger demonstrates compliance with trigger for continuous 3-month period of sampling.

Footnotes:

^[1] Refer to Appendix F-1 for an example of responding to a mercury trigger.

^[2] Possible causes of exceedances include (but are not limited to) changes in reclamation; increases in the number of sewer connections; increases in infiltration and inflow (I/I); changes in the type or number of industrial, commercial, or residential sources; changes in the raw material used in manufacturing processes; changes in treatment system operation; or factors beyond the Discharger's control, such as a natural disaster, vandalism, illegal dumping, or extreme flood event.

6.3.3. Mercury and PCBs Source Control Programs. Each Discharger shall evaluate whether there are controllable sources of mercury or PCBs to its wastewater system (e.g., PCBs-containing industrial equipment for PCBs, discharges from amalgam-generating dental practices for mercury). The Discharger shall continue to implement and look for opportunities to improve existing measures to control such sources. Each Discharger shall submit the results of this evaluation, including any proposed control actions and implementation schedules, in its annual pollution prevention reports required by its individual NPDES permit.

6.3.4. Risk Reduction Programs. Each Discharger shall continue to implement and participate in programs to reduce mercury and PCBs-related risks to humans from consumption of San Francisco Bay and Sacramento San Joaquin River Delta fish. This requirement may be satisfied by a combination of related efforts through the Regional Monitoring Program or other similar collaborative efforts. Each Discharger shall describe the progress of its efforts in its Annual Self-Monitoring Report. Alternatively, the Bay Area Clean Water Agencies (BACWA) may fulfill the annual reporting requirement by providing a summary of annual risk reduction program efforts for agencies that choose to participate through BACWA.

6.3.5. Mercury and PCBs Discharge Adjustments for Recycled Wastewater Use by Industrial Dischargers. When an Industrial Discharger listed in Table 1B uses recycled wastewater from a Municipal Discharger listed in Table 1A, the Industrial Discharger may, at its option, apply a discharge adjustment (hereinafter Mercury or PCBs Adjustment) to its mercury or PCBs discharge concentration or mercury mass emission to be subtracted from the final discharge concentration or mass emission when determining compliance with

its concentration and mass limits specified in Tables 4A and 4B. The Industrial Discharger may also use its own recycled wastewater to receive a mercury or PCBs concentration adjustment. The Mercury or PCBs Adjustment shall be based on measured influent mercury and PCBs levels from the recycled wastewater in accordance with the following:

- 6.3.5.1. **Monitoring Frequencies.** The Industrial Discharger shall sample and analyze the influent recycled wastewater and the effluent discharge at least semi-annually for mercury and annually for PCBs. Influent sampling shall include measurement of daily flow volume for the entire duration that the Mercury or PCBs Adjustment is applied. Influent sampling shall occur at an appropriate influent monitoring location as identified in the Discharger's individual permit.
- 6.3.5.2. **Time Intervals between Influent and Effluent Sampling.** The Industrial Discharger shall determine the time interval (i.e., lag time) between sampling a given constituent of concern in the influent recycled water and sampling the same water for the constituent when it appears in the final effluent. The basis for this determination shall be included in any calculation of a Mercury or PCBs Adjustment.
- 6.3.5.3. **Adjustment Calculation Procedure**
- 6.3.5.3.1. **Concentration Adjustment.** The Mercury or PCBs Adjustment for concentration shall be calculated as follows:

$$(C_i - C_p) \times Q_t \div Q_y$$

where:

C_i = Recycled water influent mercury or PCBs concentration, $\mu\text{g/L}$

C_p = Potable water influent mercury or PCBs concentration, $\mu\text{g/L}$

Q_t = Total influent recycled water flow volume corresponding to the appropriate monitoring period and no less than annually (e.g., quarterly flow volume for mercury and annual flow volume for PCBs), million gallons

Q_y = Total effluent flow volume corresponding to the appropriate monitoring period and lag time (e.g., Y days) after influent is sampled, million gallons

Example: Mercury is monitored quarterly. The lag time is Y days.

Step 1: $\{(\text{influent concentration of mercury in recycled wastewater, } C_i) - (\text{influent concentration of mercury in potable water, } C_p)\} \times$

(total influent volume of recycled wastewater for the quarter, Q_t) =
(influent mass of mercury from recycled wastewater for the
quarter)

Step 2: (influent mass) ÷ (total effluent discharge volume for the quarterly
period, Y days after influent sampled, Q_y) = (Mercury Adjustment
to be subtracted from the concentration of mercury in the
discharge, valid for that quarter)

6.3.5.3.2. **Mass Adjustment.** The Mercury Adjustment for mass shall be calculated
as follows:

$$(C_i - C_p) \times Q_t$$

where

C_i = Recycled water influent mercury concentration, $\mu\text{g/L}$

C_p = Potable water influent mercury concentration, $\mu\text{g/L}$

Q_t = Total influent recycled water flow volume corresponding to the
appropriate monitoring period and no less than annually (e.g.,
quarterly flow volume for mercury and annual flow volume for PCBs),
million gallons

Example: Mercury is monitored quarterly. The lag time is Y days.

Step: $\{($ influent concentration of mercury in recycled wastewater, C_i) –
(influent concentration of mercury in potable water, C_p) $\} \times$ (total
influent volume of recycled wastewater for the quarter, Q_t) =
(influent mass of mercury from recycled wastewater, or Mercury
Adjustment to be subtracted from the quarterly mass emission,
valid for that quarter, and to be reported to the Municipal
Discharger that provided the recycled wastewater)

6.3.5.4. **Effluent Limit Exceedance.** If an Industrial Discharger opts to apply a Mass
Adjustment after receiving recycled wastewater from a Municipal Discharger
listed in Table 1A, the Regional Water Board shall transfer that adjustment to
the mass emission for the corresponding discharge interval from the
Municipal Discharger that is the producer and source of the recycled
wastewater. If this reverse adjustment results in an adjusted mass discharge
level above both of the following criteria, then that Municipal Discharger is in
violation of its Annual Average Effluent Limit and is subject to Regional Water
Board enforcement:

6.3.5.4.1. **Individual Mass Adjustment.** The sum of the adjusted mass discharge
levels from the Industrial Discharger and the Municipal Discharger

exceeds the sum of the individual Average Annual Effluent Limits for these two Dischargers; and

- 6.3.5.4.2. **Aggregate Mass Adjustment.** The adjusted mass discharge levels from the Municipal Discharger results in an aggregate mass emission from all Municipal Dischargers that exceeds the Aggregate Mass Emission Limit for Municipal Dischargers.
- 6.3.6. **PCBs Discharge Adjustment for Urban Stormwater Treatment by Municipal Dischargers.** When a Municipal Discharger listed in Table 1A accepts and treats urban runoff that is diverted from municipal separate storm sewer systems to all or parts of its wastewater treatment facility, the Municipal Discharger may, at its option, apply an adjustment (hereinafter Runoff Adjustment) to its PCBs discharge concentration when determining compliance with its concentration limits specified in Table 3B, provided that the total mass used in Runoff Adjustments from all Municipal Dischargers does not exceed 1 kg/year. The Runoff Adjustment shall be based on measured influent PCBs levels from urban runoff in accordance with the following:
- 6.3.6.1. **Representative Samples.** The Municipal Discharger shall have data from a representative sample or samples of the urban runoff targeted for diversion. Separate sampling shall be conducted to characterize dry weather diversions and wet weather diversions. The Discharger shall measure daily flow volumes for the entire duration that the Runoff Adjustment is to be applied. The Discharger shall measure these flows at an appropriate influent monitoring location as identified in the Discharger's individual permit and shall categorize each diversion as a dry weather diversion or a wet weather diversion.
- 6.3.6.2. **Adjustment Calculation Procedure.** The PCBs Runoff Adjustment shall be calculated as follows:

$$[(C_{di} \times Q_{dr}) + (C_{wi} \times Q_{wr})] \div Q_t$$

where

C_{di} = Dry weather urban runoff influent PCBs concentration, $\mu\text{g/L}$

Q_{dr} = Total dry weather influent urban runoff flow volume corresponding to the appropriate monitoring period for the dry season (e.g., semi-annual flow volume), million gallons

C_{wi} = Wet weather urban runoff influent PCBs concentration, $\mu\text{g/L}$

Q_{wr} = Total wet weather influent urban runoff flow volume corresponding to the appropriate monitoring period for the wet season (e.g., semi-annual flow volume), million gallons

Q_t = Total effluent flow volume corresponding to the appropriate monitoring period, million gallons

Example: PCBs are monitored twice during the Order term; once during dry weather (May 1 through October 31) and once during the wet weather (November 1 through April 30).

Step 1: $\{(\text{influent urban runoff concentration of PCBs in dry weather, } C_{di}) \times (\text{total influent urban runoff volume of dry weather diversion for the dry season, } Q_{dr}) + (\text{influent urban runoff concentration of PCBs in wet weather, } C_{wi}) \times (\text{total influent urban runoff volume of wet weather diversion for the wet season, } Q_{wr})\} = (\text{influent mass of PCBs from urban runoff})$

Step 2: $(\text{influent mass}) \div (\text{total effluent discharge volume for the monitoring period, } Q_t) = (\text{Runoff Adjustment to be subtracted from the concentration of PCBs, valid for that monitoring period})$

ATTACHMENT A – DEFINITIONS AND ABBREVIATIONS

DEFINITIONS

Arithmetic Mean (μ)

Also called the average, sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

$$\text{Arithmetic mean} = \mu = \Sigma x / n$$

where: Σx is the sum of the measured ambient water concentrations,
and n is the number of samples

Average Monthly Effluent Limitation (AMEL)

Highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)

Highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Bioaccumulative

Taken up by an organism from its surrounding medium through gill membranes, through epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Carcinogenic

Known to cause cancer in living organisms.

Coefficient of Variation (CV)

Measure of data variability calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

Daily Discharge

Either: (1) the total mass of a constituent discharged over a calendar day (12:00 a.m. through 11:59 p.m.) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit) for a constituent with limitations expressed in units of mass; or (2) the unweighted arithmetic mean measurement of a constituent over a day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period is considered the result for the calendar day in which the 24-hour period ends.

Detected, but Not Quantified (DNQ)

Sample results less than the RL, but greater than or equal to the laboratory's MDL. Sample results reported as DNQ are estimated concentrations.

Dilution Credit

Amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio or determined through conducting a mixing zone study or modeling of the discharge and receiving water.

Effluent Concentration Allowance (ECA)

Value derived from the water quality criterion or objective, dilution credit, and ambient background concentration that is used, in conjunction with the CV for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as wasteload allocation (WLA) as used in U.S. EPA guidance (*Technical Support Document for Water Quality-based Toxics Control*, March 1991, second printing, EPA/505/2-90-001).

Enclosed Bays

Indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

Estimated Chemical Concentration

Concentration that results from the confirmed detection of a substance below the ML by the analytical method.

Estuaries

Waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters are considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater. Estuarine waters included, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220; Suisun Bay; Carquinez Strait downstream to the Carquinez Bridge; and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

Inland Surface Waters

All surface waters of the state that are not the ocean, enclosed bays, or estuaries.

Instantaneous Maximum Effluent Limitation

Highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation

Lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Maximum Daily Effluent Limitation (MDEL)

Highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median

Middle measurement in a data set. The median of a data set is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2+1)})/2$ (i.e., the midpoint between $n/2$ and $n/2+1$).

Method Detection Limit (MDL)

Minimum concentration of a substance that can be reported with 99 percent confidence that the measured concentration is distinguishable from method blank results, as defined in 40 C.F.R. part 136, Appendix B.

Minimum Level (ML)

Concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Mixing Zone

Limited volume of receiving water allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

Not Detected (ND)

Sample results less than the laboratory's MDL.

Persistent Pollutants

Substances for which degradation or decomposition in the environment is nonexistent or very slow.

Pollutant Minimization Program

Program of waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of a Pollutant Minimization Program is to reduce all potential sources of a priority pollutant through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. Cost effectiveness may be considered when establishing the requirements of a Pollutant Minimization Program. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), is considered to fulfill the Pollutant Minimization Program requirements.

Pollution Prevention

Any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State Water Resources Control Board or Regional Water Board.

Reporting Level (RL)

ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order, including an additional factor if applicable as discussed herein. For priority pollutants, the MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from State Implementation Plan (SIP) Appendix 4 in accordance with SIP section 2.4.2 or established in accordance with SIP section 2.4.3. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Source of Drinking Water

Any water designated as municipal or domestic supply (MUN) beneficial use.

Standard Deviation (σ)

Measure of variability calculated as follows:

$$\text{Standard deviation} = \sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where: x is the observed value
 μ is the arithmetic mean of the observed values
 n is the number of samples

Toxicity Reduction Evaluation (TRE)

Study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. A TIE is a set of procedures to identify the specific chemicals responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

ABBREVIATIONS

%	Percent
µg/L	Micrograms per liter
1/Month	Once per month
1/Quarter	Once per quarter
1/Week	Once per week
1/Year	Once per year
2/Year	Twice per year
AMEL	Average monthly effluent limitation
AWEL	Average weekly effluent limitation
B	Background concentration
C	Water quality criterion or objective
C-24	24-hour composite
Continuous	Measured continuously
Continuous/D	Measured continuously, and recorded and reported daily
Continuous/H	Measured continuously, and recorded and reported hourly
CV	Coefficient of Variation
DNQ	Detected, but not quantified
DL	Detection level
ECA	Effluent Concentration Allowance
Grab	Grab sample

MDEL	Maximum Daily Effluent Limitation
MDL	Method detection limit
MEC	Maximum effluent concentration
MG	Million gallons
MGD	Million gallons per day
ML	Minimum level
ND	Not detected
pg/L	Picograms per liter
RL	Reporting level
RPA	Reasonable potential analysis

ATTACHMENT E – MONITORING AND REPORTING PROGRAM

Clean Water Act (CWA) section 308 and 40 C.F.R. sections 122.41(h), (j)-(l), 122.44(i), and 122.48 require that all NPDES permits specify monitoring and reporting requirements. Water Code section 13383 also authorizes the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. This MRP establishes monitoring, reporting, and recordkeeping requirements that implement the federal and state laws and regulations.

1. GENERAL MONITORING PROVISIONS

- 1.1. Dischargers shall comply with this MRP. The Executive Officer may amend this MRP pursuant to 40 C.F.R. section 122.63. If any discrepancies exist between this MRP and the “Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits” (Attachment G) in the individual permits listed in Attachment B of this Order, this MRP shall prevail. If any discrepancies exist between this MRP and the MRP in individual NPDES permits listed in Attachment B of this Order, the more stringent requirements shall apply.

- 1.2. Dischargers shall conduct all monitoring in accordance with Attachment D section 3 of their individual permits listed in Attachment B of this Order, as supplemented by Attachment G of their individual permits listed in Attachment B of this Order. Equivalent test methods must be more sensitive than those specified in 40 C.F.R. section 136 and must be specified in this permit.

- 1.3. For compliance monitoring, analyses shall be conducted using the lowest commercially available and reasonably achievable detection levels. The objective is to provide quantification of constituents sufficient to allow evaluation of observed concentrations with respect to the Minimum Levels given below. All Minimum Levels are expressed as µg/L, equivalent to parts per billion (ppb). According to the SIP, method-specific factors can be applied. In such cases, the additional factor must be applied in the computation of the Reporting Level. Application of such factors will alter the Reporting Level from the Minimum Level for the analysis. Dischargers are to instruct laboratories to establish calibration standards so that the Minimum Level is the lowest calibration standard. At no time is a Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve. Table E-1 below indicates the highest Minimum Level that the Discharger’s laboratory may achieve for calibration purposes:

Table E-1. Minimum Levels

Constituent Analysis	Minimum Level	Units
Mercury	0.0005	µg/L
PCBs 1016, 1221, 1232, 1242, 1248, 1254, 1260	0.5	µg/L

2. MONITORING LOCATIONS

Dischargers shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements of this Order:

Table E-2. Monitoring Locations

Sample Type	Monitoring Location	Monitoring Location Description
Effluent	Individual monitoring locations for discharges of treated wastewater (normally Monitoring Location EFF-001) are specified in the MRPs of Dischargers' individual NPDES permits as listed in Attachment B of this Order. ^[1]	Individual monitoring location descriptions are provided in the MRPs of Dischargers' individual NPDES permits as listed in Attachment B of this Order.

Footnotes:

- ^[1] For the City and County of San Francisco (Southeast Plant), the monitoring location shall be Monitoring Location EFF-001A. For the City of Calistoga, annual monitoring shall alternate each year between Monitoring Locations EFF-001 and EFF-002. For C&H Sugar Company, Inc., the monitoring location shall be Monitoring Location EFF-002. For Fairfield-Suisun Sewer District, the monitoring location shall be Monitoring Location EFF-001D. For The Pittsburg Owner LPV, LLC, the monitoring location shall be Monitoring Location EFF-001G.

3. EFFLUENT MONITORING REQUIREMENTS

The Dischargers listed in Tables 3A and 4A of the Order shall monitor their individual treatment plant effluent for mercury and the Dischargers listed in Tables 3B and 4B of the Order shall monitor their individual treatment plant effluent for PCBs as follows:

Table E-3. Effluent Monitoring

Parameter	Unit	Sample Type ^[1]	Minimum Sampling Frequency ^[2]
Major Dischargers (see Tables 1A and 1B of the Order)			
Mercury, Total ^[3]	µg/L	C-24 or Grab ^[4]	1/Quarter
PCBs, Total (as Aroclors) ^[5]	µg/L or pg/L	Grab	Once
PCBs (as congeners) ^[6]	µg/L or pg/L	Grab	2/Year (for design flows ^[7] ≥ 50 MGD)
			1/Year (for design flows ^[7] 5.0 MGD ≤ Q < 50 MGD ^[8])
			Once (for design flows ^[7] < 5.0 MGD)
Minor Dischargers (see Tables 1A and 1B of the Order)			
Mercury, Total ^{[3],[9]}	µg/L	C-24 or Grab ^[4]	2/year
PCBs, Total (as Aroclors) ^[5]	µg/L or pg/L	Grab	Once
PCBs (as congeners) ^[6]	µg/L or pg/L	Grab	Once

Footnotes:

- [1] 24-hour composites may be made up of discrete grab samples collected over a 24-hour period or may be collected using automatic compositing equipment. If using compositing equipment, the Discharger shall implement all feasible ultra clean techniques to reduce sample contamination (such as using ultra clean Teflon tubing).
- [2] Intermittent or seasonal Dischargers shall collect samples during those quarters for which a discharge occurs.
- [3] Dischargers shall use ultra-clean sampling (U.S. EPA Method 1669) and ultra-clean analytical methods (U.S. EPA Method 1631) for total mercury monitoring.
- [4] If allowed in the Pretreatment and Biosolids Monitoring Requirements of the Dischargers' individual NPDES permits, grab samples may be collected coincident with composite samples collected for the analysis of other regulated parameters.
- [5] Dischargers shall use U.S. EPA Method 608.3 or 625.1 for Aroclor monitoring. These data will be used to assess compliance with the limits in Tables 3B and 4B of the Order. Non-detected and estimated values shall be treated as zeros in the calculation of Total PCBs.
- [6] PCBs congeners monitoring is for informational purposes. Dischargers shall use U.S. EPA Proposed Method 1668C and report the results for each of the 40 congeners that contribute to San Francisco Bay's impairment and congeners that co-elute with the 40 congeners (see Fact Sheet Tables F-7 and F-8). For congeners that co-elute with the 40 congeners, Dischargers shall report the sum of these co-eluting congeners. A summation for total PCBs as congeners is not required. When the Regional Water Board estimates sums, non-detected values are treated as zeros and estimated values are counted.
- [7] The design flows for each facility are included in Fact Sheet Tables F-1A and F-1B.
- [8] For the Cities of San Jose and Santa Clara and the Treasure Island Development Authority, the minimum monitoring frequency for PCBs (as congeners) shall be 1/Year.
- [9] For Sanitary District No. 5 of Marin County (Paradise Cove) and Crockett Community Services District (Port Costa), the minimum monitoring frequency for total mercury shall be 1/Year.

4. PCBs CONGENERS SAMPLING REQUIREMENTS (U.S. EPA METHOD 1668C)

4.1. Sample Collection. Dischargers shall collect samples as 1-liter (L) grab samples in appropriate pre-cleaned amber glass bottles following applicable clean sampling techniques from U.S. EPA Method 1669 (U.S. EPA, 1996). The following procedures shall be used to reduce the likelihood of sample contamination:

- Wear clean, powder-free gloves
- Minimize the time the container is open
- Avoid setting the bottle lid down
- Avoid rainwater from dripping into the bottle
- Avoid touching the inside of the bottle or lid

Dischargers shall keep bottles dust-free prior to sample collection. Dischargers shall collect multiple 1-L grab samples at each monitoring location sufficient for analysis and quality-control (QC). Additional 1-L grab samples may be collected and retained onsite at the facility until the analysis is completed and the data are accepted for reporting to the Regional Water Board. In the event of a QC failure or loss of the initial grab samples, Dischargers shall send an extra sample retained onsite to the laboratory to be analyzed and reported or collect new samples.

4.2. Sample Handling. If residual chlorine is present, Dischargers shall add 80 mg of sodium thiosulfate to each 1-L sample. Samples shall be kept in the dark at less than or equal to 6°C from the time of collection until receipt at the laboratory. Sample bottles, shipping instructions, chain of custody templates, and billing information shall be provided by the analytical laboratory. If the sample will be frozen, the Discharger shall allow room for expansion. U.S. EPA Method 1668C allows samples to be held for up to one year prior to extraction if stored in the dark at less than or equal to 6°C.

4.3. Analytical Laboratories. All samples shall be analyzed using proposed U.S. EPA Method 1668C (April 2010) to provide consistent concentration information for the 40 PCB congeners and their co-elutions. Any laboratory analyzing and reporting PCB congeners data shall demonstrate that laboratory background levels do not adversely affect the analytical results by statistically determining and documenting that laboratory background levels found in laboratory method blanks are acceptable. To achieve this, for each congener, the value of two standard deviations above the mean in a minimum of 10 blanks shall be at or below 75 percent of the corresponding method-specified Minimum Level (ML). The sample-specific detection limit (SSDL) of the corresponding congener shall be used as a numerical value in the following equation when the congener is not detected (ND) as specified by the method:

$$\text{MEAN}_{\text{MB}, 10} + (2 \times \text{SD}_{\text{MB}, 10}) \leq 0.75 \times \text{ML}$$

where:

$\text{MEAN}_{\text{MB}, 10}$ = The mean of 10 or more method blanks
 $\text{SD}_{\text{MB}, 10}$ = Standard deviation of 10 or more method blanks
ML = Corresponding ML for the congener

4.4. Quality Assurance and Quality Control. Quality assurance and quality control (QA/QC) samples are required in conjunction with samples to verify data quality. With each batch of 20 or fewer samples, the laboratory shall analyze method-required QA/QC samples of method blanks and spike blanks. Matrix spikes may be analyzed based on sample availability.

Method-required batch controls are as follows:

- Method blank – for batch contamination monitoring. If any of the 40 congeners or co-elutes of interest are present in the method blank at greater than 20 pg/L, the batch is invalidated.
- Spike blank – for sample preparation recovery assessment.
- Mid-calibration range standards performed at the start and every 12 hours of instrument calibration thereafter – as calibration verification. Calibration verification shall also be performed at the end of the analysis.

5. REPORTING REQUIREMENTS

5.1. General Monitoring and Reporting Requirements. The Dischargers shall comply with all Standard Provisions (Attachments D and G) related to monitoring, reporting, and recordkeeping.

5.2. Individual Reporting in Self-Monitoring Reports (SMRs)

- 5.2.1. **SMR Format.** Dischargers shall electronically submit SMRs using the State Water Board's [California Integrated Water Quality System \(CIWQS\) Program website](https://waterboards.ca.gov/water_issues/programs/ciwqs) (waterboards.ca.gov/water_issues/programs/ciwqs). The CIWQS website will provide additional information for SMR submittal in the event of a planned service interruption for electronic submittal.
- 5.2.2. **SMR Due Dates and Contents.** The Discharger shall submit SMRs by the due dates, and with the contents, specified below:
- 5.2.2.1. **Routine SMRs** — Dischargers shall submit mercury and PCBs data collected to comply with this Order in the routine monthly or quarterly SMRs required in Dischargers' individual NPDES permits. This includes data for mercury, total PCBs as Aroclors (using U.S. EPA Method 608.3 or 625.1), and PCBs as congeners (using U.S. EPA Method 1668C). The PCBs congeners shall include the 40 that contribute to San Francisco Bay water quality impairment plus co-elutes (59 to 66 congeners in total, see Fact Sheet Tables F-7 and F-8), using U.S. EPA Method 1668C.
- For Industrial Dischargers claiming a discharge adjustment for recycled water use pursuant to Provision 6.3.5 of the Order, the amount of adjustment claimed for that month shall be reported monthly to the Municipal Discharger that supplied the recycled water. The reporting from the Industrial Discharger to the Municipal Discharger shall be completed no later than 15 days following the end of the calendar month. The Municipal and Industrial Dischargers shall then include this information in their respective monthly (or quarterly) and annual SMRs.
- Each SMR shall include all new mercury or PCBs monitoring results obtained since the last SMR was submitted. If a Discharger monitors mercury or PCBs more frequently than required by this Order, the Discharger shall include the results of such monitoring in the calculations and reporting for the SMR.
- 5.2.2.2. **Annual SMR** — Annual SMRs shall be due February 1 each year, covering the previous calendar year. The annual SMR shall contain a summary of all mercury data. This summary shall include, at a minimum, mercury concentrations for each sample, the corresponding flow, and the annual mercury loading.
- 5.2.3. **Specifications for Submitting SMRs to CIWQS.** Dischargers shall submit analytical mercury, total PCBs as Aroclors (using U.S. EPA Method 608.3 or 625.1), and PCBs as congeners (using U.S. EPA Method 1668C) results to CIWQS in electronic reporting format by EDF/CDF upload or through manual entry.

When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format, the Discharger shall electronically submit the data in a tabular format as an attachment. Dischargers shall arrange all reported data in a tabular format and summarize the data to clearly illustrate whether their facility is operating in compliance with the effluent limitations.

5.2.4. **Monitoring Periods.** Monitoring periods for all required monitoring shall be as set forth below unless otherwise specified:

Table E-4. Monitoring Periods

Sampling Frequency	Monitoring Period Begins On...	Monitoring Period
1/Month	First day of calendar month following or on Order effective date	First day of calendar month through last day of calendar month
1/Quarter ^[1]	Closest January 1, April 1, July 1, or October 1 before or after Order effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31
1/Year	Closest January 1 before or after Order effective date	January 1 through December 31
2/Year	Closest January 1 or July 1 before or after Order effective date	January 1 through June 30 July 1 through December 31
Once	Order effective date	Once during the term of the Order within 12 months of the expiration date

Footnote:

^[1] Definitions of 1/Quarter in the individual NPDES permits listed in Attachment B of this Order supersede this definition.

5.2.5. **RL and MDL Reporting.** The Discharger shall report with each sample result the Reporting Level (RL) and Method Detection Limit (MDL) as determined by the procedure in 40 C.F.R. part 136. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

5.2.5.1. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

5.2.5.2. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

For purposes of data collection, the Discharger shall require the laboratory to write the estimated chemical concentration next to DNQ. The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be

percent accuracy (\pm a percentage of the reported value), numerical ranges (low to high), or any other means the laboratory considers appropriate.

- 5.2.5.3. Sample results less than the laboratory's MDL shall be reported as "Not Detected", or ND.
- 5.2.5.4. Dischargers shall instruct laboratories to establish calibration standards so that the minimum level (ML) value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time are Dischargers to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.
- 5.2.6. **PCBs Congeners Reporting.** General requirements for reporting U.S. EPA Method 1668C data are as follows:
- 5.2.6.1. **Minimum Levels.** The ML for each congener shall be published Method MLs ([Table 2](#) of EPA1668C). The laboratory analyzing the samples shall have on file data demonstrating a lower calibration level that is equal to or less than the published Method ML. Laboratories may revise the lower calibration level based on final published values if and when U.S. EPA Method 1668C is fully approved or promulgated.
- 5.2.6.2. **Method Detection Limits.** The MDLs reported by the laboratory shall meet the criteria set in U.S. EPA Method 1668C. The laboratory shall demonstrate capability by achieving MDLs below method-specified MDLs. The MDL is based on analysis of low-level replicates of clean matrices (e.g., deionized water). SSDLs for each congener shall be reported when there is a ND result. The SSDL is calculated by using the instrument processing method based on the noise level in the vicinity of the largest peak in sample extracts containing the real matrix.
- 5.2.6.3. **Co-elution.** Congeners in a co-elution shall be reported as a combination of the congeners, with the lowest numerically designated congener reported first and separated by a slash (/) from numerically higher designated congeners.
- For example, if PCB congeners 020, 021, and 033 are co-eluted, the Discharger shall report the co elution as PCB 020/021/033.
- 5.2.6.4. **Qualifiers.** Qualifiers allowed in reporting U.S. EPA 1668C data are as follows:

Table E-5. U.S. EPA Method 1668C Qualifiers in CIWQS

Qualifiers	CIWQS Field	Qualifier Description
ND	Qualifier	The analyte was not detected in the sample at the SSDL.
DNQ	Qualifier	The reported result is an estimate. The concentration is greater than the SSDL but less than the method-specified ML.
M	QA Code	Estimated maximum possible concentration.
D	QA Code	Result obtained from the analysis of a diluted sample.
B	QA Code	Congener is present in the method blank.

- 5.2.6.5. **Method Blank Correction.** Results shall be reported without method blank correction.
- 5.2.6.6. **Units.** Concentrations shall be reported in micrograms per liter ($\mu\text{g/L}$) or picograms per liter (pg/L).
- 5.2.7. **Transmittal Letter.** Each Discharger shall attach a transmittal letter to its SMR. The transmittal letter shall clearly identify violations of this Order and any trigger exceedances. The Discharger shall also describe any requirement violated or trigger exceeded, discuss corrective actions taken or planned, and propose a time schedule for the corrective actions.
- 5.2.8. **Compliance Determination.** Compliance with effluent limitations shall be determined using sample reporting protocols defined above, in Attachment A of this Order, and in Attachments D and Attachment G (as amended) of Dischargers' individual NPDES permits listed in Attachment B of this Order. For purposes of reporting and administrative enforcement by the Regional Water Board and State Water Board, the Dischargers shall be deemed out of compliance with effluent limitations if the concentration of the pollutant in the monitoring sample is greater than the effluent limitation and, if applicable, greater than or equal to the RL.
- 5.3. Discharge Monitoring Reports (DMRs).** DMRs are U.S. EPA reporting requirements. The Discharger shall electronically certify and submit DMRs together with SMRs using Electronic Self-Monitoring Reports module eSMR 2.5 or the latest upgraded version. Electronic DMR submittal shall be in addition to electronic SMR submittal. Information about electronic DMR submittal is available at the [DMR website](https://waterboards.ca.gov/water_issues/programs/discharge_monitoring) (waterboards.ca.gov/water_issues/programs/discharge_monitoring).

Discharger	Facility Contact, Title, and Phone	Mailing Address	Facility Type	Facility Design Flow (MGD)
Non-Petroleum Refineries ^[1]				
C&H Sugar Company, Inc., and Crockett Community Services District, Crockett Sanitary Dept.	Hal McCutchan Environmental Supervisor (510) 201-0126 Gaunt Murdock General Manager/District Engineer (510) 787-2992	<u>C&H Sugar Company</u> 830 Loring Avenue Crockett, CA 94525 Contra Costa County <u>Crockett Sanitary Dept.</u> P.O. Box 578 Crockett, CA 94525 Contra Costa County	Sugar Cane Crystalline Industry	1.8
Crockett Cogeneration, LP	Thane Jennings Plant Engineer (510) 787-4101	550 Loring Avenue Crockett, CA 94525-1232 Contra Costa County	Industrial – Electrical Generation, SIC Code 4931	0.5
Eco Services Operations, LLC	Wahyet Li Plant Manager (925) 313-8204	100 Mococo Road Martinez, CA 94553 Contra Costa County	Industrial – Chemical and Allied Products, SIC Code 2891	0.8
The Pittsburg Owner LPV, LLC	Glenn Brown Entitlements (925) 984-7137	888 San Clemente Drive, Suite 100 Newport Beach, CA 92660 Orange County	Decommissioned Electric Power Generation	2.2 ^[1]
USS-UPI, LLC	Freddy Ripoli Manager – Health and Safety (925) 439-6706	900 Loveridge Road Pittsburg, CA 94565 Contra Costa County	Industrial – Steelworks, SIC Code 3312	28

Discharger	Facility Contact, Title, and Phone	Mailing Address	Facility Type	Facility Design Flow (MGD)
Petroleum Refineries ^[1]				
Chevron Products Company	Shawn Lee Health, Safety, & Env. Manager (510) 242-1400	841 Chevron Way Richmond, CA 94801 Contra Costa County	Industrial – Petroleum Refining	25
Phillips 66	John Francis Carroll II Environmental Specialist 510-245-4677	1380 San Pablo Avenue Rodeo, CA 94572-1354 Contra Costa County	Industrial – Petroleum Refining	10
Martinez Refining Company, LLC	Adeline Ford Staff Engineer (925) 229-6370	3485 Pacheco Blvd Martinez CA 94553 Contra Costa County	Industrial – Petroleum Refining	8.2
Tesoro Refining & Marketing Co.	Kevin Obad Environmental Supervisor (925) 228-1220 ext. 2325	150 Solano Way Martinez, CA 94553 Contra Costa County	Industrial – Petroleum Refining	10.4
Valero Refining Company	Marisol Pacheco-Mendez Environmental Engineer (707) 745-7573	3400 East Second Street Benicia, CA 94510-1005 Solano County	Industrial – Petroleum Refining	3.7

Footnotes:

^[1] Some facilities deemed as petroleum refineries in the Mercury TMDL no longer operate as petroleum refineries. However, this Order retains the previous order's nomenclature to remain consistent with the Mercury TMDL.

^[2] Though The Pittsburg Owner LPV, LLC's facility has a permitted design flow of 2.2 MGD, it discharges less than 1.0 MGD of treated stormwater runoff. Additionally, The Pittsburg Owner LPV, LLC plans to upgrade its treatment system with a design flow of less than 1.0 MGD. Therefore, The Pittsburg Owner LPV, LLC is classified as a minor discharger (see Table 1B).

1.1. Municipal Dischargers listed in Table 1A and Industrial Dischargers listed in Table 1B (collectively, Dischargers) own and operate their respective wastewater treatment plants and collection systems (collectively, Facilities). Municipal Dischargers provide secondary or advanced secondary treatment of wastewater collected from their service areas, and Industrial Dischargers provide various levels of wastewater treatment depending on their activities. After treatment, both Municipal and Industrial Dischargers discharge to San Francisco Bay and its tributaries. Details of the Municipal and Industrial wastewater treatment processes and discharges are described in the individual NPDES permits listed in Attachment B of this Order.

For the purposes of this Order, references to “discharger” or “permittee” in applicable federal and State laws, regulations, plans, or policies are held to be equivalent to references to the Dischargers herein.

- 1.2. The Dischargers are regulated pursuant to NPDES Permit CA0038849. The Dischargers are authorized to discharge subject to waste discharge requirements (WDRs) in this Order at the discharge locations described in Tables 2A and 2B of this Order.
- 1.3. The Dischargers were previously subject to Order R2-2017-0041 (previous order) as amended by Orders R2-2016-0008 and R2-2021-0028.
 - Order R2-2016-0008 amended the previous order to provide for an alternate monitoring program.
 - Order R2-2021-0028 amended Order R2-2016-0008 and the previous order to provide updated monitoring requirements and require supplemental funding for the Regional Monitoring Program (RMP).

Provisions of these orders have been incorporated into this Order as appropriate and applicable.

- 1.5. Regulations in 40 C.F.R. section 122.46 limit the duration of NPDES permits to a fixed term not to exceed five years. Accordingly, this Order limits the effective period for the discharge authorization. Pursuant to 40 C.F.R. section 122.6(d) and California Code of Regulations, title 23, section 2235.4, the terms and conditions of an expired permit are automatically continued pending reissuance of the permit if the Discharger complies with all requirements for continuation of expired permits.
- 1.6. This Order continues to implement the wasteload allocations and implementation requirements of the San Francisco Bay Mercury Total Maximum Daily Load (TMDL), adopted August 9, 2006, and PCBs TMDL, adopted February 13, 2008.
- 1.7. When applicable, state law requires dischargers to file a petition with the State Water Resources Control Board (State Water Board), Division of Water Rights, and receive approval for any change in the point of discharge, place of use, or purpose of use of treated wastewater that decreases the flow in any portion of a watercourse. The State Water Board retains separate jurisdictional authority to enforce such requirements under Water Code section 1211. This is not an NPDES permit requirement.

2. FACILITY DESCRIPTION

2.1. Wastewater Collection and Treatment

- 2.1.1. **Locations and Service Areas.** The municipal wastewater treatment plants are located throughout the San Francisco Bay Region. The industrial wastewater

treatment plants are located around San Pablo Bay, Carquinez Strait, and Suisun Bay.

- 2.1.2. **Wastewater Treatment.** Municipal wastewater treatment plants provide at least secondary treatment, which includes screening, skimming, settling, and biological treatment. Some plants also provide advanced secondary treatment, which typically removes additional solids, often with sand filtration. Removing additional solids removes additional pollutants, including mercury and PCBs that adhere to particles. Municipal wastewater treatment plants generally remove over 90 percent of the mercury and PCBs in their influent. While the removed mercury and PCBs are not directly discharged to water, some is returned to the environment through landfills, incinerators, or soil amendments. The primary sources of mercury in municipal wastewater are expected to be human waste and medical and dental facilities. The primary source of PCBs in municipal wastewater is expected to be human waste.

Industrial Dischargers include petroleum refineries, chemical plants, and other large industrial facilities. Their mercury and PCBs loads depend on the types of activities in which they engage. The primary sources of mercury in industrial wastewater are expected to be human waste and industrial activities with materials containing mercury (e.g., refining crude oil). The primary sources of PCBs in industrial wastewater are expected to be human waste and wastewater generated from old industrial equipment that may contain PCBs.

- 2.2. **Discharge Points and Receiving Waters.** The municipal wastewater treatment plants discharge throughout San Francisco Bay, including Lower South San Francisco Bay, South San Francisco Bay, Central San Francisco Bay, San Pablo Bay, Carquinez Strait, Suisun Bay, and connected tributaries. Most industrial wastewater treatment plants discharge to San Pablo Bay, Carquinez Strait, and Suisun Bay. Tables 2A and 2B of this Order provide the discharge locations for each facility. Attachment C shows a map of these discharge locations.
- 2.3. **Previous Requirements.** The previous order's effluent limitations were the same as those in this Order.
- 2.4. **Compliance Summary.** Annual load calculations for mercury and PCBs vary year-to-year but have remained generally consistent. Variability in annual loads could be due to sample timing, analytical variability, or weather.
- 2.4.1. **Mercury.** Annual mercury loads for Municipal and Industrial Dischargers have been well below annual mass allocations since the previous order became effective in 2018, as shown in the charts below:

2.4.1.1. **Municipal Dischargers.** On average, the annual municipal load during the previous order term was 17 percent of the TMDL load allocation. In 2020, the municipal load was 1.5 kg/year, the lowest annual load recorded since adoption of the TMDL. In 2021, the municipal load was 1.8 kg/year, which is comparable to the performance throughout the previous order term.

During the previous order term, the most significant exceedance of mercury effluent limitations occurred at the Rodeo Sanitary District Water Pollution Control Facility, which exceeded its average weekly effluent limitation (0.072 µg/L) once in February 2019 with a single result of 0.75 µg/L. Subsequent accelerated sampling resulted in concentrations well below the facility’s effluent limitations and triggers, indicating the exceedance was an

isolated incident. Rodeo Sanitary District, which treats domestic and commercial wastewater, did not identify a cause for the exceedance, but it has not exceeded its mercury limitations or triggers since February 2019.

2.4.1.2. **Industrial Dischargers.** On average, the annual industrial load during the previous order term was 28 percent of the TMDL load allocation. In 2020 and 2021, the industrial loads were 0.15 kg/year and 0.23 kg/year, the lowest and second-lowest annual loads recorded since adoption of the TMDL.

During the previous order term, the most significant exceedance of mercury effluent limitations occurred at the Valero Benicia Refinery, which exceeded its maximum daily effluent limitation (0.12 µg/L) twice on January 20 and 21, 2018, with results of 0.17 µg/L and 0.20 µg/L. Valero Benicia Refinery reported the high mercury concentrations were caused by an equipment bypass to repair a failed tank mixer during the same period. Subsequent accelerated sampling resulted in concentrations well below the facility's effluent limitations and triggers, and the Valero Refining Company has not exceeded its mercury limitations or triggers since January 2018.

2.4.2. **PCBs.** Annual PCBs loads for Municipal and Industrial Dischargers have been well below annual mass allocations since the previous order became effective in 2018. PCBs as congeners, which are measured for informational purposes, were used to evaluate mass loads. The annual PCBs congeners mass loads during the previous order term, which includes all detected and estimated values, are shown in the charts below:

- 2.4.2.1. **Municipal Dischargers.** On average, the annual municipal load during the previous order term was 43 percent of the TMDL load allocation. Throughout the previous order term, annual loads remained consistent, and all Municipal Dischargers complied with their PCBs effluent limitations.
- 2.4.2.2. **Industrial Dischargers.** On average, the annual municipal load during the previous order term was 32 percent of the TMDL load allocation. In 2020 and 2021, the industrial loads were 0.0039 kg/year and 0.0062 kg/year, the lowest and second-lowest annual loads recorded since adoption of the TMDL. All Industrial Dischargers complied with their PCBs effluent limitations during the previous order term.

3. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in this Order are based on the requirements and authorities described in this section.

- 3.1. **Legal Authorities.** This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by the U.S. EPA, and Water Code chapter 5.5, division 7 (commencing with § 13370). It serves as an NPDES permit authorizing the Discharger to discharge into waters of the United States at the discharge location described in Table 1 subject to the WDRs in this Order.
- 3.2. **California Environmental Quality Act (CEQA).** Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act (CEQA), Public Resources Code division 13, chapter 3 (commencing with § 21100).

3.3. State and Federal Laws, Regulations, Policies, and Plans

3.3.1. **Water Quality Control Plan.** The Regional Water Board adopted the *Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan), which designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. Requirements in this Order implement the Basin Plan. State Water Board Resolution 88-63, establishes as state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply. Beneficial uses applicable to San Francisco Bay and its tributaries are as shown below:

Table F-3. Beneficial Uses

Discharge Points	Receiving Water	Beneficial Uses
[1]	San Francisco Bay and its tributaries [2]	Agricultural Supply (AGR) Cold Freshwater Habitat (COLD) Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Industrial Service Supply (IND) Marine Habitat (MAR) Fish Migration (MIGR) Municipal and Domestic Supply (MUN) Navigation (NAV) Industrial Process Supply (PROC) Preservation of Rare and Endangered Species (RARE) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Shellfish Harvesting (SHELL) Fish Spawning (SPWN) Warm Freshwater Habitat (WARM) Wildlife Habitat (WILD)

Footnotes:

[1] Individual discharge points for discharges of treated wastewater (normally Discharge Point 001) are specified in the MRPs of Dischargers' individual NPDES permits as listed in Attachment B of this Order.

[2] Specific beneficial uses that apply to each Discharger are included in the individual NPDES permits listed in Attachment B of this Order.

The Regional Water Board adopted a Basin Plan Amendment on August 9, 2006, that established new water quality objectives for mercury and a San Francisco Bay Mercury TMDL to attain the new objectives in San Francisco Bay and contiguous bay segments. The Regional Water Board's Executive Officer made corrections on May 23, 2007, and the State Water Board approved the Basin Plan Amendment (as corrected) and the water quality objectives on July 17, 2007. The U.S. EPA approved the new water quality objectives on February 12, 2008.

The Regional Water Board also adopted a Basin Plan Amendment on February 13, 2008, that established a San Francisco Bay PCBs TMDL to attain

water quality objectives for PCBs in San Francisco Bay and contiguous bay segments. The State Water Board approved the Basin Plan amendment on October 20, 2009, and U.S. EPA approved the amendment on March 29, 2010.

- 3.3.2. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** The NTR and CTR contain federal water quality criteria for priority pollutants. U.S. EPA adopted the NTR on December 22, 1992, and amended it on May 4, 1995, and November 9, 1999. About 40 NTR criteria apply in California. U.S. EPA adopted the CTR on May 18, 2000. The CTR promulgated new toxics criteria for California and incorporated the NTR criteria that applied in the state. U.S. EPA amended the CTR on February 13, 2001.
- 3.3.3. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP establishes implementation provisions for priority pollutant criteria and objectives, and provisions for chronic toxicity control. The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated for California through the NTR and the priority pollutant objectives the Regional Water Board established through the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. Requirements of this Order implement the SIP.
- 3.3.4. **Antidegradation Policy.** Federal regulations at 40 C.F.R. section 131.12 require that state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy through State Water Board Resolution 68-16, *Statement of Policy with Respect to Maintaining High Quality of Waters in California*, which incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, both the state and federal antidegradation policies. Permitted discharges must be consistent with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution 68-16.
- 3.3.5. **Anti-Backsliding Requirements.** CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.
- 3.3.6. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act

that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code §§ 2050 to 2097) or Federal Endangered Species Act (16 U.S.C.A. §§ 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the state, including protecting rare, threatened, or endangered species. The Discharger is responsible for meeting all applicable Endangered Species Act requirements.

3.4. Impaired Water Bodies on CWA section 303(d) List. On May 11, 2022, U.S. EPA approved a revised list of impaired waters pursuant to CWA section 303(d), which requires identification of water bodies where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. Where it has not done so already, the Regional Water Board plans to adopt TMDLs for pollutants on the 303(d) list. TMDLs establish wasteload allocations for point sources and load allocations for nonpoint sources and are established to achieve water quality standards.

San Francisco Bay is listed as impaired by mercury and PCBs. On February 12, 2008, U.S. EPA approved a TMDL for mercury in San Francisco Bay. On March 29, 2010, U.S. EPA approved a TMDL for PCBs in San Francisco Bay. The Mercury and PCBs TMDLs apply to the discharges covered by this Order and are implemented through this Order.

4. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants discharged into waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 C.F.R. section 122.44(a) requires that permits include applicable technology-based limitations and standards, and 40 C.F.R. section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of receiving waters. The individual NPDES permits listed in Attachment B of this Order contain the applicable technology-based limitations for the discharges covered by this Order. No additional discharge prohibitions beyond those already specified in the Dischargers' individual NPDES permits are necessary to implement the San Francisco Bay Mercury and PCBs TMDLs.

4.1. Water Quality-Based Effluent Limitations

4.1.1. Scope and Authority

CWA section 301(b) and 40 C.F.R. section 122.44(d) require permits to include limitations more stringent than federal technology-based requirements where necessary to achieve water quality standards. WQBELs are included in this

permit to implement the wasteload allocations established through the San Francisco Bay Mercury and PCBs TMDLs.

4.1.2. **Beneficial Uses and Water Quality Criteria and Objectives**

Fact Sheet section 3.3.1 identifies the beneficial uses of San Francisco Bay and its tributaries. Water quality criteria and objectives to protect these beneficial uses are described below.

- 4.1.2.1. **Mercury.** Basin Plan Table 3-3B specifies two mercury water quality objectives that apply to all San Francisco Bay segments, including all marine and estuarine waters contiguous to San Francisco Bay:
 - 4.1.2.1.1. **Protection of Human Health.** The mercury water quality objective for protection of human health from fish consumption is 0.2 milligrams (mg) mercury per kilogram (kg) fish tissue (average wet weight concentration measured in the muscle tissue of fish large enough to be consumed by humans).
 - 4.1.2.1.2. **Protection of Aquatic Organisms and Wildlife.** The mercury water quality objective for protection of aquatic organisms and wildlife is 0.03 mg mercury per kg fish (average wet weight concentration measured in whole fish 3 to 5 centimeters (cm) in length).
- 4.1.2.2. **PCBs.** Basin Plan section 7.2.3.1 includes a narrative water quality objective that states that controllable water quality factors shall not cause a detrimental increase in toxic substances found in bottom sediments or aquatic life. Basin Plan section 7.2.3.2 specifies a numeric fish tissue target to protect both human health and wildlife, expressed as an average fish tissue concentration of 10 micrograms total PCBs per kilogram of typically consumed fish on a wet weight basis (10 µg/kg wet weight). The PCBs TMDL and implementation plan are designed to attain the fish tissue target and resolve PCBs impairment in all San Francisco Bay segments. For municipal and industrial wastewater discharges, this means limiting loads to 2.0 kg/year and 0.035 kg/year.

4.1.3. **Reasonable Potential Analysis**

The Regional Water Board is including WQBELs for mercury and PCBs in this Order that are consistent with the assumptions and requirements of the San Francisco Bay Mercury and PCBs TMDLs, including wasteload allocations. Based on the water quality monitoring done prior to TMDL adoption, the TMDLs set the wasteload allocations for mercury and PCBs at levels necessary to attain water quality standards. Therefore, compliance with the effluent limitations will satisfy the TMDL requirements.

The Regional Water Board has developed WQBELs for mercury and PCBs pursuant to 40 C.F.R. section 122.44(d)(1)(vii), which does not require a reasonable potential analysis. Similarly, SIP section 1.3 recognizes that a reasonable potential analysis is unnecessary if a TMDL has been developed.

4.1.4. Water Quality-Based Effluent Limitations

4.1.4.1. Mercury. This Order contains mass-based and concentration-based WQBELs:

4.1.4.1.2. Mass-based WQBELs. The mass-based WQBELs are based on the established aggregate wasteload allocations for Municipal Dischargers and Industrial Dischargers that comprise a portion of the San Francisco Bay Mercury TMDL. For the San Francisco Bay Mercury TMDL, loads are expressed in terms of annual mercury loads because the adverse effects of mercury occur through long-term bioaccumulation. The loads are intended to represent long-term averages and account for long-term variability, including seasonal variability.

Basin Plan Table 7.2.2-3 specifies the San Francisco Bay Mercury TMDL’s aggregate mass emission limit and associated individual mass emission limits for Municipal Dischargers as shown below:

Table F-4. Mercury Mass Emission Allocations for Municipal Dischargers

Total Aggregate Mass Emission Limit ^[2]	-	11
---	---	-----------

Footnotes:

^[1] The Regional Water Board rescinded the individual NPDES permit.

^[2] Total differs slightly from the column sum due to rounding to the nearest kilogram.

The municipal wasteload allocations are based on load estimates computed using available data on effluent mercury concentrations and effluent discharge volumes from 2000 through 2003. At the time of San Francisco Bay Mercury TMDL development, the combined mercury load for all Municipal Dischargers discharging to San Francisco Bay and its tributaries was estimated to be about 17 kg/yr. The San Francisco Bay Mercury TMDL granted Municipal Dischargers 20 years to ensure aggregate loads do not exceed a limit of 11 kg/yr. However, pursuant to 40 C.F.R. section 122.47, which requires compliance as soon as possible, the 2012 order imposed the limit of 11 kg/yr because municipal discharges had been well below this limit.

This Order does not contain requirements for California Department of Parks and Recreation (Angel Island State Park) because it ceased discharging from its facility and the Regional Water Board rescinded its NPDES permit. Due to the small mass allocation (0.013 kg/year), the permit rescission had a negligible effect on the aggregate municipal limit.

In 2018, the Regional Water Board adopted an individual NPDES permit for the Oro Loma and Castro Valley Sanitary Districts to discharge out of their shared facility’s local outfall to Lower San Francisco Bay during wet weather (NPDES Permit CA0037559). In 2022, the Regional Water Board adopted an individual NPDES permit for the City of San Leandro to discharge to Lower San Francisco Bay from its treatment wetland (NPDES Permit CA0038881). Discharges from these facilities are included in the East Bay Dischargers Authority’s mercury TMDL allocation.

Also in October 2022, the Regional Water Board rescinded the individual NPDES permit for Hayward Marsh (NPDES Permit CA0038636) because it ceased discharging. The allocation for the East Bay Dischargers Authority remains unchanged because treated wastewater that was discharged to Hayward Marsh, and subsequently San Francisco Bay, is now conveyed to the EBDA Common Outfall (see Table 2A for the discharge point).

Basin Plan Tables 7.2.2-4 and 7.2.2-5 specify the San Francisco Bay Mercury TMDL’s final aggregate mass emission limit and associated individual mass emission limits for Industrial Dischargers as below:

Table F-5. Mercury Mass Emission Allocations for Industrial Dischargers

Total Aggregate Mass Emission Limit ^[4]	-	0.9

Footnotes:

- [1] Wasteload allocations for industrial wastewater discharges do not include mass from once-through cooling water. The Regional Water Board will apply intake credits to once-through cooling water as allowed by law and consistent with Provision 6.3.5. of this Order.
- [2] The Regional Water Board rescinded the individual NPDES permit.
- [3] This facility is now covered under NPDES Permit CAG982001, which covers aggregate mining, marine sand washing, and sand offloading activities.
- [4] Total differs slightly from the column sum due to rounding to the nearest kilogram.

Like the municipal wasteload allocations, the industrial wasteload allocations are based on load estimates computed using available data on effluent mercury concentrations and effluent discharge volumes from 2000 through 2003. The combined load for all Industrial Dischargers was estimated to be about 1.3 kg/yr. Combined with the municipal wasteload allocation, the total municipal; and industrial wastewater discharges were estimated to account for a load of about 18.3 kg/yr, or about two percent of San Francisco Bay's total mercury load.

This Order does not contain requirements for Dow Chemical Company, General Chemical, GWF Sites I and V, Hanson Aggregates (Olin Jones Dredge Spoils Disposal Facility), Pacific Gas and Electric, Southern Energy Delta LLC, and the U.S. Department of Navy (Point Molate) because these dischargers have ceased discharging from their facilities, and the Regional Water Board has rescinded their NPDES permits. To account for these rescissions, the 2012 order reduced the aggregate industrial limit from 1.3 to 1.0 kg/yr. This Order retains the reduced aggregate industrial limit.

This Order also does not contain requirements for the Hanson Aggregates Amador Street and Tidewater Avenue facilities because they are covered under NPDES Permit CAG982001, which covers aggregate mining, marine sand washing, and sand offloading activities consistent with those facilities' activities and is consistent with the San Francisco Bay Mercury TMDL. In addition, this Order does not contain requirements for the San Francisco International Airport industrial wastewater treatment plant because it is now regulated as a single facility for both sanitary municipal and industrial activities. Because flows to the San Francisco International Airport's treatment facility are now predominantly municipal, it is appropriate to regulate this facility as a municipal wastewater treatment plant. These facilities comprise a very small portion of the total wastewater mercury load to San Francisco Bay.

In 2016, the Regional Water Board adopted an individual NPDES permit (NPDES Permit CA0030228) for Schnitzer Steel Industries, Inc. This Order does not contain requirements for Schnitzer Steel Industries, Inc., because it discharges to the City of Oakland's storm drain, which is covered under the Alameda County Clean Water Program wasteload allocation of 20 kg/yr and implemented through NPDES Permit CAS612008, which covers San Francisco Bay Mercury TMDL urban stormwater discharge requirements for regional stormwater discharges.

The Regional Water Board may rescind the individual NPDES permit for The Pittsburg Owner LPV, LLC (NPDES Permit CA0004880) during this Order term. The Pittsburg Owner LPV, LLC decommissioned its power generation plant on January 1, 2017, but continues to operate a

stormwater treatment system to address residual contaminants in runoff from former process areas. Influent monitoring shows a decreasing trend in mercury concentrations well below this Order's effluent limitations and triggers, indicating that the site is not generating additional contaminants. Due to The Pittsburg Owner LPV, LLC's small mass allocation (0.0078 kg/year), the permit rescission would have a negligible effect on the aggregate industrial limit of 1.0 kg/year.

- 4.1.4.1.3. **Concentration-based WQBELs.** The concentration-based WQBELs are consistent with the San Francisco Bay Mercury TMDL and State Water Board Resolution 2007-0045 approving the TMDL, which states, in part, the following:

... any NPDES permit or permits that implement the San Francisco Bay Mercury TMDL will include individual numeric effluent limitations consistent with the assumptions and requirements of waste load allocations for each wastewater discharger, that will be individually-enforceable.

A primary assumption and requirement of the San Francisco Bay Mercury TMDL is that wastewater dischargers maintain current treatment performance. The TMDL and its supporting documents state this assumption:

The watershed NPDES permit for municipal facilities will put in place a set of triggered actions ... intended ... to ensure that municipal wastewater facilities maintain their ongoing operation, maintenance, and performance.” (Total Maximum Daily Load [TMDL] Proposed Basin Plan Amendment and Staff Report, September 2, 2004, p. 75)

[The TMDL's] conditions are intended ... to ensure that industrial wastewater facilities maintain proper operation, maintenance, and performance.” (Basin Plan section 7.2.2.6)

This Order retains the individual concentration-based limitations from the previous order, which are consistent with Municipal and Industrial Discharger performance because Dischargers continue to perform well below their mass allocation. Three separate performance categories were derived using mercury data between 2000 and 2003: municipal secondary treatment, municipal advanced secondary treatment, and industrial treatment performance. Non-petroleum refinery performance-based limitations were determined using performance data from petroleum refineries because the TMDL set performance-based triggers for all Industrial Dischargers using petroleum refinery data. The data used to derive these performance-based limitations are from the same dataset used to calculate the San Francisco Bay Mercury TMDL's initial wasteload

allocations; therefore, these performance-based limitations are consistent with the TMDL. Appendix F-2 of this Fact Sheet describe the effluent limitation calculations.

40 C.F.R. section 122.45(d) requires average monthly and average weekly effluent limitations for Municipal Dischargers, and average monthly and maximum daily effluent limitations for Industrial Dischargers. These limitations are intended to minimize the potential for adverse effects in the immediate vicinity of discharges and to ensure that wastewater facilities maintain proper operation, maintenance, and performance.

- 4.1.4.2. **PCBs.** Basin Plan section 7.2.3.6 states that NPDES permits must include performance based WQBELs consistent with the wasteload allocations of the San Francisco Bay PCBs TMDL. This Order retains the individual concentration-based effluent limitations from the previous order because these concentration limits resulted in mass discharges that complied with the TMDL (see Appendix F-3 for U.S. EPA 1668C data of 66 PCBs congeners used to calculate loads between 2018 and 2021).

Four separate performance categories were derived using PCBs data between 1999 and 2001 (included in Appendix F-4 of this Fact Sheet): municipal secondary treatment, municipal advanced secondary treatment, petroleum refinery, and non-petroleum refinery. The data used to derive these performance-based limitations are from the same dataset used to calculate the San Francisco Bay PCBs TMDL wasteload allocations; therefore, these performance-based limitations are consistent with the TMDL. Calculating limits based on categories of treatment type reduces the likelihood of penalizing good performers and Dischargers that have implemented effective control measures.

40 C.F.R. section 122.45(d) requires, unless impracticable, average monthly and average weekly effluent limitations for Municipal Dischargers and average monthly and maximum daily effluent limitations for Industrial Dischargers. This Order continues to implement a maximum daily effluent limitation instead of an average weekly effluent limitation for Municipal Dischargers consistent with the U.S. EPA's Technical Support Document (section 5.2.3), which states, "... *in lieu of an AWL [average weekly effluent limitation] for POTWs, EPA recommends establishing an MDL [maximum daily effluent limitation] for toxic pollutants and pollutant parameters in water quality permitting.*"

Consistent with previous orders, this Order does not establish mass-based limitations. Concentration-based limitations better relate to facility performance because mass-based limitations rely on flows, which are highly influenced by rainfall and thus not entirely within a Discharger's control. Furthermore, the derivation of limitations with longer averaging periods,

which would be required to establish mass-based limitations, requires frequent monitoring (e.g., monthly) in order to capture performance variability. Frequent monitoring is not a reasonable or practicable use of resources because the Municipal and Industrial Dischargers are a small source of PCBs to San Francisco Bay (less than seven percent) relative to the high cost of PCBs analyses (approximately \$800 for each sample).

The performance-based limitations were derived from the 99 percent upper confidence level of the mean concentration for each dataset of the four performance categories. The 99 percent upper confidence level was used on the mean of the datasets because of the high level of uncertainty in the actual mean (or actual performance) from the very small dataset for each discharge category used to establish TMDL allocations (the number of samples were between 6 and 14). The resulting long-term average for each performance category was then multiplied by the appropriate multiplier from the Technical Support Document to calculate the average monthly and maximum daily effluent limitations, as shown below:

Table F-6. PCBs WQBEL Calculations

	Secondary	Advanced Secondary	Petroleum Refinery	Non-Petroleum Refinery
Units	µg/L	µg/L	µg/L	µg/L
Number of data points <10 or at least 80% of data reported non-detect? (Y/N)	Y	N	N	Y
Mean of TMDL effluent data points	0.003556	0.000211	0.000272	0.003543
Standard deviation of TMDL effluent data points	0.002206	0.000066	0.000199	0.001554
Coefficient of variation, calculated	0.62	0.31	0.73	0.44
Coefficient of variation, Selected	0.60	0.31	0.73	0.60
99% upper confidence level on the mean	0.005547	0.00025	0.000402	0.005678
AMEL multiplier ⁹⁵ from U.S. EPA Technical Support Document	2.13	1.58	2.37	2.13
MDEL multiplier ⁹⁹ from U.S. EPA Technical Support Document	3.11	1.94	3.70	3.11
AMEL	0.012	0.00039	0.00095	0.012
MDEL	0.017	0.00049	0.0015	0.018

These limitations are based on data for 40 congeners that are representative surrogates for the PCBs causing impairment. These 40 congeners are the same ones monitored in the Regional Monitoring Program (using U.S. EPA Method 1668A) that formed the basis for the impairment determination.

Because some other congeners co-elute with these 40 congeners (using U.S. EPA Method 1668C), the concentrations of as many as 66 congeners, if the laboratory uses a SB-Octyl column (shown in Table F-7 below), or as many as 59 congeners, if the laboratory uses a DB-1 column (shown in Table F-8 below), form the basis for the limits. Therefore, it would be reasonable and consistent with the San Francisco Bay PCBs TMDL (if U.S. EPA Proposed Method 1668C is an approved method at the time of the next permit reissuance) that any future compliance with effluent limitations be determined using the same congeners used to derive the limits specified in this Order.

4.4. Discharge Requirement Considerations

- 4.4.1. **Anti-Backsliding.** This Order complies with the anti-backsliding provisions of CWA sections 402(o) and 303(d)(4), and 40 C.F.R. section 122.44(l), which generally require effluent limitations in a reissued permit to be as stringent as those in the previous order. The requirements of this Order are at least as stringent as those in the previous order.
- 4.4.2. **Antidegradation.** This Order complies with the antidegradation provisions of 40 C.F.R. section 131.12 (federal policy) and State Water Board Resolution 68-16 (state policy). Permitted discharges must be consistent with these policies. This Order does not decrease the quality nor increase the quantity of the Dischargers' discharges to San Francisco Bay and its tributaries.

5. RATIONALE FOR RECEIVING WATER LIMITATIONS

No additional receiving water limits beyond those already specified in the Dischargers' individual NPDES permits are necessary to implement the San Francisco Bay Mercury and PCBs TMDLs.

6. RATIONALE FOR PROVISIONS

6.1. Standard Provisions

Attachment D of each individual NPDES permit listed in Attachment B of this Order contains standard provisions that apply to all NPDES permits in accordance with 40 C.F.R. section 122.41 and additional conditions applicable to specific categories of permits in accordance with 40 C.F.R. section 122.42. The Discharger must comply with these provisions. The conditions set forth in 40 C.F.R. sections 122.41(a)(1) and (b) through (n) apply to all state-issued NPDES permits and must be incorporated into permits either expressly or by reference.

In accordance with 40 C.F.R. section 123.25(a)(12), states may omit or modify conditions to impose more stringent requirements. Attachment G of each individual NPDES permit listed in Attachment B of this Order contains standard provisions that supplement the provisions in Attachment D. This Order omits the federal conditions that address enforcement authority specified in 40 C.F.R. sections 122.41(j)(5) and (k)(2) because the state's enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates Water Code section 13387(e) by reference.

6.2. Monitoring and Reporting Provisions

CWA section 308 and 40 C.F.R. sections 122.41(h), 122.41(j)-(l), 122.44(i), and 122.48 require that NPDES permits specify monitoring and reporting requirements. Water Code section 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. The

MRP establishes monitoring, reporting, and recordkeeping requirements that implement federal and state requirements. For more information, see Fact Sheet section 7.

6.3. Special Provisions

6.3.1. Reopener Provisions

This provision allows changes or modifications if the Mercury or PCBs TMDL is revised.

6.3.2. Triggers for Additional Mercury Control

Mass and concentration-based triggers were developed to allow for early actions in the event that a Discharger observes an increasing trend in mercury discharge. The purpose of the triggers is to identify potential new mercury sources and reduce them to ensure that wasteload allocations continue to be achieved.

Consistent with the San Francisco Bay Mercury TMDL, mass triggers for Municipal and Industrial Dischargers are equivalent to the individual mass-based limitations stated in this Order, with the exception that compliance with the mass-based limitations is determined monthly, instead of annually, using a rolling 12-month average. This is necessary to capture any mercury load increase in a timely manner and allow development and implementation of reduction measures that may avoid effluent limit violations.

For concentration-based triggers, there are two broad categories of municipal facilities: (1) those that provide secondary treatment, and (2) those that provide advanced secondary treatment. Facilities providing advanced treatment have better performance, hence lower effluent concentrations than those providing secondary treatment. Therefore, the triggers for advanced treatment facilities are lower than those for secondary treatment facilities.

Consistent with the TMDL implementation plan, the proposed effluent mercury concentration triggers for municipal secondary treatment facilities are a daily maximum of 0.065 µg/l total mercury (derived from the 99th percentile concentration of effluent data collected from January 2000 to September 2002) and a monthly average of 0.041 µg/l total mercury (derived from the 95th percentile concentration of effluent data collected from January 2000 to September 2002). For facilities providing advanced treatment, the proposed concentration triggers are a daily maximum of 0.021 µg/l total mercury (the 99th percentile concentration) and a monthly average of 0.011 µg/l total mercury (the 95th percentile concentration).

Consistent with the TMDL implementation plan, the proposed effluent triggers for Industrial Dischargers are a daily maximum of 0.062 µg/l total mercury

(derived from the 99th percentile concentration of petroleum-refinery effluent data collected from January 2000 to September 2002) and a monthly average of 0.037 µg/l total mercury (derived from the 95th percentile concentration of petroleum-refinery effluent data collected from January 2000 to September 2002).

Consistent with the TMDL, if a Discharger exceeds either its mass or concentration trigger, this Order requires the Discharger to report the exceedance in its Self-Monitoring Report and include the following:

- a. Evaluation of the cause of the trigger exceedance;
- b. Evaluation of the effectiveness of existing pollution prevention or pretreatment programs and methods for preventing future exceedances; and
- c. Evaluation of the feasibility and effectiveness of technology enhancements to improve plant performance.

This Order allows 130 days to provide this report, which allows for 30 days for standard laboratory turnaround on ultra-clean samples, 40 days for accelerated monitoring to verify and better characterize trigger exceedances, and 60 days from the TMDL implementation plan to submit the report. The Regional Water Board may pursue enforcement against Dischargers that do not respond to trigger exceedances or do not implement actions to correct and prevent trigger exceedances. Determination of appropriate actions will be based on an updated assessment of source control measures and wastewater treatment technologies applicable for the term of each issued or reissued permit.

The TMDL implementation plan requires the permit to specify that a trigger exceedance cause a Discharger to take corrective actions. The TMDL implementation plan explains that one of the concepts behind requiring triggered actions is to ensure that wastewater dischargers continue ongoing operation, maintenance, and performance of their treatment facilities. This Order is consistent with the TMDL because it allows accelerated monitoring to determine if ongoing performance is maintained before corrective measures must be taken. Accelerated weekly monitoring for at least six events spanning over two months is sufficient to provide reasonable and convincing weight of evidence that the first trigger exceedance was either an anomaly or reflected a spurious source and can be disregarded. The additional samples would also help to characterize the duration and magnitude of the exceedance and help with development of the action plan if one is necessary.

See Appendix F-1 for an example of actions required in response to initial trigger exceedances.

6.3.3. **Mercury and PCBs Source Control Programs**

The San Francisco Bay Mercury and PCBs TMDLs both require that Municipal and Industrial Dischargers develop and implement programs to identify and control manageable sources of mercury and PCBs. Therefore, this Order requires Dischargers to implement source control programs to reduce mercury and PCBs loads to their respective treatment plants.

6.3.4. **Risk Reduction Programs**

The San Francisco Bay Mercury and PCBs TMDLs require Municipal and Industrial Dischargers to develop and implement effective programs to reduce mercury related and PCBs-related risks to human health and aquatic organisms and wildlife and to quantify risk reductions resulting from these activities. This Order requires Dischargers to implement these measures to reduce mercury and PCBs-related risks.

In coordination with this effort, the Regional Water Board will work with different health agencies and Dischargers that pursue risk management as part of their mercury and PCBs-related programs. For an effective and efficient regional program, this Order allows for third parties to conduct these programs if Dischargers provide funding for this purpose.

6.3.5. **Mercury and PCBs Discharge Adjustments for Recycled Wastewater Use by Industrial Dischargers**

The Regional Water Board encourages water recycling pursuant to Water Code sections 13510 through 13512. Recycled wastewater can preserve potable water supply sources. Consistent with Basin Plan section 4.6.1.1, the Mercury or PCBs Adjustment provided in this Order accounts for recycled water that is produced by Municipal Dischargers and used by Industrial Dischargers in industrial processes.

The Mercury or PCBs Adjustments only apply if the mercury or PCBs in the recycled wastewater is discharged through an Industrial Discharger's outfall. The Mercury or PCBs Adjustments are calculated based on mass balance principles and will not result in any net increase in mercury or PCBs loads to San Francisco Bay.

The Mass Adjustment is subtracted from the actual mass discharge of one Industrial Discharger and is then added to the actual mass discharge of the Municipal Discharger who supplied the recycled wastewater who would have otherwise discharged that mercury or PCBs through its municipal treatment plant outfall. Local impacts from this shifting in load would be minimal because the municipal or industrial discharge would be discharged to the same receiving water body, as the cost of water transport between facilities that are very far apart would make such a reuse project infeasible.

A Concentration Adjustment is provided because a typical reuse project for an industrial facility involves using the recycled water in cooling towers or boilers where the concentration of mercury or PCBs increases through evaporative losses. The blowdown would eventually go to the Industrial Discharger's sewer and potentially elevate its discharge concentration. Since the concentration limit is based on past performance, future recycled wastewater use could affect the Industrial Discharger's compliance with the performance limitation. Unlike the Mass Adjustment, it is inappropriate to add the Concentration Adjustment to the supplying Municipal Discharger because an increase in concentration that occurs at the industrial facility does not affect or reflect the Municipal Discharger's performance.

6.3.6. **PCBs Discharge Adjustment for Urban Stormwater Treatment for Urban Stormwater Treatment by Municipal Dischargers**

The Regional Water Board recognizes that routing urban runoff through municipal wastewater treatment facilities may be an efficient means of reducing PCBs and other particle-associated contaminant loads to the San Francisco Bay. For this reason, the San Francisco Bay PCBs TMDL includes a reserve allocation of 1.0 kg/year for municipal wastewater treatment plants to treat urban runoff (specified in Basin Plan Table 7.2.3-2). This provision provides a mechanism for Municipal Dischargers to receive a credit for treating urban runoff that would otherwise be discharged directly to San Francisco Bay.

Adjustments are calculated based on mass balance principles and will not result in any net increase in PCBs loadings to San Francisco Bay. Unlike the use of recycled water, urban runoff diversions will occur intermittently, most likely over a period of hours. For this reason, it is impossible to coordinate influent and effluent sampling with the precision applied for recycled water adjustments. Additionally, the concentrations of PCBs in urban runoff are expected to be much more variable than those found in recycled water. East Bay Municipal Utility District's study, *Characterization of Stormwater Flows, Diversion of Dry Weather and First Flush Flows to a Publicly-Owned Treatment Works* (July 2010), found the concentrations of PCBs in dry weather runoff to be almost an order of magnitude lower than those found in wet weather. As such, when determining credits for urban runoff diversions, this Order groups them into two categories: (1) dry weather diversions and (2) wet weather diversions.

During this Order term, the Municipal Discharger may use the entire influent PCBs mass for the concentration adjustment described in Provision 6.3.6.

7. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

Attachment E contains the MRP for this Order. It specifies monitoring locations, monitoring frequencies, and reporting requirements. The following provides the rationale for these requirements.

Basin Plan sections 7.2.2.6 and 7.2.3.6 require Dischargers to monitor and report mercury and PCBs discharge loads. Effluent monitoring is also necessary to capture any increases in loading and develop and implement reduction measures in advance of an effluent limitation exceedance.

Compliance with effluent limitations must be determined using an approved method under 40 C.F.R. Part 136. For PCBs, this is either U.S. EPA Method 608.3 or 625.1, used to monitor PCBs Aroclors. Consistent with the San Francisco Bay PCBs TMDL, this Order also requires each Discharger to monitor and report PCBs congeners using the proposed U.S. EPA Method 1668C, which can quantify PCBs that are present at lower levels than U.S. EPA Method 608.3 or 625.1. The Regional Water Board will use U.S. EPA Method 1668C data to verify assumptions and evaluate the need to further refine wasteload allocations in the TMDL.

This Order reduces the monitoring frequencies for PCBs congeners. An analysis of PCBs congeners data from the previous order term supported by a technical memo by the Bay Area Clean Water Agencies, *Proposal for PCB Congener Monitoring Reductions in 2022 Mercury and PCBs Watershed Permit (2022)*, confirmed that a reduction in monitoring frequencies to the frequencies defined in the MRP of this Order would not significantly change the characterization of PCBs in San Francisco Bay.

8. PUBLIC PARTICIPATION

The Regional Water Board considered the issuance of WDRs that will serve as an NPDES permit for point source discharges of mercury and PCBs from Municipal and Industrial Dischargers. As a step in the WDR adoption process, Regional Water Board staff developed tentative WDRs and encouraged public participation in the WDR adoption process.

- 8.1. Notification of Interested Parties.** The Regional Water Board notified the Dischargers and interested agencies and persons of its intent to prescribe WDRs for the discharge and provided an opportunity to submit written comments and recommendations. The public had access to the agenda and any changes in dates and locations through the [Regional Water Board's website](https://waterboards.ca.gov/sanfranciscobay) (waterboards.ca.gov/sanfranciscobay).
- 8.2. Written Comments.** Interested persons were invited to submit written comments concerning the tentative WDRs as explained through the notification process. Comments were to be submitted either in person, by e-mail, or by mail to the Executive Office at the Regional Water Board at 1515 Clay Street, Suite 1400, Oakland, California 94612, to the attention of James Parrish.

For full staff response and Regional Water Board consideration, the written comments were due at the Regional Water Board office by 5:00 p.m. on November 14, 2022.

8.3. Public Hearing. The Regional Water Board held a public hearing on the tentative WDRs during its meeting at the following date and time:

Date: December 14, 2022
Time: 9:00 a.m.

Contact: James Parrish, (510) 622-2381, James.Parrish@waterboards.ca.gov

Interested persons were provided notice of the hearing and information on how to participate. At the public hearing, the Regional Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony was requested to be in writing.

If the date or venue of any public hearing changes, the changes will be reflected in the most current agenda posted on the [Regional Water Board's website](http://waterboards.ca.gov/sanfranciscobay) (waterboards.ca.gov/sanfranciscobay).

8.4. Reconsideration of Waste Discharge Requirements. Any person aggrieved by this Regional Water Board action may petition the State Water Board to review the action in accordance with Water Code section 13320 and California Code of Regulations, title 23, sections 2050. The State Water Board must receive the petition at the following address within 30 calendar days of the date of Regional Water Board action:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

A petition may also be filed by email at waterqualitypetitions@waterboards.ca.gov.

For instructions on how to file a water quality petition for review, see the [Water Board's petition instructions](http://waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml) (waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml).

8.5. Information and Copying. Supporting documents and comments received are on file. To review these documents, contact Melinda Wong the Regional Water Board's custodian of records by calling (510) 622-2300 or emailing Melinda.Wong@waterboards.ca.gov. Document copying may be arranged.

8.6. Register of Interested Persons. Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference the Facility, and provide a name, address, and phone number.

8.7. Additional Information. Requests for additional information or questions regarding this Order should be directed to James Parrish, (510) 622-2381, James.Parrish@waterboards.ca.gov.

APPENDIX F-1 WHEN REQUIRED MERCURY INVESTIGATIVE ACTIONS ARE TRIGGERED

This appendix provides an example of the actions necessary to respond to a mercury trigger exceedance, as described in Provision 6.3.2. of the Order:

Discharger X is subject to the following triggers:

- Average Monthly Trigger = 0.041 $\mu\text{g/L}$
- Maximum Daily Trigger = 0.065 $\mu\text{g/L}$
- 12-month Mass Emission Trigger = 0.91 kg/yr

A sample collected on May 4 is 0.046 $\mu\text{g/L}$, with the results received on May 30 by Discharger X from its contract laboratory.

Discharger Action 1: Initiate accelerated monitoring (weekly or more frequent) as soon as practical (and within 48 hours) after receipt of sample result above trigger (0.046 $\mu\text{g/L}$ is above the monthly trigger of 0.041 $\mu\text{g/L}$).

Discharger Action 2: Report this exceedance in its cover letter for the May Self-Monitoring Report (due June 30) and continue to report mercury data on the cover letter until successful completion of the accelerated monitoring requirements described in Table 7, task a, of the Order.

Discharger Action 3: Continue accelerated monitoring until not less than a total of six new samples have been collected.

Discharger X's accelerated samples reveal the following results:

Sample Date	Sample Result, $\mu\text{g/L}$	12-month mass, kg/yr
(May 4)	(0.046)	(0.80)
June 1	0.031	0.79
June 5	0.059	0.82
June 14	0.023	0.81
June 18	0.055	0.82
June 30	0.040	0.82
July 5	0.029	0.81

Discharger Action 4: Initiate, no later than July 5, development of Action Plan for Mercury Reduction.

Note: Although one sample for July is below all three triggers, the average of the samples in June is above the monthly average trigger.

Discharger Action 5: Discharger X may shift to monthly monitoring after collection of the sixth accelerated sample.

Additional monitoring results:

Sample Date	Sample Result, µg/L	12-month mass, kg/yr
August 11	0.027	0.80
September 14	0.042	0.78
October 5	0.042	0.075
October 7	ND (<0.0005)	
November 5	0.035	0.81
December 10	0.022	0.93
January 5	0.018	0.94
February 14	0.028	0.85
March 25	0.010	0.81
April 7	0.023	0.75

Discharger Action 6: Submit and implement Action Plan for Mercury Reduction (due 130 days after May 30).

Note: Despite the July and August samples being below both concentration triggers, three consecutive months below **all** triggers are necessary before the Action Plan activities are no longer required. The May sample is still above the monthly trigger.

Note: In September, though that sample is above the monthly concentration trigger, accelerated monitoring is not required again because Discharger X has already been triggered into Action Plan mode.

Note: In December, though the concentrations have been below concentration triggers for three consecutive months, Discharger X must continue with the Action Plan because its 12-month running average mass discharge still exceeds the mass trigger.

Discharger Action 7: Report on current mercury reduction efforts in its Annual Self-Monitoring Report due February 1st.

In April, three consecutive months show successful completion of this effort. Discharger X is no longer required to further implement its Action Plan and may thus return to routine monitoring. Discharger X reports its mercury reduction efforts in its Annual Self-Monitoring Report due the following February.

APPENDIX F-2 CALCULATION OF CONCENTRATION-BASED MERCURY LIMITS

Introduction

To calculate concentration-based mercury limitations that are consistent with the assumptions and requirements of the San Francisco Bay Mercury TMDL, the Regional Water Board analyzed mercury data from 2000 to 2003 and grouped that data into three categories (municipal secondary treatment, municipal advanced secondary treatment involving filtration, and industrial treatment). The statistical analysis used data from 17 secondary treatment plants, 7 advanced secondary treatment plants, and 5 petroleum refineries.

The purpose of pooling mercury data to calculate limitations based on category of treatment and/or processes that are similar was to reduce the likelihood of penalizing Dischargers who have implemented effective control measures and are already performing well and rewarding other Dischargers who may not have implemented similar measures.

Data Analysis of Municipal Treatment Facilities

Regional Water Board staff analyzed mercury data from all treatment plants that were using the Regional Water Board's electronic reporting system. Mercury data that did not appear to result from ultra-clean sampling because of high detection limits were removed (i.e., EBMUD data from January 2000 through May 2001 and the San Francisco City and County Southeast Plant from October 21, 2003). Additionally, when detection limits were very low (e.g., the practical quantification limit [PQL] equaled 0.5 ng/L and the method detection limit equaled 0.24 ng/L), Regional Water Board staff censored data at the PQL. Finally, the Regional Water Board did not use data from Silicon Valley Clean Water because its treatment plant did not always filter treated wastewater, which made it difficult to categorize the plant as performing secondary or advanced secondary treatment.

Secondary Treatment Plants

The Regional Water Board's analysis of secondary treatment plants indicates that mercury data fit a log-normal distribution since the data closely follow the line of normality, as shown in Figure 1 below:

Figure 1. Probability Plot of Mercury Data for Secondary Treatment Plants

Because natural log-transformed mercury data for secondary treatment plants fit a normal distribution, it was possible to calculate performance-based limits based on select percentiles. For secondary treatment plants (data sample size of 984), the mean and standard deviation in the natural log phase were -4.5212 and 0.7188, respectively. Regional Water Board staff calculated daily, weekly, and monthly mercury limits based on the 99.87th percentile (3 standard deviations above the mean), the 99.57th percentile (2.625 standard deviations above the mean), and the 99.38th percentile (2.5 standard deviations above the mean).

Table 1. Mercury Limits for Secondary Treatment Plants

Percentile	Averaging Period	Mercury Limit (ng/L)
99.87 th	Daily	94
99.57 th	Weekly	72
99.38 th	Monthly	66

Advanced Secondary Treatment Plants

The Regional Water Board’s analysis of advanced secondary treatment plants indicates those data also fit a log-normal distribution since the data follow the line of normality, as shown in Figure 2 below:

Figure 2. Probability Plot of Mercury Data for Advanced Secondary Treatment Plants

Because natural log-transformed mercury data for advanced secondary treatment plants fit a normal distribution, it was possible to calculate performance-based limits based on select percentiles. For advanced secondary treatment plants (data sample size of 434), the mean and standard deviation in the natural log phase were -5.3457 and 0.6664, respectively. Regional Water Board staff calculated daily, weekly, and monthly mercury limits based on the 99.87th percentile, the 99.57th percentile, and the 99.38th percentile.

Table 2. Mercury Limits for Advanced Secondary Treatment Plants

Percentile	Averaging Period	Mercury Limit (ng/L)
99.87 th	Daily	35
99.57 th	Weekly	27
99.38 th	Monthly	25

Data Analysis of Industrial Treatment Facilities

The Regional Water Board analyzed mercury data from five petroleum refineries that report data to the Water Board’s electronic reporting system. Regional Water Board staff determined that a number of data points from three of the refineries (i.e., Chevron, Phillips 66, and Shell) were not indicative of treatment plant performance, and therefore, were removed. Additionally, when detection limits were very low, the Regional Water Board censored data at the PQL.

The Regional Water Board’s analysis of five Bay Area refineries indicated that mercury data fit a log-normal distribution since the data closely follow the line of normality, as shown in Figure 3 below:

Figure 3. Probability Plot of Mercury Data for Bay Area Refineries

Because natural log-transformed mercury data fit a normal distribution, it was possible to calculate performance-based limits based on select percentiles. For refineries (data sample size of 296), the mean and standard deviation in the natural log phase were -4.7000 and 0.8654, respectively. Regional Water Board staff calculated daily, weekly, and monthly mercury limits based on the 99.87th percentile (3 standard deviations above the mean), the 99.57th percentile (2.625 standard deviations above the mean), and the 99.38th percentile (2.5 standard deviations above the mean).

Table 3. Mercury Limits for Industries Using Petroleum Refinery Performance

Percentile	Averaging Period	Mercury Limit (ng/L)
99.87 th	Daily	122
99.57 th	Weekly	88
99.38 th	Monthly	79
