ATTACHMENT E – NOTICE OF INTENT
IV. RECEIVING WATER INFORMATION

A. Algaecide and aquatic herbicides are used to treat (check all that apply):
1. ☐ Canals, ditches, or other constructed conveyance facilities owned and controlled by Discharger.
   Name of the conveyance system: **Balloon Track**
2. ☐ Canals, ditches, or other constructed conveyance facilities owned and controlled by an entity other than the Discharger.
   Owner’s name: ____________________________________________
   Name of the conveyance system: ______________________________________
3. ☐ Directly to river, lake, creek, stream, bay, ocean, etc.
   Name of water body: **Palco Marsh, Hikshari Trail**

B. Regional Water Quality Control Board(s) where treatment areas are located
   (REGION 1, 2, 3, 4, 5, 6, 7, 8, or 9): Region ________________________________
   (List all regions where algaecide and aquatic herbicide application is proposed.)

V. ALGAECIDE AND AQUATIC HERBICIDE APPLICATION INFORMATION

A. Target Organisms:  ____ Primary target Spartina Sp.
   Other invasive species as they present themselves.

B. Algaecide and Aquatic Herbicide Used: List Name and Active ingredients
   1. Imazamox;
   2. Imazapyr;
   3. Glyphosate;
   4. Triclopyr

C. Period of Application:  Start Date ________________       End Date ________________

D. Types of Adjuvants Used:  Non-ionic Surfactants, modified seed oil (MSO)

VI. AQUATIC PESTICIDE APPLICATION PLAN

Has an Aquatic Pesticide Application Plan been prepared and is the applicator familiar with its contents?
☐ Yes       ☐ No
If not, when will it be prepared? ____________________________

VII. NOTIFICATION

Have potentially affected public and governmental agencies been notified?
☐ Yes       ☐ No

VIII. FEE

Have you included payment of the filing fee (for first-time enrollees only) with this submittal?
☐ YES       ☐ NO       ☐ NA
IX. CERTIFICATION

"I certify under penalty of law that this document and all attachments were prepared under my direction and supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine or imprisonment. Additionally, I certify that the provisions of the General Permit, including developing and implementing a monitoring program, will be complied with."

A. Printed Name: [Signature]
B. Signature: [Signature] Date: 4/14/17
C. Title: [Signature]

The following APAP uses topic discussion titles similar to the State Water Resources Control Board’s Water Quality Order No. 2013-0002-DWQ General Permit No. CAD990005 for a NPDES permit for residual aquatic pesticide discharge to the waters of the United States.

A. Application Schedule

Applications will be scheduled annually in collaboration with stakeholders and applicable agencies. Herbicides shall not be applied unless the predicted chance of rain is less than 40 percent for the Redwood Coast segment of the National Weather Service’s forecast for Northwestern California; herbicides shall only be applied during low and outgoing tides to ensure that treated plants remain above tidal inundation levels for a minimum of several hours; and herbicide use shall not occur when winds are in excess of 10 miles per hour, or when inversion conditions exist, or when wind could carry spray drift into surrounding inhabited areas.

B. Public Notice Requirements

Every calendar year, at least 15 days prior to the first application of aquatic herbicides, the Discharger shall notify potentially affected public agencies. Provisions for posting warning/notification signs at and/or near any public trails, boat launches, and other potential points of access to herbicide application sites a minimum of one week prior to treatment.

The Discharger shall post the notification on its website. The notification shall include the following information:

1. A statement of the discharger’s intent to apply algaecide or aquatic herbicide(s);
2. Name of algaecide and aquatic herbicide(s);
3. Purpose of use;
4. General time period and locations of expected use;
5. Any water use restrictions or precautions during treatment; and
6. A phone number that interested persons may call to obtain additional information from the Discharger.

C. Aquatic Pesticide Application Plan (APAP)

C.1 The water system where the pesticide will be applied.

The project areas include diverse wetland ecosystems with saltwater, brackish, tidal, and freshwater marsh surrounded by emergent scrub-shrub and riparian vegetation and ruderal or disturbed upland areas. Projects will be targeting invasive plants throughout these project areas using targeted spot spraying techniques.

The City of Eureka has proposed to enhance marsh areas within their jurisdiction to a higher functioning state, including drainage improvements to improve the water regime within the marshes, eradicating exotic/invasive plant species, and in some cases revegetating with native species. This APAP has been designed in order to permit pesticide applications for invasive plant control starting in PALCO Marsh, however, these invasive plants have also been identified in other marsh habitats outlined herein which will be targeted in the ongoing management project.
C.2 The treatment areas.

These treatment areas are within or adjacent to coastal marshes in Eureka, California. These marshes are highly productive, herbaceous and suffrutescent (slightly woody at the base), with salt-tolerant hydrophytes forming moderate to dense cover and up to 1 meter tall. Most species are active in summer, dormant in winter. The predominant vegetation community within the marshes are classified as saltgrass flats (*Distichlis spicata*). The saltgrass flats community within the project areas is dominated by saltgrass and pickleweed; associate species include spearscale orache (*Atriplex triangularis*), gumplant (*Grindelia stricata*), and in some locales, extensive patches of cordgrass (*Spartina densiflora*), common reed (*Phragmites australis*) and other exotic invasive species.

A significant increase in invasive non-native plants has been documented over the past decade through the City’s Enhancement Monitoring Program Coastal Development Permit (CDP) No. 1-90-104-A2. There is a cause for concern regarding the continued presence of dense-flower cordgrass, a highly invasive plant within saltmarsh ecosystems. This plant is classified by the California Invasive Plant Council (Cal-IPC) as a species of high alert (Cal-IPC 2014). Another species which is a cause of concern is common reed (*Phragmites australis*). Common reed has the potential to displace marsh species and has been identified as a management priority within the CDP (Condition No. 5.2).

Treatments will target colonies of the afore mentioned species within the boundaries shown in the maps below. Treatment areas fall under the category of “near” or “over” water, no pesticides applications will be applied directly to the water.
C.3 Types of weeds to be controlled and why

Table 2: Pesticides to be used
C.5 Factors influencing the decision of using pesticide for weed control.

The action threshold level is the point at which action should be taken to control aquatic vegetation before any or all of the following occurs: an invasive species begins to displace a native species, water quality becomes degraded, intended uses of the area are impacted such as in a conveyance system or a recreational setting.

Pesticides will be used in accordance with the City’s IPM program which will rely on various control techniques throughout the course of the project. See further discussion of these methods in section C.11 Evaluation of alternatives:

C.6 Gates and control structures

The City maintains and operates a control structure at the balloon track project boundary (Balloon Track Tide Gate). During application events, the City will close this structure in a way that will prevent the discharge of pesticide residues to receiving waters. The City’s existing control structures are regularly inspected for leaks or malfunctioning components by City Staff.

C.7 The SIP exception

The SIP is not applicable for the City of Eureka as no priority pollutants are included in this APAP.

C.8 Monitoring Requirements

The City or its designated contractor will conduct a water quality monitoring and reporting program (MRP) in accordance with the requirements of the Statewide General National Pollutant Discharge Elimination System (NPDES) Permit for the Discharge of Aquatic Pesticides for Aquatic Weed Control in Water of the United States General Permit No. CAG990005.

The City or its designated contractor shall maintain a log for each aquatic herbicide application event equivalent to the form found in Appendix B: Forms. The application log shall contain the following information:

1. Date of application;
2. Location of application;
3. Name of applicator;
4. Type and amount of aquatic herbicide used;
5. Application details, such as flow and level of water body, tides, time application started and stopped, algaecide and aquatic herbicide application rate and concentration;
6. Visual monitoring assessment; and
7. Certification that applicator(s) followed the APAP.

Monitoring locations:

Locations will be selected to represent the variations in treatment that occur, including: 1) the hydrological setting with respect to tidal influence, seasonal creek flows; adjacency or proximity to standing water; 2) the application method of aquatic herbicide. Monitoring frequency will follow the schedule set forth by the NPDES general permit and is summarized below:
Background Monitoring:

When treatment areas are within standing water, background monitoring samples shall be collected in the application area just prior to the application event, or in the application area up to 24-hours in advance of the application event. In tidally influenced areas, samples will be collected during high tides or when standing water is present. If standing water is not present within a treatment area at the time of application, no sample will be collected.

Event Monitoring:

Event monitoring samples shall be collected immediately downstream of the treatment area in flowing waters or immediately outside of the treatment area in non-flowing waters. If standing water is not present outside the treatment area at the time of application, no sample will be collected. When standing water is present downwind of a treatment location, an event sample will be collected within the area potentially affected by overspray. Samples will be collected immediately after the application event, but after sufficient time has elapsed such that treated water/spray drift would have exited the treatment area (about 5 to 15 minutes).

Post-event Monitoring:

Post-event monitoring samples shall be collected from the treatment area within 7 days after application. In tidally influenced areas, samples will be taken at high tides or when sufficient depth of water is present. When applicable, one full set of three samples (Background, Event and Post-Event) will be collected during each treatment event scheduled for chemical application.

Sample Collection:

Samples shall be collected using a sampling rod or Van Dorn device at 3 feet below the surface of the water or at mid-water column depth if the water depth is less than 4 feet. Samples will be collected according to the protocol outlined in section C.9 Preventing sample contamination and delivered to a certified laboratory. All laboratory analyses shall be conducted at a laboratory certified for such analyses by the California Department of Public Health in accordance with California Water Code section 13176. Laboratories that perform sample analyses shall be identified in all monitoring reports. The Discharger shall institute a Quality Assurance-Quality Control Program for any onsite field measurements such as electric conductivity, pH, turbidity, and temperature. A manual containing the steps followed in this program must be kept and shall be available for inspection by the State Water Board and the appropriate Regional Water Board staff. The Quality Assurance-Quality Control Program must conform to United States Environmental Protection Agency (U.S. EPA) guidelines or to procedures approved by the State Water Board and the appropriate Regional Water Board.

All analyses shall be conducted in accordance with the latest edition of “Guidelines Establishing Test Procedures for Analysis of Pollutants,” promulgated by the U.S. EPA in title 40 Code Federal Regulation (40 C.F.R.) 136 or equivalent methods that are commercially and reasonably available and that provide quantification of sampling parameters and constituents sufficient to evaluate compliance with applicable effluent limits and to perform reasonable potential analysis. Equivalent methods must be more sensitive than those specified in 40 C.F.R. 136 if the method is available in the 40 C.F.R. 136, and must be approved for use by the Regional Water Board Executive Officer.
Sampling Frequency:

Pesticide residue sampling for glyphosate will be conducted for one application event from each environmental setting per year. For application of imazamox, imazapyr, and triclopyr, samples will be collected for at least six consecutive events for each environmental setting. If the results from six consecutive events report concentrations below receiving water limits/triggers, then only one sample for that active ingredient will be required in the following years. However, if any sample exceeds a limit/trigger, then the following six events will require sampling.

Sampling Log Information Recorded

In conducting the receiving water sampling, a log shall be kept of the receiving water conditions throughout the reach bounded by the treatment area. The visual and physical parameters outlined below in the General Permit Table C-1 Monitoring requirements, will be measured at the time of chemical sampling and recorded on monitoring field sheets equivalent to the one shown in Appendix B: Forms. All monitoring instruments and devices used to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their accuracy.

Calibration Log Recorded

It is necessary to keep a log of the calibration of appropriate field instruments used for water quality monitoring. Field instrument calibration should be conducted no earlier than the evening prior to the water quality monitoring, and the results recorded. These calibration records need to be in the Annual Information Collection Report submitted to the discharger/client for their records in case it is needed for a later date should the Annual Summary Report be questioned by the State Water Board.

1. All applications at all sites.
2. Field testing.
3. Field or laboratory testing.
4. Samples shall be collected at three feet below the surface of the water body or at mid water column depth if the depth is less than three feet.
5. Collect samples from a minimum of six application events for each active ingredient in each event setting (lowing water and non-flowing water) per year, except for glyphosate. If there are less than six application events in a year, collect samples during each application event for each active ingredient in each event setting (lowing water and non-flowing water). If the results from six consecutive sampling events show concentrations that are less than the receiving water limit/trigger for an active ingredient in an environmental setting, sampling shall be reduced to one application event per year for that active ingredient in that environmental setting. If the yearly sampling event shows exceedance of the receiving water limit/trigger for an active ingredient in an environmental setting, then sampling shall return to six application events for that active ingredient in each environmental setting. For glyphosate, collect samples from one application event from each environmental setting (lowing water and non-flowing water) per year.
6. Polynaphene shall be analyzed using the analytical methods described in 40 C.F.R. part 116.
7. 2,4-D, dinoseb, dichlorprop, clupran, metolflax, motalox, imazaquin, imazapyr, pendimethalin, and triclopyr.
8. It is required only when copper is used.

Notes:
* Signifies algaecide or aquatic herbicide active ingredient. Chemical analysis is only required for the active ingredient(s) used in treatment.
* Analysis not required for algaecides and aquatic herbicides containing sodium carbonate peroxo hydrate.
* EPA Methods are taken from NEMI 2004.
1 Field measured.
2 May be field or laboratory measured.
3 Required only when a nonylphenol-based surfactant is used.
HPLC – High Performance Liquid Chromatography.
m – Modified extraction or analysis technique.

Reporting Requirements

Annual Report

The Discharger shall submit to the Deputy Director and the appropriate Regional Water Board Executive Officer an annual report consisting of a summary of the past year’s activities, and certify compliance with all requirements of this General Permit. If there is no discharge of algaecides and aquatic herbicides, their residues, or their degradation byproducts, the Coalition or Discharger shall provide the Deputy Director and the appropriate Regional Water Board Executive Officer a certification that algaecide and aquatic herbicide application activities did not result in a discharge to any water body. The annual report shall contain the following information:

1. An executive summary, which is submitted by the client to the State Water Board and the local Regional Water Quality Control Board, discussing compliance or violation of this General Permit and the effectiveness of the APAP; and
2. A summary of monitoring data, including the identification of water quality improvements or degradation as a result of the algaecide or aquatic pesticide application (held by the discharger/client in case it is asked for by reviewing agencies). Dischargers shall submit the annual report according to the following schedule:

<table>

</tr>
</tbody>
</table>

Notes:
1. See Regional Water Boards’ Water Quality Control Plans (Basin Plans) for beneficial use definitions.
2. Public entities and mutual water companies listed in Attachment G are not required to meet these limitations in receiving waters during the exception period described in the APAP and Section VIII.C.10 below.
3. For waters in which the salinity is equal to or less than 1 part per thousand 95% or more of the time, the freshwater criteria apply. For waters in which the salinity is equal to or greater than 10 parts per thousand 95% or more of the time, saltwater criteria apply. For waters in which the salinity is between 1 and 10 parts per thousand, the applicable criteria are the more stringent of the freshwater or saltwater criteria.
4. For freshwater aquatic life criteria, waters with a hardness 400 mg/L or less as calcium carbonate, the actual ambient hardness of surface water shall be used. For waters with a hardness of over 400 mg/L as calcium carbonate, a hardness of 400 mg/L as calcium carbonate shall be used with a default Water-Effect Ratio of 1.
5. Values should be rounded to two significant figures.
6. This limitation does not apply to the Sacramento River and its tributaries above the State Highway 32 Bridge at Hamilton City. See Table III-1 of the Basin Plan for the Sacramento and San Joaquin River Basins for copper limitation.

Table 6: Receiving water monitoring triggers

Due to the absence of water quality criteria for imazamox and its low toxicity to aquatic life as indicated in U.S. EPA’s Ecotoxicity Database, this General Permit does not have a receiving water monitoring trigger for imazamox. However, this General Permit requires receiving water monitoring for imazamox to collect data, which will provide information on whether the use of imazamox has water quality impacts.
The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

1. Sample results greater than or equal to the reported ML shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).
2. Sample results less than the Report Limit, but greater than or equal to the laboratory’s MDL, shall be reported as “Detected, but Not Quantified,” or DNQ. The estimated chemical concentration of the sample shall also be reported. For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words “Estimated Concentration” (may be shortened to “Est. Conc.”). The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (plus a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.
3. Sample results less than the laboratory’s MDL shall be reported as “<” followed by the MDL.
4. The Coalition or Discharger shall instruct laboratories to establish calibration standards so that the ML value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Coalition or Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.
5. Multiple Sample Data: If two or more sample results are available, the Coalition or Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of DNQ or “Not Detected” (ND). In those cases, the Coalition or Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:
   a. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
   b. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.
6. The annual report shall comply with the following requirements:
   a. The Coalition or Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the algaecide and aquatic herbicide applications are conducted in compliance with effluent and receiving water limitations. The Coalition or Discharger is not required to duplicate the submittal of data that are entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Coalition or Discharger shall submit electronically the data in a tabular format as an attachment.
   b. The Coalition or Discharger shall attach a cover letter to the annual report that clearly identifies violations of the permit; discusses corrective actions taken or planned; and provides a time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.
   c. The annual report must be submitted to the State Water Board and the appropriate Regional Water Board, signed and certified as required by the Standard Provisions.
Other Reporting Requirements

Twenty-Four Hour Report

The Coalition or Discharger shall report to the State Water Board and appropriate Regional Water Board any noncompliance, including any unexpected or unintended effect of an algaecide or aquatic herbicide use that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Coalition or Discharger becomes aware of the circumstances and must include the following information:

a. The caller’s name and telephone number;
b. Applicator name and mailing address;
c. Waste Discharge Identification (WDID) number;
d. The name and telephone number of a contact person;
e. How and when the Coalition or Discharger become aware of the noncompliance;
f. Description of the location of the noncompliance;
g. Description of the noncompliance identified and the U.S. EPA pesticide registration number for each product the Discharger applied in the area of the noncompliance; and
h. Description of any steps that the Coalition or Discharger has taken or will take to correct, repair, remedy, cleanup, or otherwise address any adverse effects.

If the Coalition or Discharger is unable to notify the State and the appropriate Regional Water Board within 24 hours, the Coalition or Discharger must do so as soon as possible and also provide the rationale for why the Discharger was unable to provide such notification within 24 hours.

Five-Day Written Report

The Coalition or Discharger shall also provide a written submission within five (5) days of the time the Discharger becomes aware of the noncompliance. The written submission shall contain the following information:

a) Date and time the Coalition or Discharger contacted the State Water Board and the appropriate Regional Water Board notifying of the noncompliance and any instructions received from the State and/or Regional Water Board; information required to be provided in Section D.1 (24-Hour Reporting);
b) A description of the noncompliance and its cause, including exact date and time and species affected, estimated number of individual and approximate size of dead or distressed organisms (other than the pests to be eliminated);
c) Location of incident, including the names of any waters affected and appearance of those waters (sheen, color, clarity, etc);
d) Magnitude and scope of the affected area (e.g. aquatic square area or total stream distance affected);
e) Algaecide and aquatic herbicide application rate, intended use site (e.g., banks, above, or direct to water), method of application, and name of algaecide and herbicide product, description of algaecide and herbicide ingredients, and U.S. EPA registration number;
f) Description of the habitat and the circumstances under which the noncompliance activity occurred (including any available ambient water data for aquatic algaecides and aquatic herbicides applied);
g) Laboratory tests performed, if any, and timing of tests. Provide a summary of the test results within five days after they become available;
h) If applicable, explain why the Coalition or Discharger believes the noncompliance could not have been caused by exposure to the algaecides or aquatic herbicides from the Coalition’s or Discharger’s application; and

i) Actions to be taken to prevent recurrence of adverse incidents.

The State Water Board staff or Regional Water Board staff may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours.

C.9 Preventing sample contamination

Samples shall be, when possible, collected upwind and not in close proximity to application equipment or from an application vessel. There shall not be any contact with aquatic herbicide application equipment, containers or personal protective equipment.

When done sampling in a given location, the equipment will be cleaned with a non-phosphate cleaner and triple-rinsed with distilled water. Once at a new sampling location, the equipment will be rinsed once with the water being sampled prior to collection. Gloves will be changed between collection sites.

Samples will be tightly sealed at the point of collection and placed upright with ice packs within an ice chest used solely for sample transport.

C.10 Best Management Practices (BMPs):

Aquatic Herbicide Spill Prevention and Containment

All herbicide applications will be supervised by a California Department of Pesticide Regulation certified applicator who has received training specific to the herbicide and surfactant/adjuvant products to be used. Label language will be followed to ensure safe handling and loading of herbicides. Application equipment will be routinely maintained and checked to identify and/or minimize the possibility of leak development or failure that might lead to a spill. Tank mixing and filling will be done well away from all surface waters. In the unlikely event of an aquatic herbicide spill, the material will be prevented from entering any water bodies to the extent practicable. AEI staff is trained to contain spilled herbicide products, apply absorbent material, and remove products to an approved disposal site. Label instructions will be followed and reporting as required by local, state and federal laws will be done for all spills.

Ensure only minimum and consistent amount of pesticide used for targeted weeds:

Pest Control Adviser (PCA) and/or qualified staff will evaluate sites that have aquatic weed and algae populations to determine if thresholds have or likely will be exceeded. Thresholds relate to the ability of the water conveyance system to move water, the native species being negatively impacted, and the degradation of water quality. If it is determined that a threshold has or likely will be exceeded, an aquatic pesticide application will be considered; and barring any concerns of water quality degradation, an application plan will be initiated.

All aquatic herbicide applications are to be made according to the product label in accordance with regulations of the U.S. EPA, CalEPA, Cal OSHA, DPR and the local Agricultural Commissioner. Prior to application, a PCA will prepare a written recommendation that specifies rates of application and any
warnings or conditions that limit the application so that non-target flora and fauna are not negatively affected.

**Plan for educating applicators on avoiding adverse effect from pesticide application:**

Aquatic herbicide applications will be made by personnel holding a valid Qualified Applicator Certificate (QAC) or Qualified Applicator License (QAL), or staff under the supervision of QACs or QALs. These applicators will have the training necessary to utilize proper equipment loading, nozzle selection, calibration, and operation to ensure that spills are minimized, only target vegetation is treated, and precise application rates are made according to the label.

Licensed QACs and OALs complete 20 hours and PCAs complete 40 hours of continuing education every 2 years to remain licensed, thus ensuring that all applicators are up-to-date on the latest pest control techniques.

**Plan on informing the farmers and agencies who have water rights on the receiving water:**

Appropriate gates, weirs, etc. will be closed to prevent discharge of residual aquatic herbicide into receiving waters of adjacent landowners (private or public). Additionally, water users potentially affected by any water use restrictions will be notified prior to an application being made, per the aquatic herbicide or algaecide label.

**Plan for the prevention of fish kill from pesticide applications:**

All herbicide applications will be supervised by a California Department of Pesticide Regulation-certified applicator who has received training specific to the herbicide and surfactant products to be used. A PCA written recommendation will include rates of application and any warnings or conditions that limit the application so that fish are not adversely affected. All manufacturers label instructions for rates and mixing and precautions to prevent fish kills will be followed.

In the case of large scale infestations, when possible, mechanical removal will precede pesticide applications to reduce the amount of product required and target pest to be killed. In addition, applications will not be system wide but only made to portions of a feature. These precautions will reduce the potential for drops in dissolved oxygen as a result of decaying biomass, and leave a refugia of oxygenated water for the fish to move to if needed.

In the case of treatments to flowing water, all applications will be initiated from the downstream end of a project to the upstream end to avoid a buildup of product in the flowing water. It is important to note that even with proper application and the use of precautions; in rare circumstances, aquatic herbicide use may result in impacts to non-target aquatic fauna.
C.11 Evaluation of alternatives:

a. 

i. **Taking no action** would result in the further degradation and loss of the natural ecological structure and function as invasive non-native plants continue to encroach and displace native vegetation.

ii. **Prevention** is accomplished through exclusionary fencing and restricted or limited access. Those accessing the project areas will be subject to the City’s protocols for equipment and clothing decontamination.

iii. **Mechanical methods** include manual removal through hand pulling plants out of marsh sediments or using hand tools such as spades, mattocks, or cutting tools. Manual removal methods are effective primarily at removing aboveground plant parts, but are less effective at removing belowground root structures that have a potential to rapidly regenerate shoots. Repeated cutting can reduce energy storage in the root systems and resulting regrowth over time, however, the potential for damage to non-target organisms and the potential risk of spreading of invasive plant parts through repeated traffic across the project boundaries is high.

iv. **Cultural methods** will include controlled burning in some situations to remove vegetation prior to other control methods, or to prevent pollen and seed dispersal in founder colonies invading new sites. Burning would be used only in suitable locations, and only during periods of low-wind conditions (especially early morning), when fire hazards in succulent vegetation of tidal pickleweed marshes would be manageable. Ignition, however, may be difficult in cordgrass stands within marsh areas. All burning will be performed by qualified individuals such as CalFire (CDF).

v. **Biological controls** are not suitable for this project.

vi. **Algaecides and aquatic herbicides.** Pesticide control is the least intrusive method for this project. As such, applicators will use the minimum amount of pesticides necessary to have an effective control program and at concentrations consistent with the product’s label requirements. PCA recommendations will be relied upon to ensure proper rates of application.

b. Use of least intrusive methods

Per the decision matrix below, the least intrusive method is chemical control, however, per IPM guidelines the discharger will rely on a combination of prevention, mechanical, cultural and chemical controls in the management of invasive species throughout the project boundaries when conditions allow.
