# Today's Talk

- What is barcoding?
- Why use barcoding for bioassessment?
- What are some of the technical challenges?
- What is the status of the application of barcoding for routine bioassessment?
- What does the future hold?

# Challenges of Traditional Taxonomy

- Time required to get results
- Expense of detailed taxonomy
- Taxonomic capacity
- Unpredictable quality of specimens
- Challenges of traditional taxonomy
  - Rare and cryptic species
  - Morphology of various life stages
  - Sexual dimorphism

# Barcoding is Part of the Solution

- Faster answers
  - Weeks vs. months
- Less expensive
  - Current barcoding costs comparable with traditional taxonomy
  - Next generation sequencing costs could be 60% cheaper
- Improved taxonomy (better data)
  - Recognizing misidentifications
  - Improving taxonomic keys
  - Helping with difficult to ID taxa
  - Supports QA programs

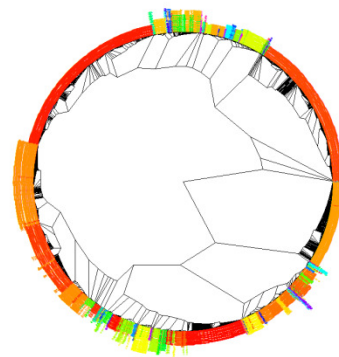

We have the technology

More robust  
understanding of  
community composition

# What is barcoding?

A DNA barcode is a short gene sequence taken from standardized portions of the genome, used to identify species.

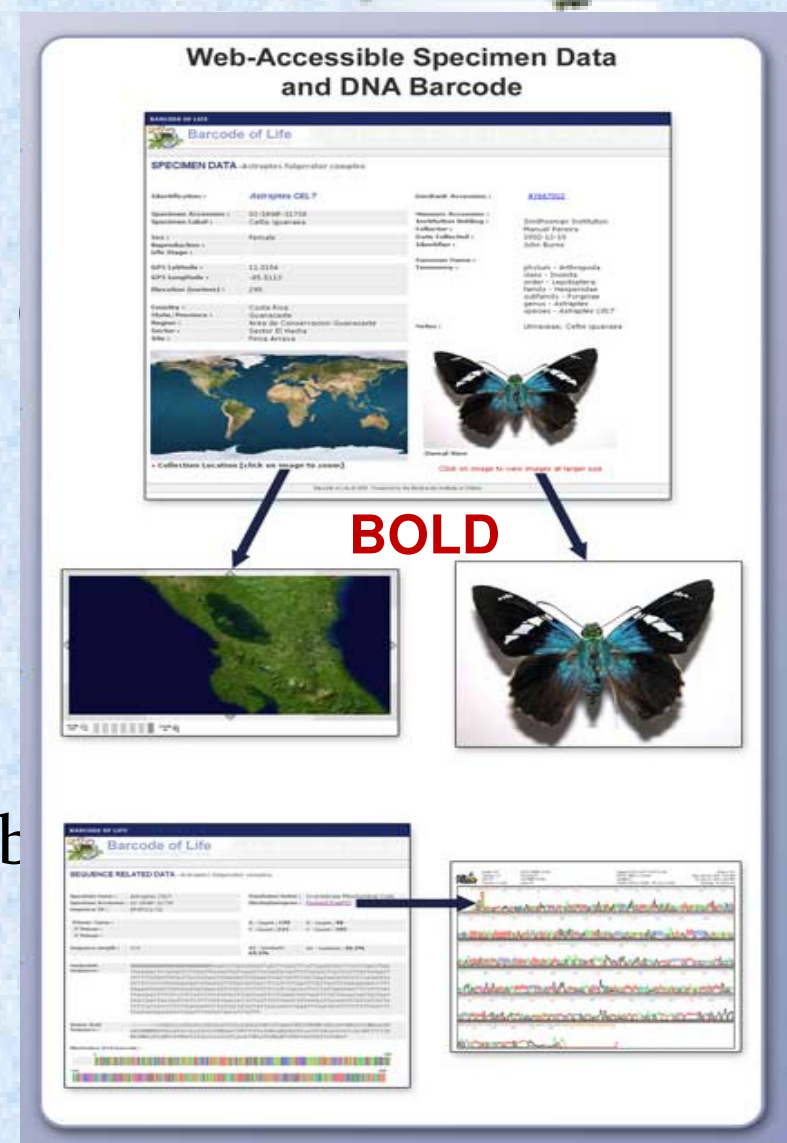

Similar to the UPC, DNA barcodes provide a universal system of unique tags for each species.

# How Does Barcoding Work?

- Collect samples
- Remove small amount of tissue
- Extract and amplify DNA
- Isolate DNA “marker”
- Compare marker to reference lib
- Identify species

# Technical Challenges

*Sounds Simple ..... But There are Technical Challenges*

- *Sampling*
- *Development of a Reference Library*
- *Efficacy of DNA Markers*
- *Application to Environmental Monitoring*

# Sampling Challenges

- Normal sample preservation methods don't work
- Formalin used in routine bioassessment
  - DNA degradation
- High volume ethanol used in molecular biology
  - Increases brittleness of samples
  - Logistically more difficult to take in the field
  - More hazardous
- Need alternative sample preservation methods

# Preservation Methods: Study Approach

- Test preservatives
  - 7 different treatments
  - Volume of ethanol
  - Number of ethanol replacements
  - Addition of glycerin
- Test holding times of 1 week – 12 months
- Barcode all samples to determine effect of preservation method
- *Initiated Sept. 2011*

# Building the Reference Library

- Routine barcode application depends on a robust library
  - Do barcodes match correct taxa?
  - Are barcode results consistent?
  - Do barcode sequence have correct amount of genetic variation?
- Progress to date
  - Collected approximately 5,500 freshwater invertebrates from CA
  - *Vouchers for all specimens barcoded to date*
  - Approximately 2,500 species on SAFIT list
  - 258 species in BOLD  $\approx$  75% from S. CA.

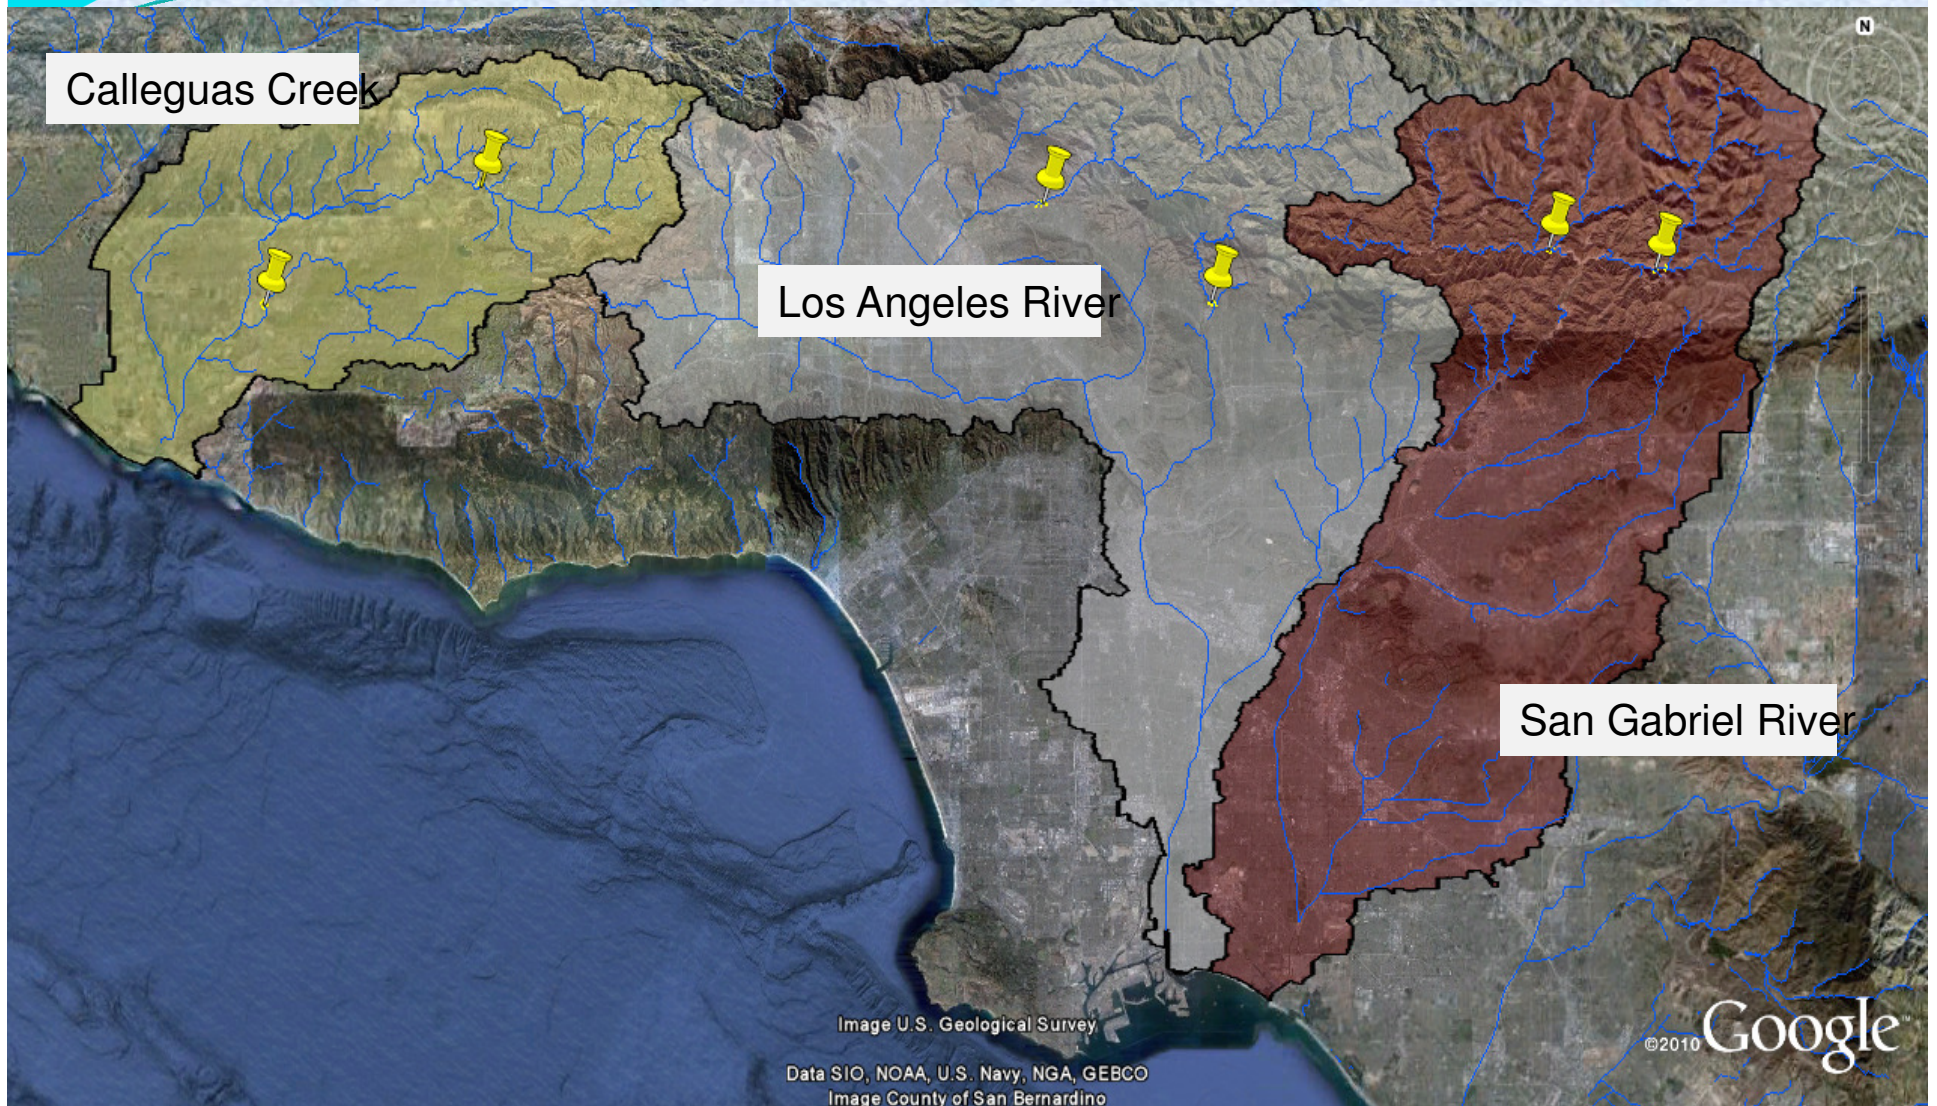

# Relationships to Traditional Taxonomy

## *Efficacy of DNA Markers*

- How does information on species and community composition vary between barcoding and traditional taxonomy?
  - What effect might this have on Indices of Biotic Integrity?
- Side-by-side comparisons of two approaches for freshwater benthic macroinvertebrates
  - Barcoding and morphology based identification
  - *Vouchers for every specimen*
- Incorporated into existing study on the effects of channel armoring on benthic communities.

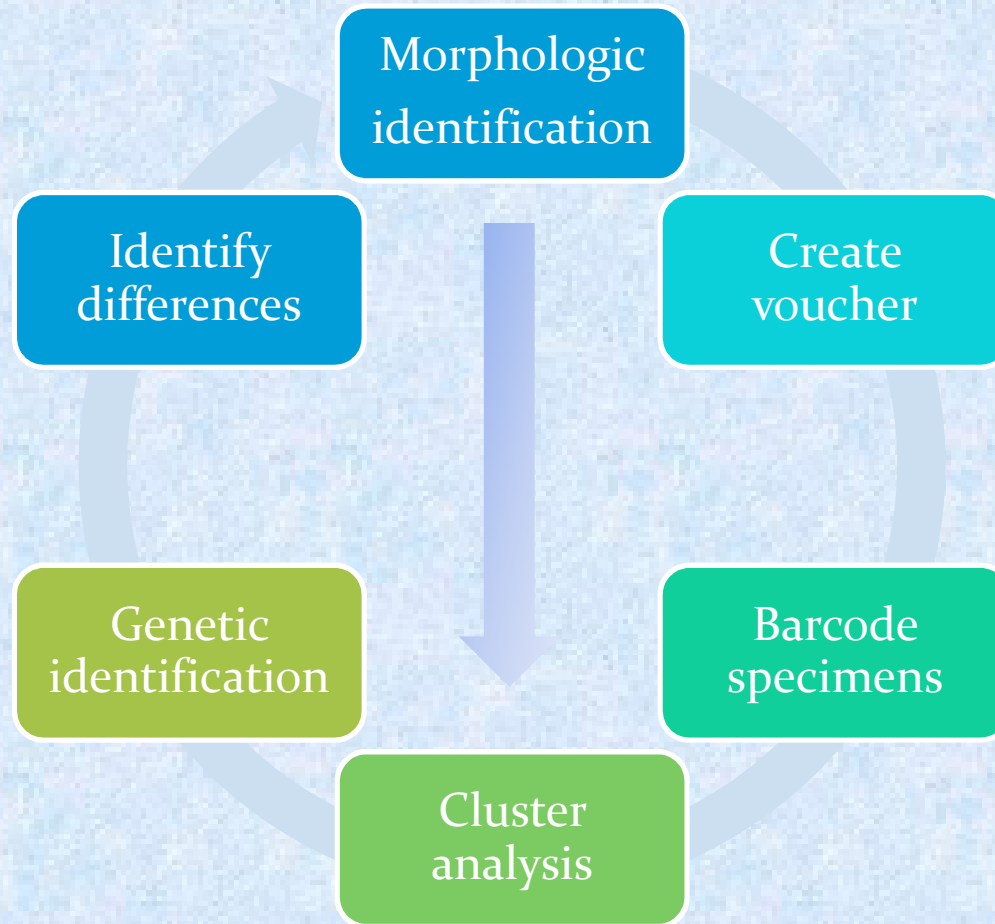

# Study Sites

# Taxonomic Identification

# Richness Measures

# Results Summary

Taxa	Seqs. > 420bp	Specimens	% Success	Morpho. Richness	Genetic Richness	% Change
Ephemeroptera	1203	1378	87.3%	15	18	20%
Diptera (Non-Chiro)	935	937	99.8%	17	20	18%
Diptera (Chironomidae)	1277	1428	89.4%	34	92	171%
Trichoptera	1004	1059	94.8%	13	18	38%
Plecoptera	13	13	100.0%	2	2	0%
Coleoptera	40	40	100.0%	7	6	-14%
Arachnida	142	145	97.9%	6	16	167%
Corbicula	451	465	97.0%	1	1	0%
Ostracods, Odonates, Snails	12	13	92.3%	6	6	0%
<b>Total</b>	<b>5107</b>	<b>5509</b>	<b>92.7%</b>	<b>101</b>	<b>179</b>	<b>77%</b>

# Neighbor-joining Grouping

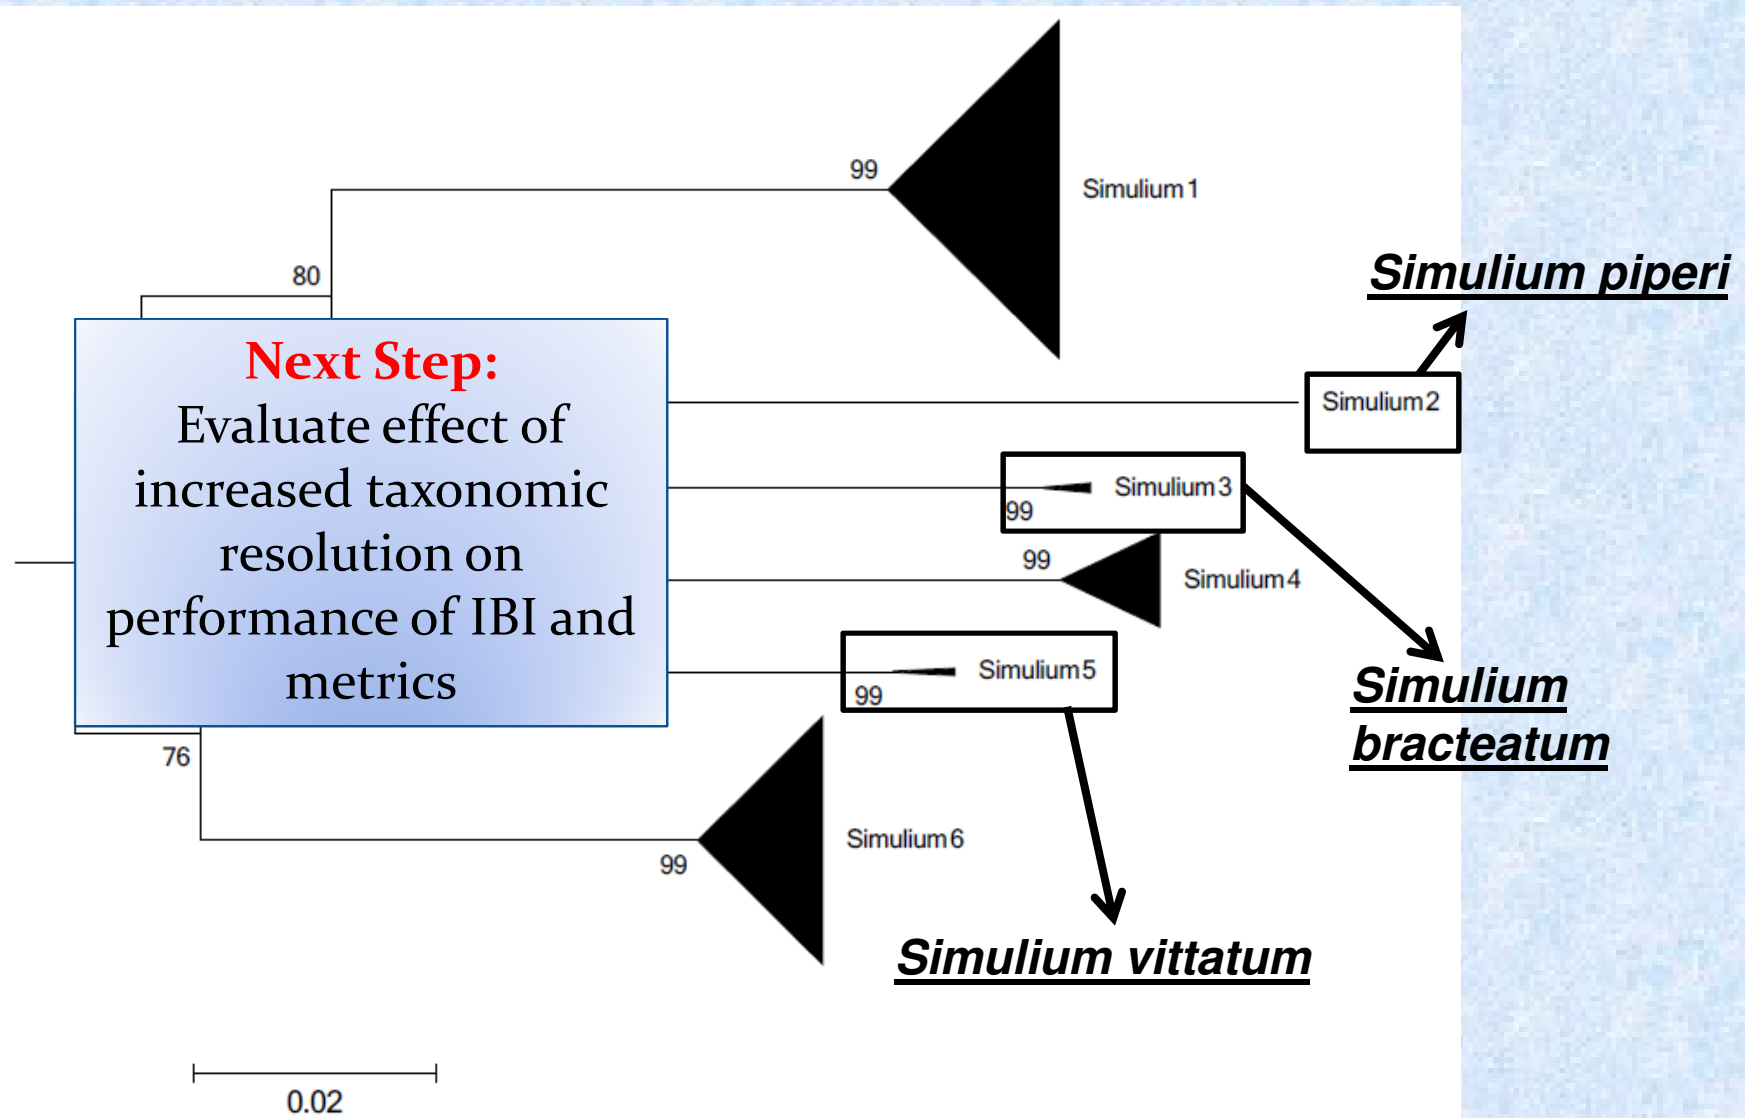

# Species Complex Resolution

*Potentially “new” or “rare” species*

# Match Unidentified Specimens to Existing Libraries

# Near-term Applications of Barcoding

- Improved taxonomic resolution
- Improved taxonomic keys
- Identification of cryptic species
- Resolving errors in original identification / QA
- Identification of additional species
  - Immature life stages
  - Previously undescribed taxa
  - Focused morphodiagnosis to answer specific questions
- Phylogenetic analysis
- More finely tuned biotic indices

**SAFIT**

# The Long View

## *10-15 Year Vision*

- Incorporate barcoding into routine bioassessment
  - Faster & cheaper results
- Develop and test next-generation sequencing
  - Analysis of bulk environmental samples
- *Develop new applications*
  - Additional taxa (algae, prokaryotes, meiofauna)
  - Early screening applications for invasive species, etc.
  - E-DNA stressor evaluation
  - Mechanistic investigations
  - Phylogeny and systematics
  - Yet unimagined applications

# THANK YOU

# Topics for Discussion

- Why is SCCWRP pursuing this research line?
- What is barcoding?
- How does barcoding fit into the larger molecular biology research agenda?
- What are our ultimate/long-term goals?
- What are some of the key technical challenges?
- What is our plan/roadmap for achieving our goals?
- Who are our partners?
- What progress have we made thus far?
- What are the next steps?
