Executive Summary

This data report presents the methods and results for the second round of sampling of a long-term program to track status and trends in concentrations of contaminants in sport fish in the many California lakes and reservoirs (collectively referred to as “lakes” in this document) where black bass species (i.e., largemouth, smallmouth, or spotted bass) are present. This work is being performed as part of the California State Water Resources Control Board’s Surface Water Ambient Monitoring Program (SWAMP). The program will sample 187 bass lakes throughout the state on a 10-year cycle. The sampling is being done in five rounds or “panels”, with approximately 38 lakes in each panel and the rounds occurring every other year. A data report will be prepared to document the results for each panel. An interpretive report on this program will be prepared in 2024, after a full round of sampling of all five panels is completed in 2023.

In this second round of sampling for the long-term bass lake monitoring effort in 2017, 828 sport fish from 15 species were collected from 37 lakes throughout California. Largemouth bass was the primary sport fish species sampled, with 426 fish collected from 32 lakes. Smallmouth bass was the only other black bass species collected, with 33 fish collected from one lake. Bluegill (92 fish from 12 locations) and common carp (67 fish from eight locations) were the next most widely sampled species after largemouth bass. Small prey fish were also sampled. A total of 1065 prey fish representing 15 species were collected from the 37 lakes. The most commonly sampled prey fish species were bluegill (364 fish from 27 locations, with a range of total length from 32 to 110 mm) and young largemouth bass (350 fish from 29 locations, with a range of total length from 2 to 149 mm).

Mercury concentrations in 426 largemouth bass ranged from 0.02 ppm in a 290 mm fish from Ferguson Lake to 2.45 ppm in a 464 mm fish from Davis Creek Reservoir. Mean concentrations estimated for a length of 350 mm provide a good basis for comparing concentrations between lakes and for comparing concentrations within lakes over time. One of the 32 lakes sampled for largemouth bass had a length-adjusted mean greater than 1.31 ppm (the California Office of Environmental Health Hazard Assessment [OEHHA] no consumption advisory tissue level [ATL] for women over 49 and men): Davis Creek Reservoir with a mean of 1.52 ppm. Thirteen of the largemouth bass lakes

had length-adjusted means greater than 0.44 ppm (OEHHA's no consumption ATL for women 18-49 and children 1-17).

Up through the 2017 dataset, previous SWAMP studies generated length-adjusted black bass means for a total of 194 lakes. The 32 Panel 2 lakes with length-adjusted black bass means sampled in 2017 had considerably higher grand mean and median concentrations (0.45 and 0.36 ppm, respectively) than the overall dataset (0.35 and 0.28 ppm, respectively). The Panel 2 lakes also had a higher percentage of lakes with length-adjusted black bass means above 0.20 ppm (the recently adopted statewide water quality objective for sport fish – SWRCB [2017]): 69% versus 65% for the overall dataset. Eleven of the top 28 length-adjusted means in the overall 194 lake dataset were observed in 2017. The lake with the lowest length-adjusted mercury concentration in this study - Laguna Niguel Park Lake (Sulphur Creek Reservoir) at 0.05 ppm – had the tenth-lowest concentration for the overall dataset.

The 26 bass lakes that had been sampled previously had a higher proportion of lakes that showed a statistically significant increase (9 of 26, or 35%) than had been observed in 2015 and 2016. The largest number of lakes (12 of 26, or 46%) were not significantly different from the prior round of sampling.

The mean length-adjusted mercury concentration in the 32 lakes from Panel 2 in 2017 was 0.45 ppm. This was considerably higher than the mean observed for Panel 1 in 2015 (0.30 ppm). The p-value of a two-sided Mann-Whitney test comparing these datasets was not quite significant at alpha=0.05 (p=0.075). The 2017 sampling was conducted after a wet season that ended a five-year drought. As future rounds of bass lake monitoring are completed, these annual means for length-adjusted mercury concentrations will provide a robust index of the statewide trend of bass lake mercury, and will allow for the influence of hydrology and other factors to be examined.

For prey fish, of the 106 composite samples analyzed, 63 (59%) had concentrations greater than or equal to 0.05 ppm, the statewide water quality objective for mercury in prey fish. This was almost double the percent greater than or equal to 0.05 ppm in the 2015 sampling (30%). Nineteen lakes out of the 34 sampled (56%) had a lakewide mean equal to or greater than 0.05 ppm. This was more than double the percentage of lakewide means equal to or greater than 0.05 ppm in 2015 (24%).

PCBs were measured in a subset of the lakes. The highest concentrations were observed in two composites from Silverwood Lake (137 ppb in a brown bullhead composite and 80 ppb in a channel catfish supercomposite).

Selenium was also measured in sport fish and prey fish, primarily so that future risk assessments can consider risks due to combined exposure to mercury and selenium. However, some sport fish samples had concentrations at low levels of concern relative to OEHHA advisory tissue levels (ATLs).

Introduction

This document presents a data report for a long-term program to track status and trends in concentrations of contaminants in sport fish in the many California lakes and reservoirs (collectively referred to as “lakes” in this document) where bass species are present. This work is being performed as part of the California State Water Resources Control Board's Surface Water Ambient Monitoring Program (SWAMP). The mission of SWAMP is to provide resource managers, decision makers, and the public with timely, high-quality information to evaluate the condition of all waters throughout California.

SWAMP sport fish surveys to date have accomplished a great deal to document the status of bioaccumulation impacts on beneficial uses in California (Davis et al. 2010, 2012, 2013, 2018). Mercury has been shown to be a particular concern across all water body types, and this has triggered the development of a statewide TMDL for mercury in reservoirs (Austin and Smitherman 2017).

In 2015 SWAMP took a significant step in initiating a long-term program to provide status and trend monitoring of bioaccumulation across the three major water body categories that support the fishing beneficial use: lakes and reservoirs, rivers and streams, and the coast. For water bodies where bioaccumulation has been determined to be a concern, a 10-year cycle for providing updated information on status was determined to be a practical minimum revisit frequency. The information generated from these updates will be useful to the state and regional boards in impairment assessments and 303(d) list updates. The long-term monitoring began with a plan for repeated, systematic sampling of lakes with black bass (largemouth, smallmouth, and spotted bass) starting in 2015.

Lakes with black bass account for a large number and proportion of the water bodies that are not being monitored by other programs and need to be sampled at a 10-year frequency. In consultation with staff from California’s nine regional water quality control boards, a list of 187 priority bass lakes to be monitored was established. The plan calls for sampling these lakes throughout the state on a 10-year cycle. The sampling is being done in five rounds or “panels”, with approximately 38 lakes in each panel and the rounds occurring every other year (Figure 1).

This plan will address the critical need of managers and the public for updated, high-quality information on the status of contaminant bioaccumulation in these important water bodies. The plan is designed in a way that will also allow tracking of long-term statewide and regional trends in mercury contamination of lake food webs as they respond to factors such as increasing global atmospheric emissions and climate change. Understanding these background trends is critically important in evaluating the effectiveness of statewide and regional mercury control plans (TMDLs).

A detailed description of the goals, design, and methods for sample collection and chemical analysis is provided in the document “Sampling and Analysis Plan for Long-term Monitoring of Bass Lakes and Reservoirs in California” (Bioaccumulation Oversight Group 2015). This data report presents the methods and results for the second round of long-term bass lake monitoring in 2017.

A data report will be prepared to document the results for each panel. An interpretive report on this program will be prepared in 2024, after a full round of sampling of all five panels is completed in 2023.

Methods

A detailed description of the methods for sample collection and chemical analysis is provided in the Sampling and Analysis Plan (Bioaccumulation Oversight Group 2015). The methods are briefly summarized here, with a focus on information specific to the 2017 effort.

Sample Collection

The original sampling plan called for collection of fish from 37 lakes in Panel 2 in 2017. Thirty five of these lakes were successfully sampled in 2017 (Figure 2). Details of sample collection are provided in the Cruise Report (Appendix 1). Crystal Lake (Region 4) could not be sampled due to low water. Mountain Meadows Reservoir (Region 5) could not be sampled because it had inadvertently been drained of water the prior fall and had not re-established fish populations. Butte Lake in Region 5 was mistakenly sampled instead of Black

Butte Lake (Butte Lake is mistakenly referred to as Black Butte Lake in the Cruise Report [Appendix 1]). Two lakes that were in Panel 1 but not sampled due to low water in 2015 were visited again in 2017: Santa Margarita Lake was successfully sampled, but Elizabeth Lake was not sampled because it had been completely dry for the previous two years and not restocked with fish. Lake Evans was added to the list of lakes for 2017 on request from Region 8 due to concern for high concentrations of PCBs in catfish observed in prior sampling. Crystal Lake is slated for sampling in 2019. Mountain Meadows Reservoir and Elizabeth Lake were still not sampleable in 2019, so they will be considered again for sampling in 2021. Overall, a total of 37 lakes was successfully sampled in 2017.

A summary of the catch at all of the lakes is provided in Table 1. Black bass were successfully collected at all of the lakes that were sampleable, except Wilderness Park Lake (where only bluegill and carp were collected), Lake Elsinore (where only two largemouth bass were collected, one of which was sub-legal size – frequent fish kills occur at this lake), and Lake Evans (where only catfish were targeted). At each location, bass were sampled across a wide range of lengths to provide a basis for regressing mercury versus length and estimating a 350 mm length-adjusted concentration. In general, 11 bass were collected at each location sampled, with larger lakes having multiple locations sampled. New Hogan Lake and Whiskeytown Lake, for example, are large lakes that had three locations sampled in each. Largemouth bass was the most common black bass species collected, with adult smallmouth bass collected at just one lake (Whiskeytown Lake), and adult spotted bass not collected at any lake.

Data gaps for PCBs and DDTs were identified by OEHHA and the Regional Boards for the Panel 2 lakes (Table 2). Organics were successfully analyzed for each of the lakes where this was targeted, but bottom-feeding indicator species were not obtained in all of the lakes where they were targeted, so in some cases non-bottom-feeders (e.g., largemouth bass, bluegill) were analyzed for PCBs.

Selenium analysis was included for all of the sport fish samples that were analyzed for mercury in order to allow for potential future assessment of the combined risk due to exposure from these two contaminants. However, to reduce costs, selenium was only analyzed in composites, not individual fish.

For prey fish, the sampling design called for collection of ten individuals from each of the three most common species. Young black bass and young bluegill were the prey species most frequently collected. Mercury and selenium were analyzed in the prey fish composite samples.

Sample Preparation and Analytical Methods

Samples were processed and distributed to the analytical laboratories as described in the Sampling and Analysis Plan (SAP) (Bioaccumulation Oversight Group 2015) by personnel at Moss Landing Marine Laboratories in Moss Landing, CA. Mercury and selenium were analyzed by Moss Landing Marine Laboratories. Mercury was analyzed following the method presented in the SAP. Selenium analysis was not included in the first round of bass lake monitoring in 2015, so the method summarized in the Monitoring Plan for 2016 was used (Bioaccumulation Oversight Group 2016). PCBs and legacy pesticides were analyzed by the California Department of Fish and Game Water Pollution Control Laboratory in Rancho Cordova, CA, following the methods presented in the SAP. Analytes included in the monitoring, detection limits, as well as numbers of observations and frequencies of detection and reporting, are provided in Table 3.

Following the design described in the SAP, PCBs and legacy pesticides were only analyzed at lakes that either had relatively high concentrations or that were specifically requested by the Regional Boards and OEHHA (Table 2).

Data Management

The complete dataset for this study includes quality assurance data (quality control samples and field duplicates) and additional ancillary information (specific location information, fish sex, weights, and other information). The complete dataset is available on the web at www.ceden.org/. The data are also available through the California Water Quality Monitoring Council's "My Water Quality" portal (<https://mywaterquality.ca.gov/>). The My Water Quality site is designed to present data on contaminants in fish and shellfish from SWAMP and other programs to the public in a nontechnical manner, and allows mapping and viewing of summary data from each fishing location. Excel files containing these tables are available from SFEI (contact Jay Davis, jay@sfei.org).

Statistical Methods

The measurement of mercury in individual black bass samples provided a foundation for statistical procedures to adjust for the relationship with fish length. A length of 350 mm has been used for length-adjustment of black bass in past studies (e.g., Davis et al. 2008, Melwani et al. 2009, Davis et al. 2010), and represents the middle of the distribution of legal-sized (>305 mm, or 12 inches) fish that are commonly caught.

Estimates of length-adjusted means presented for the results in this report are based on simple linear regressions of the data for each station. This approach provides an independently-derived estimate of the station mean that can be compared to any other station mean of interest: other station means from the same sampling period; means from the same station in past sampling; or any other station mean of interest. Length-adjusted means prior to 2015 were calculated slightly differently, with the results for multiple lakes pooled for the analysis of covariance (Davis et al. 2018).

Results

Summary of Fish Collected

In this second round of sampling for the long-term bass lake monitoring effort, 828 sport fish representing 15 species were collected from 37 lakes throughout California (Figure 2, Table 4a). A concise tabular summary of the data for each lake is provided in Appendix 2a. Data in a more detailed format for composites and means are provided in Appendix 3a, and for mercury analyses on individual fish in Appendix 4. Largemouth bass was the primary sport fish species sampled, with 426 fish collected from 32 lakes. Substantial numbers of bluegill (92 fish from 12 lakes) and common carp (67 fish from 8 lakes) were also collected.

Small prey fish were also sampled. A total of 1065 prey fish representing 15 species were collected from the 37 lakes (Figure 2, Table 4b). A concise tabulated summary of the data for each lake is provided in Appendix 2b. Data in

a more detailed format for composites and means are provided in Appendix 3b. The most commonly sampled prey fish species were bluegill (364 fish from 27 locations) and young largemouth bass (350 fish from 29 locations, ranging in total length from 26 to 149 mm).

Mercury

Sport Fish

Monitoring of mercury in black bass was the primary focus of this effort (Figures 3a-c, 4a, 5a, 5b, and 6-9).

Mercury concentrations in 426 largemouth bass ranged from 0.02 ppm in a 290 mm fish from Ferguson Lake to 2.45 ppm in a 464 mm fish from Davis Creek Reservoir (Figures 3a, 3b, 4a).

Mercury concentrations in 33 smallmouth bass – all from Whiskeytown Lake – ranged from 0.04 ppm in two fish with lengths of 216 mm and 269 mm to 0.55 ppm in a fish with a length of 470 mm.

Regressions of mercury versus length (using untransformed data) for each location sampled were used to generate estimates of mean concentrations for 350 mm black bass. One of the 33 lakes sampled for largemouth bass had a length-adjusted mean greater than 1.31 ppm (OEHHA's no consumption advisory tissue level [ATL] for women over 49 and men) (Figure 5a): Davis Creek Reservoir with a mean of 1.52 ppm.

Thirteen of the largemouth bass lakes had length-adjusted means greater than 0.44 ppm (OEHHA's no consumption ATL for women 18-49 and children 1-17) (Figure 5b): Lake Pillsbury in Region 1; Coyote Lake, San Pablo Reservoir, and Upper San Leandro Reservoir in Region 2; Chesbro Reservoir in Region 3; Magic Johnson Lakes in Region 4; Butte Lake, Collins Lake, Hensley Lake, Lake Natoma, Los Banos Reservoir, and New Hogan Lake in Region 5; and Silverwood Lake in Region 6.

Laguna Niguel Park Lake (Sulphur Creek Reservoir) was the lake sampled in 2017 with the lowest length-adjusted mercury concentration (0.05 ppm in

largemouth bass). Ferguson Lake had the next lowest length-adjusted concentration at 0.08 ppm. All of the other lakes had a length-adjusted concentration of 0.10 ppm or higher.

The length-adjusted means provide a good basis for comparing concentrations between lakes and for comparing concentrations within lakes over time. Up through the 2017 dataset, previous SWAMP studies – including the 2007-2008 lakes survey (Davis et al. 2010), the wildlife study (Ackerman et al. 2015), the survey of lakes with low concentrations of contaminants in sport fish (Davis et al. 2018), the first round of bass lake sampling (Davis et al. 2019a), and lake sampling in 2016 (Davis et al. 2019b) - generated length-adjusted means for a total of 194 lakes (Figure 6).

The 32 lakes from Panel 2 with length-adjusted means sampled in 2017 had considerably higher mean and median concentrations (0.45 and 0.36 ppm, respectively) than the overall dataset (0.35 and 0.28 ppm, respectively). The 2017 lakes also had a higher percentage of lakes with length-adjusted means above 0.20 ppm (the recently adopted statewide water quality objective for sport fish – SWRCB [2017]): 69% versus 65% for the overall dataset.

The length-adjusted means for 2017 were skewed toward the upper end of the distribution for the dataset as a whole (Figure 6). Eleven of the top 28 length-adjusted means in the overall 194 lake dataset were observed in 2017. The values for the other lakes sampled in 2017 were spread fairly evenly throughout the overall distribution. The lake with the lowest length-adjusted mercury concentration in this study - Laguna Niguel Park Lake (Sulphur Creek Reservoir) at 0.05 ppm – had the tenth-lowest concentration for the overall dataset.

The 26 bass lakes that had been sampled previously had a higher proportion of lakes that showed a statistically significant increase based on non-overlapping 95% confidence intervals of the means (9 of 26, or 35%) than had been observed in 2015 (Davis et al. 2019a) and 2016 (Davis et al. 2019b). The largest number of lakes (12 of 26, or 46%) were not significantly different from the prior round of sampling. Five of the 26 lakes had a significantly lower concentration than the prior round of sampling. For the overall dataset from 2015-2017, the largest number of lakes (25 of 51, or 49%) show no change from the prior round, and more lakes exhibited decreases (15 of 51, or 29%) than increases (10 of 51, or 20%). Nine of the 10 lakes with increases were sampled in

2017, which seemed to have unusually high concentrations relative to the other years.

The Panel 2 lakes sampled in 2017 were randomly selected from an overall list of 187 lakes with black bass that were identified as priority water bodies for long-term monitoring. The 187 lakes were divided into five randomly selected groups, or panels. Since each panel was randomly selected from the overall list, the mean for each panel provides an unbiased estimate of the mean for the whole list of 187 priority bass lakes. The mean length-adjusted mercury concentration in the 32 Panel 2 lakes in 2017 was 0.45 ppm (Figure 9). This was considerably higher than the mean observed for Panel 1 in 2015 (0.30 ppm). The p-value of a two-sided Mann-Whitney test comparing these datasets was not quite significant at alpha=0.05 ($p=0.075$). The 2017 sampling was conducted after a wet season that ended a five-year drought. As future rounds of bass lake monitoring are completed, these annual means for length-adjusted mercury concentrations will provide a robust index of the statewide trend of bass lake mercury, and will allow for the influence of hydrology and other factors to be examined.

Prey Fish

The minimum mercury concentration in composite samples of prey fish was <0.01 ppm, occurring in three samples (two bluegill and one carp) from Wilderness Park Lake in Region 4, one largemouth bass sample from Laguna Niguel Park Lake (Sulphur Creek Reservoir) (Region 9), and one largemouth bass sample from Skinner Lake (Region 9). The maximum concentration was 0.67 ppm in a largemouth bass composite from Davis Creek Reservoir (Region 5). Of the 106 composite samples analyzed, 63 (59%) had concentrations greater than or equal to 0.05 ppm, the statewide water quality objective for mercury in prey fish. This was almost double the percent greater than or equal to 0.05 ppm in the 2015 sampling (30%) (Davis et al. 2019a).

Lakewide mean concentrations (across species) ranged from <0.01 ppm in two lakes - Laguna Niguel Park Lake (Sulphur Creek Reservoir) and Skinner Lake in Region 9 - to a maximum of 0.37 ppm in Lake Nacimiento (Figure 10). Nineteen lakes out of the 34 sampled (56%) had a lakewide mean equal to or greater than 0.05 ppm. This was more than double the percentage of lakewide means equal to or greater than 0.05 ppm in 2015 (24%) (Davis et al. 2019a).

Organic Contaminants

PCBs were analyzed in 23 composite samples from 16 lakes. Eight different species were analyzed. The highest concentrations were observed in two composites from Silverwood Lake (137 ppb in a brown bullhead composite and 80 ppb in a channel catfish supercomposite). The next highest concentration was 18 ppb in a carp composite from Laguna Niguel Park Lake (Sulphur Creek Reservoir). The median concentration was 0.7 ppb.

Legacy pesticides were analyzed in just three samples, with all non-detects for dieldrin and sum of chlordanes, and a maximum of 12 ppb for sum of DDTs.

Selenium

Selenium was measured primarily so that future risk assessments can consider risks due to combined exposure to mercury and selenium. However, some samples had concentrations at low levels of concern relative to OEHHA advisory tissue levels (ATLs).

Selenium concentrations were measured in 114 composite samples of sport fish. Concentrations ranged from a minimum of 0.08 ppm to a maximum of 2.99 ppm, with a median of 0.47 ppm. The lowest OEHHA ATL for selenium is 1.0 ppm, with consumption of 6 or fewer servings per week associated with concentrations above this level. Fifteen of the 114 samples had concentrations above 1.0 ppm. The two highest concentrations were observed in Silverwood Lake: a brown bullhead composite at 2.99 ppm and a bluegill composite at 2.95 ppm.

Selenium concentrations were measured in 106 composite samples of prey fish. Concentrations ranged from a minimum of 0.08 ppm to a maximum of 2.27 ppm, with a median of 0.62 ppm. The highest concentration was observed in Upper San Leandro Reservoir: a largemouth bass composite at 2.27 ppm.

Davis, J.A., J.R.M. Ross, S.N. Bezalel, A. Bonnema, G. Ichikawa, B. Jakl, and W.A. Heim. 2019a. Long-term Monitoring of Bass Lakes and Reservoirs in California: 2015 Data Report. A Report of the Surface Water Ambient Monitoring Program (SWAMP). California State Water Resources Control Board, Sacramento, CA.

Davis, J.A., J.R.M. Ross, S.N. Bezalel, A. Bonnema, G. Ichikawa, B. Jakl, and W.A. Heim. 2019b. Contaminants in Fish in California Lakes and Reservoirs 2016: Data Report. A Report of the Surface Water Ambient Monitoring Program (SWAMP). California State Water Resources Control Board, Sacramento, CA.

Melwani, A.R., S.N. Bezalel, J.A. Hunt, J.L. Grenier, G. Ichikawa, W. Heim, A. Bonnema, C. Foe, D.G. Slotton, J.A. Davis. 2009. Spatial trends and impairment assessment of mercury in sport fish in the Sacramento–San Joaquin Delta watershed. Environ. Pollut. 157: 3137-3149.

Figure 1. Sampling locations for long-term bass lake monitoring.

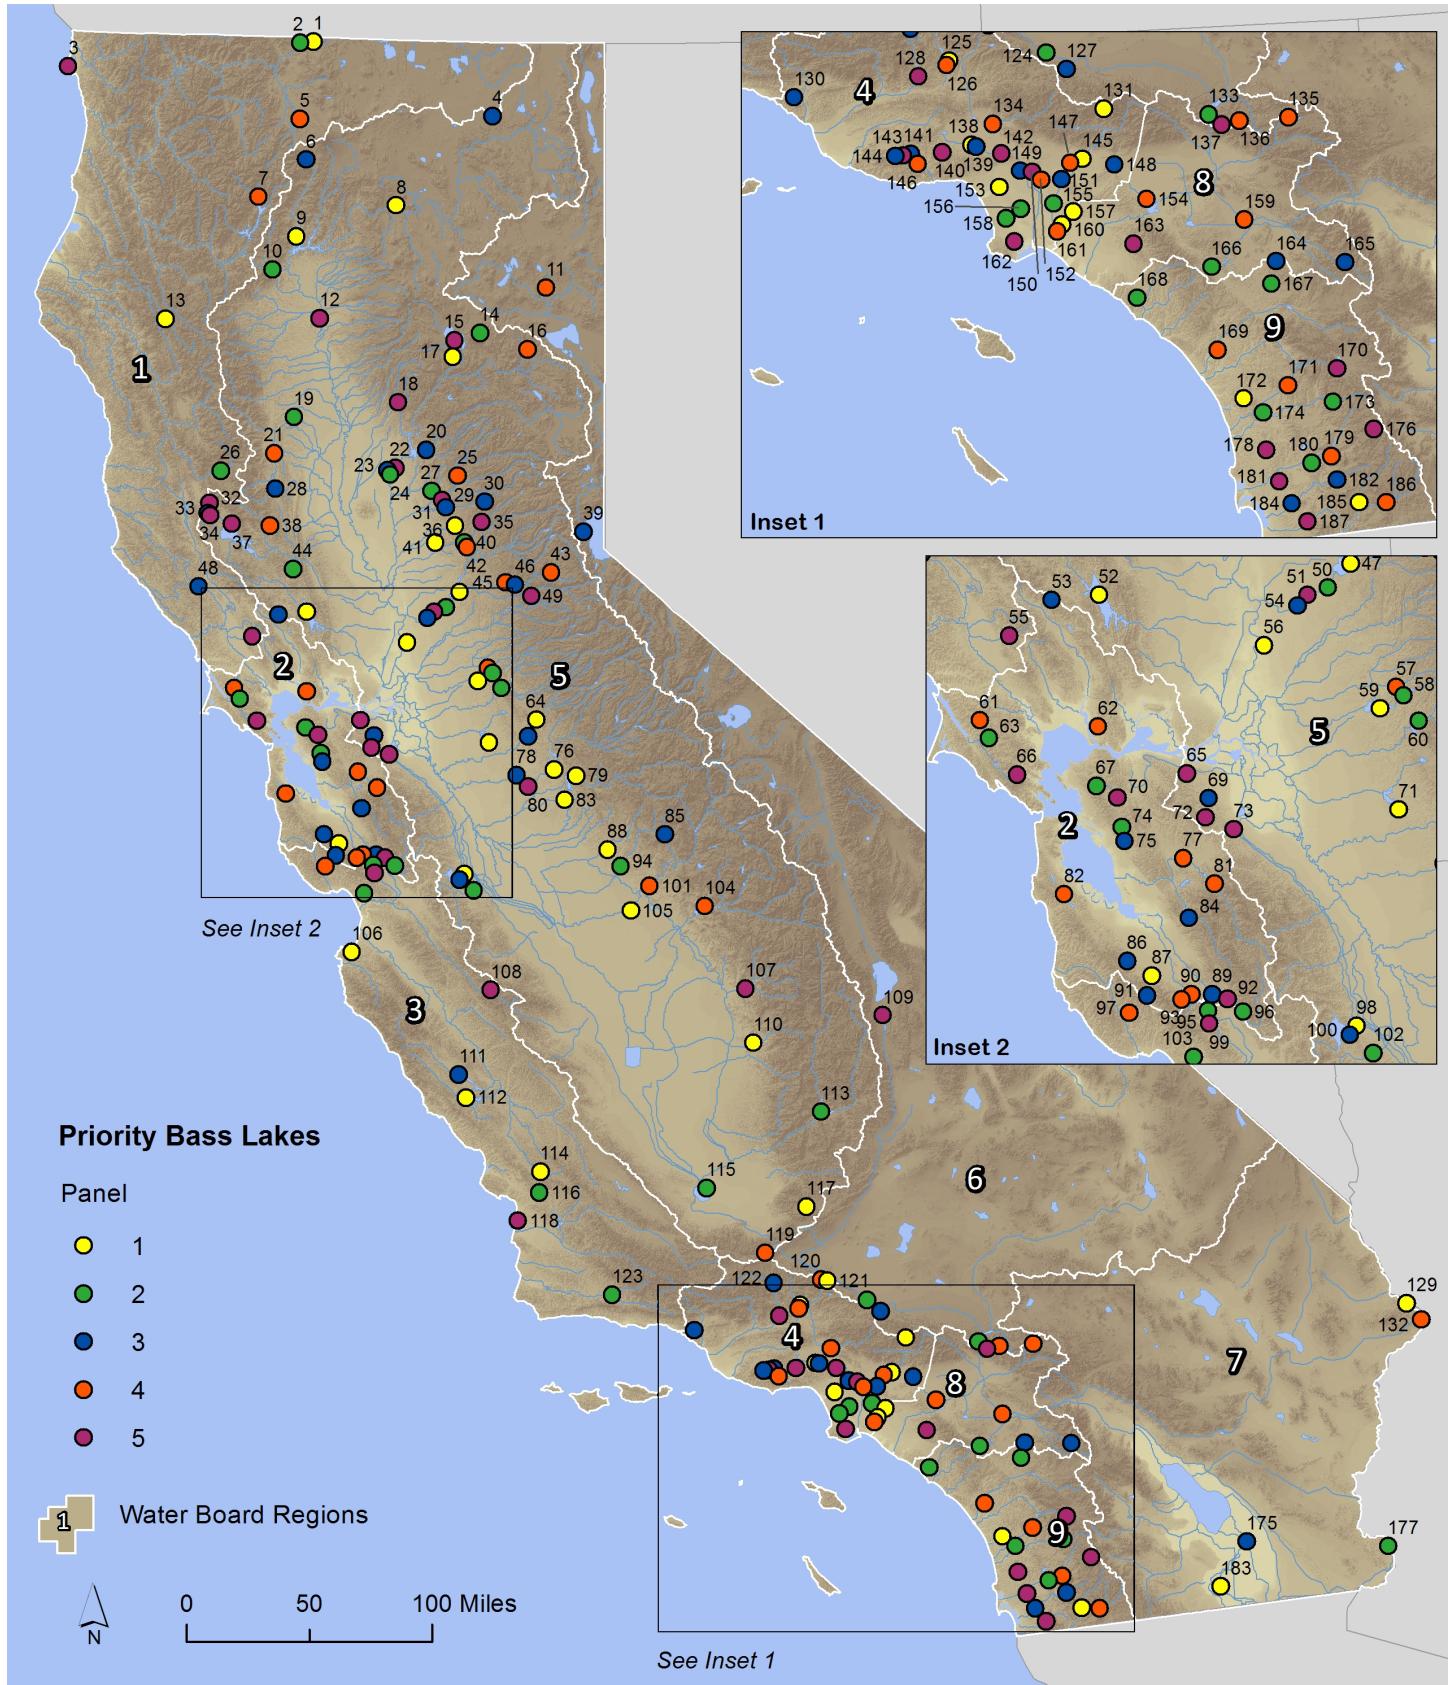

Figure 2. Sampling locations for long-term bass lake monitoring, Panel 2 sampled in 2017. Mountain Meadows could not be sampled (see text). Black Butte Lake was mistakenly not sampled.

Region	Map Label Number	Lake Name
1	2	Iron Gate Reservoir
1	26	Pillsbury, Lake
2	74	Upper San Leandro Reservoir
2	67	San Pablo Reservoir
2	63	Nicasio Lake
2	96	Coyote Lake
3	123	Cachuma, Lake
3	103	Pinto Lake
3	95	Chesbro Reservoir
3	116	Lopez Lake
4	155	Wilderness Park Lake
4	156	Magic Johnson Lakes
4	158	Alondra Park Lake
5	60	New Hogan Lake
5	10	Whiskeytown Lake
5	50	Natomas, Lake
5	113	Isabella Lake
5	24	Mile Long Pond
5	19	Black Butte Lake
5	44	Davis Creek Reservoir
5	102	Los Banos Reservoir
5	58	Pardee Reservoir
5	115	Webb, Lake
5	14	Mountain Meadows Reservoir
5	27	Collins Lake
5	40	Lake of the Pines
5	94	Hensley Lake
6	124	Palmdale Lake
6	133	Silverwood Lake
7	177	Ferguson Lake
8	166	Elsinore, Lake
9	167	Skinner
9	174	Hodges, Lake
9	180	Jennings, Lake
9	168	Laguna Niguel Park Lake
9	173	Sutherland, Lake

Figure 3a. Mercury (ppm wet weight) versus length (mm) for largemouth bass (part 1). The largemouth bass were split into two graphs due to the large number of lakes where this species was sampled. .

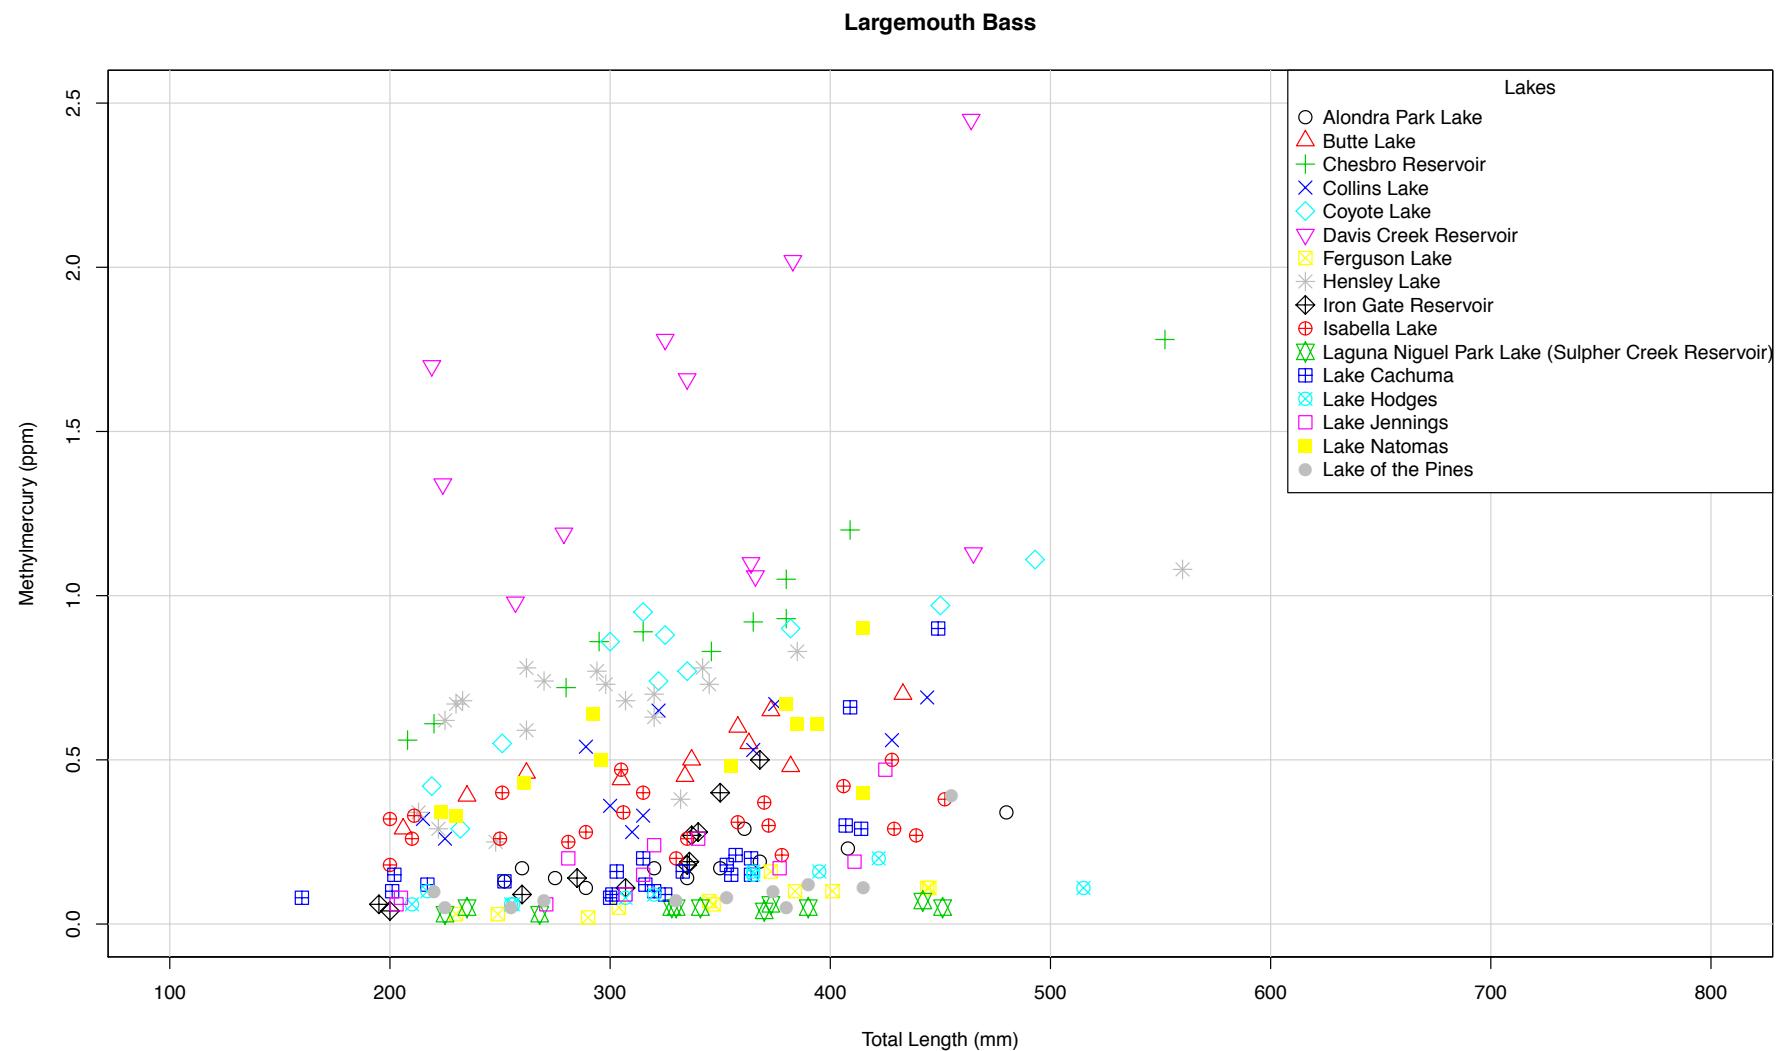

Figure 3b. Mercury (ppm wet weight) versus length (mm) for largemouth bass (part 2). The largemouth bass were split into two graphs due to the large number of lakes where this species was sampled.

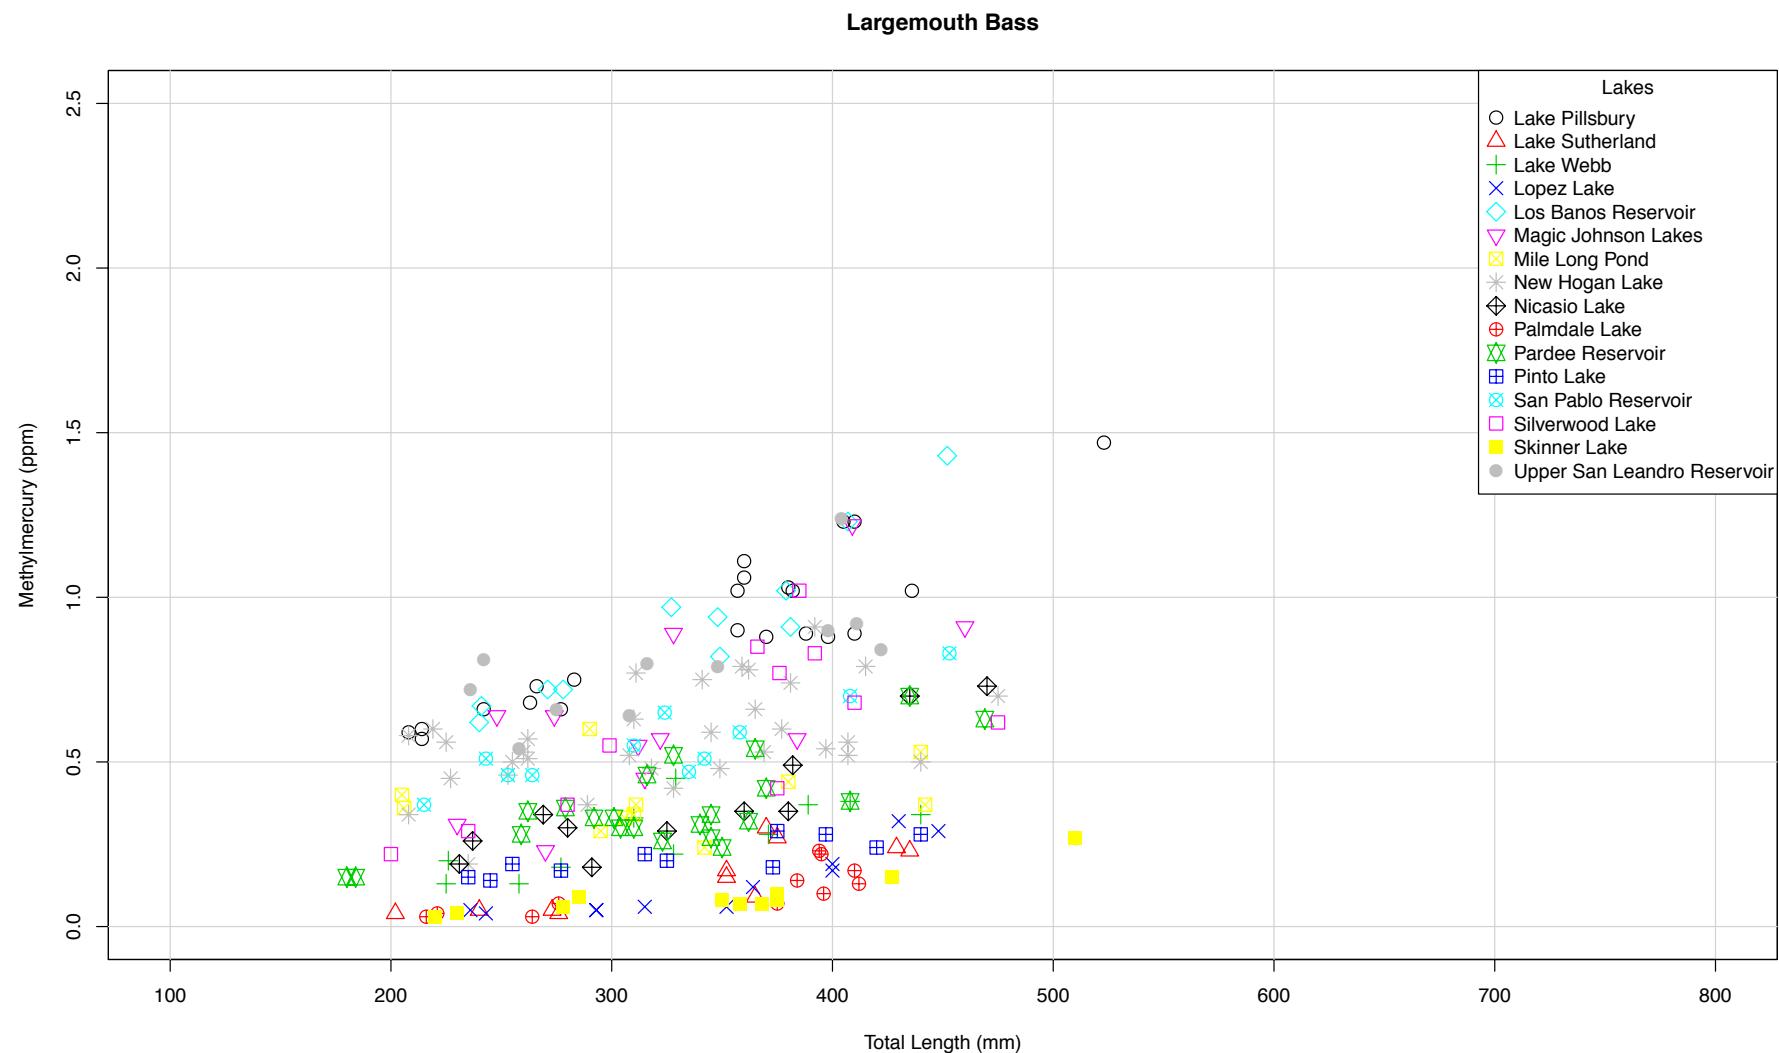

Figure 3c. Mercury (ppm wet weight) versus length (mm) for smallmouth bass.

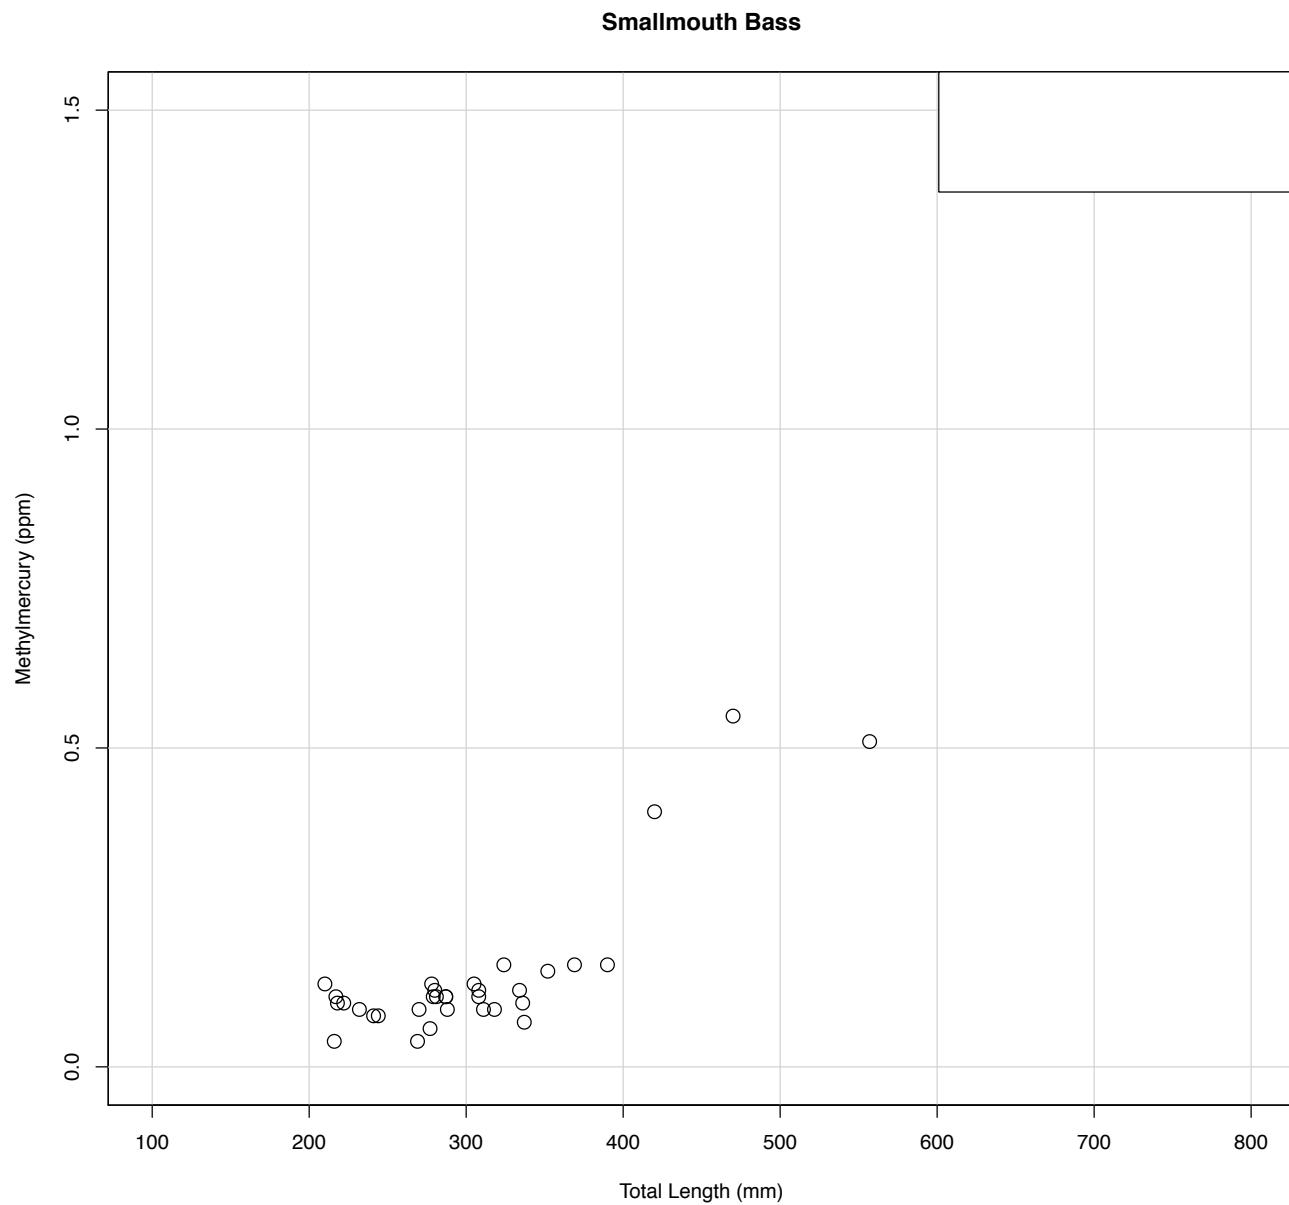

Figure 4a. Mercury concentrations by species: sport fish. Data for individual black bass were adjusted to 350 mm. The points represent the composite and individual concentrations for each species; bars represent means.

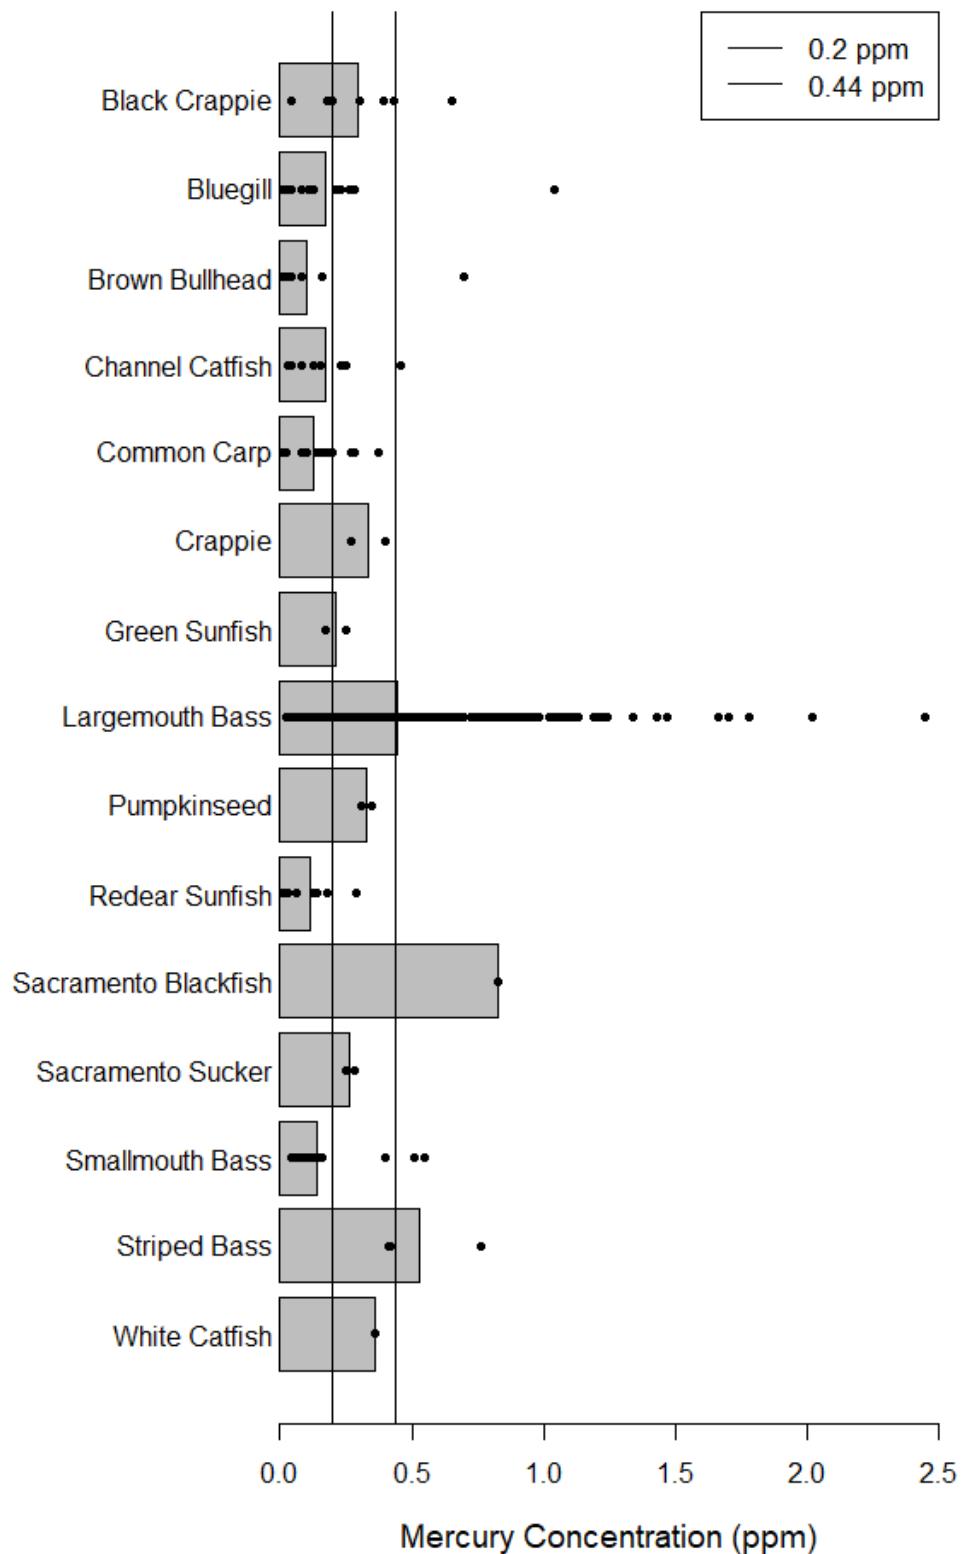

Figure 4b. Mercury concentrations by species: prey fish. The points represent the composite sample concentrations for each species. The bar is the mean of the composite concentrations.

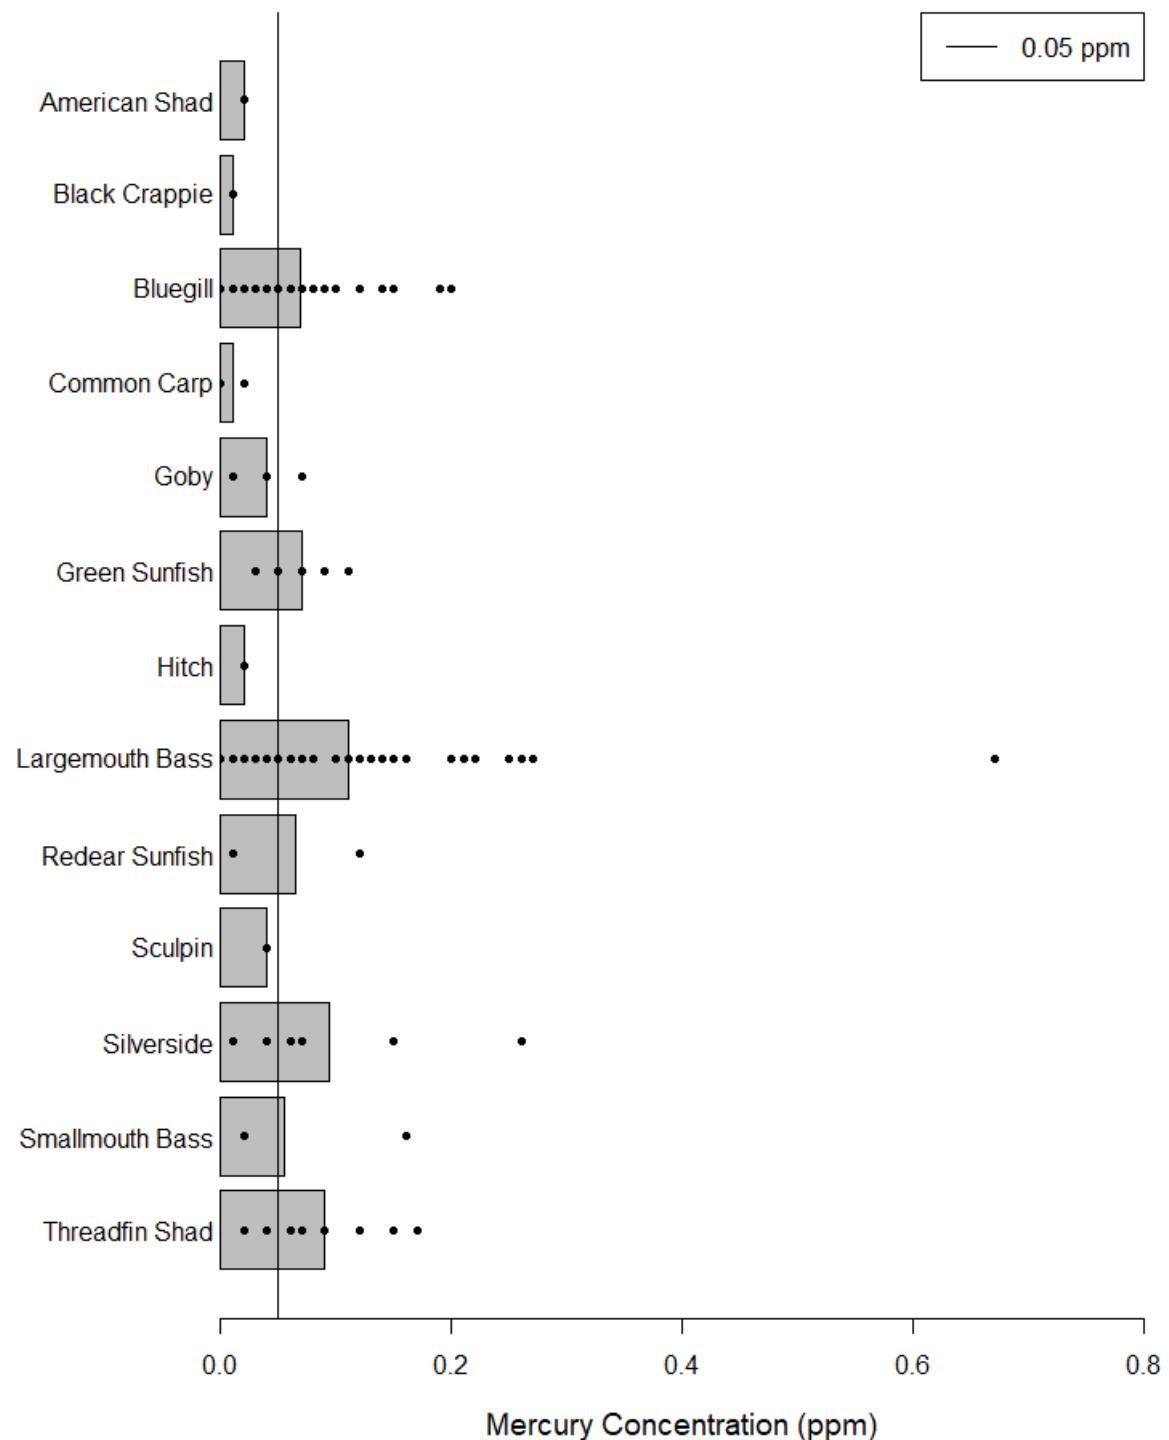

Figure 5a. Spatial pattern in mercury concentrations in largemouth bass. Thresholds based on ATLs for women over 49 and men. Colors based on mean concentrations adjusted to a length of 350 mm.

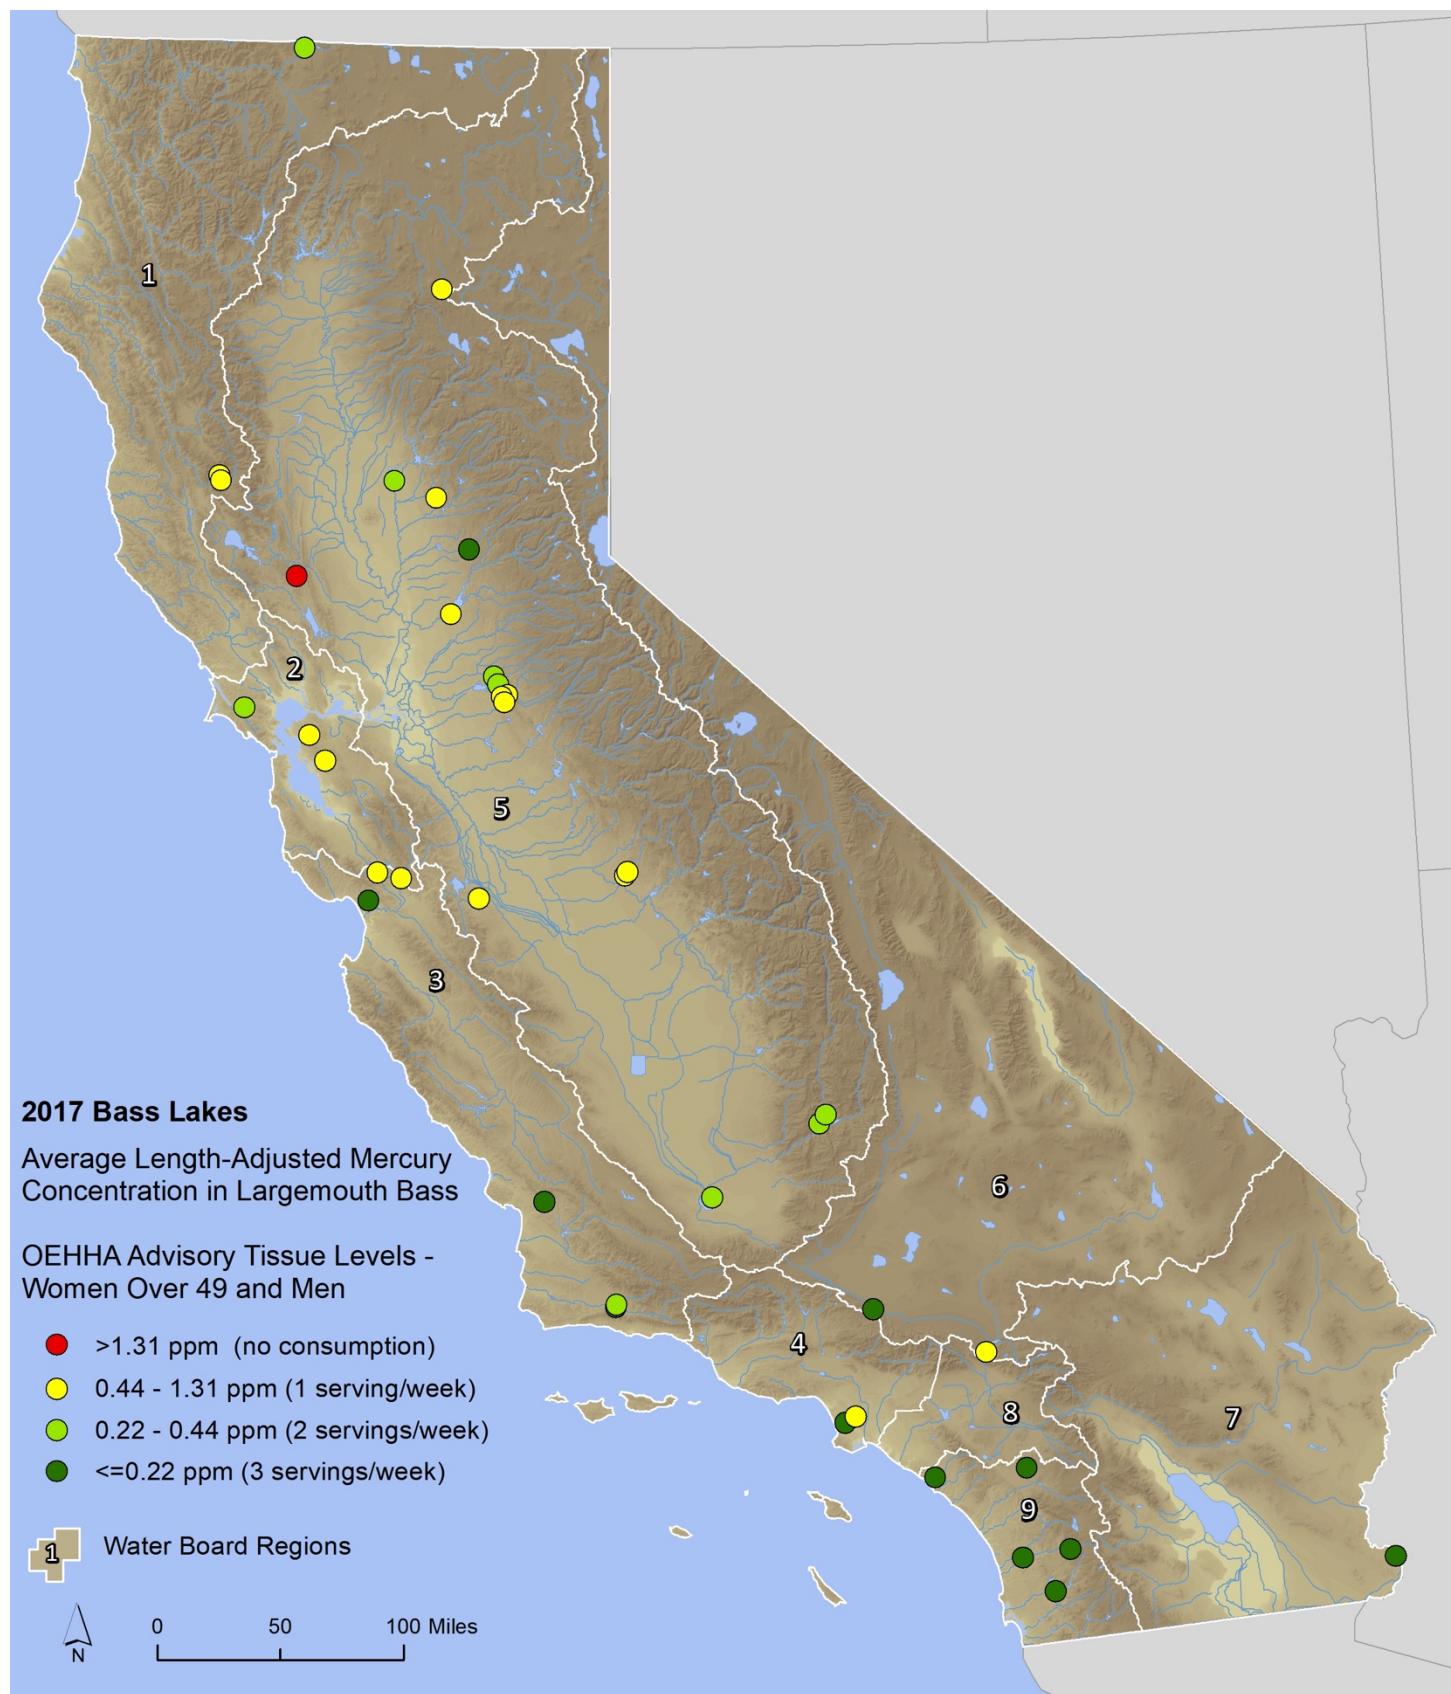

Figure 5b. Spatial pattern in mercury concentrations in largemouth bass. Thresholds based on ATLs for women 18-49 and children 1-17. Colors based on mean concentrations adjusted to a length of 350 mm.

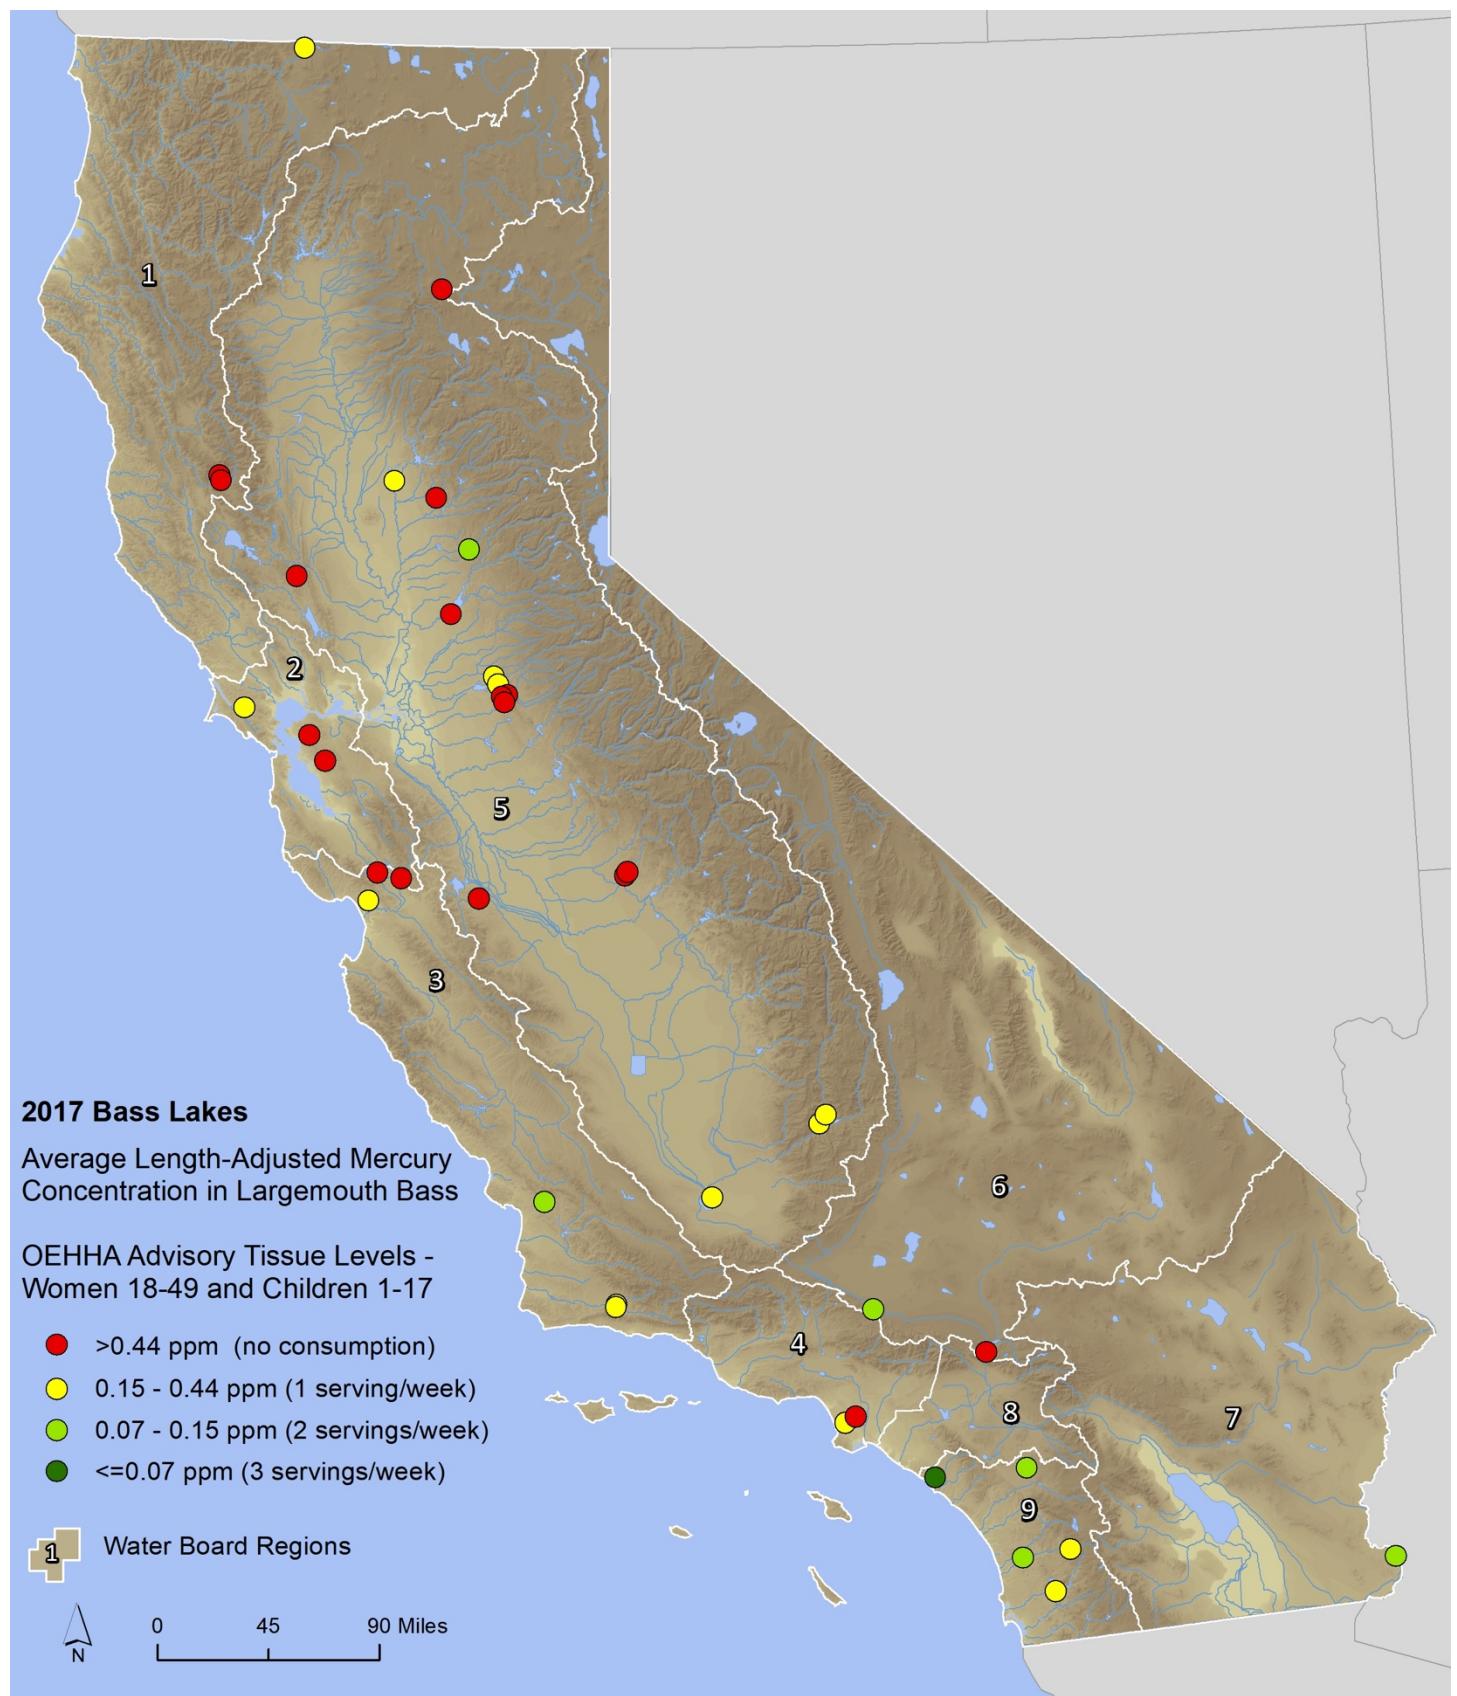

Figure 6. Mean mercury concentrations in 350 mm black bass in California lakes. Most recent sampling year for each lake is shown. Blue shading indicates lakes sampled in 2017.

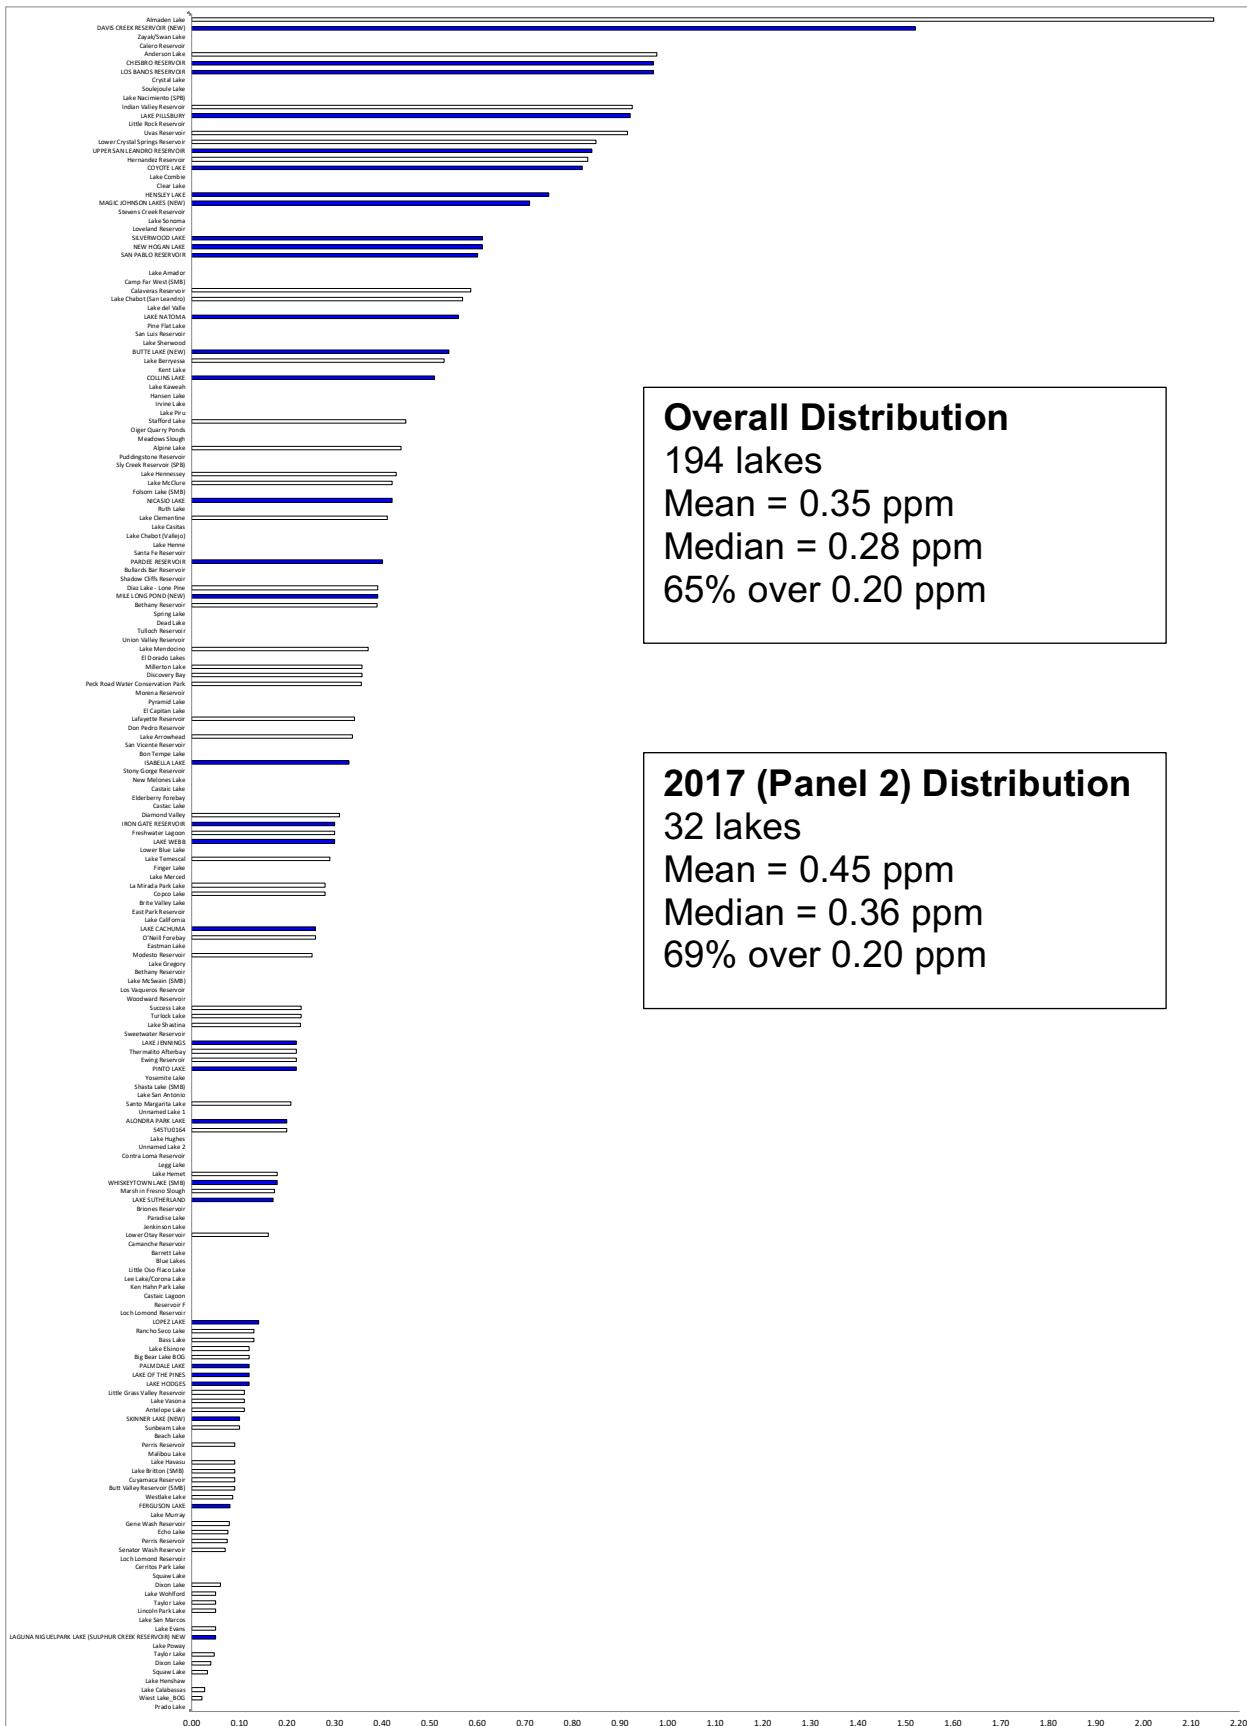

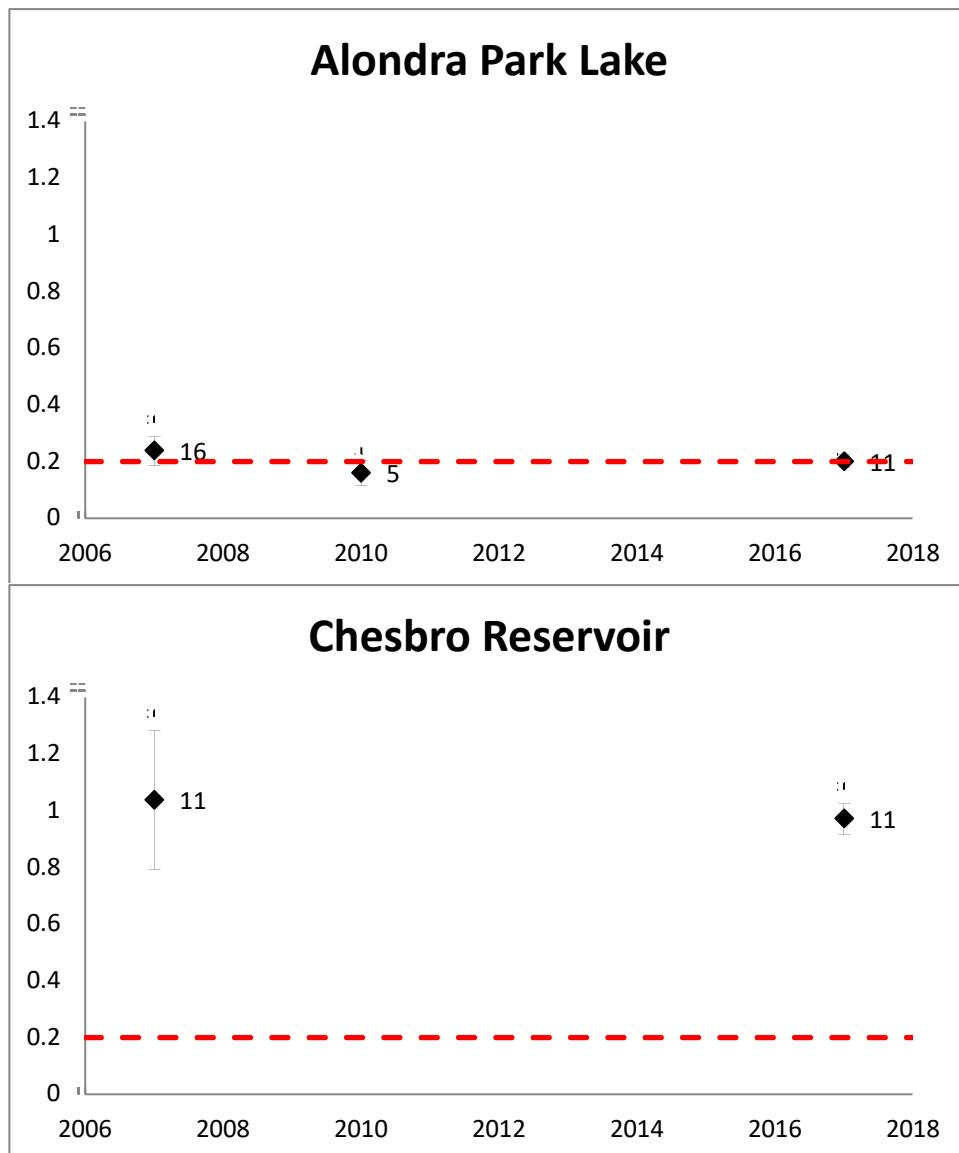

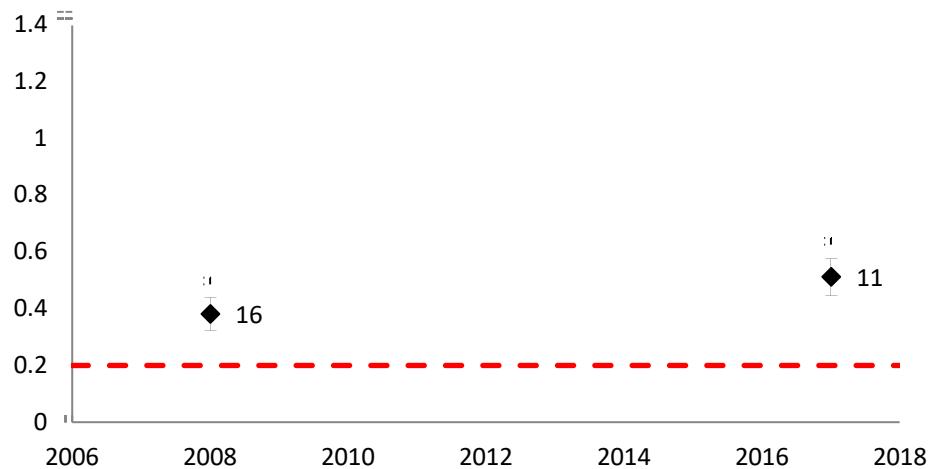

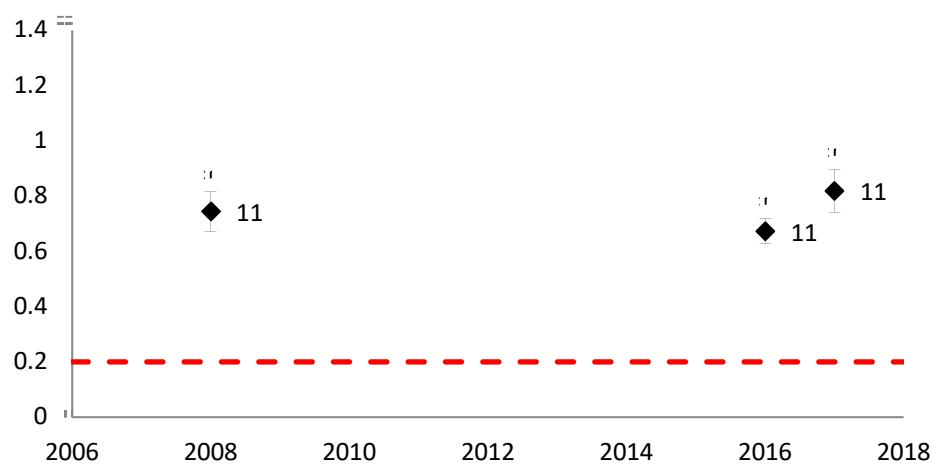

Figure 7. Length-adjusted mean methylmercury concentrations (ppm wet weight) in black bass, current and prior data. Error bars show 2 times the standard error of the mean. Numbers of samples indicated next to each point. Dashed red line shows the 0.2 ppm statewide water quality objective for sport fish.

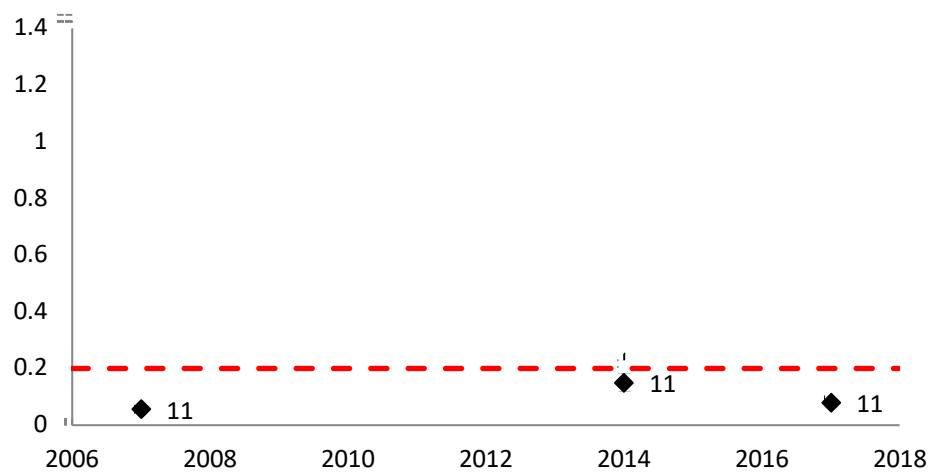

Collins Lake

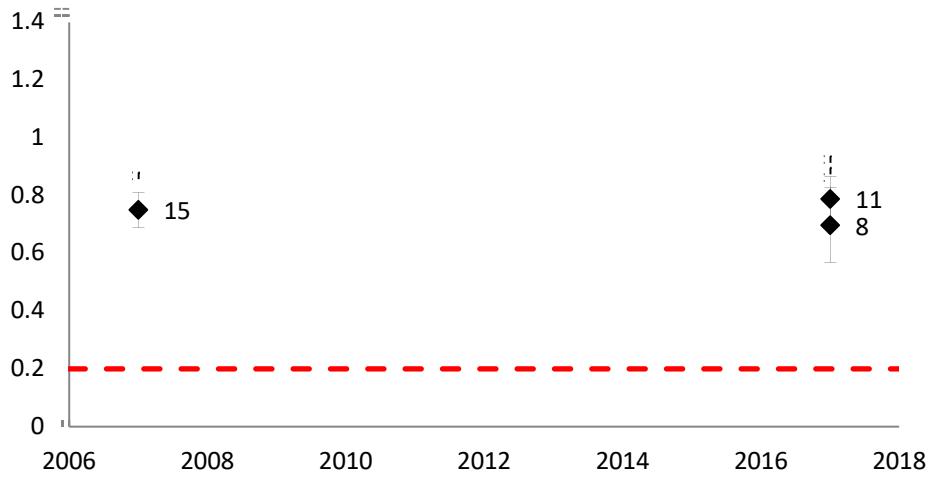

Coyote Lake

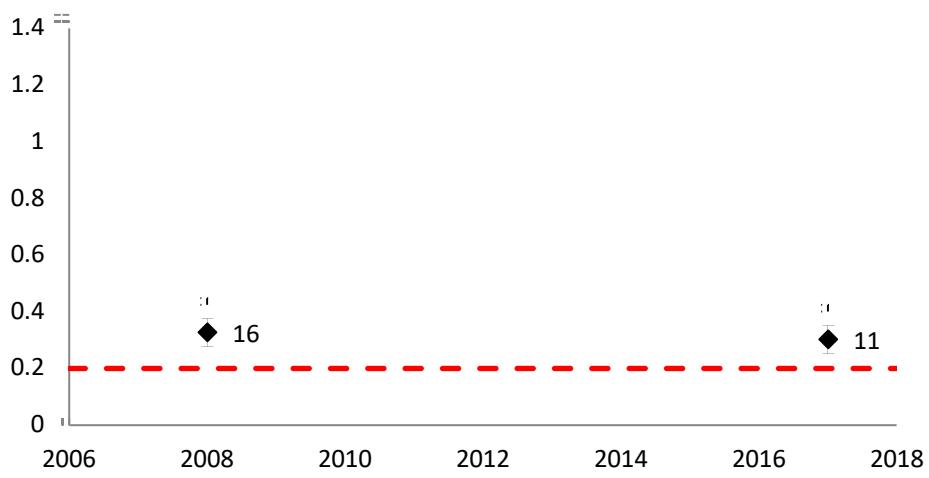

Ferguson Lake

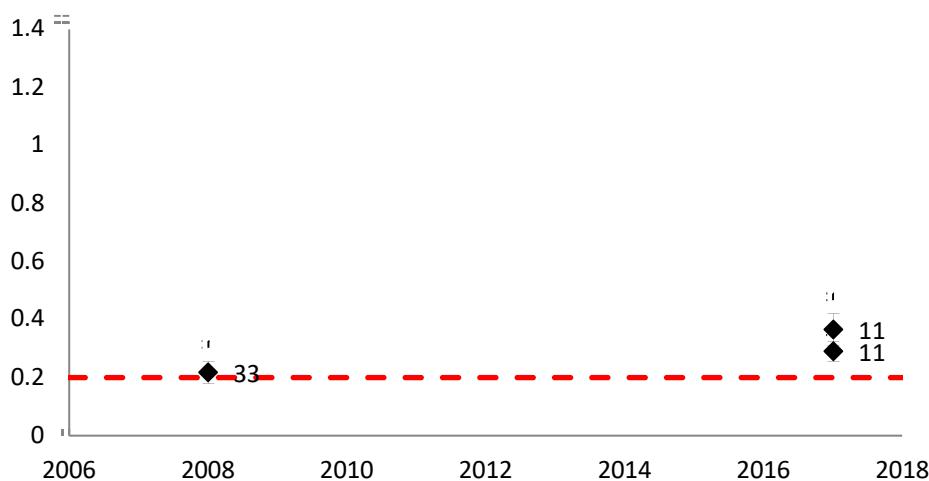

Hensley Lake

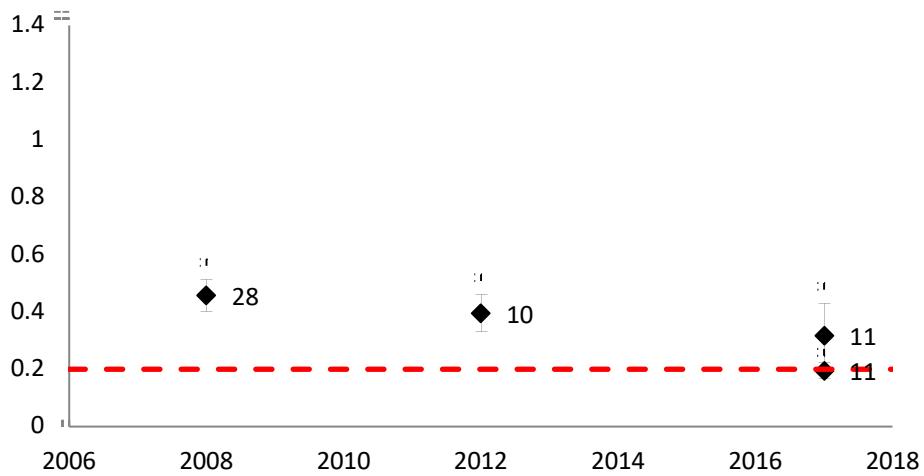

Iron Gate Reservoir

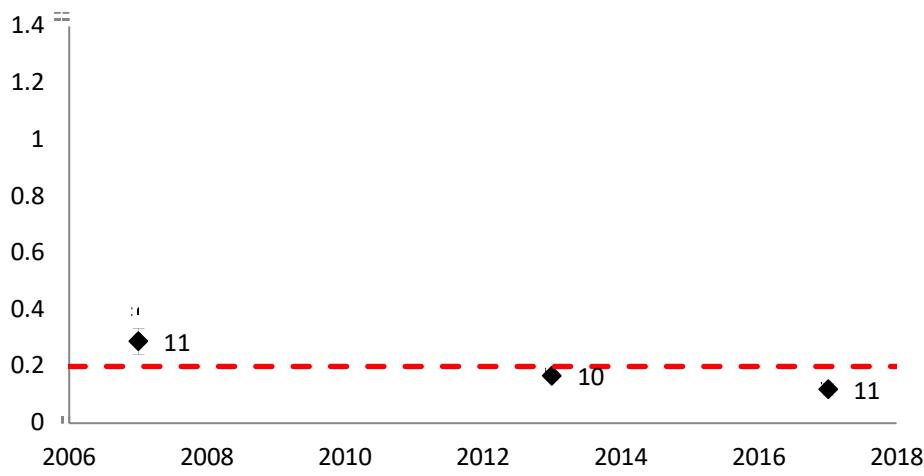

Isabella Lake

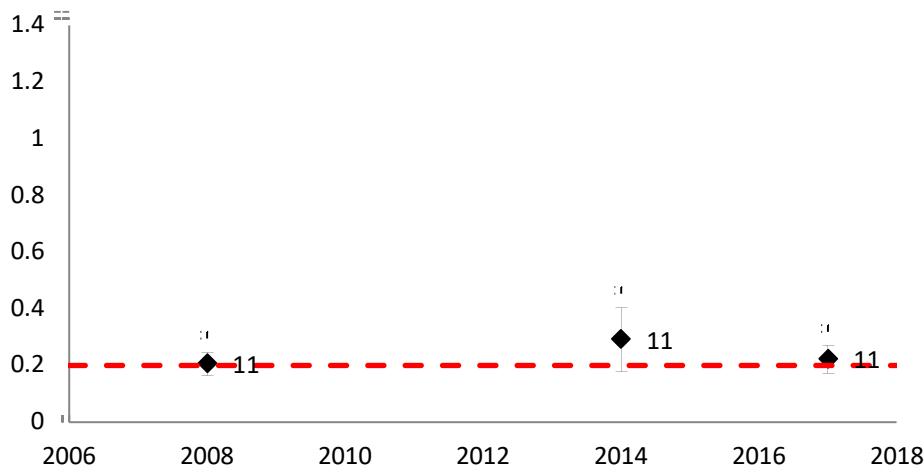

Lake Cachuma

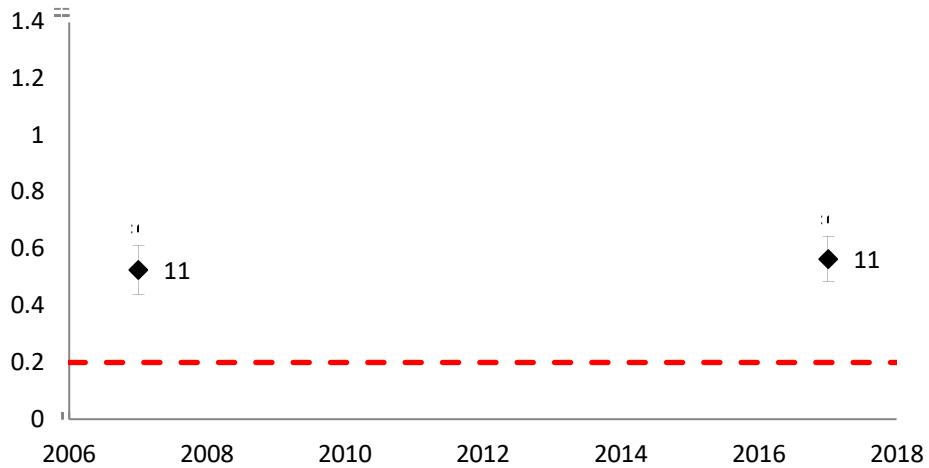

Lake Hodges

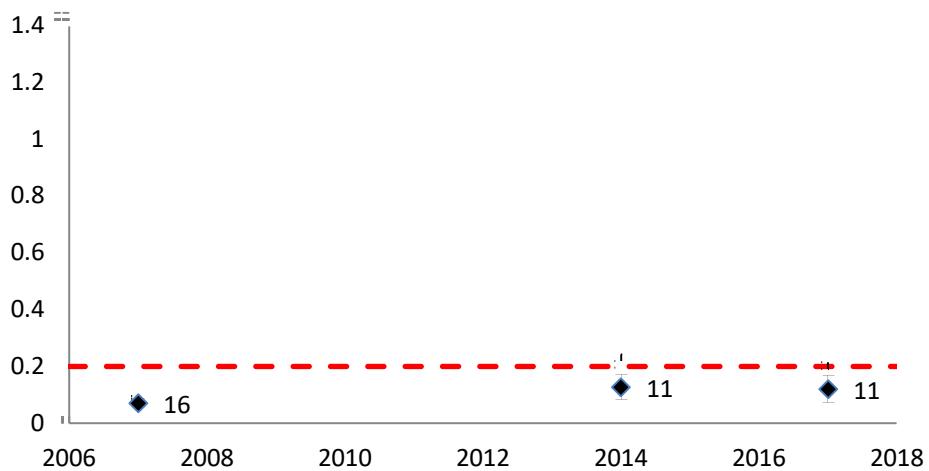

Lake Jennings

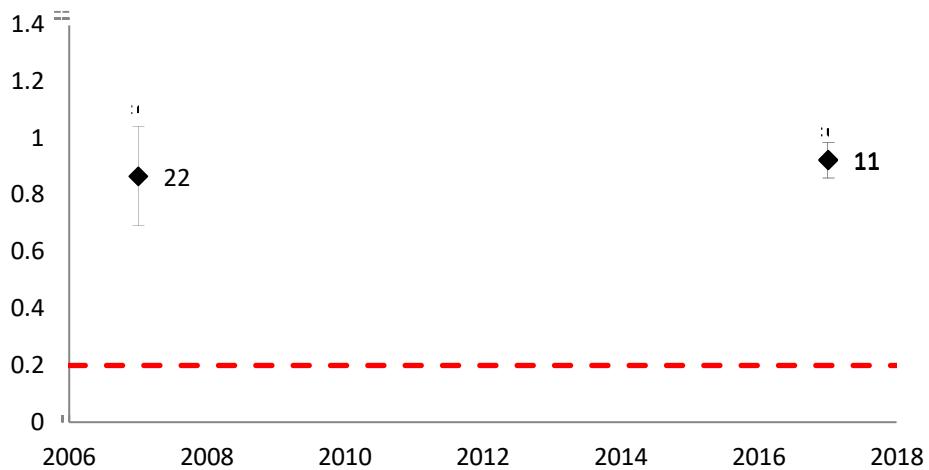

Lake Natomas

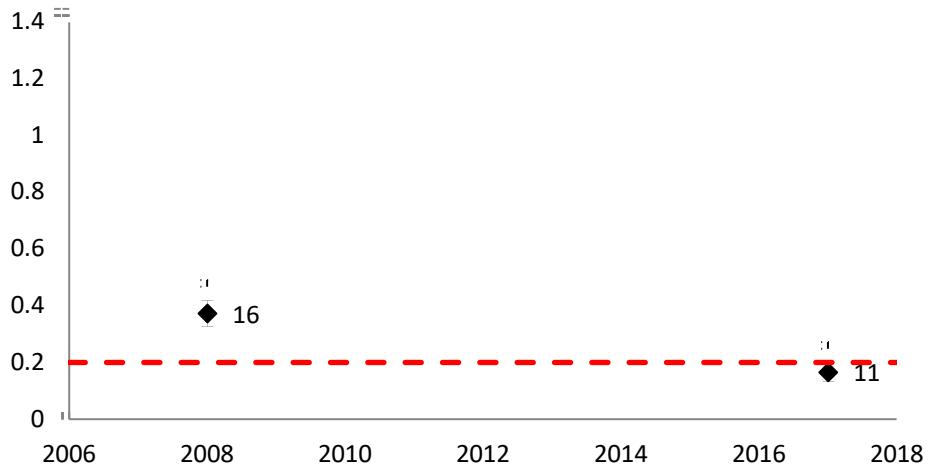

Lake of the Pines

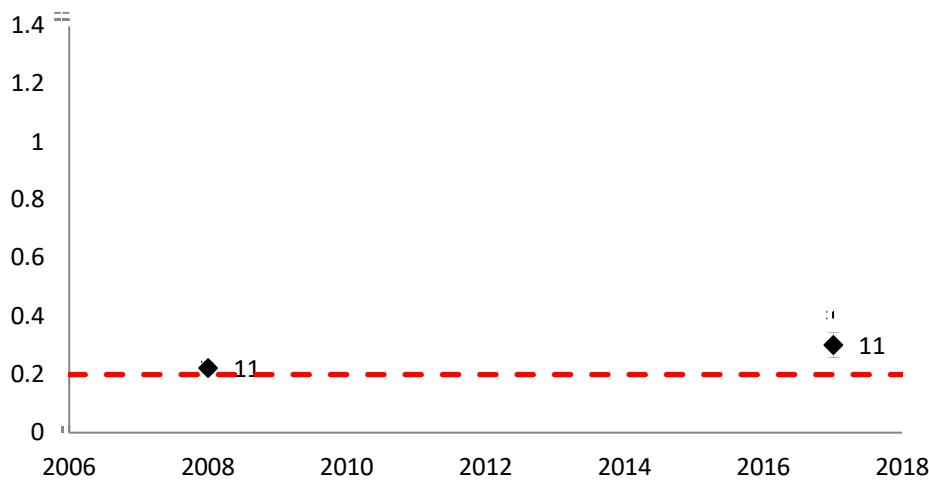

Lake Pillsbury

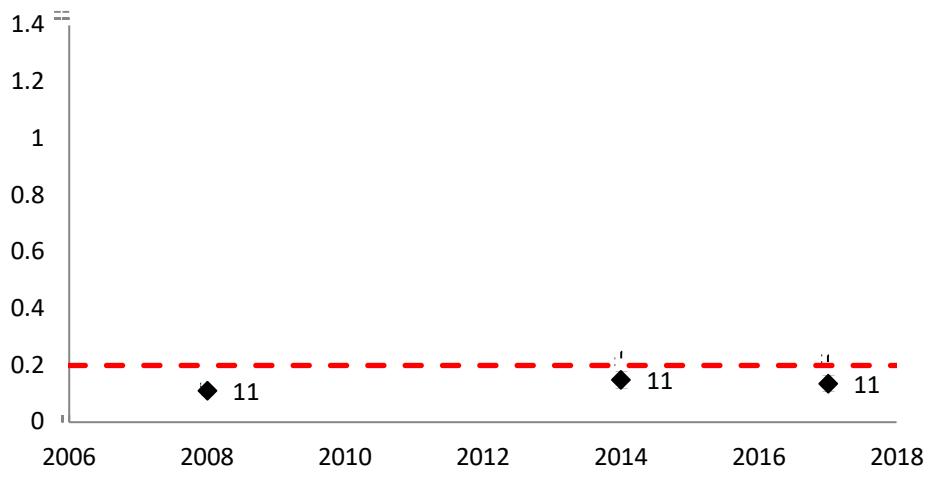

Lake Sutherland

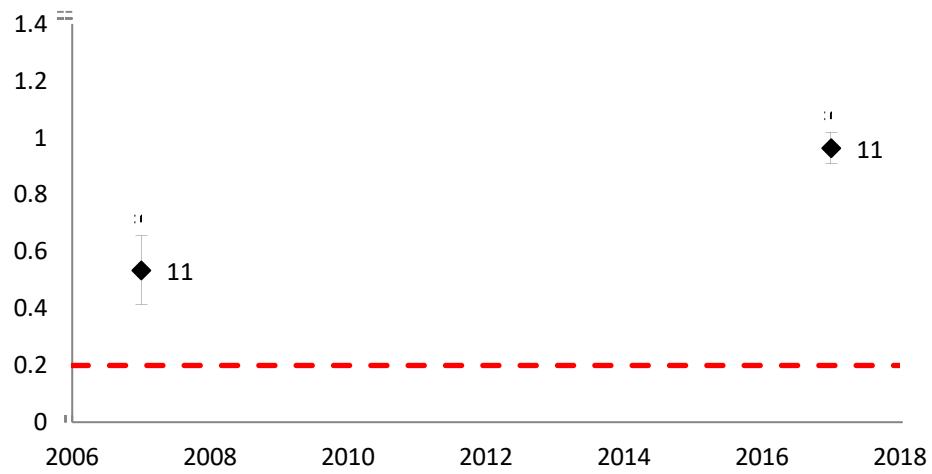

Lake Webb

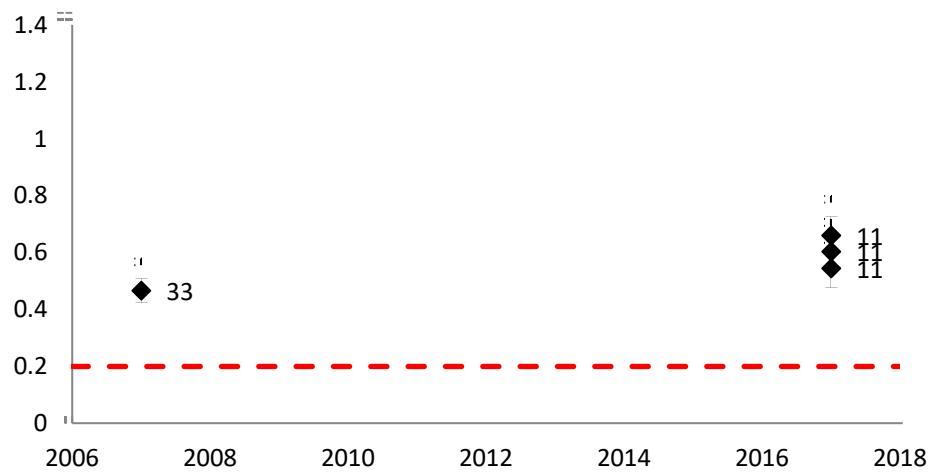

Lake Lopez

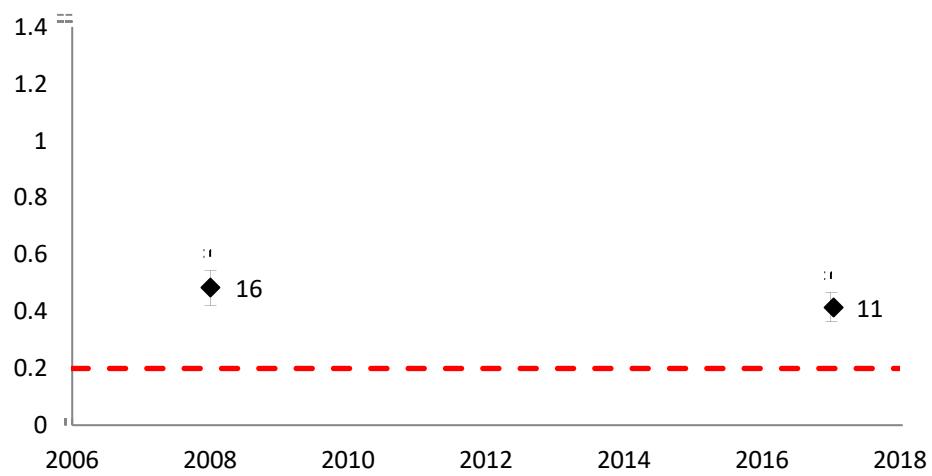

Los Banos Reservoir

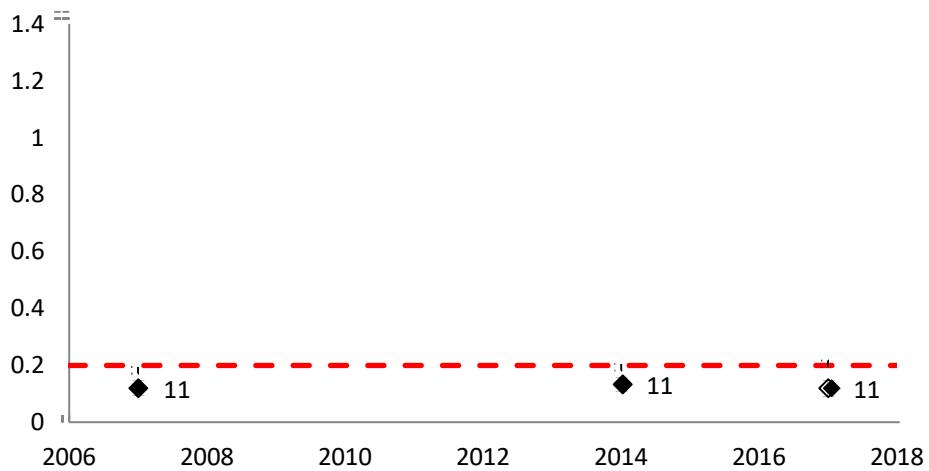

New Hogan Lake

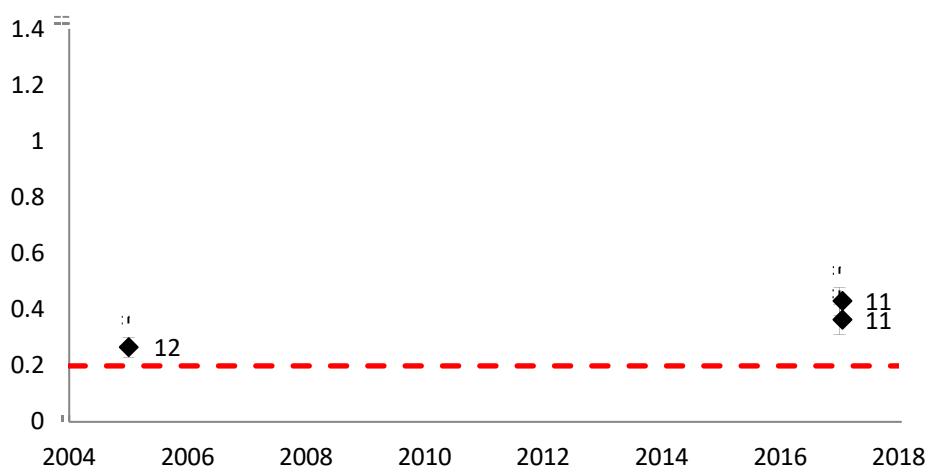

Nicasio Lake

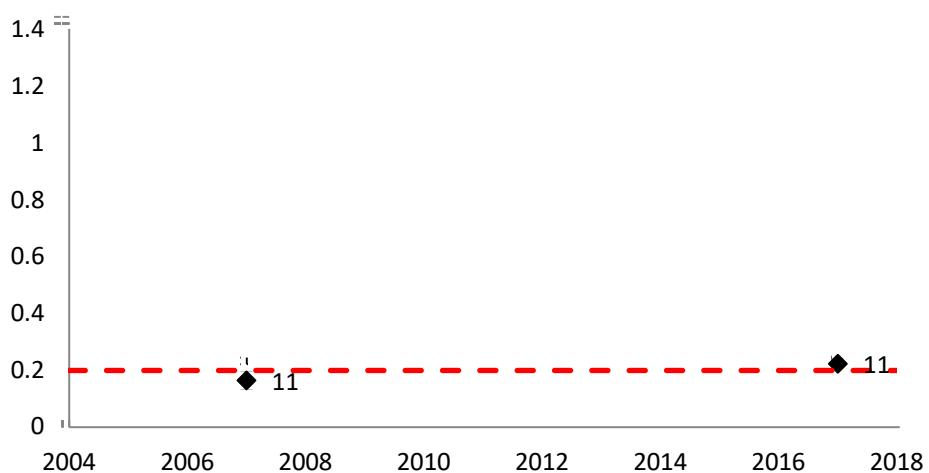

Palmdale Lake

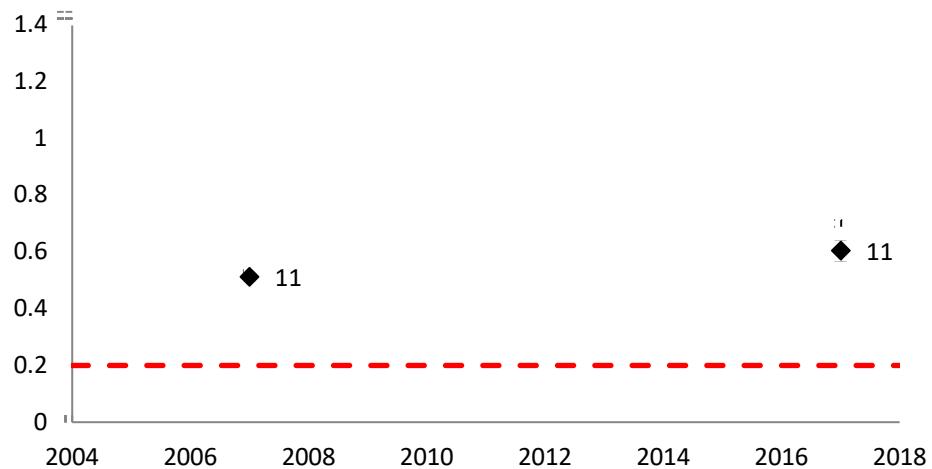

Pardee Reservoir

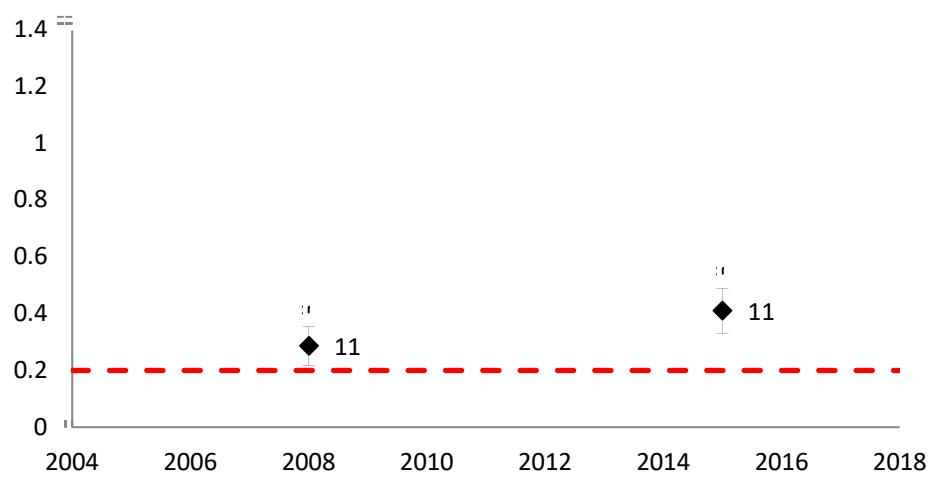

Pinto Lake

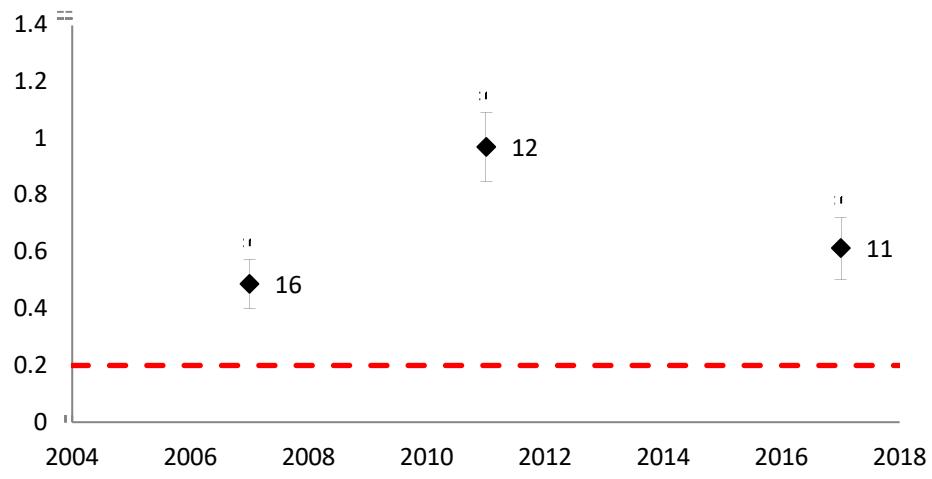

San Pablo Reservoir

Santa Margarita Lake

Silverwood Lake

Whiskeytown Lake

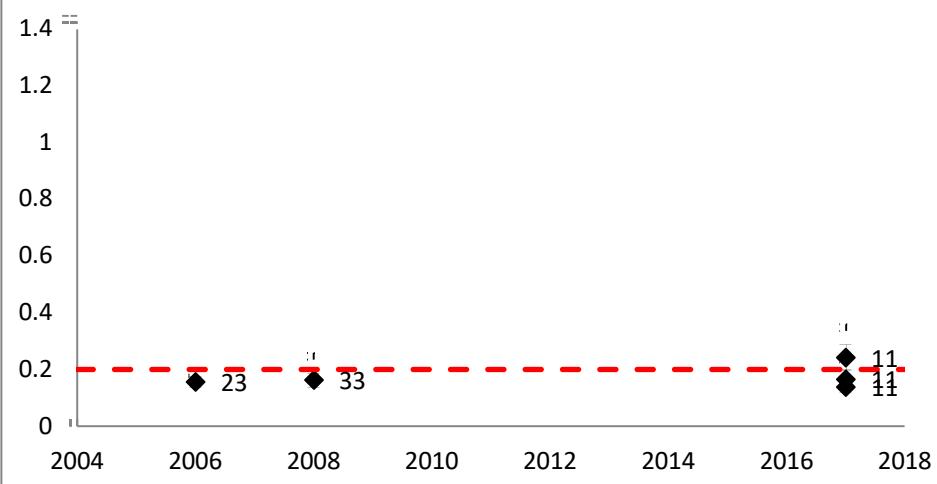

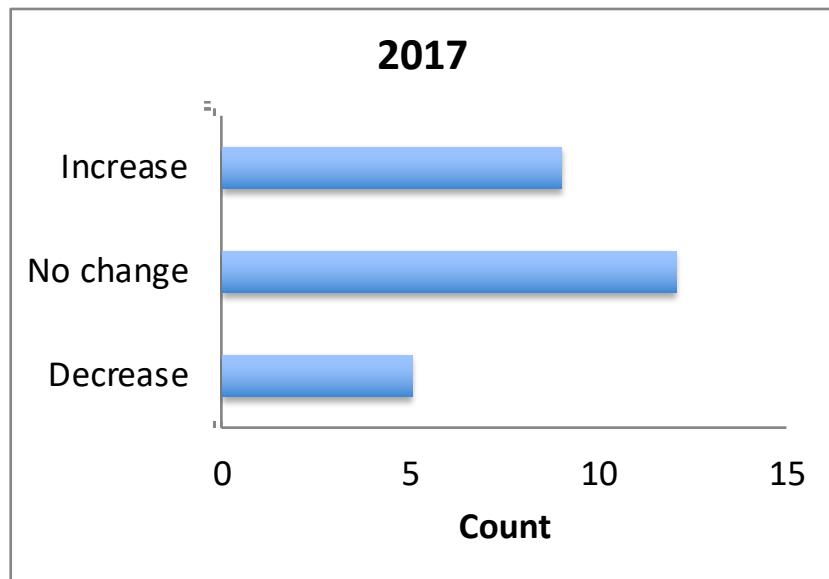

Figure 8. a) Numbers of bass lakes monitored in 2015 with significant increases (zero), no change, significant decreases, or up and down fluctuation. b) Numbers of bass lakes monitored in 2015-2017 with significant increases (zero), no change, significant decreases, or up and down fluctuation. Based on comparison of 350 mm annual means for black bass.

a)

b)

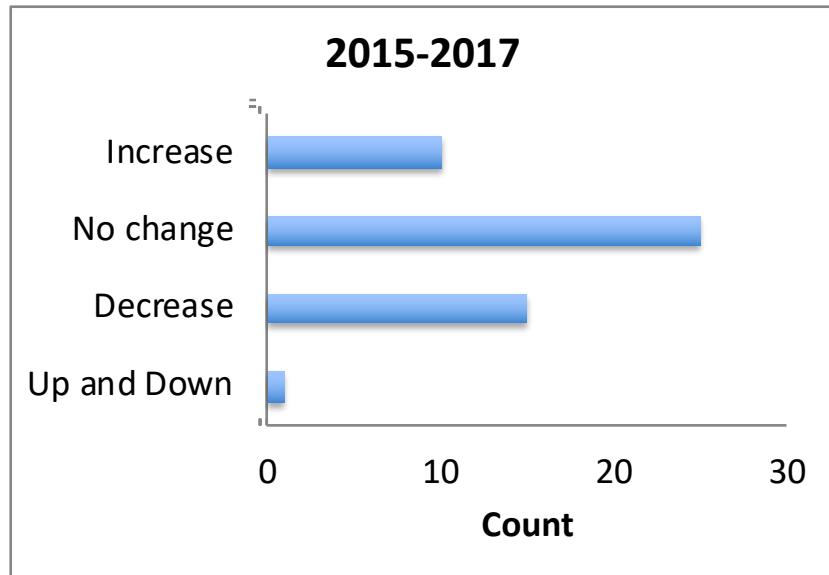

Figure 9. Statewide mean methylmercury concentration (ppm wet weight) in black bass. Based on length-adjusted means for 32xx lakes monitored in 2015xx. Error bars show 2 times the standard error of the mean.

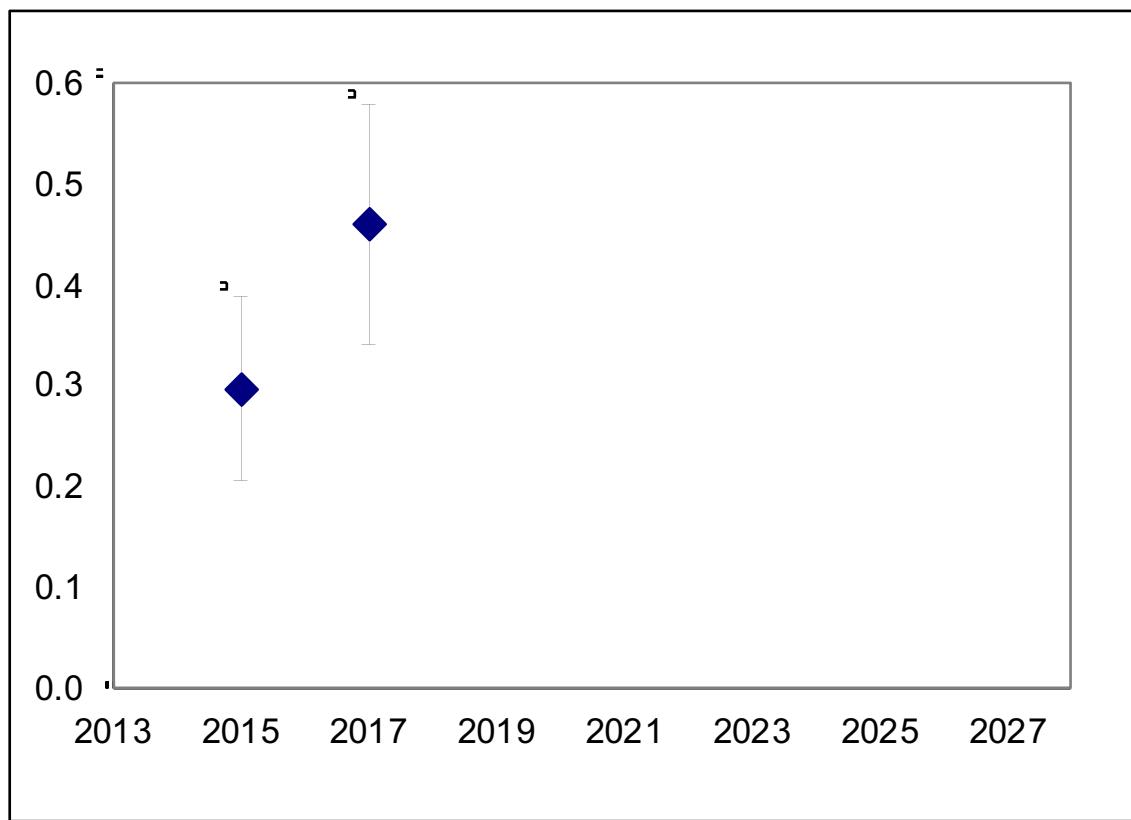

Figure 10. Lakewide mean mercury concentrations in prey fish. Each mean is based on composite samples of multiple species.

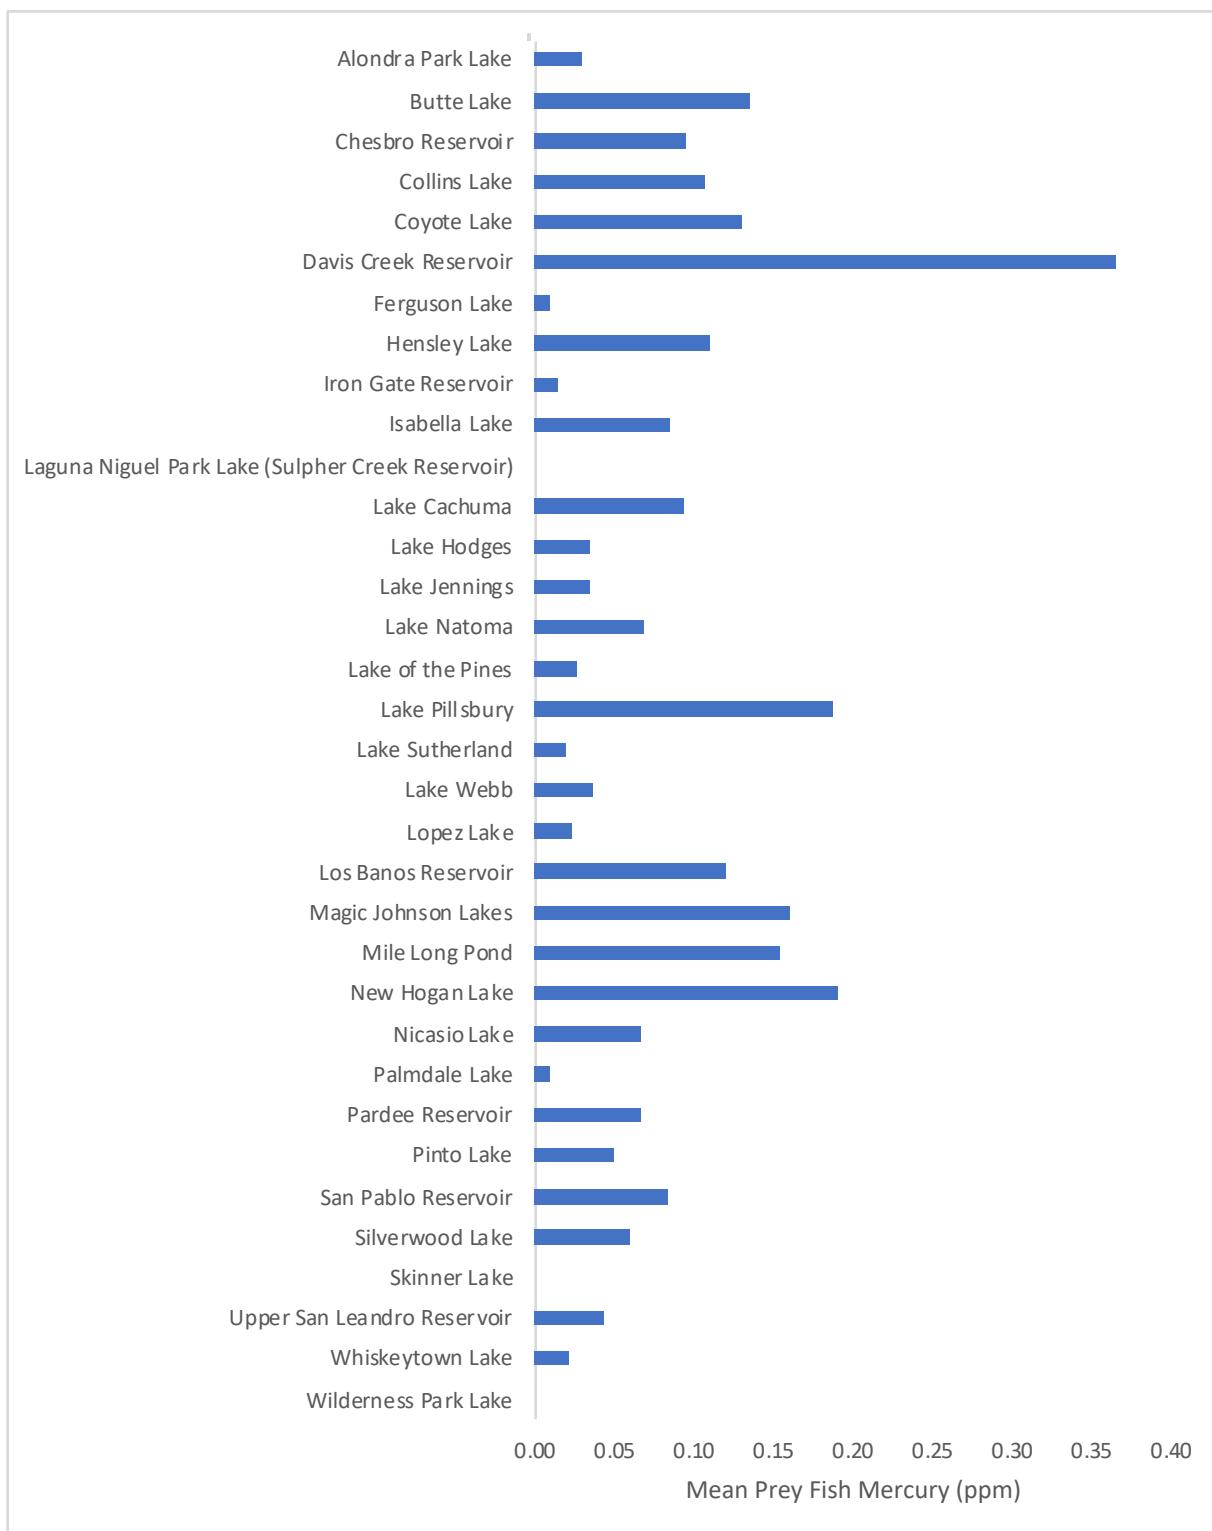

Table 1. Summary of sport fish and prey fish collected at each location. Data listed for Black Butte Lake are actually for Butte Lake.

Region	Waterbody	Sport fish								Prey spp						
		Black Bass Spp	Common Carp	Bluegill	Rear	Green Sunfish	Catfish Spp	Crappie	Brown Bullhead	Other	Bass Spp	Bluegill	Threadfin shad	Silverside	Green sunfish	other

Table 2. Targets for organics sampling to fill information gaps for OEHHA and the Regional Boards.

p 1 of 2

BOG 2017 OEHHA Wish List vs BOG Design						
StatCode	Water Body	PCBs	OCs	Current Data	Data Needed by OEHHA to Develop Fish Advisory	BOG requests (on Matrix)
105PIG154	Iron Gate Reservoir			LMB (hg=28, PCB=10)	Need 9 each of 2 species other than LMB	LMB, 10 each of 2 other spp and 3 prey spp at 1 location
111PLP137	Pilsbury, Lake			Bluegill (hg=1), Green Sunfish (hg=9), LMB (hg=86, PCB=15), RBT (hg=14), Sacramento Pikeminnow (hg=28)	We have adequate data but data for additional species welcome	LMB and 3 prey spp at 2 locations
201PNL105	Nicasio Lake	X		LMB (hg=48, PCB=15), Bluegill (hg=15), carp (hg=12)	We have adequate data but new data welcome (e.g. catfish, crappie), Need PCB for sunfish or carp	LMB, 10 CRP, and 3 prey spp for 1 location; other sunfish OK
204TL0138	Upper San Leandro Reservoir			LMB (hg=15, PCB= 10)	Need 9 each of 2 species other than LMB	LMB, 10 each of 2 others and 3 prey spp at 1 location
205PCL212	Coyote Lake			carp (hg=10, PCB=5), LMB (hg=7)	Need 2 more LMB, and 9 more of another species (not carp)	LMB, 10 each of 2 other spp and 3 prey spp at 1 location; No CAR
206PSP205	San Pablo Reservoir			carp (hg=39, PCB=15), LMB (hg=6), black crappie (hg=15), catfish (hg=12)	We have adequate data but data for additional species welcome (e.g. Rainbow Trout, Redear)	LMB and 3 prey spp at 1 location
305PCB032	Chesbro Reservoir	X		carp (Hg=10, PCB=10), LMB (hg=7)	Need 2 LBM and 9 of another species (not carp)	LMB, 5 PCB indicator, and 3 prey spp for 2 locations; indicator does not have to be CHC but no CAR
305PPL088	Pinto Lake		X	Bluegill (hg=10, PCB=10), Brown Bullhead (hg= 10, PCB=10), carp (hg=15, PCB=15), Goldfish (hg=10, PCB=10)	We have adequate data but data for additional species welcome (e.g. Rainbow Trout, crappie, catfish)	LMB, 10 OC indicator, and 3 prey spp for 1 location; indicator does not have to be CHC but should be other
310PLL106	Lopez Lake			Bluegill (Hg=10), Brown Bullhead (Hg=10, PCB=10), crappie (Hg=10), Redear (Hg=10), LMB (Hg= 23)	We have adequate data but data for additional species welcome (e.g. catfish)	LMB and 3 prey spp at 1 location
314PLC191	Cachuma, Lake			carp (hg=15, PCB=15), Bluegill (hg=3), LMB (hg=41)	Need 6 more Bluegill, would like PCBs for sunfish, too	LMB, 5 BGL and 3 prey spp at 3 locations
405CRYTLK	Crystal Lake	X		sublegal LMB, sufficient PKS (Hg, Se, PCBs)	trout, bass and catfish sampling with PCBs in the catfish	LMB, 10 RBT, 10 CHC and 3 prey spp at 1 location
405DOWILD	Wilderness Park Lake			catfish (Hg and PCB=3), carp (Hg and PCB=5)	Need 6 Catfish, 4 Carp, and 9 of another species	LMB, 4 CAR, 6 CHC, 10 other spp and 3 prey spp at 1 location
411PAP023	Alondra Park Lake	X		carp (Hg and PCB=10), LMB (Hg=17, PCB=10)	Need 9 of another species (Not carp or LMB)	LMB, 10 PCB indicator, and 3 prey spp at 1 location; indicator does not have to be CHC but no CAR
412MGJSLK	*Magic Johnson Lakes	X		Bass (Hg, PCB=13), Bluegill (Hg, PCB=30), carp (Hg, PCB=7), catfish (Hg, PCB=12), Trout (Hg, PCB=9)	We have adequate data but data for additional species welcome (e.g. crappie)	LMB, 10 CRP, and 3 prey spp for 1 location;
513DAVSCR	Davis Creek Reservoir	X		No data	Need 9 each of 3 species	LMB and 3 prey spp, 10 each of 2 other spp at 1 location; Will analyze PCBs on 2 comps
515MILGPD	Mile Long Pond	X		No data	Need 9 each of 3 species	LMB, 10 each of 2 other spp and 3 prey spp at 1 location; Will analyze PCBs on 2 comps
516TP0045	Lake of the Pines			Bluegill, (Hg=10), Green Sunfish (Hg=10, PCB=10), LMB (Hg=19, PCB=5)	Need 9 of another species (not Bluegill, Green Sunfish, or LMB)	LMB, 10 other sp and 3 prey spp at 1 location; No BGL or GRS
517PCL005	Collins Lake			LMB (Hg=42, PCB=15)	Need 9 each of 2 other species (not LMB)	LMB, 10 each of 2 other spp and 3 prey spp at 1 location
518MTMEDR	Mountain Meadows Reservoir	X		No data DRAINED 2015	Need 9 each of 3 species	sampling with Panel 3 (2019)
519PLN133	Natomas, Lake	X		Carp (Hg=10, PCB=5), Catfish (Hg=10), LMB (Hg=10)	We have adequate data but data for additional species welcome (e.g. Rainbow Trout, sunfish)	LMB, 10 BGL, 10 PCB indicator, and 3 prey spp for 1 location; indicator sp does not have to be CHC or CAR
524PWT057	Whiskeytown Lake			Bluegill (Hg=11), Brook Trout (Hg= 16), Brown Bullhead (Hg=6), LMB (Hg=46, PCB=20), SMB (Hg=3), SP (Hg=5),	We have adequate data but data for additional species welcome (Kokanee, Rainbow Trout, Brown Trout)	LMB and 3 prey spp at 3 locations
526PBL114	Black Butte Lake			carp (Hg and PCB=40), SMB (Hg=34), White Crappie (Hg=21)	We have adequate data but data for additional species welcome (Spotted Bass, catfish, sunfish)	LMB and 3 prey spp at 1 location
532PPD073	Pardee Reservoir			Channel Catfish (Hg=21), Carp (Hg=5), Kokanee (Hg=10), Redear (Hg=7), LMB (Hg=17)	Have enough data, but 2 Redear and 4 carp would be helpful	LMB and 3 prey spp at 2 locations
533PNH089	New Hogan Lake			Bluegill (Hg=10), catfish (Hg=12), Redear (Hg=4), LMB (Hg=31, PCB=15), SMB (Hg=10)	We have adequate data but data for additional species welcome (e.g. Striped Bass, Crappie)	LMB and 3 prey spp at 3 locations
539PHL082	Hensley Lake			Black Crappie (Hg=3), Bluegill (Hg=3), carp (Hg=15, PCB=10), LMB (Hg=20), White catfish (Hg=1)	Need 6 Black Crappie, 6 Bluegill, and/or 8 White Catfish	LMB, 10 CRP, 10 BGL 10 WHC and 3 prey spp at 1 location
542PLB064	Los Banos Reservoir		X	LMB (Hg=7, PCB=5)	Need 2 LMB and 9 each of 2 additional species	LMB, 10 OC indicator, 10 of other sp and 3 prey spp for 1 location; indicator does not have to be CHC but should be

Table 2. Targets for organics sampling to fill information gaps for OEHHA and the Regional Boards (continued).

p 2 of 2

StatCode	Water Body	PCBs	OCs	Current Data	Data Needed by OEHHA to Develop Fish Advisory	BOG requests (on Matrix)
554PLB026	Isabella Lake	X	X	Carp (Hg and PCB=21), LMB (Hg=39)	Need 9 more of another species (not carp or LMB)	LMB, 5 PCB indicator, and 3 prey spp for r3 locations; indicator spp does not have to be CHC but no CAR
557PWB010	Webb, Lake	X		carp (Hg=10, PCB=5), LMB (Hg=9)	Need 9 of another species (not carp or LMB)	LMB, 10 PCB indicator, and 3 prey spp for 1 location; indicator does not have to be CHC but no CAR
626TU0279	Palmdale Lake	X		Bluegill (Hg=2), Channel Catfish (Hg=10, PCB=5), LMB (Hg=16), Rainbow Trout (Hg=1), White Catfish (Hg=5,	Need 7 Bluegill with PCBs (or PCBs in black bass), 8 Rainbow Trout, and/or 4 White Catfish COVERED BY R6	LMB and 3 prey spp. PLUS full suite of spp from R6 project wish list
628PSW035	Silverwood Lake	X		Bluegill (Hg and PCB=10), Brown Bullhead (Hg and PCB=3), catfish (Hg and PCB=9), carp (Hg and PCB=3), LMB	We have adequate data but data on additional species welcome (e.g. crappie). Also helpful: 6 Brown Bullhead, 6	LMB, 10 BRB, 10 CRP or other sunfish and 3 prey spp at 1 location; other PCB indicator OK, but try for those listed
715TF0091	Ferguson Lake			carp (Hg=35, PCB=20), Bluegill (Hg=7), catfish (Hg=8), LMB (Hg=31), Redear (Hg=4), Striped Bass (Hg=1)	Need 2 Bluegill, 1 catfish, 5 Redear, and/or 8 Striped Bass	LMB and 3 prey spp at 1 location
802PEL058	Elsinore, Lake	X	X	carp (Hg=56, PCB=20), LMB= (Hg= 13)	Need 9 of another species (not carp or LMB)	LMB, 5 PCB indicator, and 3 prey spp for 2 locations; indicator does not have to be CHC but no CAR
901LAGNPL	Laguna Niguel Park Lake	X		No data	Need 9 each of 3 other species, including PCBs	LMB, 10 each of 2 other spp and 3 prey spp at 1 location; Will analyze PCBs on 2 comps
902SKINLK	Skinner	X		No data	Need 9 each of 3 species (including PCBs)	LMB, 10 each of 2 other spp and 3 prey spp at 1 location; Will analyze PCBs on 2 comps
905PLH070	Hodges, Lake	X		carp (Hg=10, PCB= 5), LMB (Hg=14)	Need 9 of another species (not carp or LMB), including PCBs for accumulator species	LMB, 10 PCB indicator, and 3 prey spp for 1 location; indicator does not have to be CHC but no CAR
905PLS198	Sutherland, Lake	XX		LMB (Hg=12, PCB=5)	Need 9 each of 2 other species with PCBs (not LMB)	LMB, 10 each of 2 other spp and 3 prey spp at 1 location; Will analyze PCBs on 2 comps
907PLJ102	Jennings, Lake			catfish (Hg=5, PCB= 3), LMB (Hg=14), Redear (Hg=10)	Need 4 more catfish with PCBs and PCBs for black bass	LMB, 10 CHC or WHC, and 3 prey spp for 1 location; Will run PCBs on LMB also

Table 3. Analytes included in the 2017 Bass Lakes sampling, detection limits, number of observations, and frequencies of detection and reporting.

Laboratory	Class	Analyte	Method Detection Limit	Number of Observations	Frequency of Detection (%)	Frequency of Reporting (%)

Appendix 1: Cruise report for the 2017 bass lakes survey

Cruise Report for the
Surface Waters Ambient Monitoring Program (SWAMP)
Panel 2 of Long-Term Monitoring of Bass Lakes and Reservoirs in
California.

Sampling Dates: March 28-September 13, 2017

**Written by: Gary Ichikawa
CDFW/Marine Pollution Studies Laboratory (MPSL) at Moss Landing Marine Laboratories**

1.0 Introduction

This work was performed as part of the Bioaccumulation Oversight Group (BOG) Work Plan in support of the Surface Water Ambient Monitoring Program (SWAMP) Bioaccumulation Project.

Oversight for this Project was provided by the SWAMP Roundtable. The Roundtable is composed of State and Regional Water Board staff and representatives from other agencies and organizations including USEPA, the California Department of Fish and Wildlife, the California Office of Environmental Health Hazard Assessment (OEHHA), and the California State Universities. Interested parties, including members of other agencies, consultants, and other stakeholders are also welcome to participate.

The Roundtable has formed a subcommittee, the Bioaccumulation Oversight Group (BOG), which focuses on bioaccumulation monitoring. The BOG is composed of State and Regional Water Board staff and representatives from other agencies and organizations including USEPA, the Department of Fish and Wildlife, the San Jose State University Research Foundation, the Office of Environmental Health Hazard Assessment, and the San Francisco Estuary Institute. The members of the BOG individually and collectively possess extensive experience with bioaccumulation monitoring.

Between 2007 and 2008, the BOG sampled sportfish from 258 California lakes and reservoirs. From this initial survey plus additional water bodies added by regional board staff, approximately 190 priority bass lakes have been identified for long term monitoring.

The BOG has developed a set of monitoring objectives and assessment questions for a statewide program evaluating the impacts of bioaccumulation in support of the SWAMP mission. This assessment framework is consistent with the frameworks developed for other components of SWAMP, and is intended to guide the bioaccumulation monitoring program over the long term. The four objectives can be summarized as 1) status; 2) trends; 3) sources and pathways; and 4) effectiveness of management actions.

Over the long term, the primary emphasis of the statewide bioaccumulation monitoring program will be on evaluating status and trends. Bioaccumulation monitoring is a very effective and an essential tool for evaluating status, and is the most cost-effective tool for evaluating trends for many contaminants. Monitoring status and trends in bioaccumulation will provide information useful for identifying sources and pathways and for evaluating the effectiveness of management actions at a broader geographic scale.

This work plan represents the first step in developing a long-term program to provide status and trend monitoring of bioaccumulation that support the fishing beneficial use in lakes and reservoirs. Lakes with black bass account for a large number and proportion of the water bodies that are not being covered by other programs and need to be sampled at a 10-year frequency.

The overall approach will establish a long-term cycle for sampling the 190 priority bass lakes and reservoirs (Appendix 1) that have been identified by the regional boards. Sampling of the entire group of lakes and reservoirs will occur in five biennial rounds of sampling over a 10-year period. The cycle will then be repeated. This effort will ensure that each of these lakes is sampled once every 10-years to provide updated information on concentrations of priority contaminants. By creating five randomly selected subsets (or “rotating panels”) of the overall population, each round of sampling will yield a representative estimate of the statewide average mercury concentration that will add to a long-term time series that will allow evaluation of the statewide trend in food web mercury.

The annual SWAMP bioaccumulation monitoring budget is sufficient for sampling about 35 lakes in any given year. A biennial sampling scheme could therefore cover the entire list over a 10-year period.

The goal of this sampling is to provide repeated measures of contaminant concentrations in fish to allow for status updates and assessment of long-term trends. The sampling therefore will largely replicate the approach used in prior sampling, whether the sampling was done as part of the 2007-2008 SWAMP survey (BOG 2007) or as part of another study. The one general difference from past sampling will be a narrower focus on mercury in black bass. Bass tissue mercury will be measured in all of these lakes. PCBs and organochlorine pesticides will only be measured at a subset of the lakes that have relatively high concentrations of these chemicals. High-lipid bottom-feeders (e.g., carp or catfish) will be targeted for organics analysis.

In sport fish sampling using an electroshocking boat, it is frequently necessary to sample over a linear course of 0.5 – 1 mi to obtain an adequate number of fish. For small lakes less than 500 ha in size, one sampling location covers a significant fraction of the surface area of the lake. Therefore, for lakes less than 500 ha, one location will be sampled. For lakes of medium size (500 – 1000 ha), two locations will generally be sampled. For lakes in the large (1000 – 5000 ha) and very large categories (>5000 ha), two to four locations will be sampled. Since the goal of the study is to characterize human exposure, the existing locations have been established near centers of fishing activity.

In 2015 the first panel of randomly chosen lakes was sampled. This year the second panel of lakes (Table 1) was sampled, in addition to some of the lakes that weren't sampled in 2015 because of low water.

At some of the lakes, in addition to black bass species, other sportfish species was requested by OEHHA for contaminant analyses.

In all the lakes sampled, 1-4 prey species (<100mm, TL, 10 fish/species) were collected for mercury analysis to determine wildlife risk. This followed protocols from the BOG 2015 study.

The fish collections and analyses followed the BOG Quality Assurance Program Plan (QAPP) and approved by Peer Review Panel.

1.0 Cruise Report

1.1 Objectives

The objectives were to collect 11 individual black bass over a designated size range at each location in the 38 selected lakes. Two lakes from 2015 (Panel 1) list of lakes were also added to the list. Additionally, prey fish (25-100 mm, total length) were sampled using traps, seines, electroshocking and dip nets from shoreline areas adjacent to the locations where sport fish are collected. Ten individuals each from one-four different prey fish species were sampled from each lake. We targeted the following primary prey fish target species at all lakes: Mississippi silversides, young-of-the-year black bass, young-of-the-year bluegill, young-of-the-year green sunfish and threadfin shad. Other species that were within the target size range were collected if the primary targets are not available. Efforts were made to sample the same species across all lakes, and when not possible fish that overlap in trophic guilds were sampled.

The fish tissue samples were analyzed as directed by the approved sampling plan (see Section 1.3 below). Sample sites were reached by boating and fish were collected by electroshocking, hook and line, fish traps and by nets.

1.2 MPSL/CDFW Sampling personnel

Gary Ichikawa	Crew Lead
William Jakl	Crew Lead
Chris Beebe	Research Assistant
Jon Goetzl	Environmental Scientist
April Guimaraes	Research Tech
Stephen Martenuk	Research Assistant

1.3 Authorization to collect samples

All sampling personnel are MPSL staff (San Jose State University Foundation and the California Department of Fish and Wildlife) contracted through San Jose State University Research Foundation (SJSURF) and the State Water Resources Control Board (SWRCB) to conduct the sample collection activities listed herein.

1.4 Station selection

Based upon the random selection of the BOG 2007-2008 Lakes and Reservoir Screening study and input from the regional boards, 38 lakes/reservoirs were selected to resample. Two additional lakes from 2015 sampling were also added to the list of lakes.

Up to eleven black bass per location within each lake were targeted. One to four prey species (10 fish/species) per water body were also targeted. Six lakes were designated for a bottom species collection for PCB and/or OC analyses.

1.5 Summary of types of samples authorized to be collected

Zero to thirty-three black bass, depending upon the size of the lake or fish being present, were collected to better determine mercury trends. For biomagnification estimates, 1-4 prey fish species were collected for mercury analysis. Additional sport fish species were collected as requested by OEHHA for certain water bodies.

Physical parameters were collected for each individual fish, which included: weight, total length, fork length, standard length (for prey species only) and presence of any abnormalities. Each adult black bass or sport fish was individually tagged, wrapped in aluminum foil, placed in labeled zipper-closure bag and stored on dry ice for the duration of the trip.

At the MPSL lab, samples were stored in a freezer until they were processed for authorized analysis, per appropriate SOP's. The QAPP dictates tissue analysis (QA/QC requirements-preservatives, dissecting, etc.).

1.6 Discussion

A total of 37 of the 40 lakes were sampled. Three lakes were not sampled due to differing reasons. Elizabeth Lake (from 2015, Panel 1) was not sampled because it had been completely dry for the couple year and has not been restocked with fish. We did not get our boat into Crystal Lake which had little water. It was sampled by hook and line. Mountain Meadow Reservoir had inadvertently been drained of water the prior fall and has not re-established fish. These water bodies will be sampled in 2019 if adequate water and restocking.

1.7 Results

A summary of number of prey and black bass samples collected from the 37 lakes are in Table 1.

Multiple MPSL teams sampled the 37 lakes. A more detailed fish catch, fish total length and descriptions and maps of sample collection for all lakes and species sampled are linked to Table 1.7.1 below.

Comments: The boat was launched from the main boat ramp. Largemouth, bluegill, brown bullhead, channel catfish, carp, striped bass and three samples of prey fish were collected.

Back to Table

2017 BOG Lakes, Ferguson Lake (715TF0091)

Latitude: 32.97013

Longitude: -114.49481

Collection Method: Electrofisher boat

Date (s) of Collection: March 28, 2017

Samplers: William Jakl and Chris Beebe

Sportfish Caught: Largemouth Bass, TL (mm)										
230	249	290	304	345	347	373	384	401	444	445

Prey Fish Caught: Largemouth Bass, TL (mm)										
111	124	128	130	132	135	136	144	144	149	

Comments: The boat was launched from the main boat ramp at Squaw Lake. It's about a 13 kilometer boat ride to Ferguson Lake from Squaw Lake. Largemouth and one sample of prey fish were collected.

[Back to Table](#)

2017 BOG Lakes, Lake Evans (801PEL155)

Latitude: 33.99795

Longitude: -117.37970

Collection Method: Electrofisher boat and gill nets

Date (s) of Collection: May 1, 2017

Samplers: Chris Beebe and Stephen Martenuk

Sportfish Caught: Brown Bullhead, TL (mm)							
205	215	220	245	250	262	271	535

Comments: The boat was launched from the dirt boat ramp. Access was granted by Evans Lake. The entire lake was shocked and 2 gill nets were used. Catfish were the only species requested. A sample of brown bullhead was collected.

[Back to Table](#)

2017 BOG Lakes, Lake Elsinore (802PEL058)

Latitude: 33.67803

Longitude: -117.361351

Collection Method: Electrofisher boat

Date (s) of Collection: September 11, 2017

Samplers: Chris Beebe and April Guimaraes

Sportfish Caught: Largemouth Bass, TL (mm)	
205	318

Comments: The boat was launched from the main boat ramp off Lake Shore Drive. Very few fish were seen. The lake was very shallow and difficult to navigate. They have yearly fish kills at Elsinore. Only 2 largemouth and no prey fish were collected.

[Back to Table](#)

2017 BOG Lakes, Skinner Reservoir (902SKINLK)

Latitude: 33.59232

Longitude: -117.04231

Collection Method: Electrofisher boat

Date (s) of Collection: April 25, 2017

Samplers: Gary Ichikawa and Jon Goetzl

Sportfish Caught: Largemouth Bass, TL (mm)										
220	230	278	285	350	358	368	375	375	427	510

Sportfish Caught: Bluegill, TL (mm)
