ACKNOWLEDGEMENTS

The State Water Resources Control Board wishes to acknowledge the contributions of the following individuals to the 1987-93 State Mussel Watch Program:

Department of Fish and Game, Moss Landing Laboratory

Project Director:	Mark Stephenson
Field Support:	Gary Ichikawa Jon Goetzl
Laboratory Support:	Dave Crane Deborah Holstad Jim Kanihan Norm Morgan John Newman Kim Paulson Kathleen Regalado Chris Younghans-Haug

State Water Resources Control Board

Program Support:	Fred La Caro Tim Stevens
Graphic Support:	Dale Oliver

1. STATE MUSSEL WATCH PROGRAM
1987 - 1993

Introduction

The California State Mussel Watch Program (SMWP) was initiated in 1977 by the California State Water Resources Control Board (SWRCB). The SMWP was organized to provide a uniform statewide approach to the detection and evaluation of the occurrence of toxic substances in the waters of California's bays, harbors, and estuaries through the analysis of mussels and clams. The SMWP primarily targets areas with known or suspected impaired water quality and is not intended to give an overall water quality assessment. The California Department of Fish and Game (DFG) carries out the statewide SMWP for the SWRCB by collecting and analyzing samples. The SWRCB provides funding under an ongoing interagency agreement with the DFG. Sampling stations are selected primarily by the six coastal Regional Water Quality Control Boards (RWQCB) which are identified on the inside back cover.

The DFG reports annual sampling results to the SWRCB, which distributes the information to the coastal RWQCBs and to other federal, State, and local agencies through annual preliminary data reports. These preliminary data reports are also routinely transmitted to the Office of Environmental Health Hazard Assessment of the California Environmental Protection Agency, which has responsibility for evaluating pollutant levels based on human health concerns and issuing consumption health advisories if indicated. This report is the formal report presenting the results of the 1987-93 sampling and analysis programs.

Information collected in the SMWP is used by the SWRCB, RWQCB, and other agencies to identify waters impacted by toxic pollutants. Through the SWRCB's statewide Water Quality Assessment/Clean Water Strategy, SMWP results are used to help classify water bodies from good to impaired water quality relative to each other and ranked according to this classification and resource value. For example, water bodies that exceed human health criteria are considered more impaired than water bodies that only exceed environmental protection criteria. SMWP results are also used in the SWRCB's Bay Protection Program in helping identify "Toxic Hot Spots". Lastly, SMWP results are used in the normal regulatory activities of the RWQCBs and other State agencies such as the Department of Pesticide Regulation.

Summary

Appendix A shows area map locations for each station sampled from August 1987 through March 1993. Appendix B contains station location information such as latitude and longitude and county identification. From 1987 to 1993 a total of 863 samples from 315 stations were collected and analyzed (Appendix C) including 776 samples of California mussel (*Mytilus californiaus*), bay mussel (*Mytilus edulis*), and freshwater clam (*Corbicula fluminea*), and 87 sediment samples. Two archive samples of California mussels from Point Pinole and the Dumbarton Bridge at Channel Marker 14 collected in 1981 and 1982, respectively, were also analyzed in 1989 upon special request. Samples were analyzed for trace elements (metals), organic chemicals (pesticides and PCBs), polynuclear aromatic hydrocarbons (PAHs), and tributyltin (TBT). Transplanted California mussels made up 62% of the tissue samples followed by resident California mussels (24%), transplanted freshwater clams (11%), resident bay mussels (2%), and resident freshwater clams (1%). A complete station sampling history of the SMWP from 1978 to 1993 is provided in Appendix D. Recently, station names were reviewed and updated to more accurately describe the location of the sampling site. These changes are listed in Appendix E by old station name.

Wet weight sampling results were compared to the following criteria: U.S. Food and Drug Administration (FDA) criteria, Maximum Tissue Residue Levels (MTRLs), Median International Standards (MIS), the National Academy of Sciences (NAS) recommended guidelines for predator protection, and Elevated Data Levels (EDLs). A discussion of each criterion can be found in Section 3, Administrative and Comparative Criteria on Page 5. The MTRL is a new criterion developed from water quality objectives from the 1990

California Ocean Plan (SWRCB 1990a), the *Draft November 26, 1990 Functional Equivalent Document - Development of Water Quality Plans For: Inland Surface Waters of California and Enclosed Bays and Estuaries of California* (SWRCB 1990b), and the *Draft April 9, 1991 Supplement to the Functional Equivalent Document* (SWRCB 1991). Only three samples collected from 1987 to 1993 exceeded FDA criteria (Appendix F). Two samples exceeded the FDA action level for dieldrin of 300 ppb. Transplanted California mussels collected in 1988 from the Lauritzen Canal/End contained 602 ppb dieldrin and freshwater clams from Salinas/Reclamation Canal 4 collected the same year contained 396 ppb. The FDA tolerance level for PCBs (2,000 ppb) was exceeded in only one sample. Transplanted California mussels from San Diego Bay/Harbor Island/East Basin/Storm Drain also collected in 1988 contained 2,738 ppb PCBs. A total of 500 tissue samples from 216 stations exceeded the MTRLs for ocean waters (Appendix G), enclosed bays and estuaries (Appendix H), and inland surface waters (Appendix I). The NAS guideline for DDT (1,000 ppb) was exceeded in five transplanted freshwater clam samples from four stations (Appendix F). Two samples collected in 1988 from Salinas/Reclamation Canal 4 and Revolon Slough contained 2,556 and 3,845 ppb, respectively. A sample from Revolon Slough again exceeded the NAS for DDT in 1989 with 2,507 ppb. More recently, a sample from Salinas River Lag 2 station in 1992 contained 1,068 ppb while a 1993 sample from Watsonville Slough/Bridge station contained 1,058 ppb. The MIS for trace elements were exceeded in 528 samples from 203 stations from 1987 to 1993 (Appendix J). Samples exceeding EDLs for trace elements and organic chemicals can be found in Appendices K and F.

Tabular summaries of all chemistry data are provided in Appendices L through P. Summaries of all trace element data are provided in Appendix L (wet weight) and Appendix M (dry weight). Summaries of all organic chemical data are provided in Appendix N (wet weight), Appendix O (dry weight), and Appendix P (lipid weight). A separate table containing PCP and TCP results is located in Appendix Q. PAH data summaries can be found in Appendix R (wet weight), Appendix S (dry weight), and Appendix T (lipid weight). From 1987 to 1990 samples were analyzed for a large number of PCB congeners. These data can be found in Appendix U and V (wet weight), Appendix W and X (dry weight), and Appendix Y and Z (lipid weight).

Appendix DD is an errata sheet containing corrected phenol data from 1984-85 and 1986-87.

2. FIELD AND LABORATORY OPERATIONS

The presence of many toxic substances in the State's waters is determined by analyzing tissues from aquatic organisms. Concentrations of these substances in water are often too low or transitory to be reliably detected through the more traditional methods of analysis of water samples. Also, many toxic substances are not water soluble, but can be found associated with sediment or organic matter. Aquatic organisms are sampled because they bioaccumulate and bioconcentrate toxic substances to levels which may be many hundreds of times the levels actually in the water. This concentration factor facilitates detection of toxic pollutants. Mussels and clams are excellent subjects for this purpose because they (1) are sessile, (2) are long-lived, (3) can be successfully transplanted to and maintained in areas where they do not naturally occur, and (4) reliably concentrate toxic pollutants from the water. The following is a general overall discussion of field and laboratory procedures. A detailed discussion is provided in Appendix AA.

Substances Measured

Samples are regularly analyzed for up to 14 trace elements (Table AA-1) and approximately 45 synthetic organic chemicals including pesticides and PCBs (Table AA-3). Arsenic, nickel, selenium, polynuclear aromatic hydrocarbons (PAHs), pentachlorophenol (PCP), and tetrachlorophenol (TCP), and tributyltin (TBT) are looked for on a request basis only. Not every sample is analyzed for all trace elements or organic chemicals. Each sample at each station is handled individually. The requesting agency, usually the RWQCBs, will specify the type of analysis for each sample.

Sample Size and Collection

Forty-five mussels or clams are composited and analyzed for organic chemicals. Three analytical replicates of 15 individuals each of mussels or clams are analyzed for trace elements (trace element results reported herein are mean values). Concentrations in bivalves of certain trace elements and organic chemicals can be directly correlated with several variables such as size of the animal, location of habitation within the tidal zone, and season of collection (Stephenson et al. 1987). In the SMWP, mussels of 55 to 65 mm in length are collected whenever possible in order to reduce size-related effects. Clams size is limited to 20 to 30 mm in length. In an attempt to minimize variability introduced by location of collection within the inter-tidal zone, mussels are collected from the highest point in the zone where adequate numbers occur.

Mussels and clams are transplanted where a suitable resident population does not exist and where sampling can be accomplished using scuba equipment. The mussel transplant system, consisting of a bottom anchored float buoy used in water up to 40 m depth, is shown in Appendix AA, Figure AA-1. Bags of freshwater clams are usually tied to plastic stakes placed off the bottom or are attached to submerged structures. A two month transplant period is adequate in most cases where pollutant uptake rates are expected to be high, but for trace elements in less contaminated environments a six month interval may be necessary for an adequate sample (Stephenson et al. 1980). A four to six month transplant interval is used for organic chemicals to be consistent with transplant periods for trace elements. Transplanted mussels (M. californianus) were collected from Trinidad Head for the Humboldt Bay survey, from Montana de Oro for the Diablo Canyon survey, and from Bodega Head for all other transplants. Transplanted freshwater clams (C. fluminea) were collected from Lake San Antonio up to mid-1990. Because drought conditions at Lake San Antonio prevented further collections, clams were obtained from the Rio Vista area (Solano County) from 1990 through mid-1992. Clams collected from the Rio Vista area were held in Aptos Creek until transplanted. In 1992-93 clams were collected from Lake Isabella.

Dry, Wet, and Lipid Weight Measurements

Metal data are presented in parts per million (ppm), while organic chemical data are presented in parts per billion (ppb). Tissue concentrations of trace elements and organic chemicals are measured on a dry weight basis to reduce data variability due to moisture content. Wet and lipid data are back calculated from dry weight measurements. Wet weight data are used to compare to wet weight or fresh weight criteria listed in this report (see Section 3, Administrative and Comparative Criteria). In addition, organic chemicals are expressed on a lipid weight basis. Lipid weight measurements offer several advantages. Because chlorinated hydrocarbons are much more soluble in lipids (fat tissues) than in water, they partition into lipid-rich tissues of aquatic organisms (Stout and Beezhold 1981). Animals with higher proportions of lipid in their tissue usually have had higher concentrations of chlorinated hydrocarbon pollutants (Phillips 1980). Factors such as season, water temperature, health of the organism, stress on the organism, and type of species can affect the lipid levels of samples collected for analysis and can, therefore, cause variability in results. Use of lipid weight measurements may reduce this source of variability, although disadvantages have also been noted (Phillips 1980). As a result, lipid weight values may represent a more realistic measure of environmental availability of chlorinated hydrocarbons than wet weight values. Wet weight measures, however, remain the preferred measure for most readers because all criteria for human health and for predator protection are based on wet weight measures. Also, wet weight measures better reflect the exposure of predators or humans to the actual concentration in fresh mussels or clams .

3. ADMINISTRATIVE AND COMPARATIVE CRITERIA

In this report the term “criteria” is used to refer to the criteria against which a particular trace element or organic chemical is being compared. More than one criterion may apply to any one metal or organic compound. In general, FDA action levels, Maximum Tissue Residue Levels (MTRLs), and Median International Standards (MIS), all human health-related criteria, are considered more important or critical. Following human health criteria are NAS guidelines for predator protection and Elevated Data Levels (EDLs). All five criteria are discussed below.

In interpreting the SMWP data by any of the criteria provided, the reader is cautioned that there is no simple relationship between concentrations of toxic substances observed in tissue samples and actual concentrations in water. Different aquatic organisms tend to bioaccumulate a given toxic substance in water to different levels; however, the differences usually do not prevent a general interpretation of the data. The reader is cautioned that the limited number of samples obtained and analyzed at each station in a single year is generally too small to provide a statistically sound basis for making absolute statements on toxic substance concentrations. The values reported herein should be accepted as indicators of relative levels of toxic pollution in water, not as absolute values. In this sense, trends over time and ranking values of a toxic substance provide only an indication of areas where mussels and clams are evidently accumulating concentrations which are above normal.

FDA Action Levels and NAS Guidelines

The FDA has established maximum concentration levels for some toxic substances in human foods (USFDA 1985). The levels are based on specific assumptions of the quantities of food consumed by humans and the frequency of their consumption. The FDA limits are intended to protect humans from the chronic effects of toxic substances consumed in foodstuffs. The National Academy of Sciences (NAS) has established recommended maximum concentrations of toxic substances in animals (NAS 1973). They were established not only to protect the organisms containing the toxic compounds, but also to protect the species that consume these contaminated organisms. The NAS has set guidelines for marine fish but not for marine shellfish. Only two guidelines apply to freshwater clams. The FDA limits and NAS guidelines used in this report are shown in Table 1.

Maximum Tissue Residue Levels (MTRLs)

MTRLs were developed by SWRCB staff from human health water quality objectives in the *1990 California Ocean Plan* (SWRCB 1990a), the *Draft November 26, 1990 Functional Equivalent Document - Development of Water Quality Plans For: Inland Surface Waters of California and Enclosed Bays and Estuaries of California* (SWRCB 1990b), and the *Draft April 9, 1991 Supplement to the Functional Equivalent Document* (SWRCB 1991). The objectives represent concentrations in water that protect against consumption of fish, shellfish, and water (freshwater only) that contain substances at levels which could result in significant human health problems. MTRLs are used as alert levels or guidelines indicating water bodies with potential human health concerns and are an assessment tool and not compliance or enforcement criteria. Tables 2, 3, and 4 lists MTRLs for those substances monitored in the SMWP. The MTRLs for a number of substances listed as carcinogens in the MTRL tables are below the current tissue detection limit for those substances. Detection limits can be found in Tables AA-1, AA-3, and AA-4 in Appendix AA.

The MTRLs were calculated by multiplying the human health water quality objectives in by the bioconcentration factor (BCF) for each substance as recommended in the USEPA *Draft Assessment and Control of Bioconcentratable Contaminants in Surface Waters* (USEPA 1991). BCFs were taken from the USEPA 1980 Ambient Water Quality Criteria Documents for each substance. MTRLs were not calculated for objectives that are based on maximum contaminant levels (MCLs) or taste and odor criteria.

Median International Standards (MIS) for Trace Elements

The MIS is an in-house criterion developed from a Food and Agriculture Organization of the United Nations publication of a survey of health protection criteria used by member nations (Nauen 1983). A description of how the Median International Standards were compiled by SWRCB staff is provided in Appendix BB. These criteria vary somewhat in the tissues to be analyzed or the level of protection desired, but may be compared qualitatively. Table 5 summarizes these standards as an indication of what other countries have determined to be unsafe levels of trace elements. Though the standards do not apply within the United States, they provide an indication of what other nations consider to be an elevated concentration of trace elements in shellfish.

Elevated Data Levels

The "elevated data level" (EDL) was introduced by SWRCB staff in 1983 as an internal comparative measure which ranks a given concentration of a particular substance with previous data from the SMWP. The EDL is calculated by ranking all of the results for a species and exposure condition (resident or transplant) and a given chemical from the highest concentration measured down to and including those records where the chemical was not detected. From this, a cumulative distribution is constructed and percentile rankings are calculated. For example, the 50^{th} percentile corresponds to the median or "middle" value rather than to the mean. With a large number of records, the median can be approximately compared to the mean.

The 85^{th} percentile (EDL 85) was chosen as an indication that a chemical is markedly elevated from the median. The 85^{th} percentile corresponds to measures used by the U.S. Fish and Wildlife Service in its National Contaminant Biomonitoring Program and would represent approximately one and one-half standard deviations from the mean, if the data were normally distributed. The 95^{th} percentile (EDL 95) was chosen to indicate values that are highly elevated above the median. The 95^{th} percentile would represent two standard deviations from the mean, if the data were normally distributed. When used along with other information, these measures provide a useful guideline to determine if a chemical has been found in unusually high concentrations. A more detailed description of EDL rankings is provided in Appendix CC. The reader is cautioned that EDLs are not directly related to potentially adverse human or animal health effects; they are only a way to compare findings in a particular area with the larger data base of findings from all over the state. The 1977-93 EDLs and the number of data points used to calculate each EDL are provided in Tables 6 through 13.

c As methyl mercury.

d A tolerance, rather than an action level, has been established for PCBs (21CFR 109, published May 29, 1984). An action level is revoked when a regulation establishes a tolerance for the same substance and use.

TABLE 2

Maximum Tissue Residue Levels (MTRLs) in Ocean Waters

Carcinogens [a]

Substance	Water Quality Objective [b] (µg/l)	BCF [c] (l/kg)	MTRL [d] (µg/kg, ppb wet weight)
aldrin	0.000022	**e**	0.1
chlordane (total)	0.000023	14100	0.32
DDT (total)	0.00017	53600	9.1
dieldrin	0.00004	4670	0.2
heptachlor	0.00072	11200	8.1
hexachlorobenzene (HCB)	0.00021	8690	2.0
PAHs (total)	0.0088	30	0.26
PCBs (total)	0.000019	31200	0.6
toxaphene	0.00021	13100	2.75

a. The SMWP does not analyze for any of the non-carcinogens listed in the human health section of Table B of the 1990 Ocean Plan.
b. From Table B, Objectives for Human Health, "*California Ocean Plan*" (SWRCB 1990a).
c. Bioconcentration Factors taken from the USEPA 1980 Ambient Water Quality Criteria Documents for each substance.
d. MTRLs were calculated by multiplying the Water Quality Objective by the BCF, except for aldrin.
e. Aldrin MTRL is derived from a combination of aldrin and dieldrin risk factors and BCFs as recommended in the USEPA 1980 "*Ambient Water Quality Criteria for Aldrin/Dieldrin*" (USEPA 1980).

pentachlorophenol (PCP)	8.2	11	90.0
toxaphene	0.00069	13100	9.0

Non-carcinogens

Substance	Water Quality Objective [a] (mg/l)	BCF [b] (l/kg)	MTRL [c] (mg/kg, ppm)
endosulfan (total)	0.002	270	0.5 (500 ppb)
endrin	0.0008	3970	3.2 (3,200 ppb)
mercury	0.000025	**e**	1.0
nickel	4.6	47	220.0

a. From the *Draft November 26, 1990 Functional Equivalent Document - Development of Water Quality Plans For: Inland Surface Waters of California and Enclosed Bays and Estuaries of California* (SWRCB 1990b), the *Draft April 9, 1991 Supplement to the Functional Equivalent Document* (SWRCB 1991).

b. Bioconcentration Factors taken from the USEPA 1980 Ambient Water Quality Criteria Documents for each substance.

c. MTRLs were calculated by multiplying the Water Quality Objective by the BCF, except for aldrin and mercury.

d .Aldrin MTRL is derived from a combination of aldrin and dieldrin risk factors and BCFs as recommended in the USEPA 1980 "*Ambient Water Quality Criteria for Aldrin/Dieldrin*" (USEPA 1980).

e. The MTRL for mercury is the FDA action level. The water quality objective for mercury in the Enclosed Bays and Estuaries Plan is based on the FDA action level as recommended in the USEPA 1985 "*Ambient Water Quality Criteria for Mercury*" (USEPA 1985).

TABLE 4

Maximum Tissue Residue Levels (MTRLs) in Inland Surface Waters

Carcinogens

Substance	Water Quality Objective [a] (µg/l)	BCF [b] (l/kg)	MTRL [c] (µg/kg, ppb)
aldrin	0.00013	**d**	0.05
arsenic	5.0 [e]	44	200.0 (0.2 ppm)
chlordane (total)	0.00008	14100	1.1
DDT (total)	0.00059	53600	32.0
dieldrin	0.00014	4670	0.65
heptachlor	0.00016	11200	1.8
heptachlor epoxide	0.00007	11200	0.8
hexachlorobenzene (HCB)	0.00066	8690	6.0
hexachlorocyclohexane (HCH), alpha	0.0039	130	0.5
hexachlorocyclohexane (HCH), beta	0.014	130	1.8
hexachlorocyclohexane (HCH), gamma	0.019	130	2.5
PAHs (total)	0.0028	30	0.08
PCBs (total)	0.00007	31200	2.2
pentachlorophenol (PCP)	0.28	11	3.1
toxaphene	0.00067	13100	8.8

Non-carcinogens

Substance	Water Quality Objective [a] (mg/l)	BCF [b] (l/kg)	MTRL [c] (mg/kg, ppm)
cadmium	0.01	64	0.64
endosulfan (total)	0.0009	270	0.25 (250 ppb)
endrin	0.0008	3970	3.0 (3,000 ppb)
mercury	0.000012	**f**	1.0
nickel	0.6	47	28.0

a. From the *Draft November 26, 1990 Functional Equivalent Document - Development of Water Quality Plans For: Inland Surface Waters of California and Enclosed Bays and Estuaries of California* (SWRCB 1990b), the *Draft April 9, 1991 Supplement to the Functional Equivalent Document* (SWRCB 1991)

b. Bioconcentration Factors taken from the USEPA 1980 Ambient Water Quality Criteria Documents for each substance.

c. MTRLs were calculated by multiplying the Water Quality Objective by the BCF, except for aldrin, arsenic, and mercury.

d. Aldrin MTRL is derived from a combination of aldrin and dieldrin risk factors and BCFs as recommended in the USEPA 1980 "*Ambient Water Quality Criteria for Aldrin/Dieldrin*" (USEPA 1980).

e. Arsenic MTRL was calculated from the formula NSRL ÷ (WI/BCF) + FC = MTRL. [NSRL (California's No Significant Risk Level for arsenic) = 10 µg/d, WI (Water Intake) = 2 l/d, FC (daily fish consumption) = 0.0065 kg/d].

f. The MTRL for mercury is the FDA action level. The water quality objective for mercury in the Inland Surface Waters Plan is based on the FDA action level as recommended in the USEPA 1985 "*Ambient Water Quality Criteria for Mercury*" (USEPA 1985).

TABLE 5

Median International Standards for Trace Elements[a]
(edible portion, ppm, wet weight)

Freshwater Element	Fish	Shellfish	Range	Number of Countries with Standards
Arsenic	1.5	1.4	0.1 to 5.0	11
Cadmium	0.3	1.0	0.05 to 2.0	10
Chromium	1.0	1.0	1.0	1
Copper	20.0	20.0	10 to 100	8
Lead	2.0	2.0	0.5 to 10.0	19
Mercury	0.5	0.5	0.1 to 1.0	28
Selenium	2.0	0.3	0.3 to 2.0	3
Zinc	45.0	70.0	40 to 100	6

a Based on: Nauen, C. C., Compilation of Legal Limits for Hazardous Substances in Fish and Fishery Products, Food and Agriculture Organization of the United Nations, 1983.

APPENDIX AA

Field and Laboratory Operations

FIELD AND LABORATORY OPERATIONS

Sample Collection

The State Mussel Watch Program (SMWP) collects about 100 mussels at each station, which are randomly divided into two groups for trace element and synthetic organic chemical analysis. Based on recommendations by Goldberg (1980) and Risebrough *et al.* (1980), the SMWP samples 45 mussels, three replicates of 15 individuals each, for trace elements at each site. Trace element results in the SMWP represent a mean value for the three replicates. A single replicate of 45 composited individuals is analyzed for synthetic organic compounds.

Mussels of 55 to 65 mm in length are collected wherever possible in order to reduce size related effects. Similarly, freshwater clams of 20 to 30 mm in length are collected. Mussels are collected from the highest tidal height where they occur in adequate numbers to reduce variability induced by habitat height. Stainless steel pry bars are used to collect mussels off rocks. The pry bars are cleaned and rinsed in the laboratory and rinsed again with seawater prior to use. Freshwater clams are collected by towing a dredge

At locations where mussels are unavailable and sampling can be accomplished using scuba equipment, transplanted samples are used. The mussel transplant system, consisting of a bottom anchored float buoy used in water up to 40 m depth, is shown in Figure AA-1. Transplanted mussels are placed in polypropylene mesh bags and kept cool in ice chests for no more than 24 hours prior to deployment. To minimize the risk of contamination of the mussel from boat exhaust or surface film during deployment or retrieval, mussel samples are placed in polyethylene bags, where they remain until submerged and deployed. Upon retrieval from the subsurface buoy system, samples are again placed in polyethylene bags before being brought through the air-water interface. Once collected, the transplants are triple bagged. To minimize contamination caused by handling the mussel samples, polyethylene gloves are worn during collection, as well as processing, of mussel samples.Similar bags of freshwater clams are usually tied to plastic stakes placed off the bottom or are attached to submerged structures. A two month transplant period is adequate in most cases where pollutant uptake rates are expected to be high, but for trace elements in less contaminated environments, six month interval may be necessary for an adequate sample (Stephenson *et al.* 1980). A four to six month transplant interval is used for organic chemicals to be consistent with transplant periods for trace elements.

Mussels and clams to be analyzed for trace elements are placed in a ZIPLOCK® polyethylene bag of 4 mm thickness. The samples are placed inside two additional polyethylene ZIPLOCK® bags. Mussels to be analyzed for synthetic organic compounds are placed in a bag constructed of two layers of “heavy duty” aluminum foil. Prior to use, the foil is cleaned by heating to 500° C or by rinsing in hexane. Samples in the foil bags are placed in two polyethylene ZIPLOCK® bags. After bagging, all samples are placed in non-metallic ice chests and frozen using dry ice and stored at or below -20° C until processed.

Laboratory Analysis

A detailed description of procedures and techniques discussed below can be found in the Department of Fish and Game's (DFG) *Laboratory Quality Assurance Program Plan* (DFG 1990). The following is a summary of the 1987-93 Quality Assurance/Quality Control (QA\QC) results provided by the DFG's Moss Landing Laboratory. Copies of the Laboratory Quality Assurance Program Plan and QA\QC results are available upon request. Additional QA/QC information is also provided in *Quality Assurance Report for the Analysis of Marine Bivalve Tissue and Sediment for Organic Contaminants in the California State Mussel Watch Program 1987-1993* (Newman *et al.* 1994)

Trace Elements Analytical Techniques in Tissue and Sediment

The following procedures were employed for mussel dissection and homogenization for trace element analysis: Frozen mussels were removed individually from the bags, cleaned of epiphytic organisms and debris under running deionized water by personnel wearing polyethylene gloves, and allowed to thaw in clean polyethylene trays. Adductor muscles were severed and gonads removed with a MICRO®-cleaned stainless steel scalpel. Gonads were removed from mussels to reduce variability in trace element concentrations due to the sex of the organism (Stephenson *et al.* 1987). The remainder of the soft part was placed in a pre-weighted, acid-cleaned polypropylene 4 oz. jar and re-weighed. The shell lengths were also taken at this time. Samples were then homogenized to a paste-like consistency in the jars using a Brinkmann Polytron (Model PT10-35) equipped with a titanium generator (Model PTA 20). The homogenized samples were then refrozen at -20° C until analyzed. The same procedures were used on freshwater clams except that the entire soft body of the clam (including gonads) was used.

A Perkin-Elmer Model 2280 spectrophotometer with deuterium arc background corrector and digital display was used for techniques employing conventional (flame) atomic absorption spectrophotometry (Al, Cd, Cu, Mn, Zn) and cold vapor technique for mercury. A Perkin-Elmer Model 3030 Zeeman atomic absorption spectrophotometer equipped with an HGA-600 graphite furnace and an AS-60 autosampler was used for techniques requiring a graphite furnace (Ag, As, Cr, Ni, Pb, Se). All analytical values were corrected using procedural blanks. Trace element detection limits are presented in Table AA-1. From July 1, 1987 through June 30, 1990 the technique used for digesting samples was known as "beaker digestion". From July 1, 1990 through June 30, 1993 the technique used for digesting samples was known as "teflon vessel digestion". Separate techniques were performed on sediments and tissues in the "teflon vessel digestion" technique.

The "beaker digestion" technique was performed as followed: Samples were weighed into pre-cleaned 30 ml Pyrex glass beakers. Digestion of each sample was accomplished by adding concentrated 5 ml double distilled HNO_3 and heating the beaker on a hotplate. After the initial reaction, the sample was refluxed for 2-3 hours. Each sample was then evaporated almost to dryness. The volume was brought back up by adding 2 ml of 1% concentrated double distilled HNO_3. The sample was then again evaporated almost to dryness. The digestate was diluted to 20 ml with 1% concentrated double distilled HNO_3 and transferred to a clean polyethylene bottle.

The "teflon vessel digestion" technique for tissue was performed as follows: Samples were weighed into pre-cleaned 125 ml teflon digestion vessels. Digestion of each tissue sample was accomplished by adding a 4:1 concentrated HNO_3: concentrated $HClO_4$ mixture and heating the sample on a

warm (≈75°) hotplate. After the initial reaction, the teflon vessel was capped and heated in a 130° C oven for four hours. Once the digestate had cooled it was transferred to a clean polyethylene bottle and diluted with 20 ml Type ll water. Sediment samples were digested using the same mixture as tissue samples except, instead of warming on a hotplate, sediment samples were heated in a 130° C oven for four hours. After the initial reaction, hydrofluoric acid was added to the sediment sample and the teflon vessel returned to a 130° C oven for 12 hours. Twenty ml of boric acid (2.5%) was added to each sediment sample before again returning to a 130° C oven for another 8 hours. Once the digestate was cool it was transferred to a clean polyethylene bottle.

To protect sample integrity, all materials contacting samples during laboratory operations were analyzed for trace element content. To ensure accuracy, reference materials from the National Bureau of Standards (NBS) were analyzed (Table AA-2).

Synthetic Organic Compounds Analytical Techniques in Tissues and Sediments

Samples were dissected in the same manner as trace element samples except gonads were not removed. Gonads were included because a high percentage of the whole body concentrations for most organic chemicals occur in this tissue. The dissection was conducted on a sheet of oven fired or hexane rinsed aluminum foil. The homogenization procedure was the same as for trace elements except a stainless steel shaft and blade was substituted for the titanium blade and shaft. All samples were stored at -20° C until extraction and analysis.

Summaries of the methods in use over the past six years are outlined below. Synthetic organic compound and polynuclear aromatic hydrocarbons (PAHs) detection limits are listed in Tables AA-3 and AA-4, respectively. Fractionated distribution of synthetic organic compounds are presented in Table AA-5. Results of standard reference materials starting in 1990-91 are presented in Table AA-6. Duplicate analyses results for synthetic organic compounds and PAHs are presented in Tables AA-7 and AA-8.

Analytical Methods for FY 87-88 through FY 89-90

Tissue samples (50g) were extracted using the methods described in the FDA's 1990 edition of the Pesticide Analytical Manual: *Methods Which Detect Multiple Residues* (PAM) by McMahon *et al.* (1990) using the "General Methods for Fatty Foods". Sediment samples (30g) were extracted with acetone and petroleum ether mixture. All samples were fractionated on Florisil using petroleum ether (F1 Fraction), 6% ethyl ether (F2 Fraction), 15% ethyl ether (F3 Fraction), 50% ethyl ether (F4 Fraction) and concentrated as described in PAM. Synthetic standards were fractionated to determine the column fractionation characteristics.

All organic chemicals were analyzed by capillary gas chromatography (GC) using Hewlett-Packard 5890A gas chromatographs. Synthetic organics (SOs) were analyzed on an instrument equipped with dual 30m x 0.25mm i.d. columns of different polarities (J&W Scientific, DB-5 and DB-17) and Ni^{63} electron capture detectors (ECDs). A Hewlett-Packard Pascal ChemStation system was used to acquire and analyze all data.

In FY 87-88 through FY 89-90, PAHs were analyzed from the recombination of the F2 Fraction and the F3 Fraction collected for synthetic organics analysis. Polyaromatic hydrocarbon (PAH) analysis was accomplished with an HP 5890A attached to a Finnigan Model ITD 800 ion trap detector. Sample aliquots were delivered to the detector via on-column injection onto a 30m x 0.25mm i.d. DB-5 column. Spectral data were acquired in a multiple ion mode (MID) such that the base peak and two qualifier ions were monitored for each analyte of interest. Three point calibration curves ranging from 0.025 to 4.0 ng/µl were generated and fitted with linear curve fits ($r > 0.998$). All PAH data were acquired and quantitated using an IBM compatible micro computer and Finnigan ITDS v.4 Software Package.

In FY 88-89 and FY 89-90 polychlorinated biphenyls (PCBs) were quantitated as both unique congeners and technical mixtures. In FY 88-89, PCB congeners were quantitated in the F1 Fraction using a three point calibration curve. Dilutions of the National Institute of Standards Technology (NIST) Concentrated PCB Standard ranging from 2 pg/µl to 200 ng/µl were used to calibrate the instrumentation during the standard synthetic organic analysis. In FY 89-90, PCB congener data were quantitated with a six point calibration curve of a 1:1:1 mixture of Aroclors 1242, 1254, and 1260. The EPA Lot#s of Aroclors used to make these standards were fully characterization by Schulz *et al.* (1989) making the mixture quantitative for congeners. The response factors of coeluting domains were generated in house. The quantitation standard ranged from 0.15 to 15 ng/µl total Aroclor.

Quality assurance data for these years consisted of precision measurements through method duplicate analyses for synthetic organics in tissues. Method performance was further evaluated through the use of matrix spike recoveries and the analysis of split homogenates. Each year, multiple homogenates were split and analyzed at both the DFG Water Pollution Control Laboratory in Rancho Cordova and at the Trace Organics Facility, University of California, Santa Cruz. Analytical comparability was deemed acceptable for each year and verified by the project QA Officer.

All data results were hand transcribed and submitted to the Department of Fish and Game, Moss Landing Laboratory for entry into the SMWP database.

Analytical Methods for FY 90-91

Samples for synthetic organic analysis were processed as in FY 89-90. Tissue samples for PAH analysis were extracted and prepared for GC/ITD analysis using internal standard methodologies as described by Krahn et al. (1988). Samples (5g) were extracted with methylene chloride and coextracted biologicals were removed by silica/alumina gravity flow columns followed by size exclusion chromatography on a high performance liquid chromatograph (SEC/HPLC).

Acquisition and analytical systems were the same as in previous years.

Quality assurance associated with the analysis for this year consisted of precision measurements through method duplicate analyses in tissues and sediments, accuracy measurements for tissue through the analysis of standard reference materials (SRMs), and interference checks through the analysis of method blanks.

During FY 90-91 an organics laboratory database to be used for report generation was developed. All raw data were initially entered into this database and hard copies of final report values were submitted for entry into the main SMWP database.

Analytical Methods for FY 91-92

Tissue (5g) and sediment (10g) samples were extracted and prepared for organic contaminant analyses using the methods described for PAH analyses in FY 90-91. Internal standards were used for both synthetic organic and PAH analyses. Tissue extracts were subdivided such that one quarter was used for synthetic organic analysis, one half was used for PAH analysis, and one quarter was used for gravimetric lipid weight determinations. The synthetic organic sub-sample was fractionated on silica and alumina columns to isolate the PCBs from the polar chlorinated pesticides using one percent methylene chloride in pentane (F1 Fraction) followed by straight methylene chloride (F2 Fraction). Sediment extracts were treated similarly except lipid weight determinations were not performed and one half of the extract was used for synthetic organic analysis. All data analysis was performed as in FY 90-91.

During this year's analysis, PCB congener data were but not reported. Instruments were calibrated with standards prepared in house from neat materials. Data was recorded for 12 of the 18 NIST congeners as well as 12 additional environmentally significant congeners.

Quality assurance associated with the analysis for this year consisted of precision measurements through method duplicate analyses in tissues and sediments, accuracy measurements for tissue through the analysis of SRMs and sediments through the analysis of matrix spikes, and interference checks through the analysis of method blanks.

As in FY 90-91, all raw data were initially entered into the organics laboratory database and hard copies of final reported values were submitted for entry into the main SMWP database.

Analytical Methods for FY 92-93

In FY 92-93, all sample preparation and analysis was performed as in FY 91-92 except new data acquisition systems were used. All synthetic organic data were acquired and analyzed using a Hewlett-Packard DOS based ChemStation systems. Also, a Hewlett-Packard 5971A Mass Selective Detector was substituted for the Finnigan ion trap, the chromatographic column length was increased to 60m, and samples were introduced using splitless injections. Spectral data were acquired in a selective ion mode (SIM) such that the base peak and two qualifier ions were monitored for each analyte of interest. Three point calibration curves ranging from 0.025 to 4.0 ng/µl were generated and fitted with linear curve fits ($r > 0.998$).

During this year, PCB congener data were acquired, but not reported. Instruments were calibrated with standards prepared in house from neat materials. Data were recorded for all of the 18 NIST congeners as well as 33 additional environmentally significant congeners. In addition, Aroclor concentrations were calculated during this year from congener data. Briefly, a compositional analysis was performed on all in house Aroclor mixtures providing conversion factors for PCB congener concentrations to Aroclor concentrations. Aroclor 1260 values were generated from congeners 194, 195, 201, and 203. Aroclor 1248 values were generated from congeners 18, 31, and 28. Aroclor 1254 values were generated from congeners 99, 118, 128, and 138. The bias induced in Aroclor 1254 quantitation congeners by the presence of other Aroclors was removed by subtraction prior to calculation. The values generated by this approach compared well with values calculated using classical approaches as shown by in house tests and round robin exercises with the DFG Water Pollution Control Laboratory in Rancho Cordova.

Quality assurance associated with the analysis for this year consisted of precision measurements through method duplicate analyses in tissues and sediments, accuracy measurements through the analysis of SRMs, and interference checks through the analysis of method blanks.

All data results were electronically imported into the organic laboratory database structure and electronic data copies were submitted to the Department of Fish and Game, Moss Landing Laboratory for incorporation into the SMWP database.

Analytical Techniques for Tributyltin (TBT)

Tributyltin was extracted from tissues by centrifugation 10 g of tissue, 10 ml of 50% HCL, and 25 ml of methylene chloride for 15 hours. The methylene chloride was removed and evaporated under a stream of air and the residue is dissolved in hexane. The hexane was washed in a 3% NaOH solution to remove all monobutyl- and dibutyl-tins and re-evaporated to dryness. The residue was digested with 1 ml of concentrated nitric acid and diluted to 5 ml with deionized water. The solution was analyzed on a Perkin Elmer Model 3030 Zeeman Atomic Absorption Spectrophotometer equipped with a Model 500 Graphite Furnace and an AS60 Autosampler. Ten µl sample was co-injected with 10 µl of matrix modifier consisting of 100 µg phosphate and 10 µg magnesium nitrate per injection. Tributyltin detection limits are provided in Table AA-3. Results of duplicate sample and reference material analysis for tributyltin are provided in Table AA-9.

Procedure for Lipid Determination

FY 1987-88 through FY 1990-91

A thoroughly homogenized sample weighing approximately 5 g (wet weight) was dried and macerated with anhydrous granular Na_2SO_4. The dried sample was transferred to a blender with 150 ml of petroleum ether and blended for two minutes at high speed. The liquid was suction-filtered into a 500 ml filter flask through a 10 cm Buchner funnel containing Whatman #42 filter paper. The sample was blended once more with an additional 100 ml of petroleum ether and filtered. The filtrate was concentrated to approximately 25 ml with heat (steam bath) and air. The remaining filtrate was then quantitatively transferred into a 50 ml preweighed planchet. The petroleum ether was evaporated off, the planchet containing the residue is reweighed and the percent lipid is calculated.

FY 1991-92

In FY 1991-92, the following changes were made in the lipid determination method: a 25 ml portion from the 100 ml extraction was used, methylene chloride replaced petroleum ether as the solvent, and the sample was air dried only, steam baths were not used.

FY 1992-93

In FY 1992-93, the 25 ml sample was transferred to a preweighed 50 ml pear shaped flask. The methylene chloride solvent was removed using a Bucchi Roto-vap. The sample was then dried to 110°C for two hours. The residue was reweighed and the percent lipid was calculated.

1992-93 TBT ANALYSIS OF REFERENCE MATERIAL*

Sample	Concent-tration	Certified Value	Upper Warning Limit	Lower Warning Limit	Upper Control Limit	Lower Control Limit
PACS-1 Replicate 1	1,047	1,270	1,710	893	1,790	840
PACS-1 Replicate 2	1,020					

* Standard reference material (SRM) for TBT was not available for use until 1992-93.
PACS-1 refers to marine sediment reference material from the National Research Council of Canada.
Warning and control limits were calculated according to U.S.EPA/EMAP guidelines.
Warning limits are within 15% of the certified SRM 95% confidence limits, control limits are within 20%.

APPENDIX BB

Median International Standards

Median International Standards

In 1982, the Food and Agricultural Organization (FAO) of the United Nations conducted a survey of standards and legal limits for metals including mercury, pesticides, and other contaminants in fishery products. This was in response to frequent inquiries from institutions and companies active in international commerce that found it difficult finding such information.

The FAO surveyed nations that were members of the FAO as well as those who were not. Most nations cooperated with the survey and, in certain other cases, the standards were drawn from other sources. The FAO took all of the responses and presented them in a report entitled "Compilation of Legal Limits for Hazardous Substances in Fish and Fishery Products" (Nauen 1983). Most of the limits were presented in a standard format and in standard units of fresh or live weight. Exceptions are clearly noted.

Nearly all of the standards for pesticides were from the United States (FDA standards). However, with the exception of mercury, the United States has no standards for trace metals in fishery products. It is this very lack of standards that makes interpretation of some of the SMWP findings difficult.

Table BB-1 summarizes the standards and guidelines for metals from the FAO report. The table notes whether the standards are for freshwater fish, marine fish, shellfish, or a combination of these. When more than one standard was listed by the FAO report, those values closest to a standard for fresh weight, edible portion were chosen. Exceptions are clearly noted in the table. Standards for each element are arranged in ascending order. The country of origin and the approximate date of adoption are also noted.

As can be seen in Table BB-1, some of the standards are not truly for edible portion, fresh weight. For example, some standards refer to canned products or protein. In the case of India, the standards are on a dry weight basis. If the Indian standards were stated in fresh weight terms, they would be approximately one fifth or one sixth of the stated standard.

Table BB-1 has many striking features. One feature is that most of the standards are surprisingly similar. Another feature is the large number of countries that have standards for metals. Also, although many of these countries are less developed nations, the standards adopted by these nations do not differ from those of the more developed nations.

The standards were not summarized for mercury because there is a USFDA standard of 1.0 ppm for methyl mercury in the edible portions of fish and shellfish. This was, incidentally, the highest limit set by any nation in the FAO study. The great majority of nations have set a mercury standard of 0.5 ppm.

Median International Standards presented in Table 5 were calculated from the standards listed in Table BB-1. The median standard was chosen for use for several reasons. The median is less influenced than the mean by outliers in the data. Also, direct comparisons of standards for fresh versus canned versus dry can be misleading. By using median standards, these misleading comparisons can be more easily avoided. In most cases, the Median International Standard is actually a standard set by one or more nations rather than an average value not actually set by any country. The median was calculated as follows. All standards or guidelines (with the exception of the Indian standards which are based on dry weight) were considered to be more-or-less equivalent. For the purposes of calculating the median, the Indian standards were divided by

five. The median was calculated as the middle value of all of the standards (e.g., the fourth of seven values arranged in ascending order). In a few cases, the number of standards was even. In this event, the two mid-values were averaged (most were not different). None of the adjusted dry-weight standards from India ended up as a median or as part of a mid-value pair.

For obvious reasons, the Median International Standards can only be used to provide a general idea of what other nations have chosen to use as a standard. The range of all values is listed in Table 5 as a reminder of this. However, with the lack of American standards, Median International Standards can provide a guidepost for those responsible for interpreting trace metal findings in fish and shellfish tissue.

APPENDIX CC

Elevated Data Levels

Elevated Data Levels (EDL)

An EDL is defined for the purposes of the SMWP as that concentration of a toxic substance in mussels or clams that equals or exceeds a specified percentile (such as 85 percent) of all SMWP measurements of the toxic substance in the same species and exposure condition (resident or transplant) between 1977 and 1993. EDLs were determined as follows:

(1) All SMWP data from 1977 through 1993 were pooled by species and exposure, (2) The concentrations of each toxicant were ranked from highest to lowest concentration down to, and including, instances when a chemical was not detected, (3) The cumulative frequency of occurrence and percentile ranking for all concentrations were calculated, (4) The concentration of the toxic substance representing the 85^{th} percentile was identified and designated the 85 percent EDL or EDL 85, and (5) The concentration of the toxic substance representing the 95^{th} percentile was identified and designated the 95 percent EDL or EDL 95. The EDL 85 is that concentration of a toxic substance that equals or exceeds 85 percent of all SMWP measurements of the toxic substance in the same species and exposure between 1977 and 1993. The EDL 95 is that concentration of a toxic substance that equals or exceeds 95 percent of all SMWP measurements of the toxic substance in the same species and exposure between 1977 and 1993. EDLs for trace elements are summarized in Tables 6, 7, and 8. EDLs for synthetic organic substances are summarized in Tables 9 through 13.

Because EDLs are based on the relative ranking of each measurement, rather than a percentage of the highest concentration obtained, they are not influenced by unusually high (anomalous) toxicant values. This characteristic of EDLs is especially desirable in the evaluation of synthetic organic toxicants where the highest concentration may be as much as ten times the next highest concentration. EDLs do, however, reflect the biases of the data upon which they have been based.

Because they are based on SMWP data rather than an absolute number external to the SMWP, EDLs, when exceeded, can provide a sensitive first indication of elevated toxicant levels in California waters. As such, EDLs fulfill the monitoring function of the SMWP effectively. In addition, EDLs may be expressed in dry weight to eliminate data variability due to moisture content and to conform to scientific literature relevant to mussel or clam monitoring programs worldwide. However, EDLs do not assess adverse impacts, nor do they necessarily represent concentrations that may be damaging to the mussels, clams, or to a human consuming these species. They do not directly relate to Maximum Tissue Residue levels (MTRLs), FDA action levels, NAS guidelines, or Median International Standards (MIS).
