

## **APPENDIX A – LMP Feedback**

The following comments were developed throughout the process for the Beaver Creek Ecosystem Analysis:

It is recommended that the sub-watersheds identified as areas with watershed concerns in this analysis (Hungry Creek, Grouse Creek, and Long John Creek) be given that designation in the Forest Plan and the areas with watershed concerns identified in the Forest Plan that fall outside of these new areas be removed from the areas with watershed concerns designation.

This analysis updated the Geologic layer and the Streams layer, by using these updates a more accurate mapping of Riparian Reserves is possible. It is recommended that this updated riparian reserve mapping be used.

Using the updated riparian reserve mapping, updated Areas with watershed Concerns, and refined vegetation mapping; an identification of areas capable of supporting timber harvest has been developed in this analysis. It is recommended that this refinement of capable acres in the General Forest and Partial Retention land allocations be used in developing expected timber yields from the Beaver Creek watershed.
