**Subject:** new Locations file

Joe,

Enclosed is a new locations file that has the following information for each location in the DPR Surface Water database:

Year  
number of samples  
number of positive samples (i.e. conc>0)  
number of samples that exceeded at least one exceedence value  
percent of samples that were positive  
percent of samples that were exceedences

I'd like to repeat my earlier critique of these statistics in that they are not representative nor can they be compared from year to year (or across locations) reliably. The data set is just not comprehensive enough to support that kind of general analysis. It is simple to skew these numbers by sampling when pollution is not common or the reverse.

This particular dataset is also skewed because it includes a disproportionate number of studies for DPR's Dormant Spray program. These tests are done during the winter and early spring when there is sufficient water to dilute many of the pesticides that flow off farmlands. A simple analysis of DPR's data shows that Summer samples are more likely to show high levels of pollution. However, there are relatively few samples in the summer months in this dataset.

These statistical problems aside, one thing I think would be reasonable to draw from these numbers is the simple demonstration of the existence of a problem. If direct testing shows that a chemical is present in concentrations high enough to harm aquatic life, that should be sufficient evidence to demonstrate impairment at least at that time and place. I am unsure what evidence the water board is looking for to make a judgement of impairment though our conversation indicated that you were looking for at least several incidents at each location. Most of the locations on this list have several exceedences.

Best,

-Stephan Orme  
Pesticide Action Network
