**Newport Bay and San Diego Creek—Chemistry Results**  
**for Water, Sediment, Suspended sediment**

Performed by SCCWRP  
(Steve Bay and Darrin Greenstein)

for  
Santa Ana RWQCB and EPA

(original study for RB8 per American Trader settlement, this report includes extra monitoring data—per extended RB8 contract and separate EPA contract with SCCWRP **in 2001 and 2002** to get more water samples, suspended sediment samples, and results for more contaminants)

### Newport Bay Sample Collection and Handling

Water column samples for toxicity testing, metals and organics analyses were collected using an ISCO pump from a depth of 2 to 3 meters, using EPA suggested clean techniques. Organics analysis samples were collected unfiltered and were stored in 1 gallon amber bottles at 5 °C until tested. Samples for dissolved metals were passed through a 0.45 µm filter attached to the pump. Samples for total metals and methyl mercury were collected unfiltered. All water column samples were stored at 5 °C and transported to the chemistry laboratory for analysis within 24 hrs of collection.

Sediment samples were collected using a Van Veen grab. The top 2 cm from multiple grabs were homogenized together. Subsamples for sediment chemistry and whole sediment toxicity were taken from the homogenized composite sample. The samples for chemistry were frozen at -20 °C until analyzed. Samples for sediment toxicity and grain size were stored at 5 °C until analyzed. For the November 2001 sediment-water interface sample collection, core samples were taken from a grab by manually pressing a plastic core tube into the sediment so that an undisturbed sample was obtained. The depth of sediment in the core tubes was at least 5 cm. Ten cores were collected from each station. The cores were stored at 15 °C with overlying water. In the laboratory, during the course of toxicity testing, overlying water (representing the sediment-water interface) was removed from sediment cores and transferred to clean plastic containers. The overlying water samples were transported to the chemistry laboratory with 24 hrs for analysis of dissolved metals.

### San Diego Creek Sampling

For wet weather, samples were collected from the Campus Drive bridge. To take the samples, a metal davit was attached to the bridge. From the davit a torpedo sampler was lowered to the creek. Inside the sampler was a 1 gallon glass bottle. At each sampling period, multiple drops were made and the water was transferred to a 5 gallon polycarbonate bottle until it was full. Samples for all analyses were then aliquoted from this composite. Samples for dissolved metals were taken from the composite by an ISCO sampler with a 0.45 micron filter attached using EPA suggested clean sampling techniques. Samples for total and dissolved metals analysis were transferred to cleaned plastic 500 ml or 1 liter bottles. Total suspended solids aliquots were put into 1 liter plastic bottles.

For dry weather, samples were collected directly from the creek bed at the base of the bridge using an ISCO sampler. For each collection event, a sample was taken in the morning and then another was taken 4 to 5 hours later. The samples for metals analysis went straight from the creek into their respective containers (either through the filter or not). The remaining samples were taken from a composite made in a 5 gallon polycarbonate bottle. All sample containers were the same as described above.

All samples were stored on ice until transported back to SCCWRP where they were stored at 5 °C. Samples for chemical analysis were delivered to the chemistry lab within 24 hrs of collection.
