Pacific Coast Federation of Fisherman's Associations, San Francisco Crab Boat Owner's Association, Institute for Fisheries Resources, North Coast Rivers Alliance Representative: Stephen Volker	1.01	Pursuant to this statutory and regulatory regime, the State Water Resources Control Board ("State Water Board") is belatedly preparing the California Integrated Reports that were due in 2014 and 2016 for submission as a single document to EPA in late 2017. The State Water Board staff has made recommendations in its proposed combined 2014 and 2016 California Integrated Report for the State Water Board to use the 2012 California Integrated Report with certain changes.	The combination of multiple Integrated Reports is not ideal but is a common practice across the nation when States have difficulty meeting the biennial submittal requirement.	0

	1.02	Of particular concern to the four Conservation Groups we represent, the section 303(d) lists proposed for Region 2 (San Francisco Bay) and Region 5 (Central Valley) are flawed in a number of significant respects, resulting in less protection for California waterways than is required under the CWA. Coupled with the ongoing ecological collapse of the Bay-Delta and its tributary rivers, these deficiencies threaten to drive another nail in the coffin of California's sport and commercial fisheries, and the ecosystems that support them.	The Bay-Delta is a complex network of waterbodies expanding multiple Regional Water Boards. For this reason, multiple State Agency's (Bay-Delta Plan and Irrigated Lands Program) are working together to help protect the Bay-Delta region.	No

	1.03	First, the Central Valley Project (“CVP”) and the State Water Project (“SWP”) have diverted too much of the Delta’s fresh water flows.	Comments regarding diversion associated with the Central Valley Water Project and the State Water Project should be made to the United Bureau of Reclamation and the Department of Water Resources as the supervising agencies for these projects. This comment is beyond the scope of the 2014 and 2016 California Irrigated Report process.	No

Commenter	No.	Comment	Response	Revision
	1.06	<p>These two threats to the Delta’s health have grown steadily over the past five decades, and the resulting environmental devastation has pushed the Delta’s imperiled fisheries to the brink of extinction. Several species of fish endemic to the Delta have already gone extinct; just twelve indigenous species remain. Critical habitat for the endangered Sacramento River winter run chinook salmon, Central Valley steelhead and spring run chinook, the Delta smelt, and the Southern Distinct Population Segment (“DPS”) of the Northern American green sturgeon suffers progressively accelerating degradation.</p>	See response to comment 1.02.	No
	1.07	<p>The State Water Board’s proposed 2014-2016 Integrated Report ignores or understates many of the causes of the habitat degradation that was caused these precipitous declines in the Delta’s fisheries. Consequently, as discussed below it will worsen rather than improve the Delta ecosystem, and further imperil these fish species.</p>	See response to comment 1.02.	No

	1.08	<p>The Staff Report proposes 269 listings of water bodies within Region 5. Of these, the Regional Board Staff Report dated September 2016 identified 189 new water body evaluations for temperature, and confirmed that excessive temperatures were found in 39 of these water bodies. Yet only one of these 39 impaired water segments was recommended for listing. The Draft California Integrated Report fails to correct this oversight.</p>	<p>During the December 2016 Regional Water Board meeting, the Regional Water Board responded orally to EPA's comment letter with the following response:"In all cases where elevated temperatures were reported (37 of the 186 previously unassessed water body segments), further review indicated that the monitoring programs that generated the temperature data were not designed to evaluate attainment of temperature standards to support aquatic life. The surface water grab samples collected did not provide sufficient temporal and spatial representation of temperature conditions throughout the water body segment to determine whether growth and all life stages of rainbow trout were being supported.... Staff noted in the fact sheets for these water bodies that available information is not sufficient to assess whether the aquatic beneficial use is supported" (Regional Water Quality Control Board Central Valley Region, December 2016 Final Staff Report, Page 25).The commenter has not provided how the Central Valley Water Board response was inadequate. Furthermore, U.S. EPA did not submit comments to the State Water Board on the proposes 2014 and 2016 California Integrated Report, indicating that U.S. EPA found the response adequate and deemed it unnecessary to elevate the issue further.</p>	No

	1.10	<p>However, when EPA reviewed the underlying lines of evidence, it concluded to the contrary that “there are many water bodies that are well mixed lotic systems where a surface grab sample showing exceedances of temperature thresholds would still be representative of most of the water column and suggest a temperature impairment for the water body as a whole.” EPA letter dated November 3, 2016 to Central Valley Regional Water Board, copy attached as Exhibit 1 hereto (emphasis added), at p. 1. EPA pointed out that its criticism was supported by overwhelming documentary evidence. For example, “[t]here are several water bodies, such as segments of the Sacramento River that have substantial data collected under the Irrigated Lands Regulatory Program indicating impairment,” and that “[a]dditionally, for many of these water bodies continuous monitoring stations with existing data published by [the California] Department of Water Resources in publicly available databases (e.g., California Data Exchange Center (“CDEC”) . . . and the California Water Data Library . . . are available to confirm impairments initially identified by the already analyzed grab sample data.” Id. at p. 1 (emphasis added).</p>	<p>During the December 2016 Regional Board meeting, the Central Valley Water Board responded orally to EPA’s comment letter with the following response: “In response, staff recognizes the value of the continuous data, and we assessed the continuous monitoring data submitted by other agencies during the 2010 data solicitation period. However, we currently do not have the tools needed to transfer and transform the immense data sets archived in databases managed by other state and federal agencies. We would welcome partnering with the U.S. EPA and others to develop the necessary cross-walks to be able to use this information in future assessments.” Furthermore, U.S. EPA did not submit comments to the State Water Board on the proposed 2014 and 2016 California Integrated Report, indicating that U.S. EPA found the response adequate and deemed it unnecessary to elevate the issue further.</p>	No

	1.11	<p>EPA also pointed out, correctly, that “the thresholds selected in the [Regional Board’s] Staff Report for this [section 303(d)] listing cycle, 21°C and 24°C for rainbow trout and steelhead respectively, are much warmer than the temperatures recommended in EPA’s 2003 Region 10 Guidance for Pacific Northwest State and Tribal Temperature Water Quality Standards.” Id. (emphasis added). This means that river segments with temperatures too high to support salmonid survival were omitted from the list of impaired waterways.</p>	<p>During the December 2016 Regional Board meeting, the Regional Water Board responded orally to EPA’s comment letter with the following response: "In response, different criteria were applied depending on the type of data and species present. The USEPA’s 2003 criteria were applied when continuous data and salmonids were present. When only grab samples were available, peer-reviewed and geographically relevant criteria were applied. These peer reviewed documents included USEPA issue papers published in 1999 and 2001 that documented upper threshold temperatures for most salmon and steelhead species during spawning, migration and juvenile rearing. Where presence of salmon could not be confirmed, temperature data were assessed using the upper threshold for rainbow trout growth and completion of most life stages identified by Peter Moyle in his 1976 book, Inland Fishes of California." Furthermore, U.S. EPA did not submit comments to the State Water Board on the proposes 2014 and 2016 California Integrated Report, indicating that U.S. EPA found the response adequate and deemed it unnecessary to elevate the issue further.</p>	No

Portion of the 2014 and 2016 California Integrated Report
Comment Deadline: 12:00 noon on July 10, 2017

Commenter	No.	Comment	Response	Revision
	1.12	As EPA explained, the Regional Board failed to identify numerous river segments as temperature impaired even though existing numeric temperature criteria are clearly exceeded for these river segments, many of which are salmon spawning and rearing waterways. Tables III-IV and III-IVA in the Sacramento and San Joaquin River Basin Plan for example, identify specific objectives for Deer Creek and the Sacramento River – major salmon spawning waterways – that were ignored by the Regional Board in its section 303(d) list. Id. at p. 2.	During the December 2016 Regional Board meeting, the Regional Water Board responded orally to EPA’s comment letter with the following response:“USEPA staff noted that the temperature thresholds selected for this listing cycle, for rainbow trout and steelhead, are warmer than the temperatures recommended in EPA’s 2003 Region 10 Guidance for Pacific Northwest State and Tribal Temperature Water Quality Standards.In response, different criteria were applied depending on the type of data and species present. The USEPA’s 2003 criteria were applied when continuous data and salmonids were present. When only grab samples were available, peer-reviewed and geographically relevant criteria were applied. These peer reviewed documents included USEPA issue papers published in 1999 and 2001 that documented upper threshold temperatures for most salmon and steelhead species during spawning, migration and juvenile rearing. Where presence of salmon could not be confirmed, temperature data were assessed using the upper threshold for rainbow trout growth and completion of most life stages identified by Peter Moyle in his 1976 book, Inland Fishes of California.”This response adequately addressed EPAs concerns. Commenter	No.	Comment	Response	Revision
	1.13	<p>According to the Central Valley Basin Plan, 56°F (13.3°C) is the numeric objective for the Sacramento River between Keswick Dam and Hamilton City. But in direct defiance of this clear water quality standard, the Regional Board's section 303(d) list is based on a line of evidence for this segment that erroneously utilizes a 21°C threshold for salmonid protection – nearly 8°C (14°F) too high. As a consequence, significant segments of the Sacramento River and its tributaries that are essential for spawning and rearing of chinook salmon are excluded from the Regional Board's section 303(d) list – and from the State Water Board's proposed California Integrated Report – even though these river segments currently have excessive temperatures for salmon spawning and rearing, rendering them “impaired” as a matter of law under the CWA.</p>	<p>During the December 2016 Regional Board meeting, the Regional Water Board responded orally to EPA's comment letter with the following response: "In response, different criteria were applied depending on the type of data and species present. The USEPA's 2003 criteria were applied when continuous data and salmonids were present. When only grab samples were available, peer-reviewed and geographically relevant criteria were applied. These peer reviewed documents included USEPA issue papers published in 1999 and 2001 that documented upper threshold temperatures for most salmon and steelhead species during spawning, migration and juvenile rearing. Commenter	No.	Comment	Response	Revision
	1.14	The Integrated Report fails to remedy the Region 5 Board's omission of reliable and available data that reveal impairment due to excessive temperature, salinity and other pollutants.	EPA's regulations require that "each State shall assemble and evaluate all existing and readily available water quality-related data and information to develop the [Section 303(d)] list." 40 C.F.R. §130.7(b)(5). If a state decides not to rely on certain existing and readily available data or information, the state must provide EPA with documentation explaining the rationale for that decision. 40 C.F.R. §130.7(b)(6). To meet EPA's requirement to provide EPA with documentation explaining the rationale for the decision to not include all readily available data, State Water Board provided the following direction to regional boards for the data solicitation period: "Due to the volume of data received during the 2010 data solicitation period, the State Water Board will not solicit additional data until all of the current data is assessed and migrated to the California Water Quality Assessment Database (CalWQA) for Regional Water Board listing and delisting recommendations." (Letter from Nick Martorano, Chief, Surface Water Quality Assessment Unit, Division of Water Quality, State Water Resources Control Board, to Interested Parties, California Integrated Report [Clean Water Act Sections 303(d) and 305(b)] Update (November 12, 2013)). On February 3, 2015, in its adoption of Resolution No. 2015-0005 to amend the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (Listing Policy), the State Water Board reaffirmed that "[f]or the upcoming 2012, 2014 and 2016 Integrated Reports, the data and information submitted in response to the 2010 notice of solicitation shall be assessed and considered." The data collected by the 27 monitoring stations as part of the Bay Delta Plan were not submitted as part of the 2010 solicitation period. The Central Valley Regional Water Board has committed to working with the U.S. EPA and sister agencies to ensure that past and future data not included in the 2014 and 2016	No

Commenter	No.	Comment	Response	Revision
	1.17	<p>Table 3 of the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (“2006 Bay-Delta Plan”) reiterates the salmon-doubling water quality objective set forth in the 1995 Bay-Delta Plan, as follows:Water quality conditions shall be maintained, together with other measures in the watershed, sufficient to achieve a doubling of natural production of chinook salmon from the average production of 1967-1991, consistent with the provisions of State and federal law.The salmon-doubling standard of the 2006 Bay-Delta Plan constitutes a water quality standard under the CWA with which the State Water Board section 303(d) list must be consistent. Yet both the Regional Board’s list of impaired waterways and the State Water Board’s proposed Integrated Report make no effort to implement this water quality objective. As a consequence, the Integrated Report conflicts with the 2006 Bay-Delta Plan, and the beleaguered populations of chinook salmon will continue their rapid decline, leading potentially to their extinction.</p>	<p>According to the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (page 34), D-1641 (Water Right Decision 1641, December 29, 1999) assigned responsibility to the USBR and DWR to comply with the river flow and operational objectives for fish and wildlife. These objectives help protect salmon migration through the Bay-Delta Estuary. D-1641 did not require separate actions to implement the narrative objective for salmon because the State Water Board expects that implementation of the numeric flow-dependent objectives and other non-flow measures will implement this objective. These objectives can be found in section 4.1.2.4 titled Riverine Flows, System Flushing, and Pollutant Loading.</p>	No

Commenter	No.	Comment	Response	Revision
	1.22	<p>Of particular relevance here, CDFW has pointed out that the Regional Board’s use of bioavailability calculations for predicting toxicity ignores many pathways by which pyrethroids and other pesticides harm fishes and their prey, particularly zooplankton. Id. at 5-7. For example, CDFW has stressed that the Regional Board’s “regulation of pyrethroids using [only] the dissolved fraction does not account for the fate and transport of sediment-bound pyrethroids.” Id. at p. 5. Accordingly, CDFW recommends that the Regional Board consider sediment-bound pyrethroids in calculating impairment of waterways, noting that “[r]egulating sediment-bound pyrethroids at the source would be feasible.” Id. at p. 5. CDFW “has invested great efforts to restore Delta habitats for the benefit of imperiled native species, which may be jeopardized by continued inputs of pyrethroid-contaminated sediments.” Id.</p>	<p>The analysis in the Central Valley Water Board Staff Report regarding the estimated maximum pyrethroids concentrations in sediment if the 5th percentile concentration goals are being attained was recognized as very conservative because it is based on the assumption that all of the bed sediment would contain pyrethroids at the estimated levels, but it is likely that it is mixed with sediments that do not contain pyrethroids (section 5.6.1.1, The Control of Pyrethroid Pesticides Discharges, Staff Report, May 2017). This conservative analysis was not provided as a predictive estimate of expected concentrations, which would likely be significantly lower. It is not expected that sediment bound pyrethroid concentrations will equal or exceed the LC50 values for pyrethroids when the proposed concentration goals are attained, because even the conservatively calculated estimated maximum sediment concentrations did not exceed the LC50 for 3 of the six pyrethroids and did not exceed the LC50 by more than a factor of 3 for any pyrethroid. This analysis indicates that attainment of the proposed concentration goals would likely resolve most of the toxicity to <i>Hyalella</i> observed in sediment toxicity testing. Sediment toxicity testing with <i>Hyalella azteca</i> is required in monitoring for municipal storm water and agricultural dischargers to ensure that benthic organisms are protected.</p>	No

	1.26	<p>In summary, the Regional Board’s – and now, the State Water Board’s – refusal to recognize waterway impairment by the 90 percent of pyrethroid contamination that is not dissolved, has no basis in science. Id. at p. 4. To the contrary, as Dr. Weston pointedly observes, this is a “head-in-the-sand” approach: “1) never before used anywhere in the world, 2) that disregards 90% of the pollutant, 3) that incorporates numerical values that have never been shown to be generally applicable or field-verified, and 4) that is not scheduled to be re-assessed by the Board for 15 years”</p>	See response to comment 1.22. 	1.27	<p>Id. Rather than perpetuate this evasion of proper scientific methodology and analysis, this Board should recognize, consistent with these criticisms by CDFW and Professor Weston, that pyrethroid poisoning of our waterways is a significant cause of the ongoing ecological collapse of the Delta and its tributary rivers, and that ignoring the impact of 90 percent of the pyrethroids that are not “dissolved” is an evasion of the letter and spirit of the Clean Water Act.</p>	See response to comment 1.22. 	1.28	<p>The Staff Report contains several passages that are confusing to the lay reader, and may betray logical errors. For example, under “Sediment Matrix Analyses” the Staff Report states that “[i]n the event that the OC [organic carbon]-normalized MDL result was above the evaluation guideline, the sample was not included in the analysis. However, if the OC-normalized MDL was below the guideline the result was counted as a non-exceeding sample.” Id. at p. 4. It is not clear from this passage whether Staff’s analysis of pyrethroids and other toxics excluded samples that exceeded applicable limits, including only those that did not. Although this may not be the intent (or substance) of Staff’s approach, the language used to describe Staff’s analysis is at minimum confusing and should be restated. If, on the other hand, Staff did intend to exclude samples that exceeded applicable standards, this would not be appropriate and should be corrected.</p>	<p>This section has been edited in the revised Staff Report to provide additional clarity. Samples that were detected and exceeded applicable standards were not excluded from assessment. Laboratory results that are reported as “non-detect” (ND) or as not detected do not have a numeric value associated with them. However, the ND samples have an associated Method Detection Limit (MDL) which is the minimum amount of a pollutant that can be detected given a specific laboratory method. If the MDL for a ND sample is below the evaluation guideline the sample can be counted as not exceeding the evaluation guideline because the ND sample is below the MDL and therefore below the evaluation guideline. Conversely, if the MDL for a ND sample is above the evaluation guideline the sample cannot be used for assessment purposes because it cannot be determined if the ND sample is above or below the evaluation guideline.</p>	Yes

	1.29	<p>Second, when discussing Staff's "Indicator Bacteria Assessment Approach," the Staff Report states that Staff would not update an analysis that was outdated because it used EPA's 1986 Ambient Water Quality Criteria for Bacteria, rather than EPA's 2012 criteria that are now available and should be used instead. Staff Report at p. 8. Utilizing 30-year old water quality criteria instead of current criteria does not reflect the best science available, and deviates from EPA's adopted protocol. This should be rectified.</p>	<p>The 1986 guideline was used because at the time the data solicitation period ended on Aug 31, 2010, the U.S. EPA 2012 recommended criteria was not available. To stay consistent with the data solicitation period, the older 1986 guideline was used. The State Water Board is proposing to update the statewide water quality objectives for bacteria as they apply to water contact recreation. Those objectives would supersede the objectives used in basin plans where a conflict exists and will be used for future 303(d) assessments.</p>	Yes

	1.30	<p>Third, in discussing “Toxicity Assessments,” the Staff Report states that it “determined, for 303(d) assessment purposes, only the SL [i.e., “Significantly Lower”] code should be used to determine whether a sample is considered to have a toxic effect and thereby an exceedance.” Staff Report at p. 9. It is not clear why toxicity data associated with the “Significantly Greater” result code was not likewise considered in determining whether there is “an exceedance.” Id. This discussion should be revised and clarified. And, of course, if Staff’s approach ignores toxicity data indicating a “significantly greater” impact on toxicity, improperly excluding such data from the analysis and thereby leading to an inappropriately low recognition of exceedances, then the methodology should be revisited and, where appropriate, corrected.</p>	<p>Page 9 of the Staff Report has been clarified in response to this comment.</p>	<p>Yes</p>

Committer	No.	Comment	Response	Revision
Earth Law Center Representative/Committer: Grant Wilson	2.01	On behalf of Earth Law Center (ELC), which works for waterways' rights to flow, we welcome the opportunity to submit this formal request for the inclusion of hydrologically impaired (i.e., flow impaired) waterways in the 2014 and 2016 California Integrated Report. At minimum, ELC requests the following waterways be listed as hydrologically impaired, whether under Category 4C or Category 5: 2014 Integrated Report Regions • Central Coast Region (Region 3): Salinas River, Carmel River, San Clemente Creek, Big Sur River, and Santa Maria River • Central Valley Region (Region 5): San Joaquin River, inflow to the Delta; and the San Francisco Bay Delta, outflow to Suisun Bay and San Francisco Bay • San Diego Region (Region 9): Those 30 waterways already properly identified as hydrologically impaired in Region 9's approved Integrated Report 2016 Integrated Report Regions • San Francisco Region (Region 2): Napa River (non-tidal) • Los Angeles Region (Region 4): The Ventura River (Reaches 3 and 4) and the Santa Clara River • Santa Ana Region (Region 8): Santa Ana River (Reaches 3 and 4) ELC submitted comment letters to each of the above Regions requesting that these waterways be listed as hydrologically impaired in each	Committer requests specific water bodies, located within the boundaries of the Regional Water Boards for the San Francisco, Central Coast, Central Valley, Santa Ana, San Diego, and Los Angeles regions, be identified as hydrologically impaired. Because Commenter's requests pertain to identifying hydrological impairments, which are "pollution" impairments and not "pollutant" impairments, they are beyond the scope of the State Water Board's June 9, 2017 notice of opportunity to submit written comments, which only pertains to "pollutant" impairments proposed to be included in the combined statewide 2014 and 2016 Clean Water Act Section 303(d) List. The section 303(d) List identifies water body-pollutant listings placed in Integrated Report Category 5 and does not include pollution impairments placed in category 4c. The State Water Board only takes formal action on the 303(d) List. Integrated Report Category 4c is not part of the California or Federal section 303(d) List proposed for adoption by the State Water Board. Even if waters impaired by pollution (category 4c) were within the scope of the notice for public comment, the May 5, 2017 letter requesting review was not timely as to the waterbodies located in the regions of the Regional Water Boards for the Central Coast, Central Valley, and San Diego. (See Listing Policy, Sections 6.2 and 6.3 (requests for review must be made within 30 days of the Regional Water Board's approval and only timely requests for State Water Board review may be commented on).) Although the comments concerning pollution assessments are beyond the scope of the notice, the following responds to each comment and provides the rationale for not including the identified water bodies on the 2014-2016 California Integrated Report as hydrologically impaired under category 5 or 4c.	No

		<p>region’s respective Integrated Report. Additionally, after approval of the regional 2014 or 2016 Integrated Reports (with the exception being the Los Angeles Region, which has not approved its Integrated Report), ELC requested in a May 5, 2017 letter that the State Water Board review the above listings for hydrologically impaired waterways that had not been made. ELC reiterates its request that the State Water Board list hydrologically impaired waterways within the Integrated Report, whether Category 4C or 5 – and in particular those waterways that are impaired due to low flows. As described below, this request is supported by the Clean Water Act and the implementing guidance from the U.S. Environmental Protection Agency (U.S. EPA), and is supported by compelling public policy considerations and precedent in other states as well as the State Board’s own documents as attached hereto (see Attachment C; available online at: http://bit.ly/2u0cQFG). Therefore, we ask that you revise the draft Staff Report to include, at minimum, the above listed waterways as hydrologically impaired under Categories 4C or 5.</p>

Proposed Clean Water Act Section 303(d) List of Water Quality Limited Segments (303(d) List)
Portion of the 2014 and 2016 California Integrated Report
Comment Deadline: 12:00 noon on July 10, 2017

Commenter	No.	Comment	Response	Revision
	2.02	<p>1. Full Compliance with Clean Water Act Sections 305(b) and 303(d) Requires Identification of Hydrologically Impaired Waterways Clean Water Act (CWA) Section 303(d)(1)(A) requires California to “identify those waters within its boundaries for which the effluent limitations ... are not stringent enough to implement any water quality standard applicable to such waters.” This must be a robust listing, with sufficient details about the waterways (including flow) to allow the state to “establish a priority ranking” for the waterways, also required by Section 303(d)(1)(A). In other words, California’s 303(d) list must provide a comprehensive list of all impairments. The state’s Listing Policy provides some mixed direction, stating on the one hand that the 303(d) list only covers impairments by “pollutants” (rather than also by “pollution,” such as flow), but on the other hand stating that Regional Water Board Fact Sheets supporting Section 303(d) listings “shall contain . . . Pollutant or type of pollution that appears to be responsible for standards exceedance.” The latter path is the appropriate course. No objection, further, can be made to including flow-impaired waterways on the Section 303(d) list on the basis that the state is not required to</p>	<p>The Clean Water Act requires states to identify waters for which effluent limitations for specified point sources are not stringent enough after implementation of technology-based controls to implement water quality standards applicable to those waters. (Clean Water Act § 303(d)(1)(A).) “Water quality standards” are a state’s regulatory provisions that establish beneficial uses for the state’s waters and water quality objectives for such waters based on the beneficial uses. (See generally, 40 C.F.R. § Wat. Code, § 130.2.) In identifying such water quality limited segments, a state is required to “establish a priority ranking for such waters, taking into account the severity of the pollution and the uses to be made of such waters.” (Clean Water Act, 303(d)(1)(A).) The Clean Water Action also requires states to prepare and submit to U.S. EPA reports based on a description of the water quality of all navigable waters and an analysis of the extent to which those waters provide for the protection of fish and wildlife and provide for recreational activities in and on the water. (CWA § 305(b)(1)(A)-(B); 40 C.F.R. § 130.8, subd. (b)(1).) That report is commonly referred to as the 305(b) Report. The State Water Board satisfies its reporting obligations under sections 303(d) and 305(b) by submitting to U.S. EPA a combined “Integrated Report.” Contrary to the comment asserted, and as discussed below, neither Clean Water Act section 303(d) nor section 305(b) requires the State Water Board to place the water bodies identified by Commenter as hydrologically impaired in category 4c or 5. The State Water Board’s Listing Policy is limited to describing the process by which the Regional Water Board and the State Water Board comply with the requirements of section 303(d) of the Clean Water Act. The Listing Policy was not established to aid the reporting obligations under section 305(b). Section 2 of the Listing Policy describes the categories of waters that shall be</p>	No

Commenter	No.	Comment	Response	Revision
		<p>prepare TMDLs to address “pollution.” First, Section 303(d)(1)(A) makes no mention of limiting the 303(d) list to those waterways requiring Total Maximum Daily Loads (TMDLs). In fact, no mention of TMDLs is made until Section 303(d)(1)(C), which sets requirements on how to manage impaired waterways. Moreover, the state itself does not take this position for waterways impaired by pollutants. Instead, the state lists in Category 5 (what it deems its Section 303(d) list) pollutant impaired waterways that do, and do not, require TMDLs by state evaluation. Accordingly, the state must include hydrologically impaired waterways, including those impaired by altered flow, on its 303(d) list.</p>	<p>included in the section 303(d) List. Those include waters that have limited water quality due to non-attainment of water quality standards. The standards non-attainment is due to toxicity, a pollutant, or pollutants; and remediation of the standards attainment problem requires one or more TMDLS. These waters, included in the section 303(d) List, are identified under Integrated Report category 5. The Listing Policy continues by stating that water quality limited segments (pursuant to Section 3 of the Listing Policy) but are being addressed by an approved implementation plan or regulatory program are also considered part of the section 303(d) List until the water quality standard is attained. These include waters with a U.S. EPA approved TMDL in place, identified in Integrated Report category 4a and, waters that are being addressed by an alternative regulatory program expected to result in the attainment of water quality standards within a reasonable amount of time, identified in Integrated Report Category 4b. By its express terms, the Listing Policy does not provide the process or methodology by which waters impaired by “pollution” are placed in Integrated Report category 4c. (See 40 C.F.R. § 130.2 (defining “pollution” as “[t]he man-made or man-induced alteration of the chemical, physical, biological, and radiological integrity of water.”).)The commenter is correct that section 6.1.2.2 of the Listing Policy, which pertains to a Regional Water Board’s preparation of a fact sheet for a water quality standards listing, one of the twenty-six criteria is the “pollutant or type of pollution” that appears to be responsible for the standards exceedances. Commenter suggests that the Listing Policy’s inclusion of the “type of pollution” in the fact sheets used to develop the 303(d) list is “confusing” and should be read to enlarge the scope of the Listing Policy to also contain the list of waters impaired by pollution (hydrologically impaired). Inclusion</p>

			<p>of pollution as a criterion to prepare a fact sheet does not enlarge the express purpose and scope of the Listing Policy. The requirement of providing a comprehensive description of the information in an assessment fact sheet, including the cause of the impairment, is to support each component of the weight of evidence approach for 303(d) listings. (See Clean Water Act, § 303(d)(1) (In identifying such water quality limited segments, a state is required to “establish a priority ranking for such waters, taking into account the severity of the pollution and the uses to be made of such waters.”).) Impairments not caused by a pollutant and rather solely by pollution do not require a TMDL as described in the U.S. EPA Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Section 303(d), 305(b), and 314 of the Clean Water Act (page 56). As previously stated, California considers the 303(d) List to include waters in Integrated Report categories 4a, 4b, and 5. U.S. EPA only considers those waters in Integrated Report category 5 as part of the federal 303(d) List. California does not and should not include waters impaired solely by pollution including those due to flow alterations, on the 303(d) List consistent with the Listing Policy and U.S. EPA guidance.</p>

Commenter	No.	Comment	Response	Revision
	2.03	<p>The state must also include hydrologically impaired waters in its broader, CWA Section 305(b) report. Section 305(b) requires states to submit biennial⁴ reports that “shall” describe the “water quality of all navigable waters,” including an analysis of the extent to which the waters protect fish and wildlife, for compilation and submission to Congress. Federal regulations describe this requirement and its purpose, stating that the Section 305(b) report “serves as the primary assessment of State water quality” and the basis of states’ water quality management plan elements, which “help direct all subsequent control activities.”⁶ States must use the Section 305(b) report to develop their annual work program under Sections 106 and 205(j). And must review the 305(b) report in developing the 303(d) list.⁸ California’s Integrated Report accordingly must include an adequate Section 305(b) report if the state is to develop meaningful 303(d) list and water quality plans that appropriately direct staff and resources to the most important control activities. The Section 305(b) report must particularly include information regarding waterway flows to ensure that the fundamental purpose of Section 305(b) in guiding workplanning is met. The provision</p>	<p>While it may be appropriate to assess flow alteration pursuant to section 305(b) to the extent it could be used to support water quality decision-making, the State Water Board is not required to assess, evaluate, and identify hydrologically-impaired waters to satisfy its 305(b) reporting obligations. Similar to the requirements applicable to a state developing its 303(d) list of impaired waters, waters placed in category 4c should be done in accordance with a description of the method use for category 4c placements, the data and information used and the rationale to support the decision. The State Water Board has not established such a methodology. Without a defined methodology for assessing non-pollutant related pollution, Regional Water Board and State Water Board staff does not have a consistent and transparent approach to analyzing the extent to which flow-related alterations cause or impact water quality standards. The decisions made by the State and Regional Water Boards must be based on a methodology that provides all stakeholders with the opportunity to understand exactly how assessment decisions are made. The State Water Board’s listing determinations must be supported by documentation that explains the analytical approaches used to infer true segment conditions. (See U.S. EPA’s 2006 Guidance for Assessment and Listing, p. 29 (explaining what constitutes an assessment methodology and U.S. EPA’s review of a state’s methodology for consistency with the CWA and a state’s water quality standards).) On April 8, 2015, at the meeting at which the State Water Board approved the 2012 California 303(d) List portion of the Integrated Report, staff reported to the State Water Board on the numerous ways in which water bodies adversely affected by flow issues are being addressed by State Water Board programs, most of which are within the Division of Water Rights. Any perceived benefits from including flow-related</p>	No

		<p>of information regarding waterway flow is also called for by CWA Section 101, which sets the national objective of restoring and maintaining the “chemical, physical, and biological integrity of the Nation’s waters.” (Emphasis added.) The U.S. Supreme Court itself explicitly affirmed the importance of addressing physical elements of waterway health such as flow, stating that the distinction between water quality and quantity under the CWA is “artificial.”</p>	<p>impairments within category 4c of the Integrated Report were not enough to offset staff resources needed to develop a methodology for determining pollution impairments, particularly given the extent State Water Board staff were addressing flow-related issues across the other programs. Please see the Response to Comments from the Clean Water Act Section 303(d) List portion of the 2012 California Integrated Report and the video recording of the April 19, 2015 Board meeting for more detailed information. There are efforts underway to develop flow objectives for several waterbodies and once established staff will be able to use the existing Listing Policy methodology as guidance to support applicable Category 4c placements. Additionally, U.S. EPA’s Integrated Reporting Guidance itself recommends that segments be placed in Category 4c only should occur when the cause is solely due to pollution and not a pollutant: Segments should be placed in Category 4c when the states demonstrates that the failure to meet an applicable water quality standard is not caused by a pollutant, but instead is caused by other types of pollution. Segments placed in Category 4c do not require the development of a TMDL. [...] States should schedule these segments for monitoring to confirm that there continues to be no pollutant associated with the failure to meet the water quality standard and to support water quality management actions necessary to address the cause(s) of the impairment. Examples of circumstances where an impaired segment may be placed in Category 4c include segments impaired solely due to lack of adequate flow or to stream channelization. (U.S. EPA, Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act (July 29, 2005) (p.56).) Given that the identified water bodies are currently identified as impaired by one or more pollutants on the 303(d) list,</p>

			<p>and the uncertainties associated with a lack of methodology to be used as a threshold for determining a hydrological impairment, placing segments in Category 4c of the Integrated Report is not appropriate or warranted. Neither is such a reporting format an appropriate use of its limited resources, particularly considering the State Water Board’s broad authority to address flow issues through its other legal authorities, which unlike information provided in the Integrated Report, have the potential to result in flow improvements through voluntary or regulatory action. The delay in the submittal of the 2014 and 2016 Integrated Report has been unavoidable due to resource constraints across the Water Boards. In 2015 the Listing Policy was amended to include several methods for increasing the efficiency of the creation and submittal of the Integrated Report to U.S. EPA. Those methods will begin being utilized starting with the 2018 Integrated Report as directed by the State Water Board under Resolution 2015-0005. California complies with the federal requirements of the Clean Water Act for development and usage of the Integrated Report. Work planning and programs supported by section 106 and 205(j) funds take into account the information provided within the Integrated Report. Nonpoint sources of pollution and recommendations for control of those sources are encompassed within the California Nonpoint Source Program Implementation Plan which is submitted to U.S. EPA on a six year basis. The Nonpoint source program is also considered during work plan development. See also response to comment 2.10.</p>

Commenter	No.	Comment	Response	Revision
	2.04	<p>By contrast with this direction, the draft Staff Report runs afoul of the CWA by ignoring Category 4C entirely for inclusion in either its 303(d) list or its 305(b) report, incredibly reporting that zero water bodies amongst the 2014 and 2016 regions are impaired due to altered hydrology, with only three water bodies listed under Category 4C at all.10 The State Water Board appears to rely on the Listing Policy for this decision, which states that the 303(d) list only includes those water segments that require the development of a TMDL. Here, again, the draft Staff Report assumes an illegally narrow definition of its requirements under the CWA. The Integrated Report is supposed to include both a robust and legally adequate 303(d) list as well as a robust and legally adequate 305(b) report. These requirements are combined; they are not the same (see also sec. 8). If the State Water Board takes the position that pollution-impaired waterways (including flow-impaired waters) cannot be included in the Section 303(d) list, then the Listing Policy – which by definition applies only to the Section 303(d) list – is irrelevant. It cannot be used as an excuse to ignore flow impairments entirely. In that case, the State Board must then turn to its requirements</p>	<p>See responses to comments 2.02 and 2.03. U.S. EPA describes the section 305(b) reporting goals at:http://water.epa.gov/type/watersheds/monitoring/upload/2003_07_24_monitoring_305bguide_v1ch1.pdf, and provides Integrated Report Guidance here:https://www.epa.gov/tmdl/integrated-reporting-guidance. As provided in the above U.S. EPA reference material, the primary purpose of the 305(b) and 303(d) reporting requirements is to determine the extent waters are attaining standards, identify waters that are impaired and need to be added to the 303(d) list and placed in Category 5 for the development of a total maximum daily load (TMDL), and identify waters that can be removed from the list when standards are attained. The guidance U.S. EPA developed for states to implement the Integrated Report consistently provides that segments should be placed in Category 4c when “the [S]tates demonstrate that the failure to meet an applicable water quality standard is not caused by a pollutant, but instead is caused by other types of pollution” such as lack of adequate flow. (See Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Section 303(d), 305(b) and 314 of the Clean Water Act (July 29, 2005).In making decisions concerning standards assessment, it is imperative that the State Water Board undertakes a structured framework regarding its assessment and listing methodology and also provides information on the content of such methodologies.</p>	No

	2.05	Indeed, the draft Staff Report recognizes that it must consider flow-impaired waterways in its assessment, describing Category 4C as being applicable if “[t]he non-attainment of any applicable water quality standard for the waterbody segment is the result of pollution and is not caused by a pollutant.” No legitimate reason is given for entirely failing to comply with this requirement, however. A legally adequate Section 305(b) report must include waterways impaired by pollution, including hydrologically impaired waterways, whether or not the waterways are also impaired by a pollutant. This information is also critical for the state to set waterway protection priorities properly. Proper identification of hydrologically impaired waterways is also important if the state is to fully comply not only with Section 305(b), but with CWA Section 303(d) as well. This section not only calls for identification of impaired and threatened waterways, but also requires the state to prepare a “priority ranking” of such waters, “taking into account the severity of the pollution” and waterway uses. Flow and other hydrologic alteration data and information, which must be included in the 305(b) report and considered as part of the 303(d) list development, are critical to	See response to comment 2.02, 2.03, and 2.04. 	2.06	Finally, we reiterate that because Section 303(d)(1)(A) broadly requires identification of impairments regardless of whether TMDLs are needed, the state’s Section 303(d) list should include a robust Category 4C set of listings. State law cannot weaken the requirements of the CWA by artificially limiting the scope of this list.	See response to comment 2.02, 2.03, and 2.04.	No

	2.07	<p>2. U.S. EPA Guidance and Reports, and the State Water Board Itself, Have Called for Identification of Hydrologically Impaired Waterways in Category 4C of the Integrated Report U.S. EPA issued formal Integrated Report Guidance (i.e., for the combined Sections 303(d) and 305(b) reports) to states and territories in August 2015; in it, EPA specifically addresses the topic of hydrological impairment.¹⁴ The U.S. EPA Guidance clearly states that If States have data and/or information that a water is impaired due to pollution not caused by a pollutant (e.g., aquatic life¹⁵ use is not supported due to hydrologic alteration or habitat alteration), those causes should be identified and that water should be assigned to Category 4C. The Guidance specifically references hydrologic alteration as an example of a Category 4C listing. It further references EPA Guidance going back at least to 2006, which similarly said that flow-impaired waters should be identified in the Integrated Report under Category 4C (the 2010 CCKA et al. Letter references this 2006 Guidance in support of flow listings; see attachment 4). U.S. EPA and USGS reinforced this mandate in a joint report in February 2016 on flow, stating in part that “EPA recommends reporting impairments</p>	<p>See responses to comments 2.02, 2.03, and 2.04. The email communication between U.S. EPA and State Water Board staff fails to address the lack of a defined methodology to develop the strong lines of evidence that would be necessary for making an Integrated Report category 4c determination. The communication between the State Water Board Executive Director to staff cited by the commenter was initial direction given by the Executive director. Pursuant to and subsequent to that direction, and upon further evaluation, staff concluded that without a defined methodology to assess for flow-related impairments or without a defined numeric flow criteria supported by lines of evidence, an Integrated Report category 4c determination would not appropriate for the water bodies then being evaluated. U.S. EPA’s 2015 guidance is not binding on the State Water Board and the assertion that guidance from EPA constitutes a “mandate” is inaccurate. U.S. EPA’s guidance concerning appropriate placement in the Integrated Report categories are recommendations to the States and not requirements. U.S. EPA’s 2015 guidance for the 2016 Integrated Reporting (Benita Best-Wong, Director, U.S. EPA, Office of Wetlands, Oceans, and Watershed, to Water Division Directors, Regions 1-10 (August 13, 2015) cautions (p.1): This memorandum is not a regulation and does not impose legally binding requirements on EPA or the States. EPA recommends that the States prepare their 2016 IRs consistent with previous IR guidance including EPA’s 2006 IR Guidance, which is supplemented by EPA’s 2008, 2010, 2012 and 2014 memos. The 2006 U.S. EPA Integrated Report guidance states “A segment is considered impaired when WQS are not being supported and/or met, and is considered threatened when WQS are not expected to be fully supported and/or met in the next listing cycle. In classifying the status of water quality in 2006, states have</p>	No

		<p>due to hydrologic alteration in Category 4c, which are those impairments due to pollution not requiring a TMDL." Even more specifically, U.S. EPA Region 9 has directly told the State Water Board that the Board is "well aware of [EPA's] interest toward listing selected streams for 'flow impairments' (at least under 305(b)) where lines of evidence are strong." Further, the State Water Board Executive Director himself decided that the state should identify flow-impaired waters in its Integrated Reports, stating that California "would now list for flow alterations" and that "[l]istings would be made under category 4C for impaired [sic] by pollution not a pollutant, and be based on staff's professional judgment as well as the evidence submitted by the data."20 Again, no reason is given in the Staff Report for ignoring the clear flow impairments throughout the region in light of the CWA, guidance, and state direction. Nor is the State Board's conclusion that Category 4C and Category 5 listings are mutually exclusive legally justified. The Clean Water Act makes clear and the EPA Guidance accordingly instructs that these categories overlap.22 The State Board's interpretation is overly narrow and is entirely inconsistent with the EPA Guidance and the Clean Water</p>	<p>the option to report each segment in one or more categories." (U.S. EPA, Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act (July 29, 2005) (p.47, emphasis added.) The State Water Board looks to U.S. EPA's guidance as the board evaluates its assessment decisions. In California, waterbody-pollutant combinations are assessed consistent with the Listing Policy to determine the overall beneficial use support rating. If a beneficial use is impaired by a pollutant, the water body/pollutant combination is placed on the 303(d) list. If data or information indicate that the water body may also be impaired due to pollution (hydrologic or habitat alteration), the waterbody would not be placed in category 4c until after the pollutant impairment is addressed. That overall beneficial use support rating is used by the California Water Quality Assessment Database (CalWQA) to determine the overall Integrated Report Category for the waterbody as a whole. This methodology is described on page 22 and 23 of the Staff Report. It is not clear that the water bodies Commenter identifies as hydrologically impaired because flow is variable in nature. Determining if a water body is impacted due to flow alterations would require a thorough analysis of historical flow and human related impacts to a defined and expected flow. If the flow is impacted it would then need to be determined at what level are the beneficial uses impaired beyond that naturally expected to occur in times of severe drought or storm events. This complex analysis is undertaken during the development of flow criteria and cannot be determined based on visual and qualitative information.</p>

	2.08	<p>3. The San Diego RWQCB Properly Adopted Numerous Listings for Hydrologic Impairment for Its Integrated Report, which the State Water Board Disregarded without Adequate Explanation The San Diego Regional Water Quality Control Board (SD RWQCB) adopted an Integrated Report and Staff Report²³ that identified 30 waterway segments for listing in Category 4C, either with a Category 5 pollutant listing or alone.²⁴ Consistent with U.S. EPA Guidance, the SD RWQCB recognized that identifying all pollutant and pollution impairments provides a far more accurate picture of the challenges before the state than ignoring key impairments. For example, the Staff Report found that “over 96 percent of streams that exhibited biological degradation had both an associated pollutant(s) and supporting information showing pollution from in-stream habitat/hydrologic alteration and/or watershed hydrologic alteration (hydromodification, Table 3).” If the Regional Board had ignored such pollution impairments, then virtually all of the impaired streams in the San Diego Region would have been under-assessed, likely resulting in misallocation of limited resources and attention. ELC commented to</p>	<p>See responses to comments 2.01, 2.02, 2.03 and 2.04. The San Diego Regional Water Board’s recommendation to place 30 waterbodies in category 4c is properly omitted from the State Water Board’s 305(b) Report portion of the 2014 and 2016 California Integrated Report because the 303(d) list and 305(b) report approved and submitted by the San Diego Regional Water Board to the State Water Board did not contain lines of evidence or decision fact sheets for waterway segments to be placed into Integrated Report Category 4c. The CalWQA is the database and system where water quality assessments, lines of evidence, and factsheets are developed by the Regional Water Boards and the State Water Board. The data and information in CalWQA is compared to applicable criteria, objectives or guidelines to support placement into the Integrated Report Categories consistent with the Listing Policy. There can be no placement in any Integrated Report Category for which there is no associated data and information in CalWQA, the database that provides the Integrated Report. Despite the San Diego Regional Board’s identification of 30 waterbodies in Integrated Report Category 4c in Table 3 of their regional Staff Report, CalWQA contains no analysis for such placement. As a result, the placement of those waterbodies in Category 4c never existed within CalWQA. The State Water Board did not “remove” such waterbodies from Category 4c because they never existed within the database that comprises the Integrated Report Categories. Without intending to create confusion, the State Water Board’s draft Staff Report for the 2014-2016 Integrated Report does not explain the rationale for the omission because CalWQA was utilized to determine any changes the State Water Board would make to the reports submitted by the Regional Water Boards. The State Water Board did not make any changes or “remove” any waters from Category 4c from the San</p>	No

		<p>the San Diego Board in support of these listings; these comments are attached. Rather than integrating San Diego’s approved list of impaired water segments into the statewide 2014 and 2016 Integrated Report, the State Water Board failed to list any of the 30 water segments that had been listed under Category 4C. Inexplicably and illegally, State Water Board staff failed to even offer a rationale for this omission.²⁶ While State Water Board staff may have relied upon its belief that water segments can be placed into only “one of five non-overlapping categories based on the overall beneficial use support of the water segment,” this justification is misguided, as described above and further in Section 8. And at minimum, State Water Board staff could have noted the Category 4C listings within the list of Category 5 waterways. This is the very approach that was taken for the Ventura River Reach 4, for which the Category 5 list notes that “pumping” and “water diversion” are in fact Category 4C listings (impairment due to pollution that do not require a TMDL). However, as written, the public is left to guess whether those 30 waterways identified by the SD RWQCB are in fact impaired due to hydromodification according to the draft Staff Report – and if</p>	<p>Diego region because they never existed within CalWQA. Commenter correctly notes that the San Diego Regional Board’s Staff Report (p.16) explains, “In the San Diego Water Board’s evaluation of bioassessment data and stream segment information, over 96 percent of streams that exhibited biological degradation had both an associated pollutant(s) and supporting information showing pollution from in-stream habitat/hydrologic alteration and/or watershed hydrologic alteration (hydromodification, Table 3).” The Regional Board looked to U.S. EPA Guidance which provides that a water body could be placed in more than one category. However, the State Water Board’s approach is to place a water body in one category only; see responses to comments 2.03 and 2.04. Additionally, the Regional Water Board Staff Report (p. 6) states, “Most fact sheets and overall beneficial use support determinations were developed in the California Water Quality Assessment (CalWQA) database” and (p. 5) “in the absence of quality assurance documentation, data is used only as supporting evidence and is not the basis of a listing decision.” The Staff Report (p.14) also explains, “If a stream exhibited degradation at multiple sites or over multiple years but chemistry/toxicity data was not associated or was not collected, the stream was evaluated for inclusion under Category 4c.” However, the Regional Water Board’s Staff Report contains no documented fact sheet or line of evidence supporting the decision and CalWQA contains no analysis to support a decision that the waterbody’s failure to meet an applicable water quality standard is not caused by a pollutant but instead caused by other types of pollution. In the absence of that information, placement in Category 4c is not warranted. Commenter’s assertion that the San Diego Regional Water Board determined the 30 waterbodies were impaired due to “hydrologic alteration” is not accurate. The Staff</p>

		<p>not, for what reason. The State Board’s elimination of SD RQWCB’s Category 4C listings is illegal, and cannot be justified even if the State Board offered an explanation—which it has not.</p>	<p>Report (p. 16) does not appear to render any specific determination on the possible type of pollution (i.e., flow impaired or habitat alteration) instead it generally concludes that in-stream habitat, hydrologic alteration, “and/or” watershed hydrologic alteration was associated with the waterbodies. Commenter cites to an inapplicable regulation (40 C.F.R. § 130.7(a)-(b)) to assert that the the State Water Board removal of the San Diego Regional Water Board’s water body placements in Integrated Report Category 4c is “illegal.” (See Comment Letter, p.6, fn. 26 and accompanying text.) The assertion may be due to Commenter’s mistaken view that the Regional Water Board appropriately documented and justified placement in Category 4c or that identifying water bodies in Table 3 as “4c placement” was sufficient even though no analysis for such a decision is contained in CalWQA. Additionally, the quoted regulation that requires each State to provide documentation and a description of the data and information to list or not to list waters pertains to the 303(d) list of waters impaired by pollutants and requiring a TMDL. (40 C.F.R. § 130.7(a)-(b).) And yet while not strictly applicable, the aforementioned regulation supports the omission of the Regional Water Board’s purported Integrate Report Category 4c placement as lacking sufficient data and information appropriate to justify such recommendation to the State Water Board. With respect to the Category 4c placement of the Ventura River, the Los Angeles Regional Water Board evaluated several pollution related listings from the 1990’s when California lacked an official listing and delisting methodology. Based on the research, the decision fact sheets for this reporting cycle were updated in CalWQA to either delist or moved to Integrated Report category 4c as appropriate.</p>

	2.09	<p>4. California Has Identified Hydrologically Impaired Waterways in the Past In California, “Pumping” and “Water Diversion” have been listed as the sole causes of impairment for Ventura River Reach 4, in the Los Angeles Region. Also in the Los Angeles Region, Ventura River Reach 3 has been listed for “Pumping” and “Water Diversion,” and Ballona Creek Wetlands has been listed as impaired by “Hydromodification,” among other impairments. All three water body segments have been listed for these specific flow-related impairments in Category 5. California’s history of identifying flow-related impairments under Section 303(d) is consistent with the Clean Water Act, and should be considered precedential.</p>	<p>The Water Boards have not considered the direct assessment of flow data since the adoption of the Listing Policy in 2004. However, there are four listings on the 2012 303(d) List related to flow-related alterations in the Ballona Creek and Ventura River watersheds. Those decisions were made prior to the adoption of the Listing Policy. The Listing Policy provides listing factors based solely on pollutant impairments. As a result, any section 303(d) listings related to flow alterations are contrary to the Listing Policy and U.S. EPA guidance and would be appropriate for reconsideration. Because the four segments were included on the 303(d) list due to pollution-related impairments, and not a pollutant, the four listings are currently proposed for delisting or movement to Integrated Report category 4c as appropriate.</p>	No

	2.10	<p>5. Numerous Other States Have Identified Hydrologically Impaired Waterways in Categories 4C and 5 Many states around the country have followed U.S. EPA Guidance and the CWA by properly identifying flow-impaired waterways in their Integrated Reports. These include, but are not limited to, Western states such as Idaho, Montana, Wyoming, Washington and New Mexico. One listing methodology that may be of particular interest to the San Francisco Bay Region is that used by Ohio, which identifies waters impaired by flow alteration by linking biological community degradation with upstream dams. Notably, a number of these states regularly include flow-impaired waterways on their 303(d) list as well as their 305(b) Report. ELC has collected a significant amount of information on other states' hydrologic impairment listings and processes (and provided this to the State Water Board); this can be made readily available to the San Francisco Bay RWQCB if desired.</p>	<p>Comment noted. See responses to comments 2.01, 2.02, 2.03, and 2.04. While other states may rely on other strategies for placing waterbody-pollutant combinations into Category 4c, the State Water Board prefers utilizing an approach and methodology that is transparent and empirically justified such that it could be uniformly employed by all of the Regional Water Boards requires a more transparent and scientifically defensible process. Furthermore, state law recognizes the connection between flow and water quality. The Legislature specifically identified its intention to “combine the water rights and water pollution and water quality functions of state government to provide for consideration of water pollution and water quality, and availability of unappropriated water whenever applications for appropriation of water are granted or waste discharge requirements or water quality objectives are established” when it created the State Water Resources Control Board. (Wat. Code, § 174.) The State Water Board has broad authority to consider water quality and pollution when it makes water allocation determinations. (Wat. Code, §1258.) The State Water Board has significant experience both setting and implementing flow criteria through water right actions, including its Bay-Delta Program and its Policy for Maintaining Instream Flows in Northern California Coastal Streams. The State Water Board also has experience setting flow requirements as part of its responsibility to certify that the operation of hydropower facilities subject to Federal Power Act licensing meet water quality standards. Those actions are always controversial and frequently involve differences of opinion among scientists, who testify under oath, as to appropriate flow criteria in those proceedings. The State Water Board has previously recognized that its major rivers are over-allocated and adversely impacted by flow alterations (see for instance Strategic Plan Update 2008-2012, State</p>	No

			<p>Water Resources Control Board, September 2, 2008, p.10). However, the extent of the impact on instream beneficial uses of a stream depends on the unique circumstances of each situation and requires knowledge of other factors impacting the physical and biological integrity of the watercourse, including physical impediments to fish passage and sediment recruitment (dams and culverts, in addition to natural impediments such as waterfalls and landslides), the source of the water accreting to the stream (is it cool groundwater or is it warm runoff from open lands), the location and physical effect of diversions relative to habitat, and other factors that affect pollution. Pursuant to the above-cited state law, the State Water Board is expressly required to consider water quality and pollution when making water rights determinations. Unlike state law, federal law does not require the States to consider water flow requirements or impairments when developing the Integrated Report. The federal statutory directives pursuant to CWA 303(d) and 305(b) require states to report on the water quality necessary to provide for fish, wildlife, and recreational opportunities and other beneficial uses. In fulfilling its reporting obligations pursuant to CWA 303(d) and 305(b), the federal statutes do not expressly require the states to consider flow, pollution, or allocation of water rights, when reporting on standards attainment.</p>

	2.11	<p>6. Flow Standards Are Not Required to Identify Hydrologically Impaired Waterways in Category 4C Most, if not all, of the states that identify hydrologic (including flow) impairments make those listing decisions based on best professional judgment and the information before them. Flow standards are not required to be developed first. Even the State Water Board has stated that flow listings could be done “based on staff’s professional judgment as well as the evidence submitted by the data,” and that they “would likely be mostly narrative . . . unless there are specific numeric targets for flow in place.”³¹ In other words, the state itself has recognized that flow criteria are not necessary for flow impairment listings. ELC has compiled significant information collected on various states’ hydrologic impairment listing strategies, which are attached hereto (see Attachment D).</p>	<p>See responses to comments 2.03 and 2.10. The email cited by the commenter was intended to be deliberative in nature and in the context of examining potential methods for assessing for flow with the internal Integrated Report roundtable which consists of Regional and State Water Board staff as well as U.S. EPA. The result of those deliberations was a recommendation that pollution related impairments that lacked specific numeric criteria, objectives, and guideline would require a specific and consistent methodology.</p>	No

	2.12	<p>U.S. EPA addresses the process of identifying hydrologically impaired waters in its 2015 EPA Listing Guidance, stating that: if States have data and/or information that a water is impaired due to pollution not caused by a pollutant (e.g., aquatic life use is not supported due to hydrologic alteration or habitat alteration), those causes should be identified and that water should be assigned to Category 4C. Examples of hydrologic alteration include: a perennial water is dry; no longer has flow; has low flow; has stand-alone pools; has extreme high flows; or has other significant alteration of the frequency, magnitude, duration or rate-of-change of natural flows in a water; or a water is characterized by entrenchment, bank destabilization, or channelization. Where circumstances such as unnatural low flow, no flow or stand-alone pools prevent sampling, it may be appropriate to place that water in Category 4C for impairment due to pollution not caused by a pollutant. In order to simplify and clarify the identification of waters impaired by pollution not caused by a pollutant, States may create further sub-categories to distinguish such waters. Note that this description of the process for identifying flow impairments does not require adoption</p>	<p>Comment noted. See responses to comments 2.03, 2.04, and 2.07.</p>	<p>No</p>

	2.17	<p>8. Water Bodies Can and Should Be Placed in All Relevant Categories of Identification The draft Staff Report states that “[t]o meet CWA section 305(b) requirements of reporting on water quality conditions, the Integrated Report places each assessed waterbody into one of five non-overlapping categories based on the overall beneficial use support of the waterbody.” This statement appears to limit the State Water Board to placing waterbodies in only one category, an interpretation presumably reflected in the recommendation to include zero flow-impairment listings in Category 4C. This approach is simply illegal and incorrect. Consistent with the requirements of sections 303(d) and 305(b) of the Clean Water Act, the U.S. EPA has been quite clear that water bodies can be placed into multiple categories, and in fact should be in order to provide the best available information to U.S. EPA and Congress. As explained by the SD RWQCB in its Staff Report: It is important to note that USEPA recommended in its 2015 guidance that “States assign all of their surface water segments to one or more of five reporting categories” U.S. EPA reiterated this point in its joint report with USGS, stating that “EPA’s guidance has noted that</p>	See response to comment 2.07. 		<p>assessment categories are not mutually exclusive, and waters may be placed in more than one category (for example, categories 4C and 5).”³⁹ Accordingly, flow impairments should be reflected in Category 4C whether or not there is a pollutant present, the approach taken recently by the SD RWQCB. Otherwise, the state is conflating the Section 303(d) and 305(b) reports rather than combining them, ignoring its Section 305(b) responsibilities in the process.⁴⁰ Because the state must comply with both Sections 305(b) and 303(d), it must provide information relevant to all categories applicable to a single water body.⁴¹ The Integrated Report does not meet these mandates.</p>

	2.18	<p>Like the SD RWQCB, other states demonstrate the correct understanding in accordance with U.S. EPA Guidance by placing water bodies (with U.S. EPA approval) in Category 4C for pollution, even when other impairing pollutants are identified for the same segment. For example, Tennessee lists Egypt Hollow Creek as impaired due to flow alterations under Category 4C and impaired due to low dissolved oxygen and manganese under Category 5. Further, Tennessee places both impairments on their 303(d) List. Idaho similarly lists waterway segments as impaired under both Category 4C and Category 5. Appendix I of the latest Idaho Integrated Report contains 36 pages (7,342 river/stream miles) of Category 4C impairments, including numerous waterways listed as impaired for “low flow alterations”; many of these are also dual-listed for pollutant impairments. In another example, Montana classifies waterways under Category 4C when there is only a pollution impairment. If there is a pollution and a pollutant impairment, then Montana lists the waterway under Category 5, and compiles all of the impairment causes in Appendix A (“Impaired Waters”) (see Figure 3). This is consistent with the “single-</p>	See response to comment 2.07, 2.08, and 2.10.	No

	2.19	<p>Even within California, as described above, there is precedent of dual listings under Category 4C and Category 5. First, the SD RWQCB listed waterways as impaired due to hydromodification and habitat alteration in Category 4C, whether with a Category 5 listing or alone. Explaining its decision, the SD RWQCB's Staff Report echoes the EPA's finding, stating that Category 4C listed waters "may be a priority for restoration by a Regional Water Board." Further, the 2014 and 2016 California Integrated Report itself notes the dual Category 5 and Category 4C listing for the Ventura River Reach 4. California's 303(d) list (or, alternatively, the 305(b) Report) in full similarly should accurately reflect all sources of impairment, regardless of dual pollutant/pollution listings.</p>	See response to comment 2.08. 	2.21	<p>Federal regulations state that states must evaluate “all existing and readily available information” in developing their 303(d) lists and prioritizations. Readily available data includes the 305(b) report. The SWRCB’s Executive Director reinforced the breadth of this requirement in a memorandum on the scope of listing regulations at 40 CFR § 130.7(b)(5).⁴⁵ This information must include flow, a position recently reinforced by U.S. EPA, who stated that the integrated reporting format is key to “acknowledge the important role of flow in contributing to water-body impairments.” Attachment A provides summaries of such information, including in regards to the severe dewatering of waterways across California. The State Water Board has more than enough data needed to list waterways, at a minimum those listed above, which it may not ignore in its development of the Integrated Report.⁴⁷ Proper, timely identification under the Clean Water Act of all hydrologically impaired waterways in California Integrated Report is required and critical to setting appropriate plans and priorities that will help reverse significant declines in aquatic species.</p>	See response to comment 2.03. 	3.02	<p>The Clean Water Act Requires Completion of a Biennial Water Quality Report. Section 305(b) of the Clean Water Act (“CWA”) requires that states submit a report every two years on the health of the waterbodies within the state. (See 33 U.S.C. § 313(d), 1315(b); 40 C.F.R. § 130.7(d)(1).) In addition to the text of the CWA, the 8th Circuit has held that since 1992 states have had a biennial requirement to submit the water quality report to the EPA. (Thomas v. Jackson 581 F.3d 658 (8th Cir. 2009.) The purpose of this requirement is to protect public health and welfare as well as “enhance the quality of water” to serve the goals of the CWA. (40 CFR § 130.3.) Since information from the Integrated Report is used to develop the “threatened and impaired waters” list it is vital that the report be accurate.</p>	Comment noted.	No

Commenter	No.	Comment	Response	Revision
	3.03	<p>The Integrated Report contains the 303(d) list for both the 2014 and 2016 calendar years thus the requirements of the CWA, as well as public policy, have not been upheld. Water quality standards are weakened when required reports are not completed. In late 2014, Heal the Bay commented on the State Board's Proposed Amendment to the Water Quality Control Policy for Developing the Clean Water Act Section 303(d) List and inadequate responses were given to those comments. In those comments, the State Board deferred the remedy to a proposed Amendment of the Listing Policy, which has yet to provide a remedy. Since this timeliness issue is still occurring, we continue to have concerns regarding the new amendment and its effect on the Integrated Report.</p>	<p>The combination of multiple Integrated Reports is not ideal but is a common practice across the nation when States have difficulty meeting the biennial submittal requirement. The commenter has not indicated how the response to comments for the amendment to the Listing Policy were inadequate. The amendment was approved by the Office of Administrative Law on May 15, 2015 which supports that the administrative record for the amendment to the Listing Policy was complete and adequate including the response to comments.</p>	No

	3.04	<p>First, Staff limitations do not justify the “Rotating Basin Approach” when coming into compliance with requests for biennial updates for the federal CWA’s Section 303(d), which is a clear mandatory duty. This effectively reduces regional updates on impaired waters from every two to every six years, which is clearly contrary to the CWA’s implementing regulations. The updated staff report, which seems to downplay the importance of the lists, does not include an appropriate justification for reducing the frequency of the updates by a factor of three.</p>	<p>The rotating basin approach” to submitting the Integrated Report is a common practice used by many states. As detailed in a letter from the Deputy Director of the Division Water Quality to the Director of the Water Division at U.S. EPA Region 9, management from the State Water Board discussed the rotating basin approach” and other amendments to the Listing Policy with U.S. EPA representatives on June 14, 2013 and received verbal concurrence on the strategies including the rotating basin approach. The justification for the rotating basin approach was discussed as part of the public process for the amendment to the Listing Policy in 2015 and is not part of the scope of the Staff Report for the 2014 and 2016 California Integrated Report.</p>	No

Commenter	No.	Comment	Response	Revision
	3.07	<p>Considering this discrepancy in timing from data submittal to listing and delisting proposals, waiting to delist until more current data s received will eliminate the possibilityof delisting a water body that is currently impaired, as there is no way to know the condition of the waters in question using data solely from 2010 or before. To err on the side of caution when dealing with our state waters will be in the best interest of our water quality standards and beneficial uses. The severity of these delisting decisions are even further accentuated by the fact that these bodies of water will not be evaluated again until 2020 or 2022.</p>	<p>Recommended delistings were made using Section 4 of the Listing Policy. If data submitted as part of the 2018 solicitation indicates that waters should be re-listed, then the applicable Regional Water Board can make a priority listing or delisting off-cycle consistent with Section 6 of the Listing Policy.</p>	No

Commenter	No.	Comment	Response	Revision
	3.21	<p>Based on continued concerns and numerous questions surrounding the evidence, not delisting bodies of water is a reasonable, precautionary request and is in fact supported by the State Board itself in policy language that has been adopted as well as in discussion during past State Board hearings concerning adoption of delisting policy. From a policy language perspective, this point is represented in the State Board’s Water Quality Control Policy for Developing California’s Clean Water Act Section 303(d) List itself. Adopted on Sept. 30, 2004 and Amended February 3, 2015, Section 4.11 states, “When making a delisting decision based on the situation-specific weight of evidence, the Regional Water Board must justify its recommendation by [Bullet 1] Providing any data or information including current conditions supporting the decision.” We argue that there is no way to demonstrate current conditions with information and data that is aged seven years or more. Because of this it seems in-line with State Listing Policy that no waterbodies be delisted for the current 303(d) List. During the next listing/delisting cycle, which will be depending on region in either 2020 or 2022, staff will be able to make a more accurate judgment on</p>	<p>Simply not delisting any waterbody ignores those areas where water quality may have improved albeit only as demonstrated with pre-2010 data. The Los Angeles Water Board anticipates that there may be waterbodies that are listed one listing cycle and delisted the next, perhaps to be re-listed in a later cycle. The Integrated Report and the 303(d) list should remain the State’s best assessment based on water quality data evaluated, even as we recognize the limitations to the 303(d) list. Delisting a waterbody/pollutant combination from the 303(d) list does not result in any change to existing TMDLs adopted by the Los Angeles Water Board or established by the U.S. EPA. TMDLs developed to address the previously listed impairment remain as regulations in the Region’s Basin Plan. Nor does a delisting negate requirements to implement TMDL wasteload allocations (WLAs) and load allocations in NPDES permits, Waste Discharge Requirements (WDRs), waivers of WDRs, or any other State or Regional Water Board orders (e.g., Time Schedule Orders, Clean-up and Abatement Orders). NPDES permits must include effluent limitations to implement available WLAs from TMDLs, and NPDES permits, WDRs and waivers of WDRs must be consistent with applicable state and regional water quality control plans, including the Region’s basin plan. Section 4.11 of the Listing Policy is utilized when all other Delisting Factors outlined in Section 4 do not result in the delisting of a water segment but information indicates attainment of standards. The current delistings being proposed are based on either Section 4.1 or 4.2 of the Listing Policy and do not require the use of Section 4.11.</p>	No

	3.22	<p>The intent of the policy in regard to maintaining ecological standards of California’s waterbodies is reiterated in language that is taken from a prior State Board Hearing Transcript from Sept. 30, 2004, in which former State Board Member Nancy H. Sutley states, “If it’s on the list . . . then you have to have some information that says that they[fish] are not dying now and the waterbody is not currently impaired . . .” Though Board Member Sutley is referring to listings that were made by mistake, the principle behind her words should still hold true. The intent was to say that information and data on waters should currently show that water quality standards are met and that the body of water is not currently impaired before being removed from the list. Board Member Sutley goes further to suggest that boards should affirm a lack of current impairment before delisting bodies of water by stating she was “Okay with not adding [additional] language [to the Listing Policy] as long as we’re all in agreement and that’s the direction of the regional boards that you have to look at the current conditions as well [before delisting].”</p>	<p>The exact intent of State Board Member Sutley’s words from the September 30, 2004 adoption meeting cannot be inferred outside of the context of the adoption meeting. The commenter suggests that no delistings should occur unless current information indicates standards are attained but does not assert the converse regarding new listings indicating standards are not met. The Regional and State Water Boards strive to make listing and delisting decisions based on the data and information available from the applicable solicitation period which is consistent with Section 6.1 of the Listing Policy. Starting with the 2018 Integrated Report cycle data will be solicited from the California Environmental Data Exchange Network (CEDEN) on a consistent basis to allow for assessment of more current data and information for a given Integrated Report cycle.</p>	No

	3.23	We know that this multi-year process has been demanding for all agencies involved from the regional to the state level. Still we implore the State Board to err on the side of caution in regards to California's water resources. This is especially true when confronted with the fact that the next listing/delisting for some regions will be, at its earliest, five years in the future.	The State Water Board recognizes the currently proposed delistings and listings as consistent with the Listing Policy and that any decision that is later deemed incorrect based on more current data, shall be updated accordingly. Regional Water Boards are encouraged to make high priority listings and delistings while off-cycle consistent with Section 6.1.2 of the Listing Policy.	No

	3.24	<p>It is Misleading to Entitle this Current Edition the “2014 and 2016 California Integrated Report.”It seems off-track and misleading to title this Integrated Report the 2014 and 2016 California Integrated Report Clean Water Act Section 303(d) List of Impaired Waters when it is based on information from 2010. Since the State Board’s original 2010 solicitation for data was intended for the 2012 list we think it would be much more constructive and accurate to have the current list in question labeled exactly as such and be a revised 2012California Integrated Report.Considering compliance with state and federal law, we could find no mention within the Federal Clean Water Act or the State Listing Policy of how the Integrated Report should be named, only how often it should be submitted. Since the EPA is aware of the new “rotating basin approach” following California successfully amending its own State Listing Policy in February 3, 2015, we believe there to be no compliance issues for the more accurate renaming. This renaming is also consistent with the original notice and requestfor data, titled “Notice of Public Solicitation of Water Quality Data and Information for 2012 California Integrated Report—Surface Water Quality Assessment and List of</p>	<p>The title of the 2014 and 2016 California Integrated Report is consistent with the memo circulated to interested parties on November 12, 2013. The State Water Board has been transparent and consistent in stating that data from the 2010 data solicitation would be used for the 2012, 2014 and 2016 California Integrated Reports. While this is not ideal is allowed for staff and stakeholders to implement the new processes adopted as part of the 2015 amendments to the Listing Policy. All updates and historical documents related to this process are posted on the program webpage located at: http://www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/#impaired.Any researcher or stakeholder can contact State or Regional Water Board staff with any questions or clarifications.</p>	No

		<p>Impaired Waters.” Further advantages of this approach to titling are that future inspection researchers who are unfamiliar with past reports would know that the listings would correspond much closer to the data from 2010. Looking towards the future, this more accurate labeling could also help in clarifying reporting methods. It signifies when regional agencies made a clean break from when small windows of data were analyzed in favor of the current California Environmental Data Exchange Network (CEDEN) system. While this system is still not perfect, the new system will use a constant, up-to-date stream of information and allows for a more thorough, accurate, and up to date 303(d) list for the state going forward. This would also make it crystal clear when the State of California “changed over” to the new “Rotating Basin Approach” in regards to fulfilling their obligations to Section 305(b) of the Clean Water Act.</p>

	3.26	<p>Further, as the State Board mentions in its Comment Summary and Responses for the Proposed Amendment to the Water Quality Control Policy for Developing California’s Clean Water Act Section 303(d) List from January 26, 2015, “Requiring the use of CEDEN will ensure the data used for the 303(d) listing process is of a high quality and includes the necessary information for efficient assessments.” It is true that the use of this database is likely to streamline the process for the staff of the Regional Boards, the State Board, the EPA, and any agency that wants to submit pertinent data, assuming the database is properly created, updated, and managed. While the State Board has scheduled CEDEN workshops in 2015 to “facilitate greater understanding of the needs of CEDEN users, develop tools to enhance the utility of CEDEN, and provide training on using the CEDEN system,” we ask that the State Board provide more workshops now and in the coming years in anticipation of the current and future use of CEDEN by all regional stakeholders. The people and water environment of California only stand to gain from thorough instruction given to invested stakeholders and the data they will provide.</p>	<p>Training on the use of CEDEN has occurred continuously since 2015 via the CEDEN user group managed by the Office of Information Management and Analysis. Stakeholders have been continuously encouraged to participate in the workgroup which meets on a monthly basis by submitting and email to ceden@waterboards.ca.gov.</p>	No

Commenter	No.	Comment	Response	Revision
	3.27	<p>Approval of 303(d) Listings Might be a Project Based on the California Environmental Quality Act (CEQA). We are concerned that the State Board's approval of the 303(d) List specific to the waters in the Los Angeles region and the consolidated 303(d) List portion of the Integrated Report is a "project" subject to CEQA because the approval of the 303(d) list is "an activity directly undertaken by any public agency" And that activity may cause either a direct physical change in the environment, or a reasonably foreseeable indirect change in the environment (Pub. Res. Code §21065, subd. (a).) The Supreme Court of California has held that approval of a plan is a project subject to review under CEQA. (Muzzy Ranch Co. v. Solano County Airport and Land Use Com'n 41 Cal.4th 372 (Cal. S.C. 2007.) In rejecting the argument that approval of a plan was not a project the Court held that approval "was an essential step leading to potential environmental impacts." (Ibid. at 383.) The approval of the proposed 303(d) listings and delistings is undoubtedly an essential step in the protection of our waters that can lead to potential environmental impacts if the proper level of protection is not assured.</p>	<p>See response to comment 3.20. CEQA generally applies to "discretionary projects" "approved" by a public agency. The State Water Board's approval of the 303(d) List portion of the Integrated Report and submission of the Integrated Report (sections 303(d) and 305(b)) to U.S. EPA does not constitute an "approval" of a "project" subject to CEQA. The CEQA Guidelines define "approval" as: [T]he decision by a public agency which commits the agency to a definite course of action in regard to a project intended to be carried out by any person. The exact date of approval of any project is a matter determined by each public agency according to its rules, regulations, and ordinances. Legislative action in regard to a project often constitutes approval. (Cal. Code Regs., tit. 14, § 15352, subd. (a).) The State Water Board's approval of a resolution of the 303(d) listing recommendations to the U.S. EPA is not an "approval" because it does not commit the State Water Board to any "definite course of action" "regarding a project" within the meaning of the CEQA Guidelines. The Clean Water Act requires the states to prepare and submit a proposed list of impaired waters to the U.S. EPA every two years. The State Water Board's proposed 303(d) list, while formally "approved" by resolution, constitutes a recommendation to U.S. EPA of the water quality limited segments within its boundaries, and a priority ranking of such waters, taking into account the severity of pollution and the beneficial uses to be made. (Clean Water Act, § 303(d)(1)(A).) U.S. EPA then conducts an independent review of the state's recommendations and either approves, or disapproves, the state's proposed listings. (Id., § 303(d)(2).) When a 303(d) list is approved, it becomes part of the state's water quality management plan. When the EPA disapproves a state's proposed 303(d) list, the EPA must promulgate its own list of impaired water segments, which must be incorporated into the state's water quality management</p>	No

			<p>plan. (Id.) Upon the State Water Board’s approval of the 303(d) list, no rights vest and the State Water Board is not bound to any definite course of action. The State Water Board’s 303(d) listing recommendations to U.S. EPA also does not constitute a “project” under CEQA because such action has no potential to result in a “direct physical change in the environment, or a reasonably foreseeable indirect physical change on the environment.” (Pub. Res. Code § 21065). While upon final action by U.S. EPA, the state must establish a total maximum daily load (TMDL) for pollutants identified by U.S. EPA’s final 303(d) list for California, the proposed action considered by the State Water Board at this time does not make any commitment to any particular TMDL or implementation development, which will be determined at a later date, by the Regional Water Board having water quality control planning jurisdiction over the particular impaired water body. Upon the State Water Board’s 303(d) listing approval, such action is an uncertain future project that may or may not be undertaken by a Regional Water Board. Commenter’s citation to Muzzy Ranch Co. v. Solano County Airport and Land Use Com’n, 41 Cal.4th 372 (Cal. S.C. 2007) does not have any bearing on the State Water Board’s consideration of the 303(d) listing recommendations. In that case, the supreme court held the county airport land use commission's adoption of land use compatibility plan for area surrounding Air Force base was a “project” under CEQA because it guided subsequent land use that have the potential for causing changes to the physical environment but the “common sense” exemption applied because it could be seen with certainty that there was no possibility that the action at issue would have a significant effect on the environment. Unlike the air force base’s land use compatibility plan, the State Water Board’s approval of the 303(d) list does not carry with it binding regulatory</p>

	4.14	<p>The Regional Board Staff, in its 2008 update of the Los Angeles Regional Integrated Report for Clean Water Act Section 305(b) Report and Section 303(d) List of Impaired Waters, verified its determinations in their comment for the Machado Lake TMDL by stating: "The Basin Plan contains a specific nitrogen (nitrate nitrite) water quality objective, which is established at 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen. This objective is specifically set to protect drinking water beneficial uses and is consistent with the California Department Public Health nitrate drinking water standard. This nitrogen water quality objective does not protect waterbodies from impairments related to biostimulatory substances and eutrophication."</p>	Comment noted.	No

	4.21	<p>Oxnard Industrial Drain (OID) Nitrate: VCK’s attached watershed monitoring program data indicates that on 8 out of 8 VCK monitoring events at the OID, the concentration of Nitrate in the OID water column exceeded the numeric targets for Nitrate at 1 mg/l as derived in the Los Angeles Regional Water Quality Control Board’s Machado Lake TMDL10 and the Nutrient TMDL for Malibu Creek, adopted by USEPA in 200311. In addition, it should be noted that the USEPA guidance value for CWA section 304(a) nutrient criteria specific to the Los Angeles Region (Ecoregion III) is 0.38 mg/l total nitrogen and 0.022 mg/l total phosphorus for protection of aquatic life and recreation.12</p>	<p>From the Los Angeles Water Board’s Revised Response to Comments on the Draft 2016 303(d) List (response to comment 1.6): “Nitrate was not assessed because Oxnard Drain does not have an MUN beneficial use and no evaluation guideline is available for nitrate for other beneficial uses.” In addition, the numeric targets for nitrate derived in the Machado Lake TMDL and the Malibu Creek Nutrient TMDL are not applicable to Oxnard Drain. It is stated in the Total Maximum Daily Loads for Nutrients Malibu Creek Watershed: “EPA stresses that these numeric target values are proposed only for waters in the Malibu Creek watershed. The inclusion of these numeric target values for Malibu watershed is not intended to reflect any judgements about the numeric targets needed for other nutrient TMDLs needed in California”. It is noted that the USEPA guidance value for CWA section 304(a) nutrient criteria specific to the Los Angeles Region (Ecoregion III) is 0.38 mg/l total nitrogen and 0.022 mg/l total phosphorus for protection of aquatic life and recreation. The Los Angeles Water Board is aware of the nutrient criteria, however this criteria is applicable to rivers and streams and not to estuarine waters such as Oxnard Drain. Find out from Jun if Oxnard Drain is COLD, WARM, or estuarine. If Oxnard Drain is considered EST then use see response to comment 4.12, but if it is COLD or WARM, include comment that LA Board is aware of the USEPA criteria and that it can be considered as an evaluation guideline next listing cycle.</p>	No

	4.27	<p>Santa Clara River Estuary Low Flows: As discussed in the City of Ventura Estuary Special Studies One Year Assessment (attached) and the July 23, 2008, National Marine Fisheries Service, Southwest Region Final Biological Opinion (BIOP) concerning the operation of the Vern Freeman Diversion and Fish-Passage Facility (attached), due to diversions at the Vern Freeman Diversion Dam by United Water Conservation District, the Santa Clara River Estuary, Santa Clara River Reach 1, and Santa Clara River Reach 2 are deprived of sufficient flows during the wet season for Southern California Steelhead smolt and migrating adults to migrate up and down the Santa Clara River, and the Estuary does not receive sufficient flows during the dry season when the Estuary is closed as a lagoon to sustain aquatic life. Additionally, flow data indicates that reduced flows below the Vern Freeman Diversion Dam alters the natural flow regime needed to sustain aquatic life and vegetation that evolved with the River's natural flows. Attached daily flow data obtained from United Water Conservation District from 1993-2010, and monthly flow dating back to the 1956, above and below the Vern Freeman Diversion Dam, with the quantity</p>	<p>See response to comments 2.02 and 2.03. In making decisions concerning standards assessment, it is imperative that the State Water Board undertakes a structured framework regarding its assessment and listing methodology and also provides information on the content of such methodologies. It may be appropriate to assess flow alteration pursuant to section 305(b) to the extent it could be used to support water quality decision-making. However, without a defined methodology for assessing non-pollutant related pollution, Water Board staff does not have a consistent and transparent approach to analyzing the extent to which flow-related alterations cause or impact water quality standards. The decisions made by the State and Regional Water Boards must be based on a methodology that provides all stakeholders with the opportunity to understand exactly how assessment decisions are made. The State Water Board's listing determinations must be supported by documentation that explains the analytical approaches used to infer true segment conditions. (See U.S. EPA's 2006 Guidance for Assessment and Listing, p. 29 (explaining what constitutes an assessment methodology and U.S. EPA's review of a state's methodology for consistency with the CWA and a state's water quality standards).) In addition to recognizing U.S. EPA's recommendation that segments be placed in Category 4c when the cause is solely due to pollution, and given the uncertainties associated with determining appropriate flow criteria to be used as a threshold for determining impairment, the State Water Board does not believe that placing segments in Category 4c of the Integrated Report is warranted. Neither is such a reporting format an appropriate use of its limited resources, particularly considering the State Water Board's broad authority to address flow issues through its other legal authorities, which unlike information provided in the</p>	No

	4.31	<p>Santa Clara River Reach 2 Fish Passage: As discussed in the July 23, 2008, National Marine Fisheries Service, Southwest Region Final Biological Opinion (BIOP) concerning the operation of the Vern Freeman Diversion and Fish-Passage Facility (attached), the Vern Freeman Diversion Dam with its current fish ladder are a fish barrier to migrating Southern California Steelhead in Santa Clara River Reach 2 and 3.</p>	<p>Dam and fish passage facilities are pollution impairments and not pollutant impairments and therefore may not be placed on the 303(d) list. Impairments not caused by a pollutant and rather solely by pollution do not require a TMDL as described in the U.S. EPA Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Section 303(d), 305(b), and 314 of the Clean Water Act (page 56). California considers the 303(d) List to include waters in Integrated Report categories 4a, 4b, and 5. U.S. EPA only considers those waters in Integrated Report category 5 as part of the federal 303(d) List. California does not and should not include waters impaired solely by pollution on the 303(d) List consistent with the Listing Policy and U.S. EPA guidance. Waterbodies impaired for pollution may be placed in Category 4c. U.S. EPA's Integrated Reporting Guidance recommends that segments be placed in Category 4c only when the cause is solely due to pollution and not a pollutant: Segments should be placed in Category 4c when the state demonstrates that the failure to meet an applicable water quality standard is not caused by a pollutant, but instead is caused by other types of pollution. Segments placed in Category 4c do not require the development of a TMDL. [...] States should schedule these segments for monitoring to confirm that there continues to be no pollutant associated with the failure to meet the water quality standard and to support water quality management actions necessary to address the cause(s) of the impairment. Examples of circumstances where an impaired segment may be placed in Category 4c include segments impaired solely due to lack of adequate flow or to stream channelization. (U.S. EPA, Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act (July 29, 2005) (p.56).) 	4.32	<p>Santa Clara River Reach 3a. E. Coli: VCK’s attached watershed monitoring program data indicates that on 5 out of 27 VCK monitoring events at Santa Clara River Reach 3 on the Santa Clara River below the Santa Paula Creek confluence, on the Santa Clara River below the Sespe Creek Confluence, and on the lower segments of Sespe Creek and Santa Paula Creek, the presence of E. Coli in the water column of these waterbodies exceeded the Basin Plan single sample numeric water quality standard for E. Coli density of 235/100ml for Fresh Waters Designated for Water Contact Recreation (REC-1). Additionally, water monitoring on 11/26/08, 12/15/08, 2/6/2009, and 3/5/2009 at ME-SCR (attached), the mass emissions station sampling station operated by the Ventura County Watershed Protection District just above the Vern Freeman Diversion Dam, indicated E.Coli concentrations of 820/100ml, 4884/100ml, 12033/100ml, and 3873/100ml respectively (attached). All of these samples exceeding Basin Plan numeric water quality standards were taken by the county during wet weather events (see Ventura Annual Stormwater Report Appendix F starting at PDF pg 108).</p>	<p>This comment applies to three separate waterbodies. The assessment of information and the decision for the individual waterbodies is as follows: Santa Clara River Reach 3 (Freeman Diversion to A Street): The E. coli data has been assessed and 1 of the 12 samples exceed the E. coli objective. The E. coli exceedances that occurred at the mass emissions station sampling station operated by the Ventura County Watershed Protection District just above the Vern Freeman Diversion Dam (ME-SCR) are captured within LOE 88671. The combination of the samples and exceedances results in the recommended decision to “List on 303(d) list (TMDL required list)”. Santa Clara River Reach 10 (Sespe Creek, from confluence with Santa Clara River Reach 3 to above gaging station - 500 ft downstream from Little Sespe Cr): The E. coli data has been assessed and 1 of the 7 samples exceed the E. coli objective. The recommended decision is “Do Not List on 303(d) list (TMDL required list)”. Santa Paula Creek Reach 1 (confluence w Santa Clara River to Diversion Dam): The E. coli data has been assessed and 1 of the 5 samples exceed the E. coli objective. Data on collected on 8/19/2010, 8/20/2010 and 8/25/2010 from the same site were averaged per the Listing Policy 6.1.5.6.</p>	No

City of Escondido Representative/Commenter: Helen Davies	5.01	The category assignment process should be transparent and updated with each new Integrated Report, and reflect the RWQCB's regulatory approach to restoring beneficial uses. The RWQCB should establish a defined procedure for assigning and/or reassigning 303(d) listings of Category 4b or 4c (where no TMDL is required), instead of defaulting to Category 5 (TMDL required). Specifically, when pollutants are being addressed through regulatory measures aside from TMDLs, including Water Quality Improvement Plans (WQIPs) as appropriate, the Regional Board should ensure this is reflected in the assigned category, and the categories should be assessed and updated with each new Integrated Report. This will support the Water Quality Improvement Planning process.	Clear descriptions of the Integrated Reporting categories can be found in Table 2 (page V) of the Draft Staff Report released on June 9, 2017. The Regional Board considers it prudent to evaluate the appropriateness of WQIPs as TMDL alternatives on a case by case basis, taking into consideration potential differences in pollutant sources and hydrologic conditions of different watersheds, as well as levels of success of historical management actions including restoration activities at each watershed.	No

	5.02	<p>Total Maximum Daily Load (TMDL) scheduling should be transparent and updated with each new Integrated Report, and reflect the RWQCB's regulatory approach to restoring beneficial uses. The results of assessment of criteria for TMDL scheduling (Section 5 of the Listing Policy) should be transparent in the draft Integrated Report, and updated with each new Integrated Report to reflect the true realities of state resources and priorities, including the availability of data; this will reduce uncertainty for municipalities like the City of Escondido and support the Water Quality Improvement Planning process.</p>	<p>The TMDL scheduling currently shown in the 2014 draft Integrated Report is based on an anticipated scheduling time of 11 to 13 years. The San Diego Water Board is working on an effort to identify key beneficial uses and areas/water bodies in the San Diego Region. This strategy is part of their Practical Vision. The key use(s)/key area(s) project was adopted by the San Diego Board on March 15, 2017 (Resolution R9-2017-0030) and includes a staff report. Resolution: http://www.waterboards.ca.gov/sandiego/board_decisions/adopted_orders/2017/R9-2017-0030.pdf Staff Report: http://www.waterboards.ca.gov/sandiego/board_info/agendas/2017/Mar/item12/02_Item_12_SD2_Staff_Report.pdf The adoption of this resolution and staff report provides a basis for transparency in the evaluation of TMDL scheduling based on the level of impact to multiple Beneficial Use categories. The San Diego Board endorsed using this approach moving forward as part of their evaluation of regulatory actions.</p>	No

	5.03	<p>The City of Escondido supports the County of San Diego's efforts to delist Escondido Creek and San Marcos Creek for selenium, as data collected in each creek support de-listing based on the Listing Policy. In May 2014, the County of San Diego submitted five comment letters to the RWQCB related to the 2010 §303d listings for selenium in five creeks; the letters and data are referenced and included in the County of San Diego's comment letter for this decision. Additional data were collected by the County of San Diego for use in the de-listing evaluation and compared to the California Toxics Rule (CTR) Freshwater Criterion of 0.005 mg/L. In Escondido Creek, 0 of 32 samples exceeded the criterion; in San Marcos Creek, 0 of 31 samples exceeded the criterion. Based on the age of the exceedances (each major Line of Evidence was based on samples collected in 2002) and significantly decreasing trend results (step six of section 3.10 of the Listing Policy) this pollutant is not likely to exceed the criterion in the future.</p>	<p>Data submitted after the August 30, 2010 deadline will not be included in the 2014/2016 assessment. These data (if submitted in CEDEN) will be included as high priority data in the next cycle. If deemed appropriate by the San Diego Regional Board, these data can be evaluated for a potential delisting during the "off-cycle".</p>	No

	5.04	Remove new §303(d) listings for Benthic Community Effects (Escondido Creek - Decision ID 46213, San Marcos Creek – Decision ID 43723) and clarify expectation for TMDLs for this “pollutant”.	If a water body has a designated aquatic life Beneficial Use (such as WARM), it is appropriate to evaluate whether or not that Beneficial Use is being supported as part of the Integrated Reporting process. The Benthic Community Effects listings are associated by with other pollutant listings, so waterbodies with Benthic Community Effects listings are appropriately in Category 5 or 4a. Once any associated pollutants are moved to one of the "Being Addressed" categories, The Benthic Community Effects listings will also move to the "Being Addressed" category. A separate TMDL may not be developed for Benthic Community Effects by themselves, but for the associated pollutants which are resulting in the beneficial use not being supported once a causal assessment analysis has been performed.	No

Commenter	No.	Comment	Response	Revision
	5.05	Although we appreciate the reasons for assessing biological criteria, listing waterbodies in the San Diego region for Benthic Community Effects before establishing Biological Objectives in the Basin Plan (a currently ongoing process) is premature. The Biological Objective would be the standard against which data would be assessed to establish whether there a listing required.	Per the Listing Policy, in the absence of an approved numeric water quality objective, an acceptable Evaluation Guideline can be used to interpret narrative water quality objectives. The California Stream Condition Index (CSCI) and the Regional Indices of Biological Integrity (IBIs) meets the Listing Policy requirements for acceptable Evaluation Guidelines for interpreting a narrative objective. If a water body has a designated aquatic life Beneficial Use (such as WARM), it is appropriate to evaluate whether or not that Beneficial Use is being supported as part of the Integrated Reporting process.	No

	5.07	These listings should be removed.	State Water Board supports maintaining listings based on the SCIBI and CSCI scores as they are consistent with State policy and have been assessed relative to appropriate reference sites. At this time, the CSCI and IBI (where CSCI is not available) are the best measures of biologic integrity in California streams and it is appropriate to use both IBI and CSCI scores in 303(d) listing decisions. As the science progresses, improved methods may supplant older methods and the 303(d) list will be updated, as appropriate, as that occurs. The use of the SCIBI and CSCI for 303(d) listing was done in accordance with Section 3.9 and 6.1.5.8 of the Listing Policy with biological data and impairment related to associated pollutants and/or pollution. 	5.08	<p>The State Board’s Water Quality Control Policy for Developing California’s Clean Water Act Section 303(d) List (Listing Policy) that is used to evaluate waterbody/pollutant combinations needs to be updated. The Listing Policy was adopted in 2004, and since then there have been numerous changes to the way regulated parties address pollutants, as well as improved science and methods. It would be beneficial for the State and Regional Boards to collaborate and seek comments from interested parties to update the Listing Policy to reflect current science and methods, and provide up-to-date guidance. Recommended updates include re-assessed definitions for toxicants and conventional pollutants, changes to the criteria tables and policies for listing and delisting, more transparent decisions for categories and TMDL development dates, and updates to the types of pollutants and/or conditions that are addressed by the Listing Policy.</p>	<p>The Listing Policy was amended as recently as 2015. The State Water Board updates the Listing Policy when necessary to comply with current regulatory practices when a conflict exists. The Regional Water Boards participate in the internal Integrated Roundtable during which potential updates to the Listing Policy are discussed.</p>	0

	6.05	<p>Newport Bay (Lower)Lower Newport Bay (“Lower Bay”) consists of the lower half of the Newport Bay watershed. The Newport Bay Watershed, in total, drains approximately 152.02 square miles into the Pacific Ocean within Southern Orange County.¹² The Lower Bay includes all stormwater drains and natural creeks, therefore its protection is vital to many of Orange County’s natural resources.¹³ For this reason, Coastkeeper disputes the Regional Board’s recommendation to remove the Lower Bay from the 303(d) list. Although some areas of the Lower Bay were dredged in 2012, the Regional Board has not conducted the appropriate new tests to support its determination to delist this waterbody.¹⁴ This point is supported by the fact that there are four distinct lines of evidence available in the administrative record that show samples exceeding the CTR criteria set forth for the pollutant, copper.¹⁵ The Regional Board further concluded that there are a sufficient number of samples collected that exhibit sediment and water toxicity.¹⁶ Therefore, Coastkeeper aligns with the State Water Board Recommendation to keep the Lower Bay on the 303(d) list.</p>	Comment noted. 	6.06	<p>Newport Bay (Upper)Upper Newport Bay (“Upper Bay”) makes up the upper half of the Newport Bay watershed. Beginning at the PCH bridge and extending across the bay, it includes all drainage systems within Canyon Wash, the Costa Mesa Channel, and the Santa Isabella Channel.¹⁷ Similar to its counterpart, the Upper Bay also suffers from concerns over toxicity. According to the Regional Board, there are four clear lines of evidence available in the administrative record proving that an abundant amount of the sediment and water samples showed exceedances of toxicity.¹⁸ Coastkeeper cannot support this recommendation as it stands, and agrees with the State Water Boards conclusion that the Upper Bay should not be delisted for toxicity.It is also inappropriate for this waterbody to be delisted for the pollutant, copper, because the there is no new data for the Regional Board to support this decision. From 2004 through 2011, there has been evidence that the water and sediment exceed the CTR criteria needed for a waterbody to be delisted.¹⁹ It would be unwise for this waterbody to be delisted without the proper testing needed to make this important decision. For these reasons, Coastkeeper sides with the State Water Board in its</p>	Comment noted.	No

Commenter	No.	Comment	Response	Revision
	7.03	<p>The City requests that the State Board also delist Reach 4 of the Ventura River from the 303(d) list for "pumping" and "water diversions". In accordance with the State Board's Listing Policy, waters shall be listed as water quality limited segments if a water quality standard is not attained, if the standards nonattainment is due to toxicity, a pollutant or pollutants, and if remediation of the standards attainment problem requires one or more TMDLs. Pumping and water diversions are not pollutants nor toxicity as defined in the Clean Water Act. (33 U.S.C. section 1313(d)(1).) As such, listing a water body as impaired for "pumping" and "water diversions" is not a proper listing, and delisting is legally required.</p>	<p>The waterbody-pollutant combinations of pumping and water diversion in Reach 4 of the Ventura River is currently proposed for placement into Integrated Report Category 4c based on Los Angeles Regional Water Board knowledge of the this specific reach and the TMDLs for algae, eutrophic conditions, and nutrient impairments. However, Reach 4 of the Ventura River as a waterbody will continue to be listed as Category 5 due to other pollutant impairments until these impairments have been addressed. Los Angeles Water Board staff also provided a summary document to support this recommendation and made it available within factsheets 44793 and 44534 as CalWQA reference 4378. The Regional Board's response to comment 21.1 states that Reach 4 of the Ventura River would be "delisted" for pumping and water diversions. This response is incorrect, the pumping and water diversions impairments for Reach 4 of the Ventura River are proposed for placement into Integrated Report Category 4c as impairments due to pollution. The waterbody as a whole is identified within Integrated Report Category 5 for several other pollutant impairments.</p>	No

	7.04	<p>Moreover, development of a TMDL is not required to address pumping and water diversions in the Ventura River. In fact, the Environmental Protection Agency has already concluded that a TMDL for pumping and water diversions is not required. On June 28, 2013, EPA determined that it was not necessary to establish a separate TMDL for pumping and water diversions for the Ventura River. In making this determination, EPA concluded that the Ventura River Nutrient TMDL more properly addressed the conditions of concern in the Ventura River.</p>	Comment noted.	No

	7.05	As the State Board is aware, flow conditions in the Ventura River Watershed are already being considered as part of Action 4 of the California Water Action Plan. Currently, both the Department of Fish and Wildlife and the State Board are actively engaged in a multi-year effort to assess flow conditions in the Ventura River. The City as well as other interested parties are participating in this effort.	Comment noted.	No

Commenter	No.	Comment	Response	Revision
	8.08	<p>In addition to concerns about the data that was used to list the four water bodies, Farm Bureau is concerned with the State Board's procedures that prevent the consideration of more current data when making listing determinations. Although the approval of the Central Valley Regional Board's Section 303(d) List and 2014 Integrated Report did not occur until December 5, 2016, the solicitation of data for consideration in the Integrated Report closed on August 30, 2010. Because the data solicitation period for this Integrated Report closed over six years prior to the listing approvals, the assessment of water quality conditions does not properly reflect the current status of each surface water body within the region, especially the current status of Bull Meadow Creek, Rose Creek, Bell Creek, and Niagara Creek. This is evident given the 2013 peer-reviewed research study conducted by the University of California, Davis. In order to properly assess water bodies based on timely and quality data, Farm Bureau respectfully asks the State Board to refrain from listing Bull Meadow Creek, Rose Creek, Bell Creek, and Niagara Creek in light of the additional quality data produced after the closure of the data solicitation period.</p>	0	No

City of Burbank Representative/Commenter: Daniel Rynn	9.01	This letter incorporates by reference Attachment 1, which provides the City's comments to said amendments. CWA Section 303(d) requires each state to list waters not meeting water quality standards and prioritize those waters for Total Maximum Daily Load (TMDL) development. The Los Angeles Regional Water Quality Control Board (LARWQCB) did not approve 303(d) List recommendations for waterbodies within its region. After a written public comment period and board workshop, the LARWQCB made revisions to its 303(d) List. Because the Los Angeles Regional Board did not formally approve the revised regional 303(d) List, the State Water Resources Control Board will consider and approve the proposed 303(d) List pertaining to waterbodies within the Los Angeles region, after providing an opportunity to comment and responding to comments.	Comment noted.	No

City of Los Angeles and Los Angeles Sanitation Representative/Commenter: Enrique Zaldivar	10.01	Ballona Creek Toxicity The Fact Sheet for Decision ID 34253 presents two lines of evidence that indicate the presence of sediment toxicity (83019 and 83020). LOE 83019 references a Statewide Stream Pollution Trends Study 2008 and LOE 83020 references Statewide Project Urban Pyrethroid Status Monitoring. When reviewing the station locations (404SUP093 and 404BLNAXx) associated with these two LOEs in an August 2012 Surface Water Ambient Monitoring (SWAMP) report titled "Toxicity in California Waters: Los Angeles Region", the sampling locations are identified as (page 11) "approximately one kilometer downstream from the confluence with Sepulveda Channel." In a 2014 SWAMP report titled "Trends in Chemical Contamination, Toxicity and Land Use in California Watersheds: Stream Pollution Trends (SPoT) Monitoring Program Third Report - Five-Year Trends 2008-2012", the site 404BLNAXx is identified as Ballona Creek Downstream of Centinela (33.986 - 118.417). In the Ballona Creek Toxics TMDL Staff Report, Ballona Creek Reach 2 and Estuary are defined as follows (page 5): Ballona Creek to Estuary (Reach 2) is the longest segment of the creek (approximately 4 miles) continuing on from National	The commenter is correct that the two stations fall within Reach 2 of Ballona Creek as described in the Los Angeles Region Basin Plan. Decision 34253 will not be removed but the State Water Board has made a clarifying note regarding the spatial applicability within the Fact Sheet for Decision 34253 as follows: "The sediment toxicity data collected to support this listing decision were collected from Reach 2 of Ballona Creek as identified in the Los Angeles Regional Basin Plan. The waterbodies listed within the Los Angeles Basin Plan have been segmented during recent updates and those changes have not been reflected within the assessment database. Water Board staff will work to update the waterbodies within the database to ensure consistency with the Los Angeles Basin Plan while off-cycle." 10.02 The criteria continuous concentration is the appropriate evaluation guideline for assessment of the chronic impacts of a pollutant on aquatic life and is consistent with Section 6.1.3 of the Listing Policy. As the commenter states U.S. EPA does not recommend the use of a criteria maximum concentration for the assessment of iron for protection of aquatic life.	No

	10.02	<p>Compton Creek IronThe Fact Sheet for Decision ID 62052 states that one LOE (83798) is available in the administrative record to assess iron in Compton Creek. LOE 83798 lists the following as the Evaluation Guideline used as the basis for the listing: “National Recommended Water Quality Criteria Continuous Concentrations are intended to protect freshwater aquatic organisms from chronic exposures and are expressed as 4-day average concentrations. The City has several concerns with this listing: • The only two exceedances are associated with wet-weather samples collected on October 13, 2009. The Evaluation Guideline used as the basis is Criteria Continuous Concentrations (i.e., chronic criterion). It is inappropriate to use a chronic criterion as it is meant to protect aquatic life against chronic exposure and the samples were taken during a wet-weather event not representative of chronic conditions. USEPA does not recommend a Criteria Maximum Concentration(acute criterion) for iron within its National Recommended Water Quality Criteria. • The National Recommended Water Quality Criteria Continuous Concentration for iron does not specify whether the criterion applies to the total recoverable or dissolved</p>	<p>The criteria continuous concentration is the appropriate evaluation guideline for assessment of the chronic impacts of a pollutant on aquatic life and is consistent with Section 6.1.3 of the Listing Policy. As the commenter states U.S. EPA does not recommend the use of a criteria maximum concentration for the assessment of iron for protection of aquatic life. The State Water Board has reassessed the data using the dissolved measure of iron because the dissolved fraction of iron is the most bioavailable to aquatic life. The resulting reassessment has changed the decision recommendation for Decision 62052 from List to Do Not List. Table 4 and Appendix H of the draft Staff Report been revised accordingly. The commenter’s interpretation of temporal independence is incorrect. Samples were collected across several sites that are spatially independent and should be considered independently of one another consistent with Section 6.1.5.2 of the Listing Policy. If the majority of samples were collected on the same day they must be noted in the lines of evidence and cannot be used as primary evidence to support a listing. However, samples were collected across several days, events, and years.</p>	No

		<p>fraction. None of the dissolved iron results associated with the samples used to assess the water body exceeded the criterion. • Section 6.1.5.3 of the Listing Policy states that “Samples used in the assessment must be temporally independent. If the majority of samples were collected on a single day or during a single short-term natural event (e.g., a storm, flood, or wildfire), the data shall not be used as the primary data set supporting the listing decision.” However, multiple samples were collected on the same day during the same storms and each was considered separately. Samples collected on the same day during the same storm (as was the case with the two exceedances) should not be considered independently from one another as they are clearly not temporally independent and do not meet the Listing Policy requirements. Averaging samples collected on the same day results in 1 of 5 exceedances, which does not meet the requirements of the Listing Policy for placing a water body segment on the 303(d) list. Requested Action: Revise the decision for Decision ID 62052 for the iron listing for Compton Creek to Do Not List on 303(d) list (TMDL required list) and remove from Category 5 (Appendix B) due to an inappropriate evaluation</p>

	10.03	<p>Dominguez Channel Estuary (unlined portion below Vermont Ave) Copper The Fact Sheet for Decision ID 33751 states that five LOEs are available to assess copper in the Dominguez Channel Estuary, four of which correspond to sediment and one of which corresponds to water. The sole LOE (83984) that presents water data states that 3 of 3 samples exceeded the dissolved California Toxics Rule (CTR) saltwater chronic criterion. However, these sample results were all collected on the same day and appear to be for total copper associated with a wet-weather event. Section 6.1.5.3 of the Listing Policy states that "Samples used in the assessment must be temporally independent." However, LOE 83984 considers the three samples collected on the same day during the same storm separately. Samples collected on the same day during the same storm should not be considered independently from one another. Additionally, when using the total copper CTR acute criterion (rather than the dissolved CTR chronic criterion), the samples do not exceed. As such, all LOEs that support a listing correspond to the sediment matrix. Requested Action: Remove LOE 83984, revise LOE 83984 to state 0 of 3 exceedances, or revise the pollutant for</p>	<p>Line of evidence 83984 has been adjusted to take into account the spatial and temporal independence requirements of Sections 6.1.5.2 and 6.1.5.3 of the Listing Policy. The update resulted in a finding of one sample and one exceedance of the water column guideline for copper. Furthermore Decision 33751 for copper is being recommended for placement under Integrated Report Category 4a as being addressed by a U.S.EPA approved TMDL. The decision relationships language has also been clarified to show that beneficial uses are not supported due to the exceedances associated with the sediment evaluation guideline for copper. It is important to note that Dominguez Channel Estuary as a whole will remain in Integrated Report Category 5 until all of the pollutant impairments are being addressed. This methodology is described on page 22 and 23 of the draft Staff Report.</p>	No

	10.04	<p>Ballona Creek CyanideThe Fact Sheet for Decision ID 32970 states that two LOEs are available to assess cyanide in Ballona Creek. Both LOEs (2339 and 82989) contain dry and wet weather data collected as part of the MS4 monitoring program. However, the LOEs state that only the CTR Criterion Continuous Concentration (i.e., chronic criterion) of 0.0052 mg/L for the protection of aquatic life was applied to the entire dataset rather than considering the application of the chronic CTR criterion during dry-weather and the CTR Criterion Maximum Concentration (i.e., acute criterion) during wet-weather as is traditionally done when assessing data in the Los Angeles region (particularly in the context of TMDL development). Section 6.1.3 of the Listing Policy allows for the selection of evaluation guidelines that represents water quality objective attainment or protection of beneficial uses. As such, selecting chronic and acute CTR criteria to evaluate dry and wet-weather data, respectively, would be consistent with the Listing Policy. When using the chronic and acute CTR criteria to evaluate dry and wet-weather data, respectively, the number of exceedances is 4 out of 45, meeting the delisting requirements. Maintaining the</p>	<p>See response to comment 10.02. When assessing for impacts to aquatic life beneficial use it important to utilize an evaluation guideline that is most protective. The Los Angeles Water Board may utilize separate measures for dry versus wet weather during the development of a TMDL or other regulatory action.</p>	No

	10.05	<p>Lincoln Park Lake Ammonia The 28 data points utilized to develop the original listing in 1998 (as described in USEPA's Los Angeles Area Lakes TMDL report) were reported as ammonium, without corresponding ammonia, pH, or temperature measurements making it impossible to compare these data to ammonia criteria. Only ammonia data collected with corresponding pH and temperature data should be used to determine if criteria were exceeded. However, based on the ammonium data presented in Appendix G of the USEPA TMDL report (Table G-29), only 2 of 28 samples exceeded the chronic ammonia criterion. Note that the two samples that exceeded were collected at the same location on the same day. In 2008, the Regional Board collected eight ammonia samples all of which were below the reporting limit of 0.1 mg/L and the chronic criterion. In 2009, the City of Los Angeles and USEPA/Regional Board conducted monitoring and collected 15 and three samples, respectively, all of which were below the chronic criterion. As stated in the TMDL report (pg. 5-10): "There were no exceedances of the acute or chronic ammonia criteria during any recent sampling events with associated pH and temperature</p>	<p>The commenter made a similar comment to the Los Angeles Water Board. The Los Angeles Water Board revised response is as follows: "The Water Quality Assessment Report (LARWQCB, 1996) includes ammonia as not supporting beneficial uses. Twenty-eight ammonium samples were reported ranging from non-detect to 1.14 mg-N /L which is less than the acute target, but greater than the chronic target for total ammonia N (assuming the analytical method converted all ammonia to ammonium). Data from lines of evidence developed prior to 2006 are not included in the CalWQA database. While the EPA TMDL for the Los Angeles Area Lakes did review data from 2008 and 2009, which did not exceed criteria, unlike for lead, the EPA TMDL for the Los Angeles Area Lakes did not make a finding of non-impairment for ammonia and instead established targets." (Response to comment 11.16.) The State Water Board will maintain the listing under Integrated Report Category 4a until such a time that the Los Angeles Water Board and U.S. EPA have found that the impairment due to ammonia have been remedied by the TMDL and applicable beneficial uses are supported.</p>	No

	10.06	<p>Los Angeles (LA) River Reach 2 (Carson to Figueroa Street) and Los Angeles River Reach 5 (within Sepulveda Basin) OilThe source of oil seeping into the River was found to be naturally-occurring crude oil. This conclusion is supported by the results of investigations completed by various agencies, which are summarized as follows:• An investigation was conducted following seeps of petroleum hydrocarbons into the LA River in June 2001. Based on lab results and borings, it was concluded that the source of the LA River channel oil seeps is naturally-occurring crude oil from Puente formation sands. Oil was visible in Puente formation seams, partings and fractures, as well as sand lenses, and appeared to have migrated upward into sandy alluvial soils. Gasses encountered included hydrogen sulfide, commonly sources from crude oil reservoirs. The hydrocarbon seeps appeared to be concentrated where the Puente formation contacts with younger, less permeable units or layers.• The USEPA On-Scene Coordinator (OSC) conducted subsurface investigations of the oil seeps in the LA River during August and September 2001. The OSC found that the oil did not discharge as a result of a spill, leak, or discharge from any facility and that the oil</p>	<p>The commenter made a similar comment to the Los Angeles Water Board. The Los Angeles Water Board revised response is as follows: “The State and Regional Water Boards are currently exploring options to address pollutants that may be naturally elevated in water bodies. Until the natural sources of pollutants are addressed by either an exclusion policy as adopted by the State Water Board or a natural sources exclusion (or other site-specific objective) is developed by the Los Angeles Water Board, oil in the Los Angeles River is an impairment and appropriately on the 303(d) list. There is no alternative regulatory program identified that will reduce oil in the Los Angeles River so the category cannot be 4b. However, the factsheet has been updated to include “natural sources” as the potential source.” (Response to comment 11.17.)Application of the delisting factors in the Listing Policy do not support removal from the list because information does not suggest attainment of standards. The State Water Board will maintain the listing in Category 5 until the standard is revised and such revision supports a delisting decision or a natural source exclusion for oil is adopted in Reaches 2 and 5 of the Los Angeles River.</p>	No

		<p>repeated efforts by WPD to obtain the historical information utilized to develop the original listing, the Regional Board has not provided the information for inclusion in the analysis. Therefore, the analysis is based solely on recent information available to WPD. Summary of Findings The source of oil seeping into the River was found to be naturally-occurring crude oil. This conclusion is supported by the results of investigations completed by various agencies, which are summarized below. Investigations of the Geotechnical Engineering Division, Bureau of Engineering, City of Los Angeles – June 2001 An investigation was conducted following seeps of petroleum hydrocarbons into the engineered channel of the LA River across from the Piper Technical Center in June 2001. This study concluded that the source of the LA River channel oil seeps is naturally-occurring crude oil from Puente formation sands, based on lab results and borings. The samples of the oil seeps and associated bacterial-growth scums revealed that the seeps were predominantly in the oil or heavy-hydrocarbon range. This supports the conclusion that the LA River oil seeps are natural crude oil as opposed to fuel leaks. Drilling of wells along Mission St. (east of the river channel) confirmed that oil-bearing</p>

	10.07	<p>Various waterbodies, Various pollutants Section 2.1 of the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (Listing Policy) titled "Water Quality Limited Segments" states (pg. 3): "Waters shall be placed in this category of the section 303(d) list if it is determined, in accordance with the California Listing Factors that the water quality standard is not attained; the standards nonattainment is due to toxicity, a pollutant, or pollutants; and remediation of the standards attainment problem requires one or more TMDLs." As such, all listings that do not identify either toxicity or a pollutant as the impairment do not meet the requirements for being placed in the water quality-limited segments category. This is supported by current listing decisions in Burbank Western Channel for excess algal growth, scum/foam-unnatural, and taste and odor and Calleguas Creek Reach 13 for excess algal growth that state the following (emphasis added): "Based on the readily available data and information, the weight of evidence indicates that there is sufficient justification in favor of removing these listing from the 303(d) Water Quality Limited Segment list because the segment pollutant combinations is not a pollutant."</p>	<p>The commenter's assertion that a listing "associated with," rather than "due to," toxicity or pollutants does not meet the requirements for placement in Integrated Report Category 5 as discussed in Section 2.1 of the Listing Policy is premised on an incorrect interpretation of that section. The Listing Factors inform the meaning of the category of waters described in Section 2.1 of the Listing Policy that should be placed in Category 5. The first statement of Section 2.1 "Waters shall be placed in this category of the 303(d) list if it is determined, in accordance with the California Listing Factors..." that a standard is not attained. (Emphasis added.) The California Listing Factors are subsequently described in Section 3 of the Listing Policy. Sections 3.9 specifically requires "A water segment shall be placed on the section 303(d) list if the water segment exhibits significant degradation in biological populations and/or communities as compared to reference site(s) and is associated with water or sediment concentrations of pollutants..." (Emphasis added.) Determining that a water body meets Listing Factor 3.9 satisfies the category of waters described in Section 2.1 for appropriate placement in Category 5. The decisions identified by the commenter in Burbank Western Channel are legacy decisions that were made prior to the development of the Listing Policy. The original basis for listing has been determined to be flawed by the Los Angeles Water Board because the listing was based on a condition rather than a specific pollutant. Dissolved oxygen and pH are identified as conventional pollutants in the Listing Policy and as such subject to Section 3.2 of the Listing Policy. The presence of an objective is not used in determining if a constituent is a pollutant. Decision 44553 has been revised from Do Not Delist from Category 5 to Delist based on insufficient information and lack of an associated pollutant. Decision 44498 is associated with pollutant impairments</p>	Yes

		<p>In addition, given that the Listing Policy states that the standards nonattainment must be “due to” either toxicity or a pollutant, listings that are simply “associated with” toxicity or pollutants do not meet the requirements for being placed in the water quality-limited segments category. Furthermore, given that the Listing Policy uses an “and” statement and not an “or” statement when listing the requirements for being placed in the water quality-limited segments category, requiring a TMDL (or other regulatory program) to attain standards is insufficient in and of itself for being placed in the water quality-limited segments category. Lastly, the Clean Water Act definition for a pollutant makes no mention of the presence or absence of a water quality objective. As such, the presence of an objective (as is the case within the Los Angeles region for pH and dissolved oxygen) does not necessarily signify that a constituent is a pollutant. The following table presents water body segments and listings that correspond to instances where there is not a pollutant.</p> <table border="0"> <tr> <td>Decision ID</td> <td>Water Body Segment</td> </tr> <tr> <td>Listing44553</td> <td>Arroyo Seco Reach 1 (LA River to West Holly Ave.)</td> </tr> <tr> <td>Benthic Community Effects44498</td> <td></td> </tr> </table>	Decision ID	Water Body Segment	Listing44553	Arroyo Seco Reach 1 (LA River to West Holly Ave.)	Benthic Community Effects44498		<p>due to aluminum and zinc which is consistent with Section 3.9 of the Listing Policy. Decision 32967 is consistent with Section 3.2 of the Listing Policy. Decision 38511 is a legacy listing that requires new data to remove from the 303(d) List consistent with Section 4.9 of the Listing Policy. The Decision has been revised with associated pollutant impairments and moved to Integrated Report Category 4a as it is expected that the TMDLs in place will result in attainment of the aquatic life uses. Decision 35168 is a legacy listing that requires new data to remove from the 303(d) List consistent with Section 4.9 of the Listing Policy. The Decision has been revised to include the associated pollutant impairments and moved to Integrated Report Category 4a as it is expected that the TMDLs in place will result in attainment of the aquatic life uses. Decision 66232 is associated with pollutant impairments due to copper and toxicity which is consistent with Section 3.9 of the Listing Policy. Decision 34208 is a legacy listing that requires new data to remove from the 303(d) List consistent with Section 4.9 of the Listing Policy. The Decision has been revised to include the associated pollutant impairments and moved to Integrated Report Category 4a as it is expected that the TMDLs in place will result in attainment of the aquatic life uses. Decision 61605 is consistent with Section 3.2 of the Listing Policy.</p>

	10.09	<p>Various waterbodies, Various pollutants There are numerous listings that include waterbody segments which are in nonattainment due to pollution that is not caused by a pollutant. The 2016 Clean Water Act Sections 305(b) and 303(d) Integrated Report for the Los Angeles Region Staff Report (Staff Report) states the following (pg. 9): “Impaired waters are placed in Category 4c if the impairment is not caused by a pollutant, but rather caused by pollution, such as flow alteration or habitat alteration.” Impairments for benthic community effects, exotic vegetation, habitat alterations, hydromodification, and reduced tidal flushing are caused by either flow and/or habitat alteration (not by a pollutant or combination of pollutants) and; therefore, waterbody segments under these listings should instead be moved to Category 4c. In addition, given that the Staff Report states that the impairment must be “caused by” a pollutant, listings that are simply “associated with” pollutant listings do not meet the requirements for not being placed in Category 4c. Decision ID Water Body Segment Listing 44553: Arroyo Seco Reach 1 (LA River to West Holly Ave.) Benthic Community Effects</p>	<p>See responses to comments 10.08 and 10.07. In California, waterbody-pollutant combinations are assessed consistent with the Listing Policy to determine the overall beneficial use support rating. If a beneficial use is impaired by a pollutant, the waterbody-pollutant combination is placed on the 303(d) List. If data or information indicate that the waterbody may also be impaired due to pollution (hydrologic or habitat alteration), the waterbody would not be placed in category 4c until after the pollutant impairment is addressed. That overall beneficial use support rating is used by the California Water Quality Assessment Database (CalWQA) to determine the overall Integrated Report Category for the waterbody as a whole. This methodology is described on page 22 and 23 of the Staff Report. The Fact Sheets for Decisions 44746, 34697, 34699, and 44747, associated with Ballona Creek Wetlands, have been marked as associated due to pollution and the individual waterbody-pollution combinations are within Integrated Category 4c. However, Ballona Creek Wetlands as a whole will remain in Integrated Report Category 4a until all of the pollutant impairments are remediated and delisted.</p>	No

	10.10	<p>The Fact Sheet for Decision ID 67208 presents two lines of evidence related to arsenic in Santa Monica Bay (88949 and 88950). LOE 88949 presents information related to sediment and found that 0 of 32 samples exceeded the sediment goals utilized in the assessment. LOE 88950 presents information related to fish tissue and indicates that 19 of 19 samples collected as part of Hyperion Water Reclamation Plan NPDES Permit during August of 2006, and August, September, October, and November of 2007 exceeded the evaluation guideline with the presumption that results were reported on a wet-weight basis and 10% of the total arsenic result represented the amount of inorganic arsenic in the sample for comparison to the guideline. In reviewing LOE 88950, no information/citation can be found supporting the assumption that 10% of the total arsenic result represented the amount of inorganic arsenic in the sample. It is appropriate to utilize inorganic arsenic in assessing potential risk; however, either measured inorganic arsenic or a conversion factor developed from actual measured ratios from Santa Monica Bay should be utilized. In USEPA's 2000 Guidance for Assessing Chemical Contaminant Data for</p>	<p>The commenter made a similar comment to the Los Angeles Water Board. The Los Angeles Water Board revised response is as follows: "The arsenic decision has been reviewed. The listing has been corrected to the finfish guideline (0.0034 ppm instead of 0.0052 ppm for shellfish) and the applicable reference added. The guideline, 0.0034 ppm, is the screening guideline from Guidance for Assessing Chemical Contaminant Data for Use In Fish Advisories Volume 1: Fish Sampling and Analysis (CalWQA ref 3756) and assumes an average body weight of 70 kg and a consumption rate of 32 g/day for a 30 year exposure over a 70-year lifetime. The assessment used an assumption that 10% of the arsenic would be inorganic. Even if a 0.05% inorganic to total ratio was used in the assessment, the number of exceedances would be 14 out of 19 and sufficient to list." (Response to Comment 11.21.) Decision 67208 is consistent with Section 3.1 of the Listing Policy and the evaluation guideline was selected and applied consistent with Section 6.1.3 of the Listing Policy. In addition, while the Listing Policy requires that samples be spatially and temporally independent, fish are not static; they move throughout a waterbody and accumulate pollutants in tissue over time. Therefore, the data are, by their nature, spatially and temporally independent. Lastly, the fact that tissue concentrations represent the accumulation of pollutants over a time period of years, and each fish is a different age and will have moved differently through the environment, provides independence of the tissue sample.</p>	No

		<p>Use in Fish Advisories Volume 1 Fish Sampling and Analysis Third Edition (EPA 823-B-00-007), USEPA recommends that, in both screening and intensive studies, total inorganic arsenic tissue concentrations be determined for comparison with the recommended screening value for chronic oral exposure. Scientific literature demonstrates that a range of total to inorganic arsenic ratios exist. For example, a 2008 study specifically looking at arsenic speciation in 383 samples of marine fish and shellfish, showed that the inorganic fraction of arsenic is typically <0.5% with a few of the highest samples ranging from 1-5%. The City's concern with the approach has been expressed in other regions of California as well. The Port of San Diego in an August 11, 2016 comment letter to the San Diego Regional Water Quality Control Board regarding a 303(d) arsenic listing, noted the high level of variability of the proportion of inorganic arsenic across species (typically <10%) as measured in a number of other studies, as well as a methodology that could be used to ground truth the applied proportion through actual sample data. In response to the Port of San Diego's comment the San Diego Regional Board removed an arsenic listing from their draft</p>

		<p>303(d) list and stated: "... there is a high level of uncertainty in the levels of inorganic arsenic in shellfish tissue. The assumption regarding the percent of total arsenic in shellfish tissue is likely conservative, and the San Diego Water Board agrees that a listing based on those assumptions has a high probability of mischaracterizing the results as an impairment. The San Diego Water Board supports the Port's suggestion that future monitoring of shellfish incorporate a measurement of both total and inorganic arsenic." The City also has concerns with the approach to utilizing the data in comparison to the guidelines. Section 6.1.5.3 of the Listing Policy states that "Samples used in the assessment must be temporally independent." However, each individual sample was considered on its own without consideration for temporal representation. Samples collected on the same day (i.e., October 2007, November 2007, and September 2008) should not be considered independently from one another as they are clearly not temporally independent. Furthermore, given tissue concentrations represent the accumulation of pollutants over a time period of years and the risk endpoint relates to a carcinogenic effect over a 30-year period, considering samples</p>

		<p>collected within months of each other (October and November 2007 and August and September 2008) also does not provide the required temporal independence. Data should be aggregated across appropriate temporal timeframes, which should be assessed on a case-by-case basis, but should be no less than annually. Lastly, in assessing tissue data, consideration should be given to the fact that multiple samples and species are collected and the range of concentrations within those samples and across species represents exposure and potential risk. Considering each individual sample separately from one another or across species results in an assumption that an individual sample is representative of the exposure condition. Data should not only be aggregated on an appropriate temporal scale, but also across species, potentially weighted based on likely consumption patterns. In summary, the lack of inorganic arsenic data and use of an unsupported conversion factor in combination with the approach to comparing tissue data that does not appropriately meet the requirements of temporal independence or reflect actual exposure conditions does not support listing arsenic in Santa Monica Bay. The City welcomes the opportunity to discuss</p>

	10.12	<p>Notwithstanding the City’s comments related to removing all listings that do not identify either toxicity or a pollutant as the impairment, the City identified the following listings for Benthic Community Effects (summarized in the following table) that are inappropriate: LA River Reach 4 (Sepulveda Dr. to Sepulveda Dam): Decision ID 66232 Arroyo Seco Reach 1 (LA River to West Holly Ave.): Decision ID 44553 Compton Creek: Decision ID 44498 The City believes the listings are inappropriate, based on the following issues that are described in more detail below: Listings for concrete-lined channels using current metrics are inappropriate. Reference reaches for concrete-lined channels in highly urbanized catchments are lacking. Physical habitat conditions were apparently not considered during data evaluation. The State Water Resources Control Board (State Board) is planning to develop expectations for benthic community condition for developed landscapes using the California Stream Condition Index (CSCI) and a new Algal Stream Condition Index (ASCI). TMDL development for benthic community effects in concrete-lined channels based on unofficial Index of Biotic Integrity (IBI) thresholds is premature. Impairment of the</p>	<p>Regarding assessment of concrete lined channels, California surface waters are designated with beneficial uses to protect against quality degradation. (Wat. Code, § 13050, subd. (f) (defining beneficial uses).) The Listing Policy provides guidance on assessing and interpreting data and information as they are compared to applicable beneficial uses. (Listing Policy, p.1.) Accordingly, the California section 303(d) List must include waters for which applicable water quality standards have been promulgated and may be assessed to determine whether standards are met. Regarding the use of the Southern California Index of Biological Integrity, per the Listing Policy Section 6.1.3, in the absence of an approved numeric water quality objective, an acceptable Evaluation Guideline can be used to interpret narrative water quality objectives. Both the California Stream Condition Index (CSCI) and the Regional Indices of Biological Integrity (IBIs) meet the Listing Policy requirements for acceptable Evaluation Guidelines for interpreting a narrative objective. If a water body has a designated aquatic life beneficial use (such as WARM), it is appropriate to evaluate whether or not that beneficial use is being supported as part of the Integrated Reporting process. Although moving forward the CSCI is the preferred index for assessment, it could not be used for some of the data that was assessed due to lack of taxonomic information. It is still appropriate to use the IBI score when a CSCI score is not available consistent with Section 6.1.5.8 of the Listing Policy. Lastly, The Listing Policy does not define “reference” but rather defines how it should be calculated which has been done and validated repeatedly by the CSCI and reference threshold studies. The technical work referenced by the commenter is meant to support the Biostimulatory-Bio Integrity Policy is still under development. These tools could potentially be used in future reporting cycles but</p>	Yes

		<p>reaches was not demonstrated using an appropriate metric for benthic community condition. The listing decisions were based on Southern California Coastal Index of Biotic Integrity (SCIBI). The State Board has rejected use of the SCIBI in favor of the CSCI. The Regional Board Staff Conclusions (Staff Conclusions) for the listing decisions do not acknowledge that the data used to support the decisions were SCIBI scores, not CSCI scores. Instead, the Staff Conclusions imply that the decisions are based on CSCI scores. There is no established water quality criteria for benthic community condition. Use of a SCIBI score of 40 (or other "cutoffs" promulgated by the authors of the SCIBI) as a listing threshold is not consistent with the State Board's current approach for identifying impairment thresholds for benthic community data. The Regional Board use of a CSCI score of 0.79 in other listing decisions (and implied to be appropriate for Ballona Creek) is also not consistent with the State Board's current approach for identifying impairment thresholds for benthic community data. Insufficient data are available to meet the listing requirements. Notwithstanding the previous issues, several of the listings rely on a single site for data as a basis of the listing</p>	<p>currently it would be premature to use information from these technical products to support a listing decision recommendation. In response to whether a TMDL is appropriate, it is not expected that a TMDL will be developed for Benthic Community Effects themselves, but for the associated pollutants which are resulting in the beneficial use not being supported. If all known pollutant impairments have been addressed and the biological community continues to show degradation the listing decision would need to be evaluated for delisting in accordance with Section 4.9 of the Listing Policy. Also see responses to comments 10.07 and 21.08.</p>

		<p>inconsistent with the Listing Policy. Listings for concrete-lined channels using currently available metrics are inappropriate. Application of the SCIBI to concrete-lined channels is especially inappropriate given the lack of a reference population for lowgradient streams in coastal southern California, in general, much less for modified channels, in specific. Section 6.1.5.8 of the listing policy states: "When evaluating biological data and information, RWQCBs shall evaluate all readily available data and information and shall evaluate bioassessment data from other sites, and compare to reference condition. Evaluate physical habitat data and other water quality data, when available, to support conclusions about the status of the water segment." USEPA's causal assessment manual cites physical habitat as a leading cause of impairment in streams on 303(d) lists and recommends that, in all cases where physical habitat is evaluated, stream size and channel dimensions, channel gradient, channel substrate size and type, habitat complexity and cover, vegetation cover and structure, and channel-riparian interactions should all be considered before making a decision. Physical habitat conditions are not referenced in the LOEs for the benthic</p>

		<p>community effects listings in the preceding table, although physical habitat data collection is a standard part of bioassessment monitoring and reporting. Ultimately, benthic community impairments in concrete-lined channels should be evaluated for potential listing in Category 4c of the 305(b) integrated report, instead of on the 303(d) list of segments requiring a TMDL. The USEPA Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act (IRG) states: "Circumstances where an impaired segment may be placed in Category 4c include segments impaired solely due to lack of adequate flow or to stream channelization." As part of its statewide Biostimulatory-Biointegrity Project, in recognition that it may not be appropriate or productive to apply a single set of benthic community condition expectations to streams in pristine and developed landscapes, the State Board is currently employing SCCWRP and CDFW to develop expectations for benthic community condition for developed landscapes using the CSCI and the ASCI. The probability that concrete-lined channels in highly urbanized settings will be candidates for alternative</p>

		<p>benthic community endpoints is illustrated by language from the Work Plan: “In some streams, direct channel modifications (e.g., bank armoring) may also limit opportunities to sustain highqualityecological conditions for aquatic life. In these highly developed settings, the large number of linked stressors mayprevent a stream from supporting its beneficial uses or attaining high scores on indices of biological condition. Often, these stressors are difficult to mitigate or remove under the traditional mechanisms available to the Water Boards. In these circumstances, the range of CSCI and/or ASCI scores may be constrained, but targeted restoration could improveconditions. Key technical questions underpinning the range of options and prioritization of management actions for wadeable streams along the continuum from undeveloped to highly developed landscapes found within California are: For which streams is biological integrity constrained by development in the catchment? How can they be identified and mapped? What are the ranges of biological conditions these developed landscapes can support?” (Mazor et al. 2017; emphasis added)The following waterbody segments are concrete lined or directly downstream of</p>

		<p>3.9 of the Listing Policy states:“A water segment shall be placed on the section 303(d) list if the water segment exhibits significant degradation in biological populations and/or communities as compared to reference site(s) and is associated with water or sediment concentrations of pollutants including, but not limited to chemical concentrations, temperature, dissolved oxygen, and trash.” [Emphasis added.]While it is commonly assumed that the SCIBI inherently accounted for reference conditions, the reference conditions used to develop the SCIBI were not representative of the low-elevation/low-gradient streams commonly found in the alluvial plains of the Los Angeles Region. It was developed using data from 275 sites, ranging from Monterey County to the Mexican border, but not a single reference location represented low-elevation and low-gradient streams. The reaches listed in the table above are extremely low gradient, low-elevation water bodies, and thus the SCIBI does not adequately define relevant reference conditions. Furthermore, the reference conditions used in the SCIBI represent a less restrictive definition of the reference condition than that which was deemed adequate as part of the State’s</p>

		<p>Reference Condition Management Program. The lead scientist for development of the SCIBI, Dr. Peter Ode, has acknowledged the limitations on application of the SCIBI. In a recently published paper regarding a study examining the SCIBI relative to other benthic macroinvertebrate bioassessments, he concluded that the SCIBI did not adequately address reference conditions in low-elevation sites, stating that the SCIBI was “not completely effective at controlling for an elevation gradient.” Dr. Ode was also the coauthor of a March 2009 report on recommendations for development and maintenance of a network of reference sites to support biological assessment of California’s wadeable streams.¹⁰ This report describes recommendations made by a technical panel of experts on bioassessment, including experts from the California Department of Fish and Wildlife, Southern California Coastal Water Research Project (SCCWRP), USEPA Region 9, and various universities. The technical panel laid out a number of steps that would be necessary to develop a network of adequate reference sites for implementation of criteria for bioassessments. They note that adequate reference sites have not been identified in</p>

		<p>southern California, stating, “human-dominated landscapes can be so pervasive in locations such as urban southern California and the agriculturally dominated Central Valley that no undisturbed reference sites may currently exist in these regions. A statewide framework for consistent selection of reference sites must account for this complexity.”In 2010, as part of its project to develop a statewide Biointegrity Policy, the State Board abandoned use of the SCIBI and other regional IBIs, and funded development of the statewide CSCI (Mazor et al., 2016). The CSCI addressed at least some of the problems with the SCIBI through its use of a modeled reference condition as opposed to a regional reference pool. Starting in late 2016, the State Board began funding the development of a “companion” Algal Stream Condition Index (ASCI). The State Board is developing expectations for benthic community condition using both the CSCI and the ASCI which will be incorporated in a statewide Biointegrity Assessment Implementation Plan. The Staff Conclusions associated with the new listings in the preceding table do not acknowledge that the data used to support the new listings were SCIBI scores. Further, the Staff Conclusions for all of the</p>

		<p>arbitrary statistical criterion (two standard deviations below the mean reference site score). Although it was not used for the listings in the table above, Regional Board staff have also used a CSCI score of 0.79 as a listing threshold for other reaches. However, a CSCI threshold of 0.79 is also based on an arbitrary statistical criterion (10th percentile of the reference calibration site scores; Mazor et al. 2016), and is not an adopted water quality criteria. The State Board is not pursuing use of arbitrary statistical cutoffs, such as reference population percentiles, to identify benthic community impairment going forward. As outlined in the November 2016 Work Plan¹², the State Board is using a Biological Condition Gradient Expert Synthesis approach to relate ranges of biological condition scores to community condition. Using this approach, a team of experts uses taxonomic metrics to assign degrees of biological condition to test sites while being blind to the degree of anthropogenic stressors present at the sites. In addition, the analysis is blind to the relationship between site scores and statistical distributions of overall datasets or reference datasets. Insufficient data are available to meet the listing requirements. Notwithstanding the previous issues, several</p>

	10.14	<p>Section 3.9 of the Listing Policy titled “Degradation of Biological Populations and Communities” states “A water segment shall be placed on the section 303(d) list if the water segment exhibits significant degradation in biological populations and/or communities as compared to reference site(s) and is associated including but not limited to chemical concentrations, temperature, dissolved oxygen, and trash...Association of chemical concentrations, temperature, dissolved oxygen, trash, and other pollutants shall be determined using sections 3.1, 3.2, 3.6, 3.7, 6.1.5.9, or other applicable sections.” As such, listing a waterbody for benthic community effects does not only require LOEs that support significant degradation in biological populations and/or communities. LOEs that support an association with water or sediment concentrations of pollutants must also be provided for a waterbody to be listed for benthic community effects. The Listing Policy is explicit that the same conditions which must be met to make a determination that water quality standards are being exceeded must also be met to make a determination that an association with water or sediment concentrations of pollutants is present. In one instance, an</p>	<p>See response to comment 10.07. This decision has been changed from List to Delist as there is insufficient information to determine an associated pollutant per Section 3.9 of the Listing Policy.</p>	Yes

	10.15	<p>The City of Los Angeles (and City of Burbank) have installed and implemented nitrification/denitrification (NDN) treatment processes at three water reclamation plants in the LA River watershed. The City of Los Angeles has spent approximately \$75 million to construct these advanced treatment facilities to address ammonia (in addition to nitrate and nitrite) at both the Los Angeles-Glendale Water Reclamation Plant (LAGWRP) and Donald C. Tillman Water Reclamation Plant (DCTWRP), and spend approximately \$6 million per year to operate those facilities. Through the installation and implementation of NDN treatment facilities and process optimization by the City of Los Angeles (and City of Burbank) water quality has improved significantly for ammonia (and for nitrogen as a whole). In fact, the quality of the water in the LA River watershed has been demonstrated to be fully attaining the applicable water quality objectives for ammonia since completion of NDN at all three WRPs (LAGWRP, DCTWRP, and Burbank WRP). These findings are supported in the fact sheets. Because NDN represented the implementation of management practices that have resulted in a change in the water body segments listed downstream</p>	<p>The commenter made a similar comment to the Los Angeles Water Board. The Los Angeles Water Board revised response is as follows: "Los Angeles River Reach 3 includes three LOEs (85894, 86019, and 2507); 85894 and 86019 were grouped to make the assessment that there were 33 exceedances out of 111 samples total. Los Angeles River Reach 3 and Los Angeles River Reach 5 are being addressed by the Los Angeles River Nutrient TMDL. Bull Creek, Wildlife Lake, and Balboa Lake have been updated in the CalWQA database to reflect that they are being addressed by the Los Angeles River Nutrient TMDL. Los Angeles River Reach 4 is meeting the criteria based on the available data. Data collected after the NDN processes were put in place may show that the water quality in these reaches has improved; this update to the 303(d) list is only considering data submitted by August 30, 2010. Los Angeles Water Board staff encourages the commenter to enter all the relevant data into CEDEN in preparation for the next listing cycle that includes the Los Angeles Region." (Response to comment 11.26.) Delisting these waterbody-pollutant combinations may be appropriate based on changes to the environment as a result of regulatory management actions described by the commenter. However, Section 4.1 of the Listing Policy requires data to support such a finding and to show that beneficial uses are fully supported. The Los Angeles Regional Water Board can examine more recent data if submitted into CEDEN and recommend a high priority listing or delisting off-cycle consistent with Section 6.1.2 of the Listing Policy. Furthermore, as clarified by the Los Angeles Water Board, the waterbody-pollutant combinations assessed in Decisions 32974, 32567, 60597, 66374, and 60378 are identified within Integrated Report Category 4a as being addressed by the U.S. EPA approved Los Angeles River Nutrient TMDL. The waterbodies as a whole however are identified as Category 5 due to</p>	No

		<p>quality of the water in the LA River watershed has been demonstrated to be fully attaining the applicable water quality objectives for ammonia. The message from the City and the Regional Board should be that the cooperative process worked, and that the applicable water quality standards are now being attained. Instead, the 303(d) list does not reflect the water quality improvement. Given that the addition of the NDN treatment process to the WRPs has eliminated exceedances, the timeframe used to evaluate impairments due to ammonia should be made consistent with the timeframe used in LA River Reach 4 which would result in the same listing decision for each water body (i.e., Delist from 303(d) list [being addressed by USEPA approved TMDL]). Requested Action: Revise the following Decision IDs to a finding of nonimpairment and remove listings for ammonia from Category 5 (Appendix B) because the data used to conclude that the applicable water quality standards for the pollutant were exceeded are no longer representative of ammonia concentrations observed within the water bodies due to the installation and operation of NDN:- Los Angeles River Reach 3 Decision ID 32947- Los Angeles River Reach 5 Decision ID</p>

Commenter	No.	Comment	Response	Revision
	12.03	<p>The Basin Plan clearly states that there are no water quality objectives for waterbodies designated REC-2 Only.6 The 409 cfu/100mL objective cited in the draft Integrated Report is the Single Sample Maximum (SSM) which applies only to waterbodies designated REC-1 and assigned to Tier C or Tier D (as described in Chapter 5 of the Santa Ana Region's Basin Plan). It does not apply to waterbodies where the REC-1 use has been properly removed through a Use Attainability Analysis that has been approved by USEPA - such as the Santa Ana Delhi Channel and Reach 1 of Cucamonga Creek.</p>	<p>See response to comment 12.02. The evaluation guideline of 409 cfu/100mL has been changed to 1104 cfu/mL, and Decisions 34154 and 44427 have been changed from Do No Delist from the 303(d) list (TMDL required list) to Delist from the 303(d) list (TMDL required list). However, Table 4-pio of Chapter 4 of the Santa Ana Basin Plan does not specify that there are no objectives for REC-2 only waterbodies, but rather that Chapter 5 of the Santa Ana Region Basin Plan must be used to derive the correct antidegradation targets for a waterbody. Chapter 5 of the Santa Ana Basin Plan outlines the derivation procedure which was carried out on Santa Ana Delhi Channel and Cucamonga Creek Reach 1 as part of the Use Attainability Analysis (UAA) that was conducted to dedesignate the REC-1 beneficial use from those waterbodies. Antidegradation targets for Cucamonga have been calculated, and are undergoing the approval process. This waterbody-pollutant combination is being proposed for removal from the 303(d) List See also response to comment 12.10.</p>	Yes

Committer	No.	Comment	Response	Revision
	12.04	Waterbodies designated REC-2, but not REC-1, must continue to comply with the state Antidegradation Policy (Res. 68-16). To this end, the Regional Board has developed and approved Antidegradation Targets to implement this policy. However, the Antidegradation Targets are not water quality objectives and exceedances of these targets are not evidence that the beneficial uses are impaired. EPA acknowledges that antidegradation policies "may not lend themselves to attainment determinations" like those made in conjunction with developing the 303(d) list.	U.S. EPA's guidance is not binding on the State Water Board. U.S. EPA's guidance concerning appropriate placement in the Integrated Report categories are recommendations to the States and not requirements. The antidegradation targets provided in Chapter 5 of the Santa Ana Regional Basin Plan are intended to ensure that the REC-2 beneficial uses are maintained and not degraded as a result of removing the REC-1 beneficial use. The Antidegradation Targets are also calculated to protect downstream beneficial uses. As such it is appropriate for the State Water Board to apply the antidegradation targets for assessment of the REC-2 beneficial use.	No

Portion of the 2014 and 2016 California Integrated Report
Comment Deadline: 12:00 noon on July 10, 2017

Commenter	No.	Comment	Response	Revision
	12.11	In the event that the State Board elects to over-ride the Regional Board's determination and keep these stream segments on the 303(d) list, both should be re-assigned from Category 5 (TMDL required) to Category 2 because there is "insufficient information to determine beneficial use support."	The following change has been made: Santa Ana Delhi Channel is being proposed for placement in Integrated Report Category 1. No change has been made to Cucamonga Creek Reach 1 (Valley Reach). . In California, waterbody-pollutant combinations are assessed consistent with the Listing Policy to determine the overall beneficial use support rating. That overall beneficial use support rating is used by the California Water Quality Assessment Database (CalWQA) to determine the overall Integrated Report Category for the waterbody as a whole. This methodology is described on page 22 and 23 of the Staff Report.. Therefore, although the listing associated with bacteria in Cucamonga Creek Reach 1 (Valley Reach) is proposed for removal, the waterbody will remain in Integrated Report Category 5 due to other pollutant impairments.	No

Lake Elsinore TMDL Task Force Representative/Commenter: Timothy Moore	13.01	The Task Force recently learned that DDT was applied to Lake Elsinore in the spring of 1954 by the California Bureau of Vector Control. At the time, the region was undergoing a prolonged drought and state authorities sprayed DDT directly on the dry lakebed to eradicate a severe gnat infestation.2 Sixty years ago the harmful side-effects were not yet known and DDT was widely used. It was also applied in Blue Lakes (1949) and Clear Lake (1954).	Comment noted.	0

Commenter	No.	Comment	Response	Revision
	13.02	Task Force recommends that the Source section of the 303(d) Listing Decision be revised to indicate that: "DDT was applied directly to lakebed sediments by the California Bureau of Vector Control in 1954."	No change has been made. In past cycles, potential sources were identified during the listing process using staff's best professional judgement. This has been shown to result in inconsistencies that made source identification unreliable. As a result, the potential sources are only added to fact sheets after a formal source analysis has been completed. This is typically completed as part of TMDL development, but can be completed outside of a TMDL as well. This methodology of source analysis standardizes and strengthens the information contained in the section. Although the documents submitted by the commenter are helpful, they do not contain enough detail or have a large enough scope to be considered a source analysis, and therefore will not be added as a potential source at this time.	0

	13.03	<p>The Task Force also recommends that Lake Elsinore be placed in Category 4b of the 303(d) list because "another regulatory program is reasonably expected to result in attainment of the water quality standard within a reasonable, specified time frame." DDT has been banned from use in the United States since 1972. There are no controllable discharges of DDT and, for reasons discussed below, the existing federal prohibition is adequate to ensure attainment of water quality standards.</p>	<p>No change has been made. This comment was addressed by the Santa Ana Regional Water Quality Control Board's response to a similar question in regards to Big Bear Lake. Response to comment 1.007: "The water quality assessment consists of five categories, with additional subcategories. Big Bear Lake is impaired by DDT and we propose to include it in Category 5 for polluted waters. Category 4b is for polluted waters that have a pollution control program. DDT has low water solubility and metabolites may be resuspended within the lake or mobilized and enter the lake through such actions as erosion, recreation, or development. The federal ban of the use of DDT is not sufficient itself to be considered a pollution control program." This response adequately addresses the comment.</p>	0

General Public, Friends of the Agua Hedionda Lagoon Representative/Commenter :Mary Anne Viney	14.01	The basis for concluding that small samples of sediment taken at only 2 locations (one in the outer and one in the middle basin of the lagoon) are representative of, and fully describe the level of toxicity in the outer and middle sections of the lagoon, in light of the purported differences in drainage and tidal flushing etc., throughout the lagoon isn't clear. With such a paucity of samples, where does one draw an accurate line between the half with sediment toxicity and the half without?	From the Region 9 2014 Integrated Report Responses to Comments (comment 2.44, page 36):“List eastern Agua Hedionda Lagoon for toxicity. The San Diego Water Board agrees that the Agua Hedionda Lagoon (AHL) should be split into multiple waterbody segments. Based on the available data, AHL has been split two portions, with the outer and the middle lagoons as one portion (western AHL) and the inner lagoon as a separate portion (eastern AHL). Section 6.1.5.4 of the Listing Policy requires the Regional Board to “identify stream reaches or lake/estuary areas that may have different pollutant levels based on significant differences in land use, tributary inflow, or discharge input” and aggregate the data by appropriate reach or area. The splitting of the AHL to two portions is based on the greater tidal flushing at the outer and middle lagoon compared to the inner lagoon and different water chemistry characteristics observed in the two portions. Note that the 2014 cycle of assessment only includes data collected prior to August 30, 2010. Therefore, the Bight 2013 data is not eligible to be included in this cycle of assessment. However, even if the Bight 2013 sediment data were included with the pre 2010 data, the final exceedance rate of toxicity in the eastern AHL will be three over ten, justifying placing the eastern AHL on the 303(d) list for toxicity impairment. As a result, the AHL is split into the western and the eastern sections, and only the eastern AHL will be placed in Category 5 for toxicity impairment.”The lagoon is segmented into 2 sections but the data collected was from 5 sites in LOE 72909 and from LOE 72914 “Three samples were collected to test for toxicity. Two of the three samples exhibited statistically significant toxicity. The toxicity tests included survival of Eohaustorius estuarius. Each sample is a sediment composites from three different sites.”In total, 8 sites were sampled.	0

	14.04	The lagoon receives sediment-laden run-off, with chemicals/ bacteria bound to the sediment, from a variety of sources including: municipal and industrial storm drains, inadequate tidal flushing and sandbar formation as explained above, and the Agua Hedionda Creek, which empties into the eastern basin of the lagoon, as well as from highways and the railroad which intersect the lagoon, and Carlsbad streets/ lands. In light of these impacts to beneficial uses, sedimentation is a potential pollutant of concern.	Data exists for sediment toxicity in both Agua Hedionda Creek (LOEs 26225 and 72894) and Agua Hedionda Lagoon (LOEs 72909 and 72914).	0

	14.05	For a long time, until about 2010, the lagoon had been listed for sedimentation and bacteria. A document used to justify de-listing contained the following statement which seemed to help bolster the sedimentation de-listing decision: "The Encinas Power Station continues to monitor the sediment build up in the outer, middle, and inner lagoon." However, this monitoring has apparently never been done.	Decision 6360 in 2010 to delist the Agua Hedionda Lagoon was based on the available data using the Listing Policy to determine listing status based on appropriate numbers of exceedances out of number of samples. The decision to delist was not based on the continuing monitoring by the Encinas Power Station. (???) The continuing monitoring issue might be better addressed at the regional level.	0

San Diego Clean Water Authority Representative/Commenter: Toby Roy	15.01	The Water Authority's comments are limited to a proposed change to a delisting recommendation submitted by the San Diego Water Board for the San Diego region. Although the Water Authority agrees with the San Diego Water Board's recommendation to delist, our justification for delisting is different from the San Diego Water Board's. We request that the State Water Board approve the San Diego Water Board's original recommendation to delist the San Vicente Reservoir for nitrogen based on a weight of evidence approach.	The San Diego Regional Water Board adequately responded to this comment as follows: "The San Diego Water Board has reviewed the data and information submitted by the San Diego County Water Authority from this reporting cycle and has concluded that, pursuant to Sections 4.11 of the Listing Policy, the waterbodies do not warrant listing as impaired for total nitrogen related to biostimulation as specified in the Basin Plan: "Inland surface waters, bays and estuaries and coastal lagoon waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growths cause nuisance or adversely affect beneficial uses." As site-specific criteria have not been developed for all reservoirs in the San Diego Region, the San Diego Water Board evaluated the situation-specific weight of evidence provided by the San Diego County Water Authority (section 4.11 of the Listing Policy). These included:- Evidence regarding phosphorous as a limiting nutrient. This data is already in the record.- Turbidity data for the reservoirs in the form of Secchi disk readings as provided in the comment letter- Chlorophyll a concentrations in the reservoirs above the natural hypolimnion. Cumulatively these data present a weight of evidence that indicates the reservoirs should not have been listing during the prior reporting cycle(s). Thus delisting the reservoirs is warranted as there was no evidence of biostimulation. While the data submitted by the commenter does provide a weight-of-evidence for delisting and/or not listing, it should be noted that pursuant to Section 6.1.5.3 of the Listing Policy, available data from the current and past Integrated Report cycles is not temporally representative of current conditions within these reservoirs. Thus, while the weight-of-evidence supports not listing or de-listing, there is insufficient information available to properly assess the current condition of these reservoirs during this reporting	No

			<p>cycle. In 2007, as a result of the reservoirs' imported source water, Dreissenid mussels ("quagga") were introduced, resulting in drastic changes in reservoir ecosystems and management, including the drafting of management response plans in 2009. The impact of Dreissenid mussels on reservoir ecosystem dynamics, especially nutrient pools and cycling, is dramatic and well documented in the scientific literature, with mussels completely altering the physical, chemical, and biological processes within systems. Impacts of Dreissenid mussel colonization can vary depending on reservoir dynamics, but typically results in the stripping of nutrients from the phytoplankton and promotion of macrophytes due to increased water clarity. Thus, data collected prior to Dreissenid introduction and management for listing purposes should be considered insufficient to warrant continuation of impairment listings and/or determination of new listings for nitrogen, pH, and color. These pollutants should be re-assessed during future cycles (or "off-cycles") as appropriate when data is available."</p>

	15.03	<p>Key reasons to delist the San Vicente Reservoir for nitrogen, which are consistent with the weight of evidence approach, are summarized below and discussed in detail in this letter: 1. The original nitrogen listing was incorrectly based on a water quality objective for biostimulatory substances2. Characteristics of the reservoir as dominated by imported water3. Data on water clarity and chlorophyll a during 2005-2006 submitted by the City of San Diego should be evaluated4. Changed conditions regarding the San Vicente Dam Raise project, which was completed in 2015</p>	<p>1. The water quality objective for biostimulatory substances was correctly applied according to the Regional Board Basin Plan. The Basin Plan states:“Analogous threshold values have not been set for nitrogen compounds; however, natural ratios of nitrogen to phosphorus are to be determined by surveillance and monitoring and upheld. If data are lacking, a ratio of N:P = 10:1, on a weight to weight basis shall be used”In this case, there were 32 exceedances out of 37 samples where the ratio was greater than 10:12. The argument of imported water dominating the characteristics of the reservoir is supported by 3. While the weight-of-evidence supports not listing or delisting, there is insufficient information available to properly assess the current condition of the reservoir during this reporting cycle since Dreissenid mussels (“quagga”) were introduced to the reservoirs’ imported source water. This resulted in a drastic change in the reservoir ecosystem and management.4. The Dam Raise project was completed in 2015. Since the data cutoff for this listing cycle was August of 2010, the data from the project will be taken into consideration during the next listing cycle.</p>	0

	15.06	Data presented within the December 2009 Integrated Report demonstrates the dominance of phosphorus-limiting conditions during 2005-2006. Phosphorus was detected in six of the 37 San Vicente Reservoir samples during 2005-2006, but all of these detections occurred during the first 90 days of this two-year period. N:P ratios in San Vicente Reservoir were significantly in excess of 10:1 in an overwhelming majority of the samples collected during 2005-2006.	Please see response to comment 15.03(1) and 15.03(3).	0

	15.09	<p>The project to raise the San Vicente Reservoir dam was completed in 2015, which increased the reservoir's capacity from 90,000 to 242,000 acre-feet. This new capacity is owned by the Water Authority and is used for storing water (imported water) for use in dry years or emergency supply. With this expansion, imported water comprises the majority of the volume stored in San Vicente Reservoir supply. Because nutrient loads from local runoff are diluted into a considerably larger volume of water, nutrient concentrations within San Vicente Reservoir are projected to decrease from historic values.⁸ Virtually all nitrogen loads into the reservoir originate with imported water delivery and storage.</p>	See response to comment 15.01. 	15.11	<p>The reservoir thermally stratifies during spring, summer, and fall months. As shown in Table 2, Secchi disk values in 2005-2006 show a high degree of water clarity during all conditions. Observed Secchi disk values in San Vicente were typically on the order of 14 feet. While 90th percentile Secchi disk values were on the order of 6-7 feet, these lower values typically occurred in January/February, and are indicative of storm and climatic conditions rather than algae production. In general, water clarity during 2005-2006 tended to be highest (e.g. clearest) during summer months, when algal growth tends to be higher. This data substantiates the lack of adverse biostimulation effects in these reservoirs and should be considered as part of the weight of evidence approach to delist for nitrogen.</p>	Comment noted. 	15.16	<p>The City of San Diego has committed to implementing a large-scale potable reuse reservoir augmentation program called Pure Water San Diego, which could involve directing purified water to San Vicente Reservoir as part of a later phase. Delisting for nitrogen could remove a potential future regulatory obstacle to permitting potable reuse. If the San Diego Water Board required that total nitrogen concentrations be maintained at or below 0.25 mg/l in imported water reservoirs, implementation of reservoir augmentation could be rendered infeasible, as compliance with such a 0.25 mg/l nitrogen standard cannot be achieved even with the highest level of treatment proposed with draft regulations being considered by the Division of Drinking Water.¹⁰ As stated earlier, compliance could also not be achieved using imported water since total nitrogen concentrations in imported water supplies also typically exceed 0.25 mg/l.¹¹ Concentrations of phosphorus are projected to be lower in the purified water supply than the imported water supply, and along with total dissolved solids and other dissolved minerals concentrations that are lower than the existing imported supply, offers the potential for improving reservoir</p>	<p>The Water Quality Objective for Biostimulatory Substances within the San Diego Basin Plan states: "Threshold total phosphorus (P) concentrations shall not exceed 0.05 milligrams per liter (mg/l) in any stream at the point where it enters any standing body of water, not 0.025 mg/l in any standing body of water. A desired goal in order to prevent plant nuisance in streams and other flowing waters appears to be 0.1 mg/l total P. These values are not to be exceeded more than 10% of the time unless studies of the specific water body in question clearly show that water quality objective changes are permissible and changes are approved by the Regional Board." State Board is open to receiving and assessing data during the appropriate data solicitation period to whether or not biostimulation can be achieved through a limited-nutrient approach with high N:P ratios.</p>	0

County of Tuolumne Representative/Commenter: Randy Hanvelt	16.01	The Board of Supervisors expressed concern to the Central Valley Regional Water Quality Control Board regarding its use of old data and its apparent arbitrary cutoff date for data submission. This Board of Supervisors continues to hold the same concerns as your Board considers listing these same creeks as impaired.	From the California Regional Water Quality Control Board, Central Valley Region Resolution R5-2016-0083, point 10: "The State Water Board directed that, due to the volume of data received during the 2010 data solicitation period, only water quality data received through 30 August 2010 were to be evaluated for the 2012, 2014, and 2016 listing cycles." The age of the data is not pertinent as the listing is based on all available data as a whole. All years past are compiled with all years since and combined into a dataset for every listing cycle and decision. Delisting conditions can be found on pages 14 and 15, and tables 4.1 and 4.2 of the Listing Policy.	0

Commenter	No.	Comment	Response	Revision
	16.06	<p>The Board of Supervisors wholeheartedly agrees with the statement in Resolution R5-2016-0083 that the August 2010 solicitation deadline resulted in consideration of data that was not fully representative of the most current conditions for Central Valley surface waters. With this in mind, the Board of Supervisors requests your Board consider a new process by which water bodies would be listed as impaired in the future. It is clear that using a cutoff date that is so far removed from the listing consideration date is not effective.</p>	<p>From the California Regional Water Quality Control Board, Central Valley Region Resolution R5-2016-0083:“10. The State Water Board directed that, due to the volume of data received during the 2010 data solicitation period, only water quality data received through 30 August 2010 were to be evaluated for the 2012, 2014, and 2016 listing cycles. 11. Because the data solicitation period for this Integrated Report closed in August 2010 (over six years ago), the assessment of conditions may not entirely reflect the status of each surface water body at this time. 12. The State Water Board supports the Regional Water Boards in conducting CWA Section 305(b) and/or 303(d) List update(s) “off-cycle”, before their next regularly scheduled Integrated Report periods. To be efficient, off-cycle updates should be limited to priority waterbodies, pollutants, or combinations thereof as identified by the Regional Water Boards, with reallocation of resources as appropriate.”Additionally, regarding timeliness, improvements to the approval process are being implemented as seen in the California Regional Water Quality Control Board, Central Valley Region Resolution R5-2016-0083:“8. By letter dated 15 July 2013, the State Water Board informed the USEPA of its strategy for a more efficient and successful CWA 303(d)/305(b) Integrated Report process for California, which divides California into thirds by Regional Water Quality Control Boards (Regional Water Boards). The State of California Integrated Report now occurs on a rotating basis for three Regional Water Boards at once. The Central Valley Water Board is in the 2014 listing cycle group.”</p>	0

Commenter	No.	Comment	Response	Revision
	17.05	<p>I. Incorrect Category 5A ListingsA. Lack of Proper Temporal RepresentationThere are many instances where the data to support the listed pollutant lack proper temporal representation. Section 6.1.5.3 of the State Water Resources Control Board (SWRCB) Listing Policy1 states that: “Samples should be representative of the critical timing that the pollutant is expected to impact the water body. Samples used in the assessment must be temporally independent. If the majority of samples were collected on a single day or during a single short-term natural event (e.g., a storm, flood, or wildfire), the data shall not be used as the primary data set supporting the listing decision.” [Emphasis added] All of the proposed Category 5 pollutants listed in Table 1 rely on data collected from a single sample date. This directly violates the Listing Policy. For instance, the “Temporal Representation” entry in the Fact Sheet for Los Sauces Creek selenium listing [Line of Evidence (LOE) 86035] states “Data was collected on a single day 6/8/2006”. Because there is no temporal resolution for these waterbody-pollutant combinations, the proposed new listing should be removed.</p>	<p>Temporal representation as described in the Listing Policy does not apply to fish or shellfish tissue. This comment was addressed by the comment sent to the Los Angeles Regional Board by the City of Los Angeles. Comment 11.21 states that “while the Listing Policy requires that samples be spatially and temporally independent, fish are not static; they move throughout a waterbody and accumulate pollutants in tissue over time. Therefore the data are by their nature temporally independent.”Additionally response comment 11.22 from the same letter states that “In addition, the fact that tissue concentrations represent the accumulation of pollutants over a time period of years, and each fish is a different age and will have moved differently through the environment, provides independence of the tissue sample.”The responses above adequately address concerns about proposed listings based on tissue for pollutants in Table 1. Proposed listings for pollutants based on macroinvertebrate surveys, water, and sediment will be reviewed for proper temporal representation and responded to in the response to comment 17.12.</p>	No

Commenter	No.	Comment	Response	Revision
	17.06	<p>The County made this comment previously in their March 30th, 2017, letter and in response the Los Angeles Water Board stated: "Because the data collected are temporally independent, it is appropriate to assess the data as individual samples even though they were collected at the same site." This response implies that the Los Angeles Water Board did not understand the County's original comment since these listings definitively lack temporal resolution by relying on a single sample day. Using a single sample day to support a new listing is in direct contradiction to the Listing Policy.</p>	See response to comment 17.05.	0

Proposed Clean Water Act Section 303(d) List of Water Quality Limited Segments (303(d) List)
Portion of the 2014 and 2016 California Integrated Report
Comment Deadline: 12:00 noon on July 10, 2017

Committer	No.	Comment	Response	Revision
	17.07	<p>The Los Angeles Water Board went on to respond to Javon Canyon and Los Sauces Creek selenium listings with the following statement: “Fish were collected from two sites on a single day. Because the data collected is spatially independent, it is appropriate to assess the data as individual samples even though they were collected on the same date. As the data support a listing decision, the waterbody pollutant combination should be listed until more data supporting a delisting decision become available. In addition, fish are not static; they move throughout a waterbody and accumulate pollutants in tissue over time. Therefore, the data are, by their nature, spatially and temporally independent.” The County finds this response insufficient.</p>	0	0

Commenter	No.	Comment	Response	Revision
	17.34	<p>Based on a review of the available data, all the observed toxic samples occurred prior to 2009. Of the 8 exceedances, 3 occurred in 2000/2001 and the rest were in 2006, 2007 and 2008. In the 2006-2008 time period, toxicity was commonly observed due to chlorpyrifos and diazinon which were subsequently restricted. Toxicity in many watersheds has been significantly reduced as a result of these use modifications. The available data shows that no samples exceeded after 2008, indicating that those pesticides or another cause that is no longer present, were the cause of the toxicity. Because of the transient nature of toxicity and the potential that the causes of the toxicity are no longer present, exceedances from prior to the pesticide use bans should not be used as the basis for a listing. The more recent samples since the pesticide use restrictions should be used as a basis for evaluation.</p>	See response to comment 20.24.	No

	17.37	C. Benthic Community Effects Listing are Based on Flawed Analyses and Should Be RemovedThe benthic community effects listings are based on a metric which has since been deemed arbitrary and inappropriate.	If a water body has a designated aquatic life Beneficial Use (such as WARM), it is appropriate to evaluate whether or not that Beneficial Use is being supported as part of the Integrated Reporting process. State Water Board supports maintaining listings based on the SCIBI and CSCI scores as they are consistent with State policy and have been assessed relative to appropriate reference sites. At this time, the CSCI and IBI (where CSCI is not available) are the best measures of biologic integrity in California streams and it is appropriate to use both IBI and CSCI scores in 303(d) listing decisions. As the science progresses, improved methods may supplant older methods and the 303(d) list will be updated, as appropriate, as that occurs. The use of the SCIBI and CSCI for 303(d) listing was done in accordance with Section 3.9 and 6.1.5.8 of the Listing Policy with biological data and impairment related to associated pollutants and/or pollution.	No

	17.43	D. There is No Demonstration that High pH is a Result of Waste DischargeThe waterbodies listed for high pH do not appropriately demonstrate that the high pH was a result of waste discharge as required in the Basin Plan.	From the Los Angeles Water Board’s Revised Response to Comments on the Draft 2016 303(d) List (response to comments 16.2 and 16.5): “The 303(d) list appropriately identifies the pH impairments. Analysis of sources and causes or identification of implementation measures to resolve or correct the impairment are not completed as part of the Integrated Report or 303(d) listing process.” Additionally, due to the large amount of data that needs to be assessed during each update of the 303(d) list, the 303(d) list data evaluations are more general. In particular, these evaluations do not include source assessments; they rely upon existing waterbody delineations without further subdivision (e.g., Santa Monica Bay); and they typically do not entail more refined analyses such as assessing data collected during wet weather and dry weather separately. As Board staff commences TMDL development, these more temporally and spatially refined data assessments are made along with a source analysis. Based on these analyses, staff may propose a finding of no impairment with a recommendation to delist during the next 303(d) cycle, or may refine the defined scope of the impairment to be addressed by the TMDL (e.g., wet weather only).No change was made to Santa Clara River Estuary, Santa Clara River Reach 1 or Oxnard Drain.	No

	17.45	<p>In Response to Comments, the Los Angeles Water Board acknowledged that there are multiple sources of water to Santa Clara River to include waste discharge but went on to state that “the relative contribution of the causes of pH exceedances is largely speculative at this time”. The County agrees that the sources are speculative at this time and because the Basin Plan criteria requires that a source be identified before a waterbody can be deemed in exceedance, the SWRCB should either provide evidence that the elevated pH was a result of waste discharge and detail that in the Fact Sheets, or, if no such evidence exists, the listings should be removed.</p>	See response to comment 17.43.	0

	17.47	<p>The temperature listing for Ventura River Reaches 1 and 2 (Estuary to Weldon Canyon) and Ventura River Reach 4 (Coyote Creek to Camino Cielo Rd) uses an evaluation guideline of 13-21 degrees Celsius (°C) as the optimum growth range for rainbow trout. However, the applicable Basin Plan objective for waterbodies designated as COLD is “For waters designated as COLD, water temperature shall not be altered by more than 5 degrees F above the natural temperature.” The Fact Sheets provide no discussion of natural temperatures or a demonstration that the temperature was raised above natural temperatures in order to exceed the objectives.</p>	<p>The evaluation guideline (Moyle,1976), provides a temperature threshold protective of the cold water beneficial use. According to the Listing Policy 6.1.5.9: “In the absence of necessary data to interpret numeric water quality objectives, recent temperature monitoring data shall be compared to the temperature requirements of aquatic life in the water segment”. The Los Angeles Regional Board does not provide a numeric objective for use in determining protection of the cold water beneficial use, and therefore a threshold protective of the beneficial use was selected from Moyle (1976).</p>	No

	17.48	<p>Moyle 1976 is referenced as the source of the evaluation guideline. Moyle 1976 was revised and expanded by Moyle 2002. Moyle 2002 states: "Rainbows are found where daytime temperatures range from nearly 0°C in winter to 26-27°C in summer, although extremely low (<4°C) or extremely high (>23°C) temperatures can be lethal if the fish have not previously been gradually acclimated. Even when acclimation temperatures are high, temperatures of 24-27°C are invariably lethal to trout, except for very short exposures (25, 26)." As such, while temperatures above 21°C may not be optimal according to Moyle 1976, Moyle 2002 clearly states that lethal temperatures are those greater than 23°C which indicates that the evaluation guideline of 21°C is more appropriately applied as a chronic guideline (necessitating the establishment of an averaging period) and 23°C is the more appropriate "not-to-exceed" guideline if used for listing.</p>	<p>A lethal temperature of 23°C is not protective of the cold water beneficial use and is therefore inappropriate to use as an evaluation guideline. The evaluation guideline selected must be protective of the cold water beneficial use of the waterbody.</p>	No

	17.49	<p>The Los Angeles Water Board's response to comments noted that the optimum range for Rainbow Trout is 13-21 degrees Celsius and therefore this is an appropriate Evaluation Guideline. The County requests that the SWRCB review the application of this guideline as a "not to exceed" value for the purposes of making listing decisions. Based on the information provided above, the County believes that the Los Angeles Water Board has misinterpreted the science behind the selected guideline when they used the range of 13-21 as a "not to exceed" threshold when the studies used to determine the guideline indicate 23°C is the appropriate "not to exceed" threshold. Using the threshold of 23°C, no samples would exceed the threshold in Ventura River Reach 4 and only 2 samples would exceed the threshold in Ventura River Reaches 1 and 2. Neither of these number of exceedances would meet the listing thresholds</p>	See response to comment 17.48.	No

California Stormwater Quality Association Representative/Commenter: Jill Bicknell	18.01	In some cases waterbodies were listed using numeric criteria that have not been adopted by the Regional Basin Plan or California Toxics Rule even though adopted numeric criteria exist. For example, in the Los Angeles Region, many of the proposed 303(d) listings for mercury were assessed with a 2006 U.S. Environmental Protection Agency (EPA) nationally recommended criterion, however, a California Toxic Rule (CTR) adopted criteria exists for mercury. No explanation was given for the use of the EPA recommended criterion over the adopted CTR value. The state should not use an EPA criterion when an existing adopted water quality objective/criteria exists.	The commenter did not provide specific decision recommendations, however, it should be noted that the mercury criteria in the CTR does not apply to fish tissue data. The human health criteria in the CTR is for water column data. It is not appropriate to apply a water column number to tissue data.	0

	18.02	<p>In other cases, there are pollutants assessed using numeric evaluation guidelines that are inconsistent within Regions or that the selection thereof deviated from the Listing Policy with no explanation provided within the Fact Sheets. Specifically, there are many pollutants that do not have applicable numeric water quality criterion and, instead, must be assessed by interpreting an applicable narrative water quality objective with an evaluation guideline per the Listing Policy. For pesticides (e.g., bifenthrin, cyfluthrin, cypermethrin) the evaluation guidelines selected have often been either inappropriate, inconsistently applied, or are generally not well documented in the Fact Sheets.</p>	<p>The Listing Policy states "The Regional Water Boards shall assess the appropriateness of the guideline in the hydrographic unit" (Section 6.1.3). Although Statewide consistency with the use of evaluation guidelines is preferred where appropriate, there is no Listing Policy requirement that evaluation guidelines be applied Statewide.</p>	0

	18.03	<p>In Region 4, there are several instances where an LC50 or threshold for individual species was used for the assessment. This is inconsistent with the Listing Policy, which states that it must be demonstrated that an evaluation guideline is “applicable to the beneficial use, protective of the beneficial use, scientifically-based and peer reviewed, and well described.” The response of a single species should only be used when it has been shown that the species is representative of the native population response to the specific pollutant. This was not demonstrated for this listing and therefore an LC50 cannot be assumed to be protective of the beneficial use and should not be used to make a listing. Another example in Region 4 occurred for two proposed malathion listing decisions with the same beneficial use that used conflicting guidelines from two different sources.</p>	<p>Numerous studies have demonstrated the correlation between toxicity test results and instream effects. During the development of the toxicity test methods, U.S. EPA performed numerous validation studies to confirm this correlation between toxicity test results and biological or ecological impairment of receiving water systems. This has also been supported by a conclusion that was reiterated in a 1995 workshop of nationally recognized WET experts (Grothe et al., 1996), including those from academia, the regulatory community, publicly owned treatment works (POTW), and industry. These experts stated that "WET testing is an effective tool for predicting receiving system impacts when appropriate considerations of exposure are considered" (Waller et al. 1996). This workgroup also agreed that "further laboratory to field validation is not essential for the continued use of WET testing." In 1999, U.S. EPA once again sought to determine whether toxicity test results correlate with instream effects (U.S. EPA 1999). In that review, deVlaming and Norberg-King evaluated a total of 77 independent studies in which toxicity tests were compared to instream, biological/ecological responses. In 74 percent of the studies evaluated, the WET test results were reliable qualitative predictors of instream impacts. The toxicity tests underestimated instream effects in 21 percent of the studies, and results from only five percent of the studies were inconclusive or mixed. Moreover, a court decision found in the agency's favor on this issue in Edison Electric Institute et al. v. Environmental Protection Agency, (D.C. Cir. 2004) 391 F.3d 1267. The petitioners in this case claimed that U.S. EPA failed to establish the presence of "representativeness" (i.e. the ability of test results to predict instream effects accurately) for several of the toxicity tests, particularly with regard to Western state waters, which differ chemically from their Eastern counterparts. U.S. EPA responded by</p>	0

			<p>pointing to the results of numerous studies on this subject conducted throughout the 1990s. These studies support the representativeness of the toxicity test methods in general, and several demonstrate representativeness with regard to particular Western waters. (See U.S. EPA, "A Review of Single Species Toxicity Tests: Are the Tests Reliable Predictors of Aquatic Ecosystem Community Responses?" 47-50 (July 1999)).It is unrealistic to require correlation studies on every stream in the nation. U.S. EPA took the sensible approach of relying on sampling techniques to draw general conclusions, while leaving some implementation details to local entities. (See Am. Iron & Steel Inst. v. EPA (D.C. Cir. 1997) 115 F.3d 979, 1005). Pursuant to the CWA section 1342(a), states retain discretion, subject to U.S. EPA guidance and recommendations, to set their toxicity thresholds in order to compensate for local conditions at the permitting stage. (See 40 C.F.R. § 122.44(d)(1)(iii)).References:Grothe DR, Dickson KL, Reed-Judkins DK, editors. 1996. 	18.05	<p>As stated in the Listing Policy “the states are required to assemble and evaluate all existing and readily available water quality-related data and information to develop the list.” Despite this, there are multiple examples where large datasets from NPDES permit or Total Maximum Daily Load (TMDL) monitoring data are not assessed. For example, NPDES water quality data collected from 2002 to 2008 at approximately 70 sites in Santa Clara Valley creeks including total and dissolved metal concentrations and aquatic and sediment toxicity results, submitted to the San Francisco Bay Regional Water Board, were not included in the Region’s 303(d) List analysis as noted in a stakeholder comment letter.³ A similar omission occurred in the Calleguas Creek Watershed in Region 4 where monitoring data from five effective TMDLs were not included in analyses despite the annual submission of monitoring reports to the Regional Water Board as mentioned in the Calleguas Stakeholder’s comment letter.⁴ By not including data collected via NPDES permit and TMDL monitoring, the 303(d) list may mischaracterize water quality conditions in local receiving water bodies.</p>	<p>Los Angeles Water Board staff considered all readily available data and information in the administrative record in the development of the 2016 California Integrated Report. The State Water Board defined readily available data as those data submitted during the 2010 public data solicitation period, which began on January 14, 2010 and concluded on August 30, 2010. State Board staff rely on section 6.1.2 of the Listing Policy in determining "all readily available data". For the 2010 data solicitation, an additional outreach effort was made to include NPDES data. All NPDES discharges were sent notices to submit their data for the purpose of developing the Integrated Report. This was not required, but they were all given the opportunity to submit data for this process. Additionally, State Water Board staff relied on Regional Boards to submit their internal program data as part of the data solicitation. If the Regional Board did not make State Board aware of a particular data set, it was not included in the assessment.</p>	0

Commenter	No.	Comment	Response	Revision
	18.06	<p>Many stormwater stakeholders have been informed by State and Regional Water Board staff that NPDES or other similar data were not included in the listing assessment because they were not entered into CEDEN (California Environmental Data Exchange Network – the central database used to aggregate waterbody information in California). However, the Listing Policy defines “readily available data and information” as data that can be submitted to CEDEN or its successor database, however, “if CEDEN is unable to accept a particular subset of data and information, the State Water Board or the Regional Water Board will accept that data and information if it meets the formatting and quality assurance requirements detailed in section 6.1.4 of the Policy and the notice of solicitation for the current listing cycle.” There is no requirement in the NPDES permits for stormwater stakeholders to submit permit data to CEDEN. Thus, CASQA believes that the State and Regions should be responsible for compiling the data already in their possession into their own database, not the Permittees. This should be further clarified by adopting language in the Listing Policy that readily available data includes datasets submitted to the state</p>	<p>Any parties interested in having their data assessed for the Integrated Report should enter their own data into CEDEN. If assistance is needed with entering data into CEDEN, that needs to be communicated before or during the data solicitation period.</p>	0

Commenter	No.	Comment	Response	Revision
	18.10	<p>There were numerous cases in all three Regions where manmade flood channels (portions of the storm drain system), manmade lakes, or agricultural drains were listed as newly impaired waterbodies (e.g., Alondra Park Lake in Region 4 and Bolsa Chica Channel in Region 8). The listing of these waterbodies as impaired waters pursuant to Section 303(d) of the Clean Water Act is inappropriate. As originally stated in a comment letter from Orange County Public Works to the Region 8 Regional Water Board,5 many of these waterbodies are man-made flood channels constructed as part of a municipal separate storm sewer system (MS4) or as an agricultural drain used to collect and transport stormwater or agricultural runoff. Notably, as an MS4, the CWA presumptive uses (fishable/swimmable) do not apply, and these channels have no designated beneficial uses, and no applicable water quality objectives within the corresponding Basin Plans. Further, the Staff Report and Fact Sheets for such listings do not contain sufficient basis upon which jurisdiction under the CWA can be substantiated. These channels are not traditional navigable waters, and should also not be classified as tributaries to traditional navigable waters</p>	<p>Commenter’s characterization of the waters at issue as "manmade flood channels", "manmade lakes" or “agricultural drains” does not render inapplicable assessment under the Listing Policy and identification on California’s section 303(d) List. The State Water Board and Regional Water Boards administer the Porter-Cologne Water Quality Control Act (Wat. Code, Div. 7, § 13000 et seq.) (Porter-Cologne Act) to achieve an effective water quality control program for “waters of the state.” (Wat. Code, § 13000.) The phrase “waters of the state” is defined more broadly than “waters of the United States.” The Porter-Cologne Act defines “waters of the state” as “any surface water or groundwater, including saline waters, within the boundaries of the state.” (Wat. Code, § 13050, subd. (e).) The Porter-Cologne Act declares that “the people of the state have a primary interest in the conservation, control, and utilization of the water resources of the state, and that the quality of all the waters of the state shall be protected for the use and enjoyment by the people of the state.” (Wat. Code, § 13000.) The State Water Board carries out its water quality protection authority through, among other actions, the adoption of water quality control policies, which contain essential guidelines and principles for water quality control for “waters of the state.” The Listing Policy is as such a policy the State Water Board and the Regional Water Boards utilize for the State of California to comply with (at a minimum) the listing requirements under section 303(d) of the Clean Water Act. However, the Listing Policy is not limited to the assessments of “navigable waters” or “waters of the United States” within the State’s boundaries. The Listing Policy specifies its applicable scope: The objective of this Policy is to establish a standardized approach for developing California’s section 303(d) list in order to achieve the overall goal of achieving water quality standards and maintaining</p>	0

		<p>subject to CWA jurisdiction. The NPDES regulations define an MS4 as “a conveyance or system of conveyances (including roads with drainage systems, municipal streets...ditches, man-made channels or storm drains) designed or used for collecting or conveying storm water.” 40 C.F.R. 122.26(b)(8). For the channels to be subject to section 303(d) would mean that a single waterbody can be both an MS4 and a jurisdictional receiving water. The pretense that an MS4 and a receiving water body can be one in the same is contrary to the NPDES regulations. In EPA’s Preamble to the initial MS4 regulations, the agency expressly determined that “streams, wetlands and other water bodies that are waters of the United States are not storm sewers for the purposes of this rule” and that “stream channelization, and stream bed stabilization, which occur in waters of the United States,” were not subject to NPDES permits under Section 402 of the CWA.⁶ The “conveyances” identified in the regulation – “roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains” – all refer to anthropogenic structures, not natural streams.⁷ Under 40 C.F.R. § 122.26(b)(9), an MS4 outfall is defined as</p>	<p>beneficial uses in all of California’s surface waters. (Listing Policy, p.1 (emphasis added).) California’s surface waters are designated with beneficial uses to protect against quality degradation. (Wat. Code, § 13050, subd. (f) (defining beneficial uses).) The Listing Policy provides guidance on assessing and interpreting data and information as they are compared to applicable beneficial uses. (Listing Policy, p.1.) Accordingly, the California section 303(d) List always has, and will continue to, pursuant to the policy’s express objective, include waters for which applicable water quality standards have been promulgated and may be assessed to determine whether standards are met.</p>

	18.12	<p>For similar reasons as to why man-made flood control channels cannot be WOTUS, man-made flood control channels cannot be deemed a “tributary” to WOTUS, for purposes of CWA jurisdiction. In some cases, the Regional Water Boards have indicated that a man-made concrete channel is being listed based on the “tributary rule.” Historically, the tributary rule has been used to invoke federal jurisdiction over non-navigable natural waters when such water has a significant effect on a WOTUS. However, EPA recently clarified in the waters of the U.S. rulemaking that concrete channels constructed in dry lands or uplands are not waters of the U.S. 80 Fed. Reg. 124 (June 29, 2015), Clean Water Rule: Definition of “Waters of the United States”; see also 40 C.F.R. §§ 230.3(o)(2)(vi) and §230(o)(3)(iii) (specifically excluding from the definition of “tributary,” and, therefore, WOTUS, “stormwater control features constructed to convey, treat or store stormwater that are created in dry land”). While this final rule review is currently under reconsideration by Executive Order issued on February 28, 2017, EPA’s explicit exclusion of dry land “stormwater control features” from the definition of WOTUS clearly demonstrates the regulatory intent</p>	See response to 18.10.	0

	18.13	<p>There are numerous issues with the data evaluation process across the three Regions. Similar to the previous section, most of these issues are due to deviations from the Listing Policy. The data evaluation is largely performed such that each data set was given equal weight regardless of quality or completeness and listing decisions often appear to be made without consideration of the context of the data. This results in erroneous listings. In order to make the data evaluation process more robust and transparent, CASQA recommends that the State Water Board consider the following.</p>	Comment noted.	0

	18.17	The Fact Sheets should document significant programs that may affect the pollutant load in the waterbody. There are many occasions where no acknowledgement was given to significant implementation efforts to reduce pollutant loads. This is inconsistent with the Listing Policy, which states in Part L of Section 6.1.2.2 that the Fact Sheets must include any "Program(s) addressing the problem, if known."	When appropriate, Regional Boards will include information about related implementation programs in their decision recommendation. Phasing out the use of a pesticide may not have been documented as it is not considered to be sufficient information to justify a delisting of a pesticide.	0

	18.21	<p>In cases where the only available data are postdated by significant programs that are likely to significantly affect the pollutant load, the waterbodies should be classified as Category 3 waterbodies, which are defined by the USEPA 2010 Integrated Report Guidance¹⁰ as the following: “The existing and readily available data and information is not representative of current conditions of the water body. This rationale might include a determination that: significant land use changes have occurred in the watershed changing the hydrology and nonpoint source loadings, point source discharges were removed, new discharges are now operating, or the locations of sampling stations did not reflect the character of the segment (e.g., limited to locations near discharge outfalls).”</p>	<p>California defines Integrated Report Category 3 as follows: "There is insufficient data and/or information to make a beneficial use support determination but information and/or data indicates beneficial uses may be potentially threatened". The suggestion to include water bodies where the "only available data are postdated by significant programs that are likely to significantly affect the pollutant load" would not fit appropriately into this Category. State Water Board is not required to follow USEPA Guidance. It should be noted that if there is an approved TMDL (or alternative program in place that meets the requirements of Category 4B), the Regional Boards can update a listing recommendation to reflect this even if the program of implementation postdates the data solicitation cutoff period.</p>	0

	18.30	<p>Further, use of the SoCal indices of biologic integrity (IBI) is even more inappropriate because it has been replaced by CSCI and its sampling methods are less standardized than those in CSCI. In addition, the SoCal IBI is considered less accurate and more likely than CSCI to falsely identify a stream as altered. The lead scientist who developed the IBI has acknowledged the limitations of the index particularly in controlling for elevation gradient.¹³ Many of the proposed new benthic community effects listings are based on IBI scores since the data were largely collected prior to the adoption of the CSCI. However, the Fact Sheets for some of the Region 4 listings incorrectly imply that the waterbody was assessed with a CSCI. The Fact Sheets of Region 4 and 8 currently state the following, “[t]he California Stream Condition Index is a new scoring tool for bioassessment data that is applicable statewide, accounts for a much wider range of natural variability, and provides equivalent scoring thresholds in all regions of the state. The CSCI has been used in some assessments this reporting cycle and will be used in the future for water quality assessment purposes statewide over the regional indices of biologic integrity (IBIs). If CSCI scores have not been</p>	<p>State Water Board supports maintaining listings based on the SCIBI and CSCI scores as they are consistent with State policy and have been assessed relative to appropriate reference sites. At this time, the CSCI and IBI (where CSCI is not available) are the best measures of biologic integrity in California streams and it is appropriate to use both IBI and CSCI scores in 303(d) listing decisions. As the science progresses, improved methods may supplant older methods and the 303(d) list will be updated, as appropriate, as that occurs. The use of the SCIBI and CSCI for 303(d) listing was done in accordance with Section 3.9 and 6.1.5.8 of the Listing Policy with biological data and impairment related to associated pollutants and/or pollution.</p>	0

		<p>calculated for data and only IBI scores are available, IBI scores will still be used to interpret the data.” CASQA strongly disagrees with this statement. First, as stated above, the IBI is known to have significant limitations and should not be used to justify new listings even in cases where no other data exist. Second, while we agree that the CSCI is improved over the IBI metric, we do not believe any new benthic community effects listings should be listed until a statewide policy has been adopted. In addition to errors in the benthic community effects listing, there are numerous issues with newly proposed toxicity listings in Region 4 and 8 as detailed in numerous stakeholder comments including Los Angeles County.¹⁴ An intercalibration study of Southern California laboratories certified by the state and commonly used for toxicity tests found that the data were unreliable and not reproducible. Despite these results, ten new waterbodies were listed for toxicity in Los Angeles County relying on data from those very same laboratories.</p>

	18.36	<p>Due to the seven-year lag time between data solicitation and finalization of the 303(d) List, much of the data used for this listing cycle is at least a decade old and, in some cases, the data were over 30 years old. For example, one new toxicity listing, for Guadalupe Slough in Region 2, is based on two data points collected in 1997.¹⁶ As such, there are many listings where the data are no longer representative of the waterbody either due to natural changes in the waterbody or due to the implementation of a pollution control program since the data were collected (discussed further in the next comment). The State and Regional Water Boards should make every effort to avoid listing waterbodies with old data that are less likely to be representative of the waterbody. Where more recent data exists, the newer data should be given a higher weight than the older data. Consideration should also be given to whether older data are still applicable, especially where measurement techniques and detection methods may have improved (e.g., in cases where historic sediment toxicity listings are now known to be caused by a particular pesticide). Proposing new listings with data over a decade old may result in significant</p>	<p>Due to the volume of data received during the 2010 data solicitation period, the State Water Board made the decision to not solicit additional data until all of the current data is assessed and migrated to the California Water Quality Assessment Database (CALWQA) for Regional Water Board listing and de-listing recommendations. “By letter dated 15 July 2013, the State Water Board informed the USEPA of its strategy for a more efficient and successful CWA 303(d)/305(b) Integrated Report process for California, which divides California into thirds by Regional Water Quality Control Boards (Regional Water Boards). The State of California Integrated Report now occurs on a rotating basis for three Regional Water Boards at once. The Central Valley Water Board is in the 2014 listing cycle group.</p>	0

		<p>resources being used to address pollutants that are no longer problematic. The State Water Board should also consider modifying the Listing Policy to explicitly allow for exclusion of older data that are not representative of current conditions.¹⁷ The current policy does not discuss exclusion of older data and thus it is assumed that “all” available data must be assessed. Given that this is not addressed in the current policy, the right course of action when data are old or questionable is to put waterbodies in Category 3 instead of Category 518 and continue to collect more recent information on the support of beneficial uses in those waterbodies. CASQA Recommendation:• Consider the age of the data when making listing decisions. • Ensure that older data (especially data older than a decade) are not given the same weight as more recent data. • Exclude data that are no longer representative of the waterbody. • Put waterbodies in Category 3 instead of Category 5 when data are old and otherwise questionable. • Modify the Listing Policy to explicitly allow for exclusion of data beyond a certain time period.</p>

	18.37	<p>Under the current cycle, the data used to justify the 2014-2016 lists are from a 2010 data solicitation. This lag between the data solicitation and finalization of the list can cause the listings to be outdated before they are even finalized. A way to avoid this in the future would be to have a staggered data solicitation that parallels the listing cycle. For instance, the Regions that are on the latest listing timeline and scheduled for the next review in 2022 (Regions 2, 4, and 8), should not have a formal data solicitation until 1 year (or another reasonable timeframe to allow enough time for data analysis) before they are scheduled to have a listing update. Currently, there is language in the Los Angeles 2016 303(d) List Staff Report that states “Los Angeles Water Board staff estimates that the 2022 303(d) list will include data submitted through 2021.” CASQA supports this plan and expects that the same data solicitation timeline should apply to all three Regions. Such a change may address many of the issues outlined in this letter. It would also produce a more reliable and applicable list of impaired waters since the data would better reflect the current state of the waterbody. CASQA Recommendation: Adjust the data solicitation schedule to reflect the staggered</p>	<p>Comment noted. Moving forward the State Water Board intends to use a similar methodology as suggested by commenter. This can be seen in the 2018 Integrated Report data solicitation notice.</p>	0

	18.38	<p>As mentioned earlier, CASQA is aware that State Water Board staff performed many of the data analyses for the 2014-2016 303(d) List. CASQA recommends that, instead, the Regional Water Board staff be in charge of the data analysis or at least provide a final oversight and review of the proposed list. The Regional Water Board staff is more familiar with the waterbodies and ongoing implementation programs occurring at the regional level. As such, Regional Water Board staff will be better able to correct many of the errors detailed in this letter. Further, Regional Water Board staff are more likely to have developed relationships with local stakeholders and can consult with them when there are issues with the data analysis versus making assumptions or decisions that have resulted in a number of incorrect listings. CASQA Recommendation: Regional Water Board staff should conduct the data analyses OR coordinate with the State Water Board to provide final oversight QA/QC prior to the public release of the Draft 303(d) List.</p>	<p>State and Regional Boards coordinate on all assessments. Regional Board staff are given the opportunity to review all Lines of Evidence developed by State Water Board staff prior to completing all decision recommendations. State Board staff communicate with Regional Board staff during the LOE development process to ensure that Regional knowledge is incorporated into data assessments. In future cycles, the Regional Boards will have primary responsibility for factsheet preparation. The State Board will continue to act in a supporting role and coordinate with the Regional Boards as necessary.</p>	0

	18.39	<p>An additional suggestion is to consider reorganizing the listing schedule by watershed instead of by Region. A listing schedule centered on watersheds may allow the State and Regional Water Boards to be more flexible and responsive to waterbody impairments. Adjusting the listing schedule to focus on watersheds may provide the following benefits:</p> <ul style="list-style-type: none"> • Provide the Regional Water Boards with the ability to prioritize specific watersheds. • Provide the Regional Water Boards more time to review listings for a given watershed versus assessing all watersheds in a given Region at one time. • Allow the Regional Water Boards to schedule listing cycles around the end dates of major monitoring programs. • Allow Regional Water Boards to be more responsive to new pollutants. • Allow Regional Water Boards to correct Listing Policy issues more frequently than once every 6 years. <p>Under a watershed approach the Regional Water Boards, which are in the best position to prioritize their waterbodies, could set up a listing schedule such that all watersheds in their Region will be reviewed within the current six-year time frame. The result will be a 303(d) List of impaired waterbodies that is much more current and effective.</p>	<p>The Water Boards tend to use a rotating basin approach using the defined Regional Water Board Basin Plans for Integrated Report assessments. Rotating the Integrated Reporting cycles by watersheds would not be feasible due to watersheds crossing Regional Board boundaries and water bodies across watersheds having different Beneficial Uses associated with them. It is more appropriate to rotate cycles based on the Regional Board boundaries than watersheds.</p>	0

Committer	No.	Comment	Response	Revision
Calleguas Creek Watershed Management Program Representative/Commenter: Lucia McGovern	19.01	There are a number of erroneous listings detailed in the original comment letter that the Regional Board Response to Comment 1 stated would be removed however the listings are still present on the current 303(d) List (see Table 1). The Stakeholders request that the State Board correct these listings, remove them from the Category 5 list, and update the fact sheets to reflect the response to comments from the Regional Board. The original description of the issues for each of these listings can be found in the Stakeholders' original March 30, 2017, comment letter (attached). Requested Action: • Remove all listings in Table 1 from the current 303(d) List based on the decisions reached by the Regional Board in the Response to Comments.	For Calleguas Creek Reach 12: Decisions for Chlorpyrifos (decision 67492, LOE 83486), Diazinon (decision 67493, LOE 83499), and Malathion (decision 67491, LOE 83458) was not moved though it was stated to be moved in the Region 4 response to comments. This has been corrected and Calleguas Creek Reach 12 is no longer listed for the three above pollutants. For Rio De Santa Clara/Oxnard Drain No. 3, the decision 66075 for Nitrogen, Nitrate appears to have been retired.	0

	19.02	<p>As mentioned previously the Stakeholders thank the Regional Board for correcting listings which were based on data from agricultural drains not representative of the receiving waters. These erroneous listings included either pollutants measured at agricultural drain sites along Calleguas Creek Reaches 2 and 4 or the agricultural drains themselves (i.e., La Vista and Santa Clara Drains). The fact sheets for these listings include the following language: "The decisions for Calleguas Creek Reach 2 have been revised to not use the data from the tributary monitoring site. The Los Angeles Water Board staff will work with the commenter, and other stakeholders, to purposely determine and document the appropriateness of assessing the tributary monitoring site under section 303(d) of the Clean Water Act. If it is determined that the tributary monitoring site is within a waterbody which should be addressed under section 303(d), then this determination requires that a new tributary be added to the Ca/QWA underlying map, which is maintained by State Board. It is the intention of the Los Angeles Water Board staff to work with State Board staff to resolve mapping issues prior to the State Board approval of the 2016 303(d) list, or</p>	<p>Commenter’s characterization of the waters at issue as “agricultural drains” does not render inapplicable assessment under the Listing Policy and identification on California’s section 303(d) List. The State Water Board and Regional Water Boards administer the Porter-Cologne Water Quality Control Act (Wat. Code, Div. 7, § 13000 et seq.) (Porter-Cologne Act) to achieve an effective water quality control program for “waters of the state.” (Wat. Code, § 13000.) The phrase “waters of the state” is defined more broadly than “waters of the United States.” The Porter-Cologne Act defines “waters of the state” as “any surface water or groundwater, including saline waters, within the boundaries of the state.” (Wat. Code, § 13050, subd. (e).) The Porter-Cologne Act declares that “the people of the state have a primary interest in the conservation, control, and utilization of the water resources of the state, and that the quality of all the waters of the state shall be protected for the use and enjoyment by the people of the state.” (Wat. Code, § 13000.) The State Water Board carries out its water quality protection authority through, among other actions, the adoption of water quality control policies, which contain essential guidelines and principles for water quality control for “waters of the state.” The Listing Policy is a such a policy the State Water Board and the Regional Water Boards utilize for the State of California to comply with (at a minimum) the listing requirements under section 303(d) of the Clean Water Act. However, the Listing Policy is not limited to the assessments of “navigable waters” or “waters of the United States” within the State’s boundaries. The Listing Policy specifies its applicable scope: The objective of this Policy is to establish a standardized approach for developing California’s section 303(d) list in order to achieve the overall goal of achieving water quality standards and maintaining beneficial uses in all of California’s</p>	0

		<p>prior to the next Listing Cycle that includes the Los Angeles Region." [This excerpt was taken from the dimethoate listing for Calleguas Creek Reach 2, but similar language exists for all agricultural drain listings.] The Stakeholders maintain that these monitoring sites and waterbodies outlined in the original letter are agricultural drains and, therefore, not subject to listing under the 303(d) List. These agricultural drains are used to collect and transport stormwater or agricultural runoff. The Staff Report and Fact Sheets for such listings do not contain sufficient basis upon which jurisdiction under the CWA can be substantiated. These channels are not traditional navigable waters, and should also not be classified as tributaries to traditional navigable waters subject to CWA jurisdiction. Therefore, while we will participate in the requested discussion to evaluate the monitoring locations, we maintain that there is no need to add any of these waterbodies to the CalQWA underlying map and that these agricultural drains should not be included in the 303(d) List for this cycle or any future 303(d) review cycles. The Stakeholders are willing to provide any necessary information to effectively resolve this issue and welcome</p>	<p>surface waters. (Listing Policy, p.1 (emphasis added).) Waters of the state are designated with beneficial uses to protect against quality degradation. (Wat. Code, § 13050, subd. (f) (defining beneficial uses).) The Listing Policy provides guidance on assessing and interpreting data and information as they are compared to applicable beneficial uses. (Listing Policy, p.1.) Accordingly, the California section 303(d) List always has, and will continue to, pursuant to the policy's express objective, include waters for which applicable water quality standards have been promulgated and may be assessed to determine whether standards are met.</p>

	19.03	<p>The waterbodies listed for high pH do not appropriately demonstrate that the high pH was a result of waste discharge as required in the Basin Plan. The Oxnard Industrial Drain (Oxnard Drain) is proposed to be listed for high pH. As stated in the Fact Sheet and according to the Los Angeles Region Basin Plan³ "The pH of inland surface waters shall not be depressed below 6.5 or raised above 8.5 as a result of waste discharges" [emphasis added]. However, it was not demonstrated that the elevated pH levels were a result of waste discharge as opposed to natural causes. Therefore, the Regional Board or State Board should either provide evidence that the elevated pH was a result of waste discharge and detail its findings in the Fact Sheets, or, if no such evidence exists, the listing should be removed. Requested Action: • Remove the pH listing for Oxnard Industrial Drain as there is no data provided in the Fact Sheet that demonstrate that these high pH values are the result of waste discharge.</p>	<p>Decision 62330, LOE 96027. From Regional Response to Comments, comment 16.2: "The 303(d) list appropriately identifies the pH impairments. Analysis of sources and causes or identification of implementation measures to resolve or correct the impairment are not completed as part of the Integrated Report or 303(d) listing process."</p>	0

	19.06	<p>To address the other pesticides and/or toxicants, the Toxicity TMDL included a toxicity target "to address toxicity in reaches where the toxicant has not been identified." If the toxicity target or allocation is exceeded, the TMDL includes a trigger to conduct a Toxicity Identification Evaluation (TIE) and implement actions to address the identified toxicant. Additionally, the implementation actions discussed in the Toxicity TMDL implementation plan are designed to address pesticides as a whole and are not specific to diazinon and chlorpyrifos. As a result, the Toxicity TMDL proactively addresses toxicity associated with other pesticides, such as pyrethroids and other organophosphate pesticides (e.g., bifenthrin and malathion). TIEs conducted in the watershed have resulted in the identification of pyrethroids as a potential cause of toxicity and the Stakeholders have already begun actions to address these pesticides in addition to the organophosphate pesticides included in the TMDL. The structure of the TMDL is designed to proactively prevent toxicity and, therefore, it is not necessary to develop another TMDL for these constituents. There are already sufficient controls in place through the agricultural waiver and MS4</p>	<p>The State and Regional Board database has a TMDL Requirement Status built into its tracking system specifically for Category 5. 	19.09	<p>4. Correct the waterbody assigned Hydrologic Unit (HUCs) and Ca/waternumbers to reflect those listed in the Basin Plan. There are multiple instances of what appear to be incorrectly Hydrologic Unit numbers (HUCs) and Calwater numbers assigned to the various waterways. For instance, a comparison of the 8-digit HUCs listed in Appendix B of the 303(d) List to the 12-digit HUCs listed in Appendix I of the Basin Plan indicate a number of inconsistencies. For example, waterbodies present in the Santa Clara River watershed (e.g., Santa Clara River Reach 3) are listed with a Calleguas watershed HUC (18070103) while the same reaches are listed as 18070102 in the Basin Plan. This makes identifying the location of unknown waterbodies not previously listed or described in the Basin Plan difficult to assess. A full review of the 303(d) List HUCs should be completed to correct all errors. The Regional Board Response to Comments stated that, "It is the intention of the Los Angeles Water Board staff to work with State Board staff to resolve mapping issues including HUCs for those reaches, as appropriate, prior to the State Board approval of the 2016 303(d) list, or at the next Listing Cycle that includes the Los</p>	<p>No change has been made. The HUCs identified in the category reports are unreliable and updatable at this time. This is a known issue, and the State Water Board is working with the contractor that maintains the database to update the information. In the meantime the stakeholders can utilize the information available in the Los Angeles Regional Basin Plan to accurately identify waterbodies by HUC.</p>	0

Comment Deadline: 12:00 noon on July 10, 2017

Commenter	No.	Comment	Response	Revision
	19.11	<p>The assessments for the Calleguas Creek watershed do not appear to include any of the submitted Calleguas Creek Watershed TMDL monitoring data, monitoring data from the Camarillo Sanitary District, or monitoring data from the Simi Valley Wastewater Treatment Plant, which includes data collected prior to 2010. All of this monitoring data has been provided to the Regional Board in annual monitoring reports and all data were collected using approved QAPPs. As noted in the Response to Comments, the Regional Board only considered data that was submitted during the data solicitation period. However, at the time of the data solicitation, dated January 14th, 2010, Section 6.1.1 of the Listing Policy stated, "Data and information that shall be reviewed include, but are not limited to: submittals resulting from the solicitation, selected data possessed by the RWQCBs, and other sources."7 It was assumed that data provided electronically and in annual reports to the Regional Board would be considered "readily available data" per the Listing Policy. As a result, there is no reason why this data should not have been included in the 2016 303(d) listing evaluation. In fact, references show that the Regional Board selectively used discharger data for listing</p>	<p>It is possible that data from the specified programs did not pass Quality Assurance. From the California Regional Water Quality Control Board, Central Valley Region Resolution R5-2016-0083: "10. The State Water Board directed that, due to the volume of data received during the 2010 data solicitation period, only water quality data received through 30 August 2010 were to be evaluated for the 2012, 2014, and 2016 listing cycles. 11. Because the data solicitation period for this Integrated Report closed in August 2010 (over six years ago), the assessment of conditions may not entirely reflect the status of each surface water body at this time. 12. The State Water Board supports the Regional Water Boards in conducting CWA Section 305(b) and/or 303(d) List update(s) "off-cycle", before their next regularly scheduled Integrated Report periods. To be efficient, off-cycle updates should be limited to priority waterbodies, pollutants, or combinations thereof as identified by the Regional Water Boards, with reallocation of resources as appropriate." Additionally, regarding timeliness, improvements to the approval process are being implemented as seen in the California Regional Water Quality Control Board, Central Valley Region Resolution R5-2016-0083: "8. By letter dated 15 July 2013, the State Water Board informed the USEPA of its strategy for a more efficient and successful CWA 303(d)/305(b) Integrated Report process for California, which divides California into thirds by Regional Water Quality Control Boards (Regional Water Boards). The State of California Integrated Report now occurs on a rotating basis for three Regional Water Boards at once. The Central Valley Water Board is in the 2014 listing cycle group."</p>	0

		<p>assessments in Ventura County that was not submitted by the dischargers themselves at the time of data solicitation.⁸ The Regional Board should have consistently utilized previously available data across all assessed waterbodies, including those in the Calleguas Creek watershed. While we understand that it is challenging at this late date to include additional data, the Stakeholders are providing this comment to highlight the problems with the current listing process and note the progress that has been made in the watershed that is not being acknowledged due to the time frames for assessment and the lack of consideration of this data in the analysis.</p>

	19.12	<p>In 2013, the Stakeholders did an assessment of the watershed consisting of data collected between 2004 and 2012 and found that multiple waterbody-pollutant combinations could potentially be delisted as shown in Table 3. A summary of the assessment is included as an attachment to this letter and the datasets used in the analysis as well as all of the TMDL annual monitoring reports are available upon request. While we recognize that this assessment uses two more years of data than the current 303(d) listing analysis, a number of these waterbodies had many more samples than were necessary for delisting. As a result, we feel if all the watershed data were used in the assessment, a number of these waterbodies would be delisted, particularly for metals. We also feel this assessment would demonstrate that several of the proposed listings, particularly for diazinon and chlorpyrifos and a number of organochlorine pesticides, are not warranted. Additionally, a large number of new proposed listings are being added that are already covered by a TMDL. While the list acknowledges that a TMDL does not need to be developed by categorizing these new listings in Category 5B, in several cases, the watershed now has sufficient data to</p>	<p>From a State Board memo found here: https://www.waterboards.ca.gov/water_issues/programs/tmdl/docs/integr_rpt_upd_memo_final1113.pdf "Due to the volume of data received during the 2010 data solicitation period, the State Water Board will not solicit additional data until all of the current data is assessed and migrated to the California Water Quality Assessment Database (CALWQA) for Regional Water Board listing and de-listing recommendations."(???) All data submitted prior to 30 August 2010 were used in the decisions for this listing cycle. These decisions may result in a listing this cycle and a delisting next cycle when newer data is assessed. If data is present, off-cycle decisions may be made.</p>	0

Farm_Bureau of Ventura Representative/Commenter: John Krist	20.01	There are a number of erroneous listings outlined in the original comment letter that the RWQCB Response to Comment1 stated would be removed, but which are still present on the current 303(d) List (see Table 1). Farm Bureau requests that the SWRCB correct these listings, remove them from the Category 5 list, and update the fact sheets to reflect the response to comments from the RWQCB. The original description of the issues for each of these listings can be found in the March 29 comment letter.	Comment noted. The appropriate changes have been made.	No

	20.06	<p>As mentioned previously, FBVC thanks the RWQCB for correcting listings that were based on data from agricultural drains that are not representative of the receiving waters. These erroneous listings included either pollutants measured at agricultural drain sites along Calleguas Creek Reach 2 and 4 or the agricultural drains themselves (i.e., La Vista and Santa Clara Drains). The fact sheets for these listings include the following language: “The decisions for Calleguas Creek Reach 2 have been revised to not use the data from the tributary monitoring site. The Los Angeles Water Board staff will work with the commenter, and other stakeholders, to purposely determine and document the appropriateness of assessing the tributary monitoring site under section 303(d) of the Clean Water Act. If it is determined that the tributary monitoring site is within a waterbody which should be addressed under section 303(d), then this determination requires that a new tributary be added to the CalQWA underlying map, which is maintained by State Board. It is the intention of the Los Angeles Water Board staff to work with State Board staff to resolve mapping issues prior to the State Board approval of the 2016 303(d) list, or</p>	<p>Commenter’s characterization of the waters at issue as “agricultural drains” does not render inapplicable assessment under the Listing Policy and identification on California’s section 303(d) List. The State Water Board and Regional Water Boards administer the Porter-Cologne Water Quality Control Act (Wat. Code, Div. 7, § 13000 et seq.) (Porter-Cologne Act) to achieve an effective water quality control program for “waters of the state.” (Wat. Code, § 13000.) The phrase “waters of the state” is defined more broadly than “waters of the United States.” The Porter-Cologne Act defines “waters of the state” as “any surface water or groundwater, including saline waters, within the boundaries of the state.” (Wat. Code, § 13050, subd. (e).) The Porter-Cologne Act declares that “the people of the state have a primary interest in the conservation, control, and utilization of the water resources of the state, and that the quality of all the waters of the state shall be protected for the use and enjoyment by the people of the state.” (Wat. Code, § 13000.) The State Water Board carries out its water quality protection authority through, among other actions, the adoption of water quality control policies, which contain essential guidelines and principles for water quality control for “waters of the state.” The Listing Policy is such a policy the State Water Board and the Regional Water Boards utilize for the State of California to comply with (at a minimum) the listing requirements under section 303(d) of the Clean Water Act. However, the Listing Policy is not limited to the assessments of “navigable waters” or “waters of the United States” within the State’s boundaries. The Listing Policy specifies its applicable scope: The objective of this Policy is to establish a standardized approach for developing California’s section 303(d) list in order to achieve the overall goal of achieving water quality standards and maintaining beneficial uses in all of California’s</p>	0

		<p>prior to the next Listing Cycle that includes the Los Angeles Region.” [This language was taken from the dimethoate listing for Calleguas Creek Reach 2 but similar language exists for all agricultural drain listings.] Farm Bureau maintains that these monitoring sites and waterbodies outlined in the original letter are agricultural drains and therefore not subject to listing under the 303(d) List. Therefore, while we will participate in the requested discussion to evaluate the monitoring locations, we contend there is need to add any of these waterbodies to the CalQWA underlying map and that these agricultural drains should not be included in the 303(d) List for this cycle or any future 303(d) review cycles. We are willing to provide any necessary information to fully resolve this issue, and we invite RWQCB and SWRCB staff to contact us if they have any concerns. Requested Action: Agricultural drain listings for Calleguas Creek Reaches 2 and 4, as well as La Vista and Santa Clara Drains, should remain off the 303(d) list and this decision should be updated to be finalized in the Fact Sheets.</p>	<p>surface waters. (Listing Policy, p.1 (emphasis added).) California's surface waters are designated with beneficial uses to protect against quality degradation. (Wat. Code, § 13050, subd. (f) (defining beneficial uses).) The Listing Policy provides guidance on assessing and interpreting data and information as they are compared to applicable beneficial uses. (Listing Policy, p.1.) Accordingly, the California section 303(d) List always has, and will continue to, pursuant to the policy’s express objective, include waters for which applicable water quality standards have been promulgated and may be assessed to determine whether standards are met. The Los Angeles Water Board will review the waterbodies within the Calleguas Creek watershed while off cycle to make a final determination on whether or not it is appropriate to include them on a future region-specific 303(d) list.</p>

	20.07	<p>The waterbodies listed for high pH do not appropriately demonstrate that the high pH was a result of waste discharge, as required in the Basin Plan. The Santa Clara River Estuary, Santa Clara River Reach 1, and Oxnard Drain are listed for high pH. As stated in the Fact Sheet and according to the Los Angeles Region Basin Plan³ “The pH of inland surface waters shall not be depressed below 6.5 or raised above 8.5 as a result of waste discharges” [emphasis added]. However, it was not demonstrated for any of these waterbodies that the elevated pH levels were a result of waste discharge as opposed to natural causes. The Regional Board staff noted that “analysis of sources and causes [...] are not completed as part of the Integrated Report or 303(d) listing process”. However, pH samples cannot be considered impairments without specific evidence that high pH is a result of waste discharge. In Response to Comments, the Regional Board acknowledged that there are multiple sources of water to the Santa Clara River that include waste discharge, but went on to state that “the relative contribution of the causes of pH exceedances is largely speculative at this time”. The FBVC agrees that the sources are speculative at this time, and because the Basin Plan criteria requires</p>	<p>No change has been made. See response to comment 16.2 from the Los Angeles Regional Board’s Response to Comment document. “The 303(d) list appropriately identifies the pH impairments. Analysis of sources and causes or identification of implementation measures to resolve or correct the impairment are not completed as part of the Integrated Report or 303(d) listing process.” Also response to comment 32.5 of the same document. “The way to “take into account” the type of waterbody, or reference conditions, or the interaction between pH and other factors such as algae, is during the development of a TMDL.” This response adequately addressed the comment. Additionally, due to the large amount of data that needs to be assessed during each update of the 303(d) list, the 303(d) list data evaluations are more general. In particular, these evaluations do not include source assessments; they rely upon existing waterbody delineations without further subdivision (e.g., Santa Monica Bay); and they typically do not entail more refined analyses such as assessing data collected during wet weather and dry weather separately. As Board staff commences TMDL development, these more temporally and spatially refined data assessments are made along with a source analysis. Based on these analyses, staff may propose a finding of no impairment with a recommendation to delist during the next 303(d) cycle, or may refine the defined scope of the impairment to be addressed by the TMDL (e.g., wet weather only).</p>	No

	20.08	<p>The temperature listing for Ventura River Reaches 1 and 2 (Estuary to Weldon Canyon) and Ventura River Reach 4 (Coyote Creek to Camino Cielo Rd) uses an evaluation guideline of 13-21 degrees Celsius (°C) as the optimum growth range for rainbow trout. However, the applicable Basin Plan objective is as follows: “For waters designated as COLD, water temperature shall not be altered by more than 5 degrees F above the natural temperature.” The Fact Sheets provide no discussion of natural temperatures or a demonstration that the temperature was raised above natural temperatures in order to exceed the objectives.</p>	<p>No change has been made. See Los Angeles Regional Water Quality Control Board’s Response to Comment document, response comment 16.13. Response to comment 16.13: “The designated beneficial use supports cold water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates. As stated by Moyle, 1976, the optimum range for Rainbow Trout's growth and completion of most life stages is 13-21 degrees Celsius. Therefore, it is appropriate to use this information as Evaluation Guideline, which does not conflict with the water quality objective for Cold Freshwater Habitat.” Additionally, although the basin plan specifies the narrative objective as being no greater than 5 degree deviation from natural temperatures, the natural temperature for the waterbody has not yet been established. Section 6.1.5.9 of the Listing Policy states that “When ‘historic’, or ‘natural’ temperature data are not available, alternative approaches shall be employed to assess temperature impacts.” Since “historic” or “natural” temperature data were unavailable, Moyle 1976 was selected as an applicable Evaluation Guideline.</p>	No

Commenter	No.	Comment	Response	Revision
	20.09	<p>Notwithstanding that a deviation from natural temperatures has not been demonstrated, the manner in which the evaluation guideline is applied is also inappropriate. Moyle 1976 is referenced as the source of the evaluation guideline. Moyle 1976 was revised and expanded by Moyle 20024. Moyle 2002 states: “Rainbows are found where daytime temperatures range from nearly 0°C in winter to 26-27°C in summer, although extremely low (<4°C) or extremely high (>23°C) temperatures can be lethal if the fish have not previously been gradually acclimated. Even when acclimation temperatures are high, temperatures of 24-27°C are invariably lethal to trout, except for very short exposures (25, 26).” As such, while temperatures above 21°C may not be optimal according to Moyle 1976, Moyle 2002 clearly states that lethal temperatures are those greater than 23°C which indicates that the evaluation guideline of 21°C is more appropriately applied as a chronic guideline (necessitating the establishment of an averaging period) and 23°C is the more appropriate “not-to-exceed” guideline if used for listing.</p>	<p>No change has been made. Title 40 CFR § 131.3, subd. (i), states that by definition, the intent of a water quality standard is to protect the beneficial use of a given water body. Moyle 2002 states that “Even when acclimation temperatures are high, temperatures of 24-27 °C are invariably lethal to trout, except for very short exposures (25, 26).” A lethal threshold is not protective of aquatic life. Furthermore, Section 6.1.5.6 of the Listing Policy states that, “If the averaging period is not stated for the standard objective, criterion, or evaluation guideline, then the samples collected less than 7 days apart shall be averaged.” Since Moyle 1976 does not state an averaging period for the evaluation guideline, the standard 7-day averaging period listed in the Listing Policy is used, as is standard procedure for water quality assessments. Additionally, Section 6.1.5.6 of the Listing Policy states that, “If sufficient data are not available for the stated averaging period, the available data shall be used to represent the averaging period.” Since the data used in the assessments of Ventura River Reach 1, 2, and 4 were collected monthly, each sample was considered to be representative of the averaging period. Therefore, the assessments of these waterbodies fall within the requirements of the Listing Policy, as well as Section 303 of the Clean Water Act.</p>	0

Commenter	No.	Comment	Response	Revision
	20.10	<p>The RWQCB responded to this comment originally made in the March 29 letter by stating the following: “As stated by Moyle, 1976, the optimum range for Rainbow Trout's growth and completion of most life stages is 13-21 degrees Celsius. Therefore, it is appropriate to use this information as Evaluation Guideline, which does not conflict with the water quality objective for Cold Freshwater Habitat.” It is unclear to the FBVC why the RWQCB has not updated their reference to the more recent Moyle 2002. We urge the SWRCB to use the more recent reference or provide justification for the continued use of the 41-year-old reference. Using the threshold of 23°C, no samples would exceed the threshold in Ventura River Reach 4 and only 2 samples would exceed the threshold in Ventura River Reaches 1 and 2. Neither of these numbers of exceedances would meet the listing thresholds.</p>	<p>The State Water Board does not have access to a complete copy of Inland Fishes Revised and Expanded (Moyle 2002). Without a complete copy the State Water Board cannot accurately determine the appropriate numeric guideline to protect aquatic life beneficial uses based on that reference. The portion of Moyle 2002 that the State Water Board has access to still indicates that 21 degrees Celsius is the limiting temperature for fish, even when dissolved oxygen concentration are extremely low. Therefore, the evaluation guideline of 21 degrees Celsius will remain unchanged.</p>	0

	20.12	<p>There are many instances where the data to support the listed pollutant lack proper temporal representation. Section 6.1.5.3 of the State Water Resources Control Board (SWRCB) Listing Policy⁵ states that: “Samples should be representative of the critical timing that the pollutant is expected to impact the water body. Samples used in the assessment must be temporally independent. If the majority of samples were collected on a single day or during a single short-term natural event (e.g., a storm, flood, or wildfire), the data shall not be used as the primary data set supporting the listing decision.” [Emphasis added.]</p>	<p>In general, data used to list a waterbody must be both spatially, and temporally representative of the waterbody being assessed. This comment is addressed in the response to comment 20.13 of this document, as well as by comment 11.21 of the Los Angeles Regional Board’s Response to Comment document. Comment 11.21 states that “while the Listing Policy requires that samples be spatially and temporally independent, fish are not static; they move throughout a waterbody and accumulate pollutants in tissue over time. Therefore the data are by their nature temporally independent.” Additionally response comment 11.22 from the same letter states that “In addition, the fact that tissue concentrations represent the accumulation of pollutants over a time period of years, and each fish is a different age and will have moved differently through the environment, provides independence of the tissue sample.” These responses adequately address the comment</p>	0

	20.13	<p>All of the proposed Category 5 pollutants listed in Table 2 rely on data collected from a single sample date. This directly violates the Listing Policy. For instance, the “Temporal Representation” entry in the Fact Sheet for Ventura Harbor: Ventura Keys Cadmium listing (LOE 89946) states “Representative samples of locally abundant species were collected on February 28, 2007”. Because there is no temporal resolution for these waterbody-pollutant combinations, the proposed new listings should be removed.</p>	<p>Temporal representation as described in the Listing Policy does not apply to fish or shellfish tissue. This comment was addressed by the comment sent to the Los Angeles Regional Board by the City of Los Angeles. Comment 11.21 states that “while the Listing Policy requires that samples be spatially and temporally independent, fish are not static; they move throughout a waterbody and accumulate pollutants in tissue over time. Therefore the data are by their nature temporally independent.” Additionally response comment 11.22 from the same letter states that “In addition, the fact that tissue concentrations represent the accumulation of pollutants over a time period of years, and each fish is a different age and will have moved differently through the environment, provides independence of the tissue sample.” These responses adequately address the comment.</p>	0

	20.14	<p>The City of Ventura made this comment previously in their March 30, 2017, letter and in response the Regional Board stated: “Because the data collected is spatially independent, it is still appropriate to assess the data as individual samples even though they were collected on the same date.” This response implies that the Regional Board did not understand the City’s original comment since these listings definitively lack temporal resolution by relying on a single sample day. Using a single sample day to support a new listing is in direct contradiction to the Listing Policy. The Regional Board went on to respond to some Ventura Harbor: Ventura Keys and Port Hueneme Harbor (Back Basins) listings with the following statement: “Fish were collected from three sub-locations from two sites. The three samples per site were averaged prior to assessment. Because the data collected is spatially independent, it is still appropriate to assess the data as individual samples even though they were collected on the same date. As the data support a listing decision, the waterbody pollutant combination should be listed until more data supporting a delisting decision become available. In addition, fish are not static and move throughout a waterbody,</p>	See response to comment 20.13.	0

		<p>accumulating pollutants in tissue over time. Therefore, the data are, by their nature, spatially and temporally independent.” This response is wholly insufficient. First, the samples collected for the various pollutants are from mussels not fish (see Table 2). Second, the argument is not that the two samples collected on the same day should not be treated as individual samples. The Listing Policy states that “a majority of samples” collected in a single day cannot be used to justify a listing. In the case of all pollutants listed in Table 2, the Line of Evidence (LOE) used to justify the listing includes 100% of samples collected on a single day. Third, nowhere in the Listing Policy does it allow spatial representation (two samples collected at different stations on a single day) to compensate for the lack of temporal representation. As stated above, the reason temporal representation is necessitated is to avoid a short-term natural event from creating bias for the assessment of a waterbody. Because both sites were sampled on the same day it is not possible to determine if the pollutant concentrations are indicative of typical waterbody conditions as opposed to a short-term natural event. Therefore, these listings must be removed until additional samples</p>

	20.17	Ventura Harbor and Port Hueneme cadmium exceedances were incorrectly calculated and do not actually show any exceedance over the Office of Environmental Health Hazard Assessment (OEHHA) 2.2 ppm criteria limit.	The commenter is correct, the following corrections have been made: LOE 87206 has been replaced with LOE 82807. The fraction listed in LOE 82807 has been changed to Shellfish to alleviate confusion. As a result, the decision for Port Hueneme Harbor (Back Basins) has been changed to Do Not List. LOE 89946 has been changed to show the correct exceedance count of 0 exceedances of 2 samples, the fraction has been changed to Shellfish to alleviate confusion, and the evaluation guideline listed in the LOE has been changed to show the correct 3.3 ppm value. As a result of the changes to LOE 89946, the listing decision for Ventura Harbor: Ventura Keys has been changed to Do Not List.	Yes

	20.20	Ventura Harbor dieldrin listing shows two LOEs (89619 and 82787) demonstrating exceedance for shellfish surveys and fish tissue analysis. Both of these lines of evidence appear to be from the same 2 samples and should not be double counted as separate LOEs. Similar issues exist for PCBs listings for the same waterbody as well as dieldrin and PAHs for Port Hueneme. (See Table 3)	LOE 89619 was a duplicate LOE, and was deleted. The fraction on LOE 82787 was changed from Fish fillet to Shellfish to reduce confusion.	0

	20.22	<p>Table 3. Port Hueneme Harbor and Ventura Harbor Listings which need to be corrected Requested Action: • Review and recalculate all pollutant exceedances for Port Hueneme and Ventura Harbor in Table 3. • Remove the cadmium listings for Ventura Harbor and Port Hueneme as the concentrations do not exceed the criteria. • Correct and remove all reference to fish fillet in the response to comment and Fact Sheets as only shellfish samples were collected. • Correct the numerous errors in the Fact Sheets for Ventura Harbor and Port Hueneme Listings.</p>	<p>Many of these issues have been corrected by deleting the duplicated LOEs. However, decision 65893 did not have an exceedance count of 4 of 4 samples at the time of review, and therefore was left unchanged. The duplicate LOE 87197 in the fact sheet for arsenic was deleted, and now shows the correct exceedance count of 2 out of 2 samples. The duplicate LOE 87206 in the fact sheet for cadmium was deleted and now shows the correct exceedance count of 0 out of 2 samples. The listing recommendation for this fact sheet was changed from List to Do Not List as a result of these changes. The duplicate LOE 87121 in fact sheet for Dieldrin has been deleted and now shows the correct exceedance count of 2 out of 2 samples. The final listing decision for this waterbody pollutant combination remains unchanged as a result of the deleted LOE. The duplicate LOE 87149 in fact sheet for PAHs (Polycyclic Aromatic Hydrocarbons) has been deleted and now shows the correct exceedance count of 2 out of 2 samples. The final listing decision for this waterbody pollutant combination remains unchanged as a result of the deleted LOE. The fraction in LOE 89881 was changed from Fish fillet to Shellfish. Decision 67176 did not have an exceedance count of 4 of 4 samples and therefore was left unchanged. Decision 67177 did not have an exceedance count of 4 of 4 samples and therefore was left unchanged.</p>	Yes

	20.23	<p>The data used to assess mercury for Santa Clara River Reach 3 are in ng/L (nanograms per liter) and the objective is µg/L (micrograms per liter). The data need to be converted into the same units as the objective before an exceedance can be determined. The FBVC expects that after this calculation has been performed the waterbody will no longer meet the listing guidelines. Based on the justification that the data and objectives have different units, the June 9 version of the Draft 303(d) List removed the following waterbody segments for mercury impairments: Calleguas Creek Reach 3 (Potrero Road upstream to Conejo Creek confluence), Calleguas Creek Reach 4 (was Revolon Slough Main Branch), La Vista Drain (Ventura County), and Ventura River Reach 3. It is unclear why the same error for Santa Clara River Reach 3 was not corrected. Requested Action: • Repeat the mercury analysis for Santa Clara River Reach 3 after correcting the unit error. Correction of the unit error will result in no exceedances and require removal of the proposed mercury listing.</p>	<p>The Santa Clara River Reach 3 mercury data was converted from ng/L to ug/L for comparison with the criterion. None of the samples exceeded the criterion. LOE 88761 has been updated to reflect that none of the samples exceeded the mercury criterion. Decision 66954 has been updated to “Do Not List on 303(d) list (TMDL required)”.</p>	Yes

Commenter	No.	Comment	Response	Revision
	20.24	<p>Based on a review of the available data, all the observed toxic samples occurred prior to 2009. Of the 8 exceedances, 3 occurred in 2000/2001 and the rest were in 2006, 2007 and 2008. In the 2006-2008 time period, toxicity was commonly observed due to chlorpyrifos and diazinon which were subsequently restricted. Toxicity in many watersheds has been significantly reduced as a result of these use modifications. The available data shows that no samples exceeded after 2008, indicating that those pesticides, or another cause that is no longer present, were the cause of the toxicity. Because of the transient nature of toxicity and the potential that the causes of the toxicity are no longer present, exceedances from prior to the pesticide use bans should not be used as the basis for a listing. The more recent samples since the pesticide use restrictions should be used as a basis for evaluation. In response to this the original comment letter, the Regional Board retained the listing as 5A and responded that "Of the 43 samples evaluated, eight samples were in exceedance, which supported a listing decision. The waterbody pollutant combination should be listed until more data supporting a delisting decision become available. Staff encourages</p>	<p>No change has been made to Ventura River Reach 3. This comment was addressed by the Los Angeles Regional Water Quality Control Board in Response to Comment 18.43: "Of the 43 samples evaluated, eight samples were in exceedance, which supported a listing decision. The waterbody pollutant combination should be listed until more data supporting a delisting decision become available. Staff encourages commenter to submit data to CEDEN in preparation for the next listing cycle." Additionally, the Listing Policy does not put age limitations on data. The policy uses the weight of evidence approach during data assessment and all data must be considered. While the residential use of diazinon and chlorpyrifos have been restricted by the EPA, use restriction is not the same as water quality standards attainment, nor is it a pollution control program. Therefore data suggesting use attainment must be available prior to delisting.</p>	No

		<p>commenter to submit data to CEDEN in preparation for the next listing cycle.” If the SWRCB decides to maintain the listing, the FBVC requests that the pollutant be properly categorized as 4B defined as “Another regulatory program is reasonably expected to result in attainment of the water quality standard within a reasonable, specified time frame”. As stated above the cause of the toxicity has already been addressed by the banning of chlorpyrifos and diazinon in 2008 and there is already ample evidence (i.e., no exceedances since 2008) to show that the beneficial use has not been impacted since that regulatory program was put in place. Requested Action: • Either remove the listing for Ventura River Reach 3 for toxicity based on exceedances from outdated data, OR categorize the listing as 4B.</p>

	20.28	<p>The bifenthrin listings for Duck Pond and Honda Barranca should also be changed to 5B since they are covered by the 2006 Toxicity and OC Pesticides, PCBs and Siltation TMDLs.8,9 However, the RWQCB response to comments states:“The Calleguas Creek Toxicity TMDL specifically addresses the organophosphate pesticides, chlorpyrifos and diazinon, and does not apply to pyrethroids. The Toxicity TMDL would need to be revised to identify pyrethroid targets, and include the other required elements of a TMDL for pyrethroids specifically.” This statement is incorrect. The Toxicity TMDL was established to address toxicity caused by organophosphate pesticides and unknown toxicity due to other pesticides and/or toxicants. Specifically, the Basin Plan Amendment notes: “Discharge of wastes containing chlorpyrifos, diazinon, other pesticides and/or other toxicants to Calleguas Creek, its tributaries and Mugu Lagoon cause exceedances of water quality objectives for toxicity established in the Basin Plan.” To address the other pesticides and/or toxicants, the Toxicity TMDL included a toxicity target “to address toxicity in reaches where the toxicant has not been identified.” If the toxicity target or allocation is</p>	<p>No change has been made. Although pyrethroids do technically fall under the umbrella stated in the TMDL to cover currently unknown sources of toxicity, many other aspects of a TMDL as required by 40 C.F.R § 130.7 are currently missing as they relate to pyrethroids. A key component of a TMDL is the development of waste load allocations (WLA’s). Although the Calleguas Creek TMDL includes a generic portion to cover not yet identified sources of toxicity, WLA’s, and complete source analysis must be developed before other specific pollutants can be considered to fall under this TMDL. The TMDL requirement status for this Fact Sheet cannot be changed until the remaining components have been completed.</p>	No

		<p>exceeded, the TMDL includes a trigger to conduct a Toxicity Identification Evaluation (TIE) and implement actions to address the identified toxicant. Additionally, the implementation actions discussed in the Toxicity TMDL implementation plan are designed to address pesticides as a whole and are not specific to diazinon and chlorpyrifos. As a result, the Toxicity TMDL proactively addresses toxicity associated with other pesticides, such as pyrethroids and other organophosphate pesticides (e.g., bifenthrin and malathion). TIEs conducted in the watershed have resulted in the identification of pyrethroids as a potential cause of toxicity and agricultural dischargers, through VCAILG, have already begun actions to address these pesticides in addition to the organophosphate pesticides included in the TMDL. The structure of the TMDL is designed to proactively prevent toxicity and therefore it is not necessary to develop another TMDL for these constituents. There are already sufficient controls in place through the Conditional Waiver as well as the MS4 permit. The Conditional Waiver includes water quality benchmarks for both toxicity and bifenthrin, as well as actions to address exceedances. Therefore, FBVC requests that the listings</p>

	20.32	<p>The Fact Sheets often include incorrect information and discussion. While most of the identified issues do not appear to impact the listing decisions, they make the review of information difficult. Examples of errors found include:</p> <ul style="list-style-type: none"> • Incorrect TMDLs assigned to a pollutant. For example, for chlordane in Calleguas Creek Reach 2, the applicable TMDL is listed as the Calleguas Creek Metals TMDL. It should be the Organochlorine Pesticides, PCBs, and Siltation TMDL. • Incorrect number of samples evaluated and incorrect number of criteria exceedances. For example, the number of samples evaluated for toxaphene on the Rio de Santa Clara/Oxnard Drain No. 3 is identified as 2 samples, whereas data files obtained from the Regional Board website contain 5 samples for the date range indicated in Fact Sheets, including 3 samples with results of “ND”. Stating that a pollutant actually exceeds criteria in only 40% of samples, versus 100%exceedances as presented in Fact Sheets, provides a more accurate picture of the degree of impairment for that pollutant in a waterbody. The inclusion of J-flagged data when enumerating exceedances (e.g., for chlordane in the same waterbodies) further exacerbates these numbering inaccuracies. <p>Requested Action:</p>	<p>The TMDL listed in the Fact Sheet for Calleguas Creek Reach 2 has been updated to reflect the correct TMDL (State Board Resolution 2005–0068).The fact sheet for Rio de Santa Clara/Oxnard Drain No. 3 has not been changed. The 3 samples claimed by the commenter to not be included in the LOE, were not included because the water quality criteria was below the minimum detection limit and therefore could not be included in the assessment as stated in Section 6.1.5.5 of the Listing Policy.</p>	No

Portion of the 2014 and 2016 California Integrated Report
Comment Deadline: 12:00 noon on July 10, 2017

Commenter	No.	Comment	Response	Revision
	20.33	<p>There are multiple instances of what appear to be incorrectly Hydrologic Unit numbers (HUCs) and Calwater numbers assigned to the various waterways. For instance, a comparison of the 8 digit HUCs listed in Appendix B of the 303(d) List to the 12 digit HUCs listed in Appendix I of the Basin Plan indicate a number of inconsistencies such that waterbodies present in the Santa Clara River Watershed (e.g., Santa Clara River Reach 3) are listed with a Calleguas watershed HUC (18070103) while the same reaches are listed as 18070102 in the Basin Plan. This makes it especially difficult to identify the location of unknown waterbodies not previously listed or described in the Basin Plan to determine whether they are receiving waters that should be assessed. A full review of the 303(d) List HUCs should be completed to correct all errors. The RWQCB Response to Comments stated that “It is the intention of the Los Angeles Water Board staff to work with State Board staff to resolve mapping issues including HUCs for those reaches, as appropriate, prior to the State Board approval of the 2016 303(d) list, or at the next Listing Cycle that includes the Los Angeles Region.” We appreciate that the RWQCB and SWRCB intend to fix the issue</p>	<p>No change has been made. The HUCs identified in the category reports are unreliable and updatable at this time. This is a known issue, and the State Water Board is working with the contractor that maintains the database to update the information. In the meantime the stakeholders can utilize the information available in the Los Angeles Regional Basin Plan to accurately identify waterbodies by HUC.</p>	No

		<p>but find it unacceptable that the change might not come until sometime during the next Listing Cycle planned for 2022. The SWRCB should not approve any 303(d) List that includes fundamental errors in the location of reaches. If such errors are allowed to remain they will only compound the many issues experienced by FBVC and others when the list is revisited again in 6 years. Requested Action: Perform a full review of HUCs and Calwater numbers listed in the Appendices and Fact Sheets and correct any inconsistencies with the Basin Plan.</p>

Commenter	No.	Comment	Response	Revision
	20.34	<p>There is inconsistent discussion in the staff report about some proposed listings, which should be clarified. For instance, page 12 of the RWQCB Staff Report includes this statement: "For example, the proposed new listings for mercury in Calleguas Creek Reach 3 and the proposed DDT listings in Hondo Barranca are being addressed by the Calleguas Creek Metals TMDL and the Organochlorine Pesticides, PCBs and Siltation TMDL." However, there is no proposed new listing for mercury for Calleguas Creek Reach 3 because, as we noted in our March 29 letter, the proposed mercury listing was off by three orders of magnitude due to a unit conversion error. While the fact sheets were updated, the text of the Staff Report was not. Requested Action: Correct language cited above in the RWQCB Staff Report.</p>	<p>No change is necessary. Appendix H of the State Water Board draft Staff Report supersedes the information provided by the Los Angeles Water Board and its Staff Report.</p>	No

Sanitation_Districts of LA Representative / Commenter: Ann Heil	21.01	The Draft June 2017 version of the 2016 303(d) List contains a number of newly proposed listings for "Benthic-Macroinvertebrate Bioassessments." The proposed listings are based on application of the Southern California Coastal Index of Biological Integrity (SCIBI) and, in some cases, the California Stream Condition Index (CSCI). These include listings for Santa Clara River Reaches 5 and 6 and Medea Creek Reach 1. The Sanitation Districts believe these proposed listings should be removed, for the reasons listed below.	Comment noted.	0

	21.02	<p>The Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (Listing Policy) indicates that water bodies should only be listed for degradation of biological populations if they have significant degradation relative to reference sites [emphasis added]. Although the scientists that developed the SCIBI attempted to incorporate reference conditions into the index itself, the reference conditions used to develop the index did not include sufficient low elevation, low gradient locations similar to the Santa Clara River reaches of concern. Although the CSCI at least partially addresses some of the problems with the SCIBI by employing a modeled reference condition as opposed to the regional reference pool used by the SCIBI, a lack of reference sites in large watersheds, low gradient, and low elevation systems still limits the identification of appropriate thresholds using the CSCI.</p>	<p>The commenter made similar comments to the Los Angeles Water Board. The Los Angeles Water Board response is as follows:“Listings based on the SCIBI and CSCI scores are consistent with State policy and have been assessed relative to appropriate reference sites.Both the IBI and the CSCI assess benthic community relative to reference sites. The SCIBI was developed using data from 275 sites, ranging from Monterey County to the Mexican border. Eighty-eight sites were used as reference sites based on land use and local conditions. The CSCI employs a modeled reference condition as opposed to the regional reference pool used by the SCIBI.....At this time, the CSCI (and IBI where CSCI is not available) is the best measure of biologic integrity in California streams and it is appropriate to use IBI and CSCI in 303(d) listing decisions. As the science progresses, improved methods may supplant older methods and the 303(d) list will be revised, as appropriate, as that occurs... ..The use of the SCIBI and CSCI for 303(d) listing was done in accordance with Section 3.9 and 6.1.5.8 of the Listing Policy with biological data and impairment related to associated pollutants and/or pollution.” (Response to comment 26.4.)The CSCI is a preferred measure of biological health over the SCIBI. In cases where only SCIBI data was collected that information was translated into a CSCI score if possible. The scientists who determined how reference sites would be selected agreed that the physiographic setting experienced by BMIs (Benthic Macro Invertebrates) is at least as important as geography. While they acknowledge certain geographic gaps in the reference pool, the reference pool represents the full range of climate, elevation, stream size, geology, etc. that occurs naturally across the state. They evaluated how well the reference pool captures the range of natural environmental settings by comparing the distribution of key environmental variables at reference sites to the distribution of</p>	0

	21.03	#REF!	<p>Section 6.1.5.8 states “Evaluate physical habitat data and other water quality data, when available, to support conclusions about the status of the water segment.” There is no direct physical habitat element required to calculate the CSCI. However the human activity criteria (land use, road density, and hydrologic alteration) are used to evaluate stress due to anthropogenic factors and to identify minimally disturbed (reference) sites. Currently, there is no physical habitat criteria or index in place to evaluate physical habitat data. If such an index is developed the physical habitat will be evaluated consistent with the Listing Policy. The regional water boards can utilize site specific physical habitat information when addressing biological impairments as part of the causal assessment process that occurs within the context of a regulatory action.</p>	0

Committer	No.	Comment	Response	Revision
	21.04	<p>Section 6.1.5.8 of the Listing Policy also states that when "evaluating biological data and information, RWQCBs shall evaluate all readily available data and information and shall ... evaluate physical habitat data and other water quality data, when available, to support conclusions about the status of the water segment." [Emphasis added.] All of the reaches mentioned in this comment letter represent reaches that have undergone various levels of physical habitat modifications and there is no indication that an evaluation of the physical habitat was conducted. It is well recognized by the scientific community that unmanageable non-pollutant physical habitat alterations would preclude many California streams from ever having biological assemblages similar to reference. The threshold used as the listing criterion for these reaches is therefore likely inappropriate for these modified waterbodies.</p>	See response to comment 21.02.	0

	21.05	<p>The Sanitation Districts believe the proposed temperature listings for San Gabriel River Reach 2, San Jose Creek Reach 1, San Gabriel River Reach 1, and Santa Clara Reach 6 should be removed because the impairment listings are inconsistent with the Basin Plan water quality objective for temperature, which states, "at no time shall these WARM-designated waters be raised above 80°F as a result of waste discharges." [Emphasis added.] The wording of this Basin Plan objective places the burden of proof on the Water Boards to demonstrate that waste discharges are causing the elevated temperatures. The Draft List does not contain any analysis or evidence indicating that the elevated temperatures occurred as result of wastes discharged, as opposed to other factors. Rather, the Response to Comments on the Draft 2016 303(d) List prepared by the Regional Board specifically states that such analyses were not conducted. In this same document the Regional Board also acknowledged other sources of temperature exceedances, stating, "Exceedances in temperature may be caused in part by ambient temperatures or exacerbated by the lack of tree cover in some reaches; exceedances may also be caused in part by waste discharge."</p>	<p>The water quality objectives found in the Los Angeles Basin Plan for pH, DO and temperature are levels expected to protect aquatic life beneficial uses. After discussion with the Los Angeles Water Board it has been determined that the language "as a result of waste discharge" is intended to recognize that in some cases levels above the objectives can occur due to natural or non-controllable factors. However, the language is not intended to limit identification of impairment via the 303(d) list by requiring an initial source analysis. Rather it provides the Los Angeles Water Board the ability to identify areas where natural or non-controllable water quality factors are the only source of impairment and determine where the water quality objectives are not applicable. This determination would also result in a delisting.</p>	0

Committer	No.	Comment	Response	Revision
	21.06	<p>The Sanitation Districts believe that it is inappropriate to make impairment decisions using the SCIBI and premature to rely on the improved, but still limited CSCJ for making impairment decisions, particularly in reaches where surrounding development and instream physical habitat limitations are recognized and/or in large watersheds, low gradient, low elevation systems. Therefore, the Sanitation Districts respectfully recommend that the Regional Board delay making decisions regarding these benthic macroinvertebrate community impairments in this listing cycle or place these water bodies in Category 3, and instead continue to work with stakeholders, scientists, and the State Board that are currently engaged in efforts to address these and other issues as part of the Biointegrity/Bio-stimulatory Policy.</p>	<p>See response to comment 21.05. Santa Clara reach 6 has been designated with aquatic life beneficial uses. The 80°F temperature objective protects the aquatic life beneficial use of WARM in surface waters regardless of the ultimate source of the water in that reach of the river. The Los Angeles Water Board does not have alternative objectives for effluent-dominated waters.</p>	0

	21.08	<p>The State Water Resources Control Board (State Board) is currently proposing that a new listing for benthic community effects be made to the 303(d) list for Reach 5 of the Santa Clara River, based on Southern Coastal California Index of Biotic integrity (SCIBI) scores. The Sanitation Districts believe this proposed listing is inappropriate and recommend not listing or listing as a Category 3 (insufficient data) stream reach for the reasons listed below; supporting evidence is provided in the sections that follow. The SCIBI-based analysis has been demonstrated to be inadequate for use in low gradient/low elevation watersheds similar to the reaches in the upper Santa Clara River. In 2010 the State Board agreed that the SCIBI was an inadequate tool for assessment of the Santa Clara River and did not approve the staff recommendation to place these water bodies on the 303(d) for benthic community impairment. Although the CSCI at least partially addresses some of the problems with the SCIBI by employing a modeled reference condition as opposed to the regional reference pool used by the SCIBI, the low number of reference sites in large watersheds, low gradient, and low elevation systems still limits the identification of appropriate thresholds</p>	<p>See responses to comments 21.02 and 21.03. The Southern California Stormwater Monitoring Coalition reference “cloud” mentioned by the commenter comes from preliminary presentations on the CSCI. It shows an ordination of environmental variables from ~2000 sites throughout California. The “cloud” shows areas where there are reference sites in ordination space. The cloud itself is somewhat arbitrary, and a different scaling could result in a larger or smaller cloud. The interpretation of sites falling within the cloud is also dependent on user interpretation. The appropriateness of the CSCI can be validated where there are underrepresented references sites by looking at scoring results of similar sites that aren’t reference but have various levels of “non-referenceness.” The CSCI was calibrated so that the mean score of reference sites is 1. The distribution of CSCI scores at all reference sites defined the thresholds. The reference data set that was used to calibrate the CSCI had areas that ranged from 0.34 km² – 2029 km². The CSCI score for the smallest watershed was 0.869 and the CSCI for the largest watershed was 0.889. The largest reference watershed (296.7 km²) in the LA Region is Sespe Creek 3643 (SMC03643). Site elevations ranged from 7 km – 3130 km. The CSCI score for the site with the lowest elevation is 1.3 and the CSCI score for the highest elevation is 0.918. Lastly, The Listing Policy does not define “reference” but rather defines how it should be calculated which has been done and validated repeatedly by the CSCI and reference threshold studies. This Southern California Coastal Water Research Project tool identified by the commenter is still under development and utilizing it at this point to support a listing/delisting recommendation would be inappropriate. Once the tool is completed the tool could aid in causal assessment and for developing an appropriate regulatory program for addressing water</p>	0

		<p>using the CSCI. Specifically, several Santa Clara River sites have been shown to fall outside the experience of the CSCI model. Bioassessment monitoring using the CSCI scoring tool has demonstrated an unimpaired benthic community. The sole CSCI score included in the current data set met the proposed 0.79 threshold. Physical habitat was not assessed, as required by the State Board Water Quality Control Policy for Developing California’s Clean Water Act Section 303(d) List (Listing Policy). Historically unmanaged or unmanageable stressors (e.g. channel/habitat modifications) are well documented as precluding sites from achieving reference conditions. An evaluation of relevant physical habitat data is critical to identify whether observed impacts are due to these stressors. A lack of such evaluation should result in designation to Category 3. The proposed listing fails to associate the alleged impairment with pollutants impacting aquatic life beneficial uses. The Southern California Stormwater Monitoring Coalition (SMC) evaluated the CSCI reference poolusing principle components analysis. The environmental gradients used as predictors for the CSCI were compressed into two dimensions and used to generate a</p>	<p>quality impairments in those streams. It is important to note that the term ‘constrained’ refers to the biology and this could be due to habitat alterations and/or poor water quality. Decision 44468 has been revised to “Do Not List” due to lack of sufficient information to support a beneficial use support determination at this time. While an existing chloride impairment exists in the waterbody the single CSCI score does not indicate that the biology is impaired. More data should be collected and analyzed to determine if the chloride levels in the water are impacting the biological community.</p>

		<p>heat map (Figure 1). Figure 1 shows the availability of data to determine reference conditions; red areas indicate a higher density of reference locations, darker/blue areas indicate fewer reference locations, and gray indicates sites that may be outside the experience of the CSCI. Several of the Santa Clara River sites (orange symbols circled in Figure 1) fall outside of CSCI reference conditions and presumably outside the experience of the CSCI model. A more recent tool developed by Southern California Coastal Water Research Project (SCCWRP) staff through a State Board effort has resulted in a quantitative tool to identify streams/reaches that are likely to be “constrained” by habitat or other, non-water quality parameters (the model used land cover, road density, canal density, mines, dams, aerial deposition, and non-native vegetation). When applying this tool to the Santa Clara Reach 5 location, SCCWRP determined that this location is “likely constrained”, meaning unlikely to achieve a CSCI score of 0.79 due to landscape development.</p>

		<p>the Basin Plan was written to accommodate higher temperatures caused by these ambient conditions. Additionally, the Sanitation Districts respect that source identification typically is not part of the 303(d) listing process for most pollutants. However, this water quality objective clearly distinguishes between exceedance of the 80°F standard caused by “waste discharges” and those associated with other causes. In cases such as these, the burden falls on the Water Boards to demonstrate that temperature in excess of 80°F were as a result of waste discharge before an impairment listing can be made. Based on the wording of the receiving water objective, a receiving water exceeding 80°F caused by factors other than wastes discharged would not represent an exceedance of the objective. Therefore, when assessing the temperature objective in Region 4, an analysis of the source or cause is both required and critical in determining if the objective was exceeded. Furthermore, as described in more detail below, a Sanitation Districts survey clearly demonstrates that summertime excursions greater than the 80°F in this reach are not caused by waste discharges but are due to elevated ambient air temperature, conductive and radiative</p>

		<p>heating associated with hardened landscapes, a lack of riparian cover, and increased ambient temperatures related to climate change. Additionally, the proposed listing and associated fact sheets do not contain any analysis or evidence refuting the findings of this survey. Instead, the Regional Board Fact Sheet states that a single line of evidence was used in the assessment of temperature. Specifically, 42 of 301 samples from Pom-RD, Pom-RC, SJC-C1, and SJC-C2 exceeded the objective from July 2005 to November 2010 using the “Data for Various Pollutants in Various Water Bodies in Sanitation Districts of Los Angeles County, 2005-2010” dataset. (Appendix A of the Sanitation Districts’ March 30, 2017 letter “Comments on the February 2017 Proposed 2016 Los Angeles Region Clean Water Act Section 303(d) List of Impaired Waters” contains the full set of data applicable to this listing from Appendix G of the Regional Board Draft Staff Report.) Note that based on a review of the dataset utilized for the listing evaluation, the Sanitation Districts identified 339 discrete temperature measurements, not 301. The dataset contains 368 results; however, 29 samples were duplicates. Of the 339 unique temperature measurements, 46 exhibited a</p>

	21.12	<p>Pom-RC and Pom-RD Excursions Above 80 °F Are Demonstrably Not a Result of Waste Discharges Tertiary treated water from the Pomona Water Reclamation Plant is discharged to the south fork of San Jose Creek and flows into Reach 1. Receiving water stations Pom-RC, Pom-RD, and SJC-C1 are located approximately 3, 12, and 12.5 miles from the upstream border of Reach 1, respectively. Reach 1 is fully lined in concrete from the upstream border to just upstream of SJC-C1 (Figure 1). As observed by Sanitation Districts staff and corroborated by EPA staff¹, groundwater exudes from relief structures distributed throughout the concrete-lined bottom, even in mid-summer (August) after several years of drought (Figure 2). In the absence of discharge from the Pomona Water Reclamation Plant or other observed discharges, flows in SJC between Pom-RC and Pom-RD increase by 200% to greater than 400% (Figure 3) due to the release of this groundwater, which has a localized average temperature of approximately 67 °F.² As this groundwater-dominated flow travels downstream, the temperature naturally rises (Figure 4) due to heat conduction through the warm concrete lining and solar radiation exposure in the</p>	<p>See responses to comments 21.05, 21.06, and 21.11. The State Water Board encourages the commenter to work with the Los Angeles Water Board to perform a thorough assessment of sources contributing to the temperature impairment. The information provided is outside the scope of the data solicitation and does not constitute a complete source analysis.</p>	0

		<p>unshaded channel (Figure 5 shows ambient air temperature as a proxy for solar radiation³). When the concrete channel ends upstream of SJC-C1, the water leaves the heat source (concrete channel) and mixes with additional groundwater, resulting in consistently cooler temperatures. The observed spatial and temporal temperature profile, coupled with no identifiable waste discharges and substantial groundwater clearly demonstrates that the temperature excursions in Reach 1 of San Jose Creek are not a result of waste discharges.</p>

	21.13	<p>The State Water Resources Control Board (State Board) is proposing that a new listing for impairment due to water temperature be made to the 303(d) list for Reach 1 of the San Gabriel River. The Sanitation Districts of Los Angeles County (Sanitation Districts) believe this proposed listing is inappropriate and recommend not listing due to water quality objectives being achieved. Failure to Meet Water Quality Objectives Has Not Been Demonstrated. The Water Quality Control Plan: Los Angeles Region Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties (Basin Plan) states that: "At no time shall these WARM-designated waters be raised above 80°F as a result of waste discharges." [Emphasis added.]...the 80°F temperature objective is not a hard and fast number that was set as a threshold above which aquatic life would not be protected. Rather the Basin Plan only prohibits the raising of water temperature above 80°F as a result of waste discharges. The Basin Plan accommodates temperatures above 80°F without considering them to be violations, as long they are not as a result of waste discharges. The standard was set this way presumably to recognize that there are natural variations in temperature in the Los Angeles Basin that may occur even in the</p>	<p>See responses to comments 21.05, 21.06, and 21.11. 		<p>absence of waste discharges...The Southern California area routinely experiences temperatures well above 80°F during the summer months, and the Basin Plan was written to accommodate higher temperatures caused by these ambient conditions. Additionally, the Sanitation Districts respect that source identification typically is not part of the 303(d) listing process for most pollutants. However, this water quality objective clearly distinguishes between exceedance of the 80°F standard caused by “waste discharges” and those associated with other causes. In cases such as these, the burden falls on the Water Boards to demonstrate that temperature in excess of 80°F were as a result of waste discharge before an impairment listing can be made. Based on the wording of the receiving water objective, a receiving water exceeding 80°F caused by factors other than wastes discharged would not represent an exceedance of the objective. Therefore, when assessing the temperature objective in Region 4, an analysis of the source or cause is both required and critical in determining if the objective was exceeded. As detailed in the San Jose Creek Reach 1 Temperature Fact Sheet, in fully lined concrete channels, summertime excursions greater than the</p>

		<p>80°F are not caused by waste discharges but are due to elevated ambient air temperature, conductive and radiative heating associated with hardened landscapes, a lack of riparian cover, and increased ambient temperatures related to climate change. Although a specific survey for San Gabriel River Reach 1 has not been conducted, the physical conditions in that reach are very similar to those in San Jose Creek and would be expected to exhibit the same patterns (see figures 1-2). Furthermore, an analysis of ambient temperature correlated to receiving water temperature confirms this relationship and is described in more detail below. Finally, the proposed listing and associated fact sheets do not contain any analysis or evidence refuting the actuality that elevated temperatures are caused by factors such as elevated ambient temperatures and conductive and radiative heating associated with hardened landscapes. Instead, the Regional Board Fact Sheet simply states that a single line of evidence was used in the assessment of temperature. Specifically, 93 of 234 samples from LC-R4, R3-1, and R3-1b exceeded the objective from July 2005 to November 2009 using the “Data for Various Pollutants in Various Water Bodies in</p>

	21.14	<p>San Gabriel River Reach 1 Excursions Above 80 °F Are a Result of Radiative and Conductive Heating Tertiary treated water from the San Jose Creek and Los Coyotes Water Reclamation Plants (WRPs) is discharged to the main stem of the San Gabriel River. Reach 1 is a fully lined concrete channel from approximately 0.25 miles downstream of the San Jose Creek WRP discharge point 001 to the San Gabriel River estuary. As explained in Fact Sheet #4, elevated temperatures in Reach 1 of San Jose Creek occurred even in the absence of observable waste discharges and were caused by conductive heating through the concrete lining and solar radiation exposure. Although a comprehensive assessment of flows, in the absence of WRP discharge, cannot be conducted along the San Gabriel River, the same conditions associated with the radiative and conductive heating exist in San Gabriel River Reach 1. This is supported by a significant correlation between ambient air temperature and receiving water temperature ($R^2 = 0.61$, Figure 3) and the fact that 90% of excursions above 80°F in the receiving water environment occurred during summer months, between June and September. The weight of evidence supports the contention that receiving water</p>	See response to comment 21.12.	0

		<p>with hardened landscapes, a lack of riparian cover, and increased ambient temperatures related to climate change. Furthermore, an analysis of ambient temperature correlated to receiving water temperature identified a significant relationship between ambient air temperature and receiving water temperature in this Reach, as detailed below. Finally, the proposed listing and associated fact sheets do not contain any analysis or evidence refuting the findings of this survey. Both the Saugus WRP discharge and the immediate downstream receiving water location (Sa-RB) are heavily influenced by ambient air temperature. Figure 3 includes a plot of the 15-day average values of the maximum air temperature along with the individual water temperature measurements collected at the Sa-RB location¹. Nearly all of the 80oF temperature exceedances were associated with the higher, warm weather air temperatures and the two have a statistically significant correlation ($R^2 = 0.76$). Because exceedances of the Basin Plan temperature objective are limited to those “as a result of waste discharges,” an evaluation of the contribution of ambient air temperature to the receiving water should have been conducted before identifying</p>

	#REF!	<p>The 80°F Water Quality Temperature Objective Is Unnecessary and Inappropriate for Santa Clara River Reach 6. The only dry weather surface flows within this stretch of Reach 6 are associated with recycled water discharges from the Saugus WRP, which percolate into the dry riverbed a short distance downstream of the discharge point and eventually resurface downstream near the Reach 5 boundary. At the point of resurfacing, the water temperature averages 69°F and this perennial surface flow supports a diverse aquatic life community in Reach 5. However, the predominant natural condition of Reach 6 is dry and would not be expected to support any aquatic life without the Saugus WRP discharge. In addition, the cool temperatures in the water that resurfaces near the Reach 5 boundary demonstrate that elevated temperatures in the isolated discharge area are not detrimental to beneficial uses. Therefore, application of the 80°F water quality objective in Santa Clara Reach 6 is unnecessary and inappropriate, as the presence of water exceeding the 80°F water quality objective would not result in any impairment to naturally occurring aquatic life.</p>	#REF!	#REF!

	22.05	<p>In response to comments, the Los Angeles Regional Board indicated that staff did not address these waterbody-pollutant combinations due to resource constraints coupled with challenges of identifying QA/QC documents associated with the data. However, Regional Board staff do not need to do any analysis because the USEPA already conducted the analysis needed and made the recommendation to delist these waterbody-pollutant combinations. Making a reference to the USEPA's 2012 LA Area Lakes TMDL should be sufficient evidence to delist these waterbodies as a similar approach has been utilized for delisting other waterbodies. For example, the Regional Board delisted Diazinon for Dominguez Channel based on the analysis and findings of non-impairment presented in a USEPA approved TMDL. To this end, the 303(d) list fact sheet for Diazinon in the Dominguez Channel⁴ states, "there is sufficient justification to delist this waterbody/pollutant because when the Dominguez Channel and Los Angeles and Long Beach Harbors Toxics and Metals was completed, the TMDL analysis showed no diazinon concentrations above the guideline, post 2005." Therefore, the County of Los Angeles (County) and the Los Angeles</p>	<p>The following waterbody and pollutant combinations have been delisted: Peck Road Park Lake – Lead/Legg Lake - copper and lead Santa Fe Dam Park Lake - copper and lead The Los Angeles Area Lakes Nitrogen, Phosphorus, Mercury, Trash, Organochlorine Pesticides and PCBs TMDL, completed and approved by USEPA, found that there was no impairment for the above waterbody pollutant combinations and this provides justification for the delistings.</p>	Yes

	22.07	<p>The three waterbodies listed above are fully concrete-lined channels and, thus, should be reassigned to Category 3. The reconnaissance survey conducted by the Regional Board during the recreational use reassessment (RECUR) of the engineered channels of the Los Angeles River Watershed7 has confirmed that these are concrete-lined channels. *Page 88 of the RECUR report describes Alhambra Wash as, "...a concrete-lined box channel (with vertical walls) throughout its length...". LACFCD's database further confirms this fact. LACFCD's database further confirms that this reach of the LA River is fully lined with concrete. Therefore, to remain consistent, the benthic community listing for Alhambra Wash, Arroyo Seco Reach 1, and Los Angeles River Reach 4 should be removed from the 303(d) list and reassigned to Category 3. Page 66 of the RECUR report describes Arroyo Seco Reach 1 as "concrete lined the entire length except in a short section just south of W. Holly Street to the Colorado Boulevard overpass where the stream channel is natural." A further assessment by the LACFCD reveals that the natural section is approximately 0.25 miles of the more than seven miles total length of Arroyo Seco Reach 1 (see enclosed map). As</p>	0	0

	22.08	<p>The Regional Board’s decision regarding toxicity and temperature listings should be reviewed by the State Water Board in conjunction with the County and LACFCD comments. The comment letter to the Regional Board is available at http://www.swrcb.ca.gov/losangeles/water_issues/programs/303d/2016/comments/17_LAC-LACFCD_p53.pdf. Comments III and IV (pages 6-9 of the pdf) discusses justifications for not listing toxicity and temperature, respectively.</p>	<p>TemperatureThe Los Angeles Water Board’s response regarding Los Angeles River Reach 3 (response to comment 11.25), San Gabriel River Reaches 1 and 2, and Santa Clara River Reach 6 temperature assessments (response to comment 17.4) as provided in the “Revised Response to Comments on the Draft 2016 393(d) List” is appropriate and is as follows:Response to comment 17.4: “The 303(d) list appropriately identifies the temperature impairments. Analysis of sources and causes are not completed as part of the Integrated Report or 303(d) listing process. The 80°F temperature objective protects the aquatic life beneficial use of WARM in surface waters regardless of the ultimate source of the water in that reach of the river. The Los Angeles Water Board does not have different objectives for different seasons.”Response to comment 11.25: “The temperature data for the Los Angeles River Reach 3 has been re-evaluated and compared to the Basin Plan standard of not to exceed 80° and the decision has been revised to “do not list.”Additionally, due to the large amount of data to be assessed during each update of the 303(d) list, the 303(d) list data evaluations are more general. In particular, these evaluations do not include source assessments; they rely upon existing waterbody delineations without further subdivision (e.g., Santa Monica Bay); and they typically do not entail more refined analyses such as assessing data collected during wet weather and dry weather separately. As Board staff commences TMDL development, these more temporally and spatially refined data assessments are made along with a source analysis. Based on these analyses, staff may propose a finding of no impairment with a recommendation to delist during the next 303(d) cycle, or may refine the defined scope of the impairment to be addressed by the TMDL (e.g., wet weather only).ToxicityThe Los Angeles Water Board’s response regarding the ten county</p>	No

			<p>waterbodies newly listed for toxicity (comment 17.3) as provided in the “Revised Response to Comments on the Draft 2016 393(d) List” is appropriate and is as follows: “All the toxicity data assessed met the required quality assurance. The SMC Toxicity Testing Laboratory Guidance study, 2016, conducted a laboratory intercalibration study focusing on four species C. dubia, Hyalella, Strongylocentrus and Mytilus. Fathead and topsmelt were not a part of the study. The study did not conclude or recommend that previously analyzed data should be disregarded. The study authors recommended all four species for future use as part of the Stormwater Monitoring Coalition monitoring programs. The authors also provided specific guidance for stormwater testing for potential variability-inducing steps including hardness of dilution water, feeding, sample handling and water renewals, and aging of organisms. The authors further concluded: “Based on the scoring system developed for this study, the participating laboratories were comparable for most of the test endpoints (Table 10). Virtually all laboratories were able to meet test acceptability requirements, including internal positive and negative controls. Most laboratories tended to produce internally consistent results when given blind duplicate samples. Finally, most laboratories produced data consistent with non - toxic samples when exposed to laboratory dilution water.” This response adequately addresses the comment regarding validity of toxicity data.</p>

Committer	No.	Comment	Response	Revision
Los Angeles Department of Water and Power Representative/Committer: Katherine Rubin	23.01	The 303(d) listing recommendations should be updated to include current data and information. The Los Angeles Regional Water Quality Control Board (LARWQCB) staff indicated in their response to comments that "Due to the volume of data received during the 2010 data solicitation period, the SWRCB determined that no additional data would be solicited or analyzed until all the 2010 data are assessed. [...] LARWQCB staff estimates that the 2022 303(d) list will include data submitted through 2021." (Staff Report, p. 6). However, LADWP would like to reiterate the concern that many of the data upon which proposed listings are based are more than ten years old, and are not necessarily representative of current conditions and therefore listing may not be necessary for certain water bodies. LADWP respectfully requests that updated data and information be used in the 303(d) listing, as basing the listing of datasets that do not include the most recent information could list a waterbody that no longer should or need be on the list.	In 2015 the Listing Policy was amended to include several methods for increasing the efficiency of the creation and submittal of the Integrated Report to U.S. EPA. Those methods will begin being utilized starting with the 2018 Integrated Report as directed by the State Water Board under Resolution 2015-0005. That includes soliciting for newer data. The Water Boards have been transparent regarding the 2012, 2014, and 2016 Integrated Reports being developed based on data and information received as part of the 2010 data solicitation. Regional Water Boards may conduct CWA Section 305(b) and/or 303(d) List update(s) "off-cycle", before their next regularly scheduled Integrated Report periods. To be efficient, off-cycle updates should be limited to priority waterbodies, pollutants, or combinations thereof as identified by the Regional Water Boards, with reallocation of resources as appropriate.	0

Commenter	No.	Comment	Response	Revision
	23.02	<p>The proposed listings for "benthic community effects" are premature at this time, particularly for proposed listings in modified channels. LADWP notes that several of the proposed listings for "benthic community effects" are based upon limited data (2 or 3 samples) that were collected nine or more years ago, and that some of the proposed listings are based upon "index of biotic integrity" (181) scores. As the SWRCB is in the midst of developing a comprehensive, consistent state-wide Biostimulatory Substances and Biological Integrity Policy (including specifically the technical and policy approaches to regulating biological integrity in modified channels) which will include biological condition assessment methods, scoring tools, and targets for biological integrity. Workshops, meetings, and policy development are all actively underway. Given that the SWRCB's policy development is underway, tools and metrics that are no longer being developed for inclusion in the State's policy should not be used as the basis for 303(d) listings. This includes 181-based benthic community listing methods and interpretations, which do not represent current technical understanding for biological integrity in California.</p>	<p>If a water body has a designated aquatic life Beneficial Use (such as WARM), it is appropriate to evaluate whether or not that Beneficial Use is being supported as part of the Integrated Reporting process. The Benthic Community Effects listings are associated with other pollutant listings, so waterbodies with Benthic Community Effects listings are appropriately in Category 5 or 4a. Both the California Stream Condition Index (CSCI) and the Regional Indices of Biological Integrity (IBIs) meet the Listing Policy requirements for acceptable Evaluation Guidelines for interpreting a narrative objective. Although moving forward the CSCI is the preferred index for assessment, it could not be used for some of the data that was assessed due to lack of specific taxonomic information needed to calculate a CSCI score. It is still appropriate to use the IBI score when a CSCI score is not available consistent with Section 6.1.5.8 of the Listing Policy. The age of the data is not pertinent as the listing is based on all available data as a whole. All years past are complied with all years since and combined into a dataset for every listing cycle and decision. Delisting conditions can be found on page 14, table 4.1 of the Listing Policy.</p>	0

	23.03	<p>Additionally, many of the water bodies proposed for listing for benthic community effects are engineered or modified channels, and it is not scientifically or technically appropriate to expect that modified channels will achieve the CSCI or 181 scores that are observed in reference channels. The proposed listings do not consistently establish a link between the biological condition and the pollutant(s) that may be responsible for the biological condition; it is not clear that the pollutant measurements (available only for some proposed listings) were collected at the same time as the biological data.</p>	<p>Both the California Stream Condition Index (CSCI) and the Regional Indices of Biological Integrity (IBIs) meet the Listing Policy requirements for acceptable Evaluation Guidelines for interpreting a narrative objective. If a water body has a designated aquatic life beneficial use (such as WARM), it is appropriate to evaluate whether or not that beneficial use is being supported as part of the Integrated Reporting process. "Commenter's characterization of the waters at issue as "modified channels", does not render inapplicable assessment under the Listing Policy and identification on California's section 303(d) List. The State Water Board and Regional Water Boards administer the Porter-Cologne Water Quality Control Act (Wat. Code, Div. 7, § 13000 et seq.) (Porter-Cologne Act) to achieve an effective water quality control program for "waters of the state." (Wat. Code, § 13000.) The phrase "waters of the state" is defined more broadly than "waters of the United States." The Porter-Cologne Act defines "waters of the state" as "any surface water or groundwater, including saline waters, within the boundaries of the state." (Wat. Code, § 13050, subd. (e).) The Porter-Cologne Act declares that "the people of the state have a primary interest in the conservation, control, and utilization of the water resources of the state, and that the quality of all the waters of the state shall be protected for the use and enjoyment by the people of the state." (Wat. Code, § 13000.) The State Water Board carries out its water quality protection authority through, among other actions, the adoption of water quality control policies, which contain essential guidelines and principles for water quality control for "waters of the state." The Listing Policy is as such a policy the State Water Board and the Regional Water Boards utilize for the State of California to comply with (at a minimum) the listing requirements under section 303(d) of the Clean Water Act. However, the Listing</p>	0

			<p>Policy is not limited to the assessments of “navigable waters” or “waters of the United States” within the State’s boundaries. The Listing Policy specifies its applicable scope: The objective of this Policy is to establish a standardized approach for developing California’s section 303(d) list in order to achieve the overall goal of achieving water quality standards and maintaining beneficial uses in all of California’s surface waters. (Listing Policy, p.1 (emphasis added).) California's surface waters are designated with beneficial uses to protect against quality degradation. (Wat. Code, § 13050, subd. (f) (defining beneficial uses).) The Listing Policy provides guidance on assessing and interpreting data and information as they are compared to applicable beneficial uses. (Listing Policy, p.1.) Accordingly, the California section 303(d) List always has, and will continue to, pursuant to the policy’s express objective, include waters for which applicable water quality standards have been promulgated and may be assessed to determine whether standards are met.</p>

	23.06	<p>On the subject of regulating modified channels, SCCWRP has acknowledged that the newly developed California Stream Condition Index (CSCI), which compares observed to expected benthic communities in a waterbody, does not account for landscape modifications that preclude achievement of reference biological communities. Such landscape modifications include concrete-lined and other highly modified channels. As such, SCCWRP is developing a model to predict where biological quality is constrained by the landscape (e.g., modified channels), identifying conditions where it is not possible for a biological metric score to achieve reference conditions. "Some streams may not be able to attain high scores, even if key stressors are reduced" (SCCWRP webinar; June 26, 2017). Prior to a comprehensive discussion of "how policies might address constraints on biointegrity" (SCCWRP webinar; June 26, 2017), it is counterproductive and unsuitable to list such streams for benthic community effects in absence of a scientifically valid and meaningful regulatory strategy for assessing those effects. As SCCWRP stated in the feedback solicitation form provided after the June 26, 2017 webinar, it is important to</p>	<p>The technical work referenced by the commenter is meant to support the Biostimulatory-Bio Integrity Policy is still under development. These tools could potentially be used in future reporting cycles but currently it would be premature to use information from these technical products to support a listing decision recommendation. In response to whether a TMDL is appropriate, it is not expected that a TMDL will be developed for Benthic Community Effects themselves, but for the associated pollutants which are resulting in the beneficial use not being supported. If all known pollutant impairments have been addressed and the biological community continues to show degradation the listing decision would need to be updated to be consistent with Section 3.9 of the Listing Policy.</p>	0

Comment Deadline: 12:00 noon on July 10, 2017

Commenter	No.	Comment	Response	Revision
	23.07	<p>Listings made during the current listing cycle and based on the proposed use of the IBI /CSCI are likely to be out of date and inconsistent with the forthcoming policy that is currently in development. It does not appear that the 181 / CSCI in their current forms are suitable metrics for determining impairment in all circumstances, it is unclear what modified streams "should" look like, and what management action(s) might be needed to address these impairments. It is also unclear how listings that are made now would be adjusted or removed in the future, should they be found to be inconsistent with the policy that is currently in development. Thus, listings based on the IBI may lead to not needed TMDLs. In summary, it may not be possible for certain streams, particularly modified channels or channels within modified landscapes, to achieve the target IBI reference conditions. Given that the process for evaluating biological integrity is still in development, LADWP requests that the SWRCB decline to list as impaired any pollutant/water body combinations that are proposed for listing for benthic community effects based on IBI scores.</p>	<p>State Water Board supports maintaining listings based on the SCIBI and CSCI scores as they are consistent with State policy and have been assessed relative to appropriate reference sites. At this time, the CSCI and IBI (where CSCI is not available) are the best measures of biologic integrity in California streams and it is appropriate to use both IBI and CSCI scores in 303(d) listing decisions. As the science progresses, improved methods may supplant older methods and the 303(d) list will be updated, as appropriate, as that occurs. The use of the SCIBI and CSCI for 303(d) listing was done in accordance with Section 3.9 and 6.1.5.8 of the Listing Policy with biological data and impairment related to associated pollutants and/or pollution.</p>	0

Commenter	No.	Comment	Response	Revision
	23.11	LADWP understands the LARWQCB's response that even though restricted access to the CPP does not preclude it from possessing beneficial uses; LADWP would like to emphasize that public access is not allowed at Elderberry Forebay, primarily due to the high flow velocities and extreme water level fluctuations. As there is no public access, there is also no fishing of any kind allowed in the Forebay, and therefore the Forebay does not have any beneficial uses beyond being an operating body of water for the CPP. Consequently, fish consumption criteria should not be used for listing purposes of Elderberry Forebay. For these reasons, LADWP respectfully requests that the Elderberry Forebay be excluded from the 303(d) list.	We agree. See response to comment 23.09.	0

	24.04	<p>The State Water Board staff reconunendation to not de-list Santa Ana-Delhi Channel as impaired for REC-2 is inappropriate for the following reasons:</p> <p>a. The REC-2 water quality objective of 410 CFU /100rnl does not exist in the Santa Ana Region Basin Plan. Effective April 8, 2015, REC-2 in the Santa Ana Region Basin Plan was revised for Santa Ana-Delhi Channel to be based on anti-degradation targets. While Section 3.10 of the Listing Policy allows anti-degradation to be considered based on trends in water quality, the State Board appears inappropriately to be applying them as not to be exceeded values in the same way that water quality objectives are implemented.</p>	<p>The 410 CFU/100mL water quality objective is based on USEPA’s April 8, 2015 decision letter on the recreation standards amendments approved under Resolution R8-2012-0001 and State Board Resolution No. 2014-0005, USEPA disapproved the use of single sample maximum values greater than 410 cfu/100mL.</p>	No

	24.05	b. The data being used in the line of evidence to support Decision ID 44427 was collected before the baseline period when the anti-degradation target was established. Any listing considerations should therefore be deferred to a subsequent listing cycle when data subsequent to 2015 is available.	Although the anti-degradation target was established after the data was collected, the data was still submitted during the solicitation period. The collection of the data isn't dependant on the anti-degradation target and thus has no impact on the integrity of the data.	No

Comment Deadline: 12:00 noon on July 10, 2017

Commenter	No.	Comment	Response	Revision
	24.06	c. According to Listing Policy Section 3.10, the Water Board is required to complete six steps before listing a water body. The required steps which have yet to be completed in this particular listing are: using data collected for at least three years (step 1); and, determining the occurrence of adverse impacts (step 5). With no data collected subsequent to the establishment of the anti-degradation targets and the absence of an observed impact, it is inappropriate to list the water body as impaired for REC-2.	Section 3.10 of the Listing Policy is used for identifying trends in Water Quality. The actual policy language is as follows: A water segment shall be placed on the section 303(d) list if the water segment exhibits concentrations of pollutants or water body conditions for any listing factor that shows a trend of declining water quality standards attainment. This section is focused on addressing the antidegradation component of water quality standards and threatened waters as defined in 40 CDR 130.2(j) by identifying trends of declining water quality. Numeric, pollutant-specific water quality objectives need not be exceeded to satisfy this listing factor. In assessing trends in water quality the Regional Water Board shall: 1. Use data collected for at least three years; 2. Establish specific baseline conditions; 3. Specify statistical approaches used to evaluate the declining trend in water quality measurements; 4. Specify the influence of season effects, interannual effects, changes in monitoring methods, changes in analysis of samples, and other factors deemed appropriate; 5. Determine the occurrence of adverse biological response (section 3.8), degradation of biological populations and communities (section 3.9), or toxicity (section 3.6); and 6. Assess whether the declining trend in water quality is expected to not meet water quality standards by the next listing cycle. Waters shall be placed on the section 303(d) list if the declining trend in water quality is substantiated (steps 1 through 4 above) and impacts are observed (step 5). (Water Quality control Policy for Developing California's Clean Water Act Section 303(d) List, Adopted September 30, 2004, Amended February 3, 2015) As the language from the Listing Policy states, the steps described are used to identify trends of declining water quality which can eventually lead to a listing. 	24.09	<p>While most samples have a detection limit of 10 ng/ L, a number of samples had detection limit as high as 50 ng/L (discussed as being a lab issue under quality assurance in the Orange County 2008-09 MS4 annual report). Every sample in the record though has non-detectable values for chlorpyrifos and the Santa Ana Regional Board appropriately concluded that the non-detect samples with detection limits higher than the evaluation guideline were not usable and excluded them in the listing assessment.</p>	<p>The evaluation guideline used for Chlorpyrifos was 9 ng/L which is from the California Ocean Plan Water Quality Control Plan Ocean Waters of California 2009. In the cases where the samples had a reporting limit higher than the objective (9 ng/L), the samples were rendered unusable for assessment purposes. Furthermore, the lack of applicable QAPP documentation make this data only usable as a secondary line of evidence. As stated in section 6.1.4 of the Listing Policy: "Data without rigorous quality control can be used in combination with high quality data and information. If the data collection and analysis is not supported by a QAPP (or equivalent) or if it is not possible to tell if the data collection and analysis were supported by a QAPP (or equivalent), then the data and information should not be used by itself to support listing or delisting of a water segment. All data of whatever quality can be used as part of a weight of evidence determination (sections 3.11 or 4.11). (Water Quality control Policy for Developing California's Clean Water Act Section 303(d) List, Adopted September 30, 2004, Amended February 3, 2015)</p>	No

Santa Barbara CoastKeeper Representative/Commenter: Benjamin Pitterle	26.01	Region 4 justified its recategorization in its response to comments by citing EPA language in the approval letter for the Ventura River Algae, TMDL. Unfortunately, the EPA language was mischaracterized and misquoted in Region 4 Staff's response to comments. Regional Board staff quoted (in their response to comments) the EPA as saying, "EPA has determined that it is unnecessary at this time to establish separate actions for the pumping and water diversion in Reaches 3 and 4 of the Ventura River". For the record, what the EPA actually wrote was, "EPA has determined that it is unnecessary at this time to establish separate nitrogen and phosphorus TMDLs for the pumping and water diversion impairment listings for Reaches 3 and 4 of the Ventura River". Further, the EPA also wrote, "EPA's proposed TMDLs were developed to address water quality impairments caused by nitrogen and phosphorus under current hydrological conditions; EPA did not attempt to delineate the Ventura River's natural hydrological conditions, or address other issues (emphasis added) related to the pumping and diversion of water in Reaches 3 and 4 of the Ventura River". Other issues include impairments caused by increased	The language from the U.S. EPA approval letter dated June 28, 2013 for the State Water Board adopted TMDLs to address algae, eutrophic conditions and nutrient impairment in the Ventura River cited by the commenter is technically accurate. However, the commenter does not include the entire quote which provides context to the diversion and pumping related impairments. The full language from page 2 is as follows: EPA found that the effects of pumping and water diversions in these reaches were correlated with the impairment of aquatic life and cold water habitat beneficial uses due to nutrient loading and algae growth. Consequently, EPA's draft TMDLs for Reaches 3 and 4 of the Ventura River addressed water quality impairments of designated beneficial uses that were also addressed by the State's TMDLs for algae, eutrophic conditions and nutrients. EPA's proposed concentration-based wasteload and load allocations for total nitrogen and total phosphorus were consistent with the mass-based nitrogen and phosphorus loadings specified in the State's TMDLs. EPA's proposed TMDLs were developed to address water quality impairments caused by nitrogen and phosphorus under current hydrological conditions; EPA did not attempt to delineate the Ventura River's natural hydrological conditions, or address other issues related to the pumping and diversion of water in Reaches 3 and 4 of the Ventura River. Based on EPA's approval of the State's TMDLs addressing the algae, eutrophic conditions and nutrient impairments, together with other available information regarding Reaches 3 and 4 of the Ventura River, EPA has determined that it is unnecessary at this time to establish separate nitrogen and phosphorus TMDLs for the pumping and water diversion impairment listings for Reaches 3 and 4 of the Ventura River. The State's TMDLs address the same beneficial uses as EPA's draft TMDLs, identify the same stressors as EPA, were developed	0

		<p>temperatures and loss of oxygen due to stagnant flows as well as loss of endangered species and wildlife habitat and loss of recreation – which are both caused solely by loss of flows rather than by any other pollutant. It is inappropriate to place the pumping and diversion impairment in Category 4a because the TMDL will not address these impairments. Rather, the listing should be left as is, or, at a minimum, placed in category 4C, because all impairments have not been addressed by the TMDL, as confirmed by the correct quotation of EPA’s approval letter, and are not caused by any other pollutant. A copy of the EPA approval letter has been attached to this comment letter.</p>	<p>with reference to the existing hydrological conditions in the watershed, including pumping and water diversion activities, and provide the same nutrient loading capacities. The State’s nitrogen and phosphorus TMDLs also apply throughout the Ventura River, its estuary, and all tributaries. EPA finds that the State’s nitrogen and phosphorus TMDLs provide equivalent protection of water quality in Reaches 3 and 4 of the Ventura River as EPA’s proposed TMDLs. Therefore, EPA is not establishing nitrogen and phosphorus TMDLs for the pumping and water diversion impairment listings. Other State and Federal agencies have additional authorities which may be available to address other potential impacts of pumping and water diversion within Reaches 3 and 4. The commenters’ definition of and assertions related to the term “other issues” are unfounded within the U.S. EPA approval letter. Rather the approval letter indicates that the State Water Board adopted TMDLs address the nutrient impairments and the correlated impacts due to pumping and water diversion. Neither reaches are being proposed for inclusion into Integrated Report Category 4a rather the Reach 3 of the Ventura River is currently proposed for delisting for impairments due to pumping and water diversions, and Reach 4 of the Ventura River is currently proposed for placement into Integrated Report Category 4c.</p>

Commenter	No.	Comment	Response	Revision
	26.02	<p>we highlight the following issues that must be corrected before the final documents are approved. A. Inconsistent Listings for Reaches 3 and 4 Are Inappropriate and Illegal The draft Integrated Report inappropriately and illegally fails to consistently list Reaches 3 and 4 of the Ventura River in Category 5 and/or Category 4C. Reaches 3 and 4 must either remain in Category 5, or, at a minimum, be consistently categorized in Category 4C. There is no basis for entirely delisting impairments for Pumping and Diversions for Reach 3...</p>	<p>The waterbody-pollutant combinations of pumping and water diversion in Reach 4 of the Ventura River is currently proposed for placement into Integrated Report Category 4c based on Los Angeles Regional Water Board knowledge of the this specific reach and the TMDLs for algae, eutrophic conditions, and nutrient impairments. However, Reach 4 of the Ventura River as a waterbody will continue to be listed as Integrated Report Category 5 until all pollutant impairments have been addressed. Los Angeles Water Board staff also provided a summary document to support this recommendation and made it available within factsheets 44793 and 44534 as CalWQA reference 4378. http://www.waterboards.ca.gov/water_issues/programs/tmdl/records/region_4/2017/ref4378.doc. During the 1996 303(d) listing cycle, Reach 3 of the Ventura River was incorrectly listed as impaired due to pumping and water diversions. As detailed in factsheets 34271 and 33817 the draft Steelhead Restoration and Management Plan for California of 1995 (prepared by the California Department of Fish and Wildlife) was the basis for the listings in 1996. However, that document only references information related to Reach 4 of the Ventura River and not Reach 3. This is sufficient justification for delisting this waterbody for pumping and water diversions because the original basis for listing was flawed. However, Reach 3 of the Ventura River as a waterbody will continue to be listed as Category 5 until all pollutant impairments have been addressed.</p>	0

Commenter	No.	Comment	Response	Revision
	26.03	<p>...the Integrated Report is internally inconsistent as detailed below. Appendix A (Category 5) is inconsistent with Appendix D (Category 4C) In Appendix A – Category 5, the State Water Board has removed impairments for Pumping and Diversions for Ventura River Reach 3. However, impairments for Pumping and Diversions remain for Ventura River Reach 4 along with a note stating, “This is Category 4c– impairment due to pollution and does not require a TMDL or any other specific regulatory action.” Yet, at Appendix D – Category 4C, shown below, the Integrated Report fails to identify Reach 4 as a Category 4C water. Channelkeeper notes with some alarm that the pumping and diversion impairments have not been added to Appendix D, despite language elsewhere throughout the report stating that this is the case. It is illegal to delist the pumping and diversion impairments from Category 5 (Appendix A) without, at least, subsequently adding the listings to Integrated Report Category 4C. This oversight must be remedied as to both Reaches 3 and 4.</p>	<p>See response to comment 26.02. In California, waterbody-pollutant combinations are assessed consistent with the Listing Policy to determine the overall beneficial use support rating. That overall beneficial use support rating is used by the CalWQA database to determine the overall Integrated Report Category for the waterbody as a whole. This methodology is described on page 22 and 23 of the draft Staff Report. The waterbody-pollutant combinations of pumping and water diversions for Reach 4 of the Ventura River are held in CalWQA as pollution and Integrated Report Category 4c, however, Reach 4 of the Ventura River is impaired due to temperature, ammonia, toxicity, dissolved oxygen, pH, nitrate/nitrite, and benthic macroinvertebrate bioassessments. These pollutant impairments correctly place Reach 4 of the Ventura River into Integrated Report Category 5 as impaired by pollutants needing a TMDL. Similarly, Reach 3 of the Ventura River is impaired due to mercury, toxicity, and benthic macroinvertebrate bioassessments. These pollutant impairments correctly place Reach 3 of the Ventura River into Integrated Report Category 5 as impaired by pollutants needing a TMDL.</p>	0

	26.09	<p>Again, the Regional Board Conclusion still includes misquoted language from the EPA’s June 28, 2013 approval letter for the Ventura River TMDL for Algae, Eutrophic Conditions and Nutrients. As previously described, the Fact Sheet for Decision ID 44534 must be amended to include the correct language from EPA, and the State Water Board cannot rely on this ,isrepresentation of the EPA approval letter as a basis for any listing decisions.</p>	<p>The language identified by the commenter is default language populated in CalWQA based on the final listing decision. The language has been updated to appropriately indicate that a delisting is being proposed rather than identification of an Integrated Report Category 4c impairment. The language in fact sheet 34271 now reads “After review of the available data and information, RWQCB staff concludes that the water body-pollutant combination should be removed from the section 303(d) list because applicable water quality standards for the pollutant are not being exceeded.” The commenter refers to data previously submitted as part of the 2012 solicitation period. The data and information was mainly qualitative in nature and examined the impacts of flow alteration in several waterbodies across the state. It is not clear that the waters are flow impaired because flow is variable in nature. Determining if a water is impacted due to flow alterations would require a thorough analysis of historical flow and human related impacts to a defined and expected flow. If the flow is impacted is would then need to be determined at what level are the beneficial uses impaired beyond that naturally expected to occur in times of severe drought or storm events. This complex analysis is undertaken during the development of flow criteria and cannot be determined based on visual and qualitative information. See also responses to comments 2.01, 2.02, 2.03, 2.04, 2.09, and 2.10.</p>	0

	26.11	<p>Also once more, the Regional Board appears inconsistent in its narrative with regard to availability of data. In this case, the Regional Board proposes “after review of available data and information” to delist Reach 3 for Water Diversion impairment. Unlike for pumping, the Regional Board is not proposing to place this listing in Category 4C. This determination is not supported by the available data and information, and no data, studies, or reports are presented as supporting documentation for this decision. In fact, as stated above, Channelkeeper has submitted copious volumes of data and references, which support existing listings for pumping and water diversions in Reaches 3 and 4 of the Ventura River. With regard to notable water diversions, the City of Ventura currently operates a shallow- sub-surface diversion facility at its Foster Park Well field. The sub-surface diversion currently accounts for more than 1000 acre-feet per year of water production by the City of Ventura. The City’s subsurface water diversion is located immediately (approximately 100 meters) upstream of Reach 3. We are unaware of any available data, studies, or reports that have concluded that such diversions do not result in impairment of Reach 3. Rather,</p>	<p>See response to comment 26.09. The commenter fails to indicate how the State Water Board final responses to comments dated April 29, 2015 did not adequately respond to the comments posed by Santa Barbara Coast Keeper in a letter dated February 5, 2015.</p>	0

		<p>available data and information support this impairment. Therefore, the decision to delist Reach 3 for Water Diversion is inconsistent with the Listing Policy, the Clean Water Act, and facts on the ground. We refer the State Water Resources Control Board to our February 5, 2015 letter as its legal and technical merits remain unchanged. Again, the State Water Board may not ignore this existing, readily available data. . See 33 U.S.C. §§ 1313(d), 1315(b); see also 40 C.F.R. §§ 130.7, 130.8; see also Thomas v. Jackson, 581 F.3d 658, 661, 664-665, 667-668 (8th Cir. 2008). The decision to delist Reach 3 for water diversions must be revised so that the existing listing is modified to become a Category 4C listing, at a minimum. Otherwise, the Integrated Report violates the Clean Water Act.</p>

Commenter	No.	Comment	Response	Revision
	26.12	<p>There is ongoing documentation that flow alterations from pumping and diversion continue to degrade Reaches 3 and 4 such that these waters cannot support their designated beneficial uses and water quality standards are not attained. The State Water Board is currently engaged in a significant undertaking in coordination with the Department of Fish and Wildlife and Los Angeles Regional Board, to study surface-groundwater interactions and to develop protective instream flow criteria which would achieve attainment of beneficial uses. It is critical that the 303(d) List and Integrated Report accurately describe conditions, as they are best understood, in the river. The revisions highlighted in this letter will ensure that Regional and State Water Board determinations related to these impairments are consistent with the Clean Water Act.</p>	<p>See responses to comments 26.02 and 26.09. The coordinated efforts between the State Water Board Division of Water Rights, California Department of Fish and Wildlife, and Los Angeles Water Board will continue in order to enhance and protect beneficial use support in the Ventura watershed. Action 4 of the California Water Action Plan, Protect and Restore Important Ecosystems, contains a sub-action that states the following: "The State Water Resources Control Board and the Department of Fish and Wildlife will implement a suite of individual and coordinated administrative efforts to enhance flows statewide in at least five stream systems that support critical habitat for anadromous fish. These actions include developing defensible, cost-effective, and time-sensitive approaches to establish instream flows using sound science and a transparent public process. When developing and implementing this action, the State Water Resources Control Board and the Department of Fish and Wildlife will consider their public trust responsibility and existing statutory authorities such as maintaining fish in good condition." The Ventura River was identified as one of five priority stream systems on which work will occur. In the Ventura River Watershed, ground and surface waters are closely interconnected. The Sustainable Groundwater Management Act (SGMA) established a new structure for managing California's groundwater resources at a local level by local agencies. SGMA requires, by June 30, 2017, the formation of locally-controlled groundwater sustainability agencies in the State's high- and medium-priority groundwater basins and subbasins (basins). A groundwater sustainability agency is responsible for developing and implementing a groundwater sustainability plan to meet the sustainability goal of the basin to ensure that it is operated within its sustainable yield, without causing undesirable results (which may</p>	0

Committer	No.	Comment	Response	Revision
	27.02	<p>Our May 12, 2017 letter presented additional information and analysis of existing information in the administrative record that we believe provide ancillary lines of evidence that support a conclusion that there is insufficient information to reach the determination that at least one beneficial use is not supported in Guadalupe Slough and that a 303(d) Category 5 listing and TMDL are needed.</p>	<p>The May 12, 2017 request for review correctly states that the data is 20 years old and that several management actions have occurred in those years, there is no recent toxicity data that has been collected to show that the management actions have successfully addressed the toxicity impairment. The commenter also states that the requirements of Listing Policy section 4.1 would be insurmountable given the costs associated with collecting 20 more toxicity tests with zero exceedances. However, fewer samples can be collected in a strategic manner in coordination with the Regional Water Board to illustrate that the management actions have changed the environment and that the data prior to the management actions are no longer applicable. This is consistent with section 4.11 of the Listing Policy. Absent any other information specific to water toxicity the correct and conservative action is to recommend listing Guadalupe Slough until more recent data can be examined showing that the management actions have address the water toxicity impairment in Guadalupe Slough.</p>	No

Center for Biological Diversity Representative/Commenter: Emily Jeffers	29.01	On behalf of the Center for Biological Diversity (the Center), we submit these comments to the State Water Resources Control Board to request that all available information on ocean acidification be analyzed in the final 303(d) list for the 2014 and 2016 California Integrated Report. As detailed below, the Center has submitted numerous studies indicating that water bodies in California are failing to meet their beneficial uses due to impairments caused by ocean acidification. This increasing acidity is due to atmospheric carbon dioxide deposition and local contributions. The State Water Board is under a legal obligation to examine all available sources of information on pollutants that may lead to an impairment of the state's waters, and has failed to do so in this instance. Ocean acidification must be examined and acknowledged in the 2014 and 2016 Integrated Report.	The California Listing Policy requires that we consider only data and information that meet the minimum quality assurance requirements as it outlined in "Data Quality Assessment Process", Section 6.1.4 of the Listing Policy: "Even though all data and information must be used, the quality of the data used in the development of the section 303(d) list shall be of sufficient high quality to make determinations of water quality standards attainment." The variable pH data do not meet the data quality requirements described in the Listing Policy. Therefore, the research results cannot be used for 303(d) listing. If data for pH specific to California's marine waters are available for assessment during the next listing cycle, that data will be evaluated under the provisions of the Listing Policy using a weight-of-evidence approach to evaluate the lines of evidence based on the applicable water quality standard. The State Water Resources Control Board and the Regional Water Quality Control Boards solicit all readily available data and information prior to the evaluation process. Commenters are encouraged to submit data specific to California's marine waters when solicitation for data is announced, and it will be evaluated for the next 303(d) listing cycle decisions.	0

Comment Deadline: 12:00 noon on July 10, 2017

Commenter	No.	Comment	Response	Revision
	29.02	<p>California’s State Water Board can address ocean acidification in regional waters through the Clean Water Act. California has a duty and authority under the Clean Water Act section 303(d) to solicit and consider ocean acidification data and information during its biennial water quality assessments. EPA has specifically directed states to list waters on the 303(d) impaired waters list that are not meeting water quality standards due to ocean acidification (EPA 2010). Waters identified as impaired by ocean acidification allow local managers to control local sources of pollution, and even address cross-border sources of pollution that contribute to ocean acidification.</p>	<p>When Water Board staff conduct an assessment of water quality for the California 305(b) reporting and 303(d) listing, Water Board staff reviews the data and information collected from monitoring locations around the state that meet the assessment methodology described in the Water Quality Control Policy for Developing California Clean Water Act Section 303 (d) List (Listing Policy). If data show that water quality does not meet the applicable water quality standard for a pollutant, the water body segment is listed on the 303(d) list, which requires a TMDL (Total Maximum Daily Load). The Center for Biological Diversity (Center) provided scientific papers on research showing that carbon dioxide levels are expected to rise, which will in turn cause changes in the ocean chemistry. Staff reviewed the scientific papers provided by the Center; specifically, the research conducted in Central California near Monterey Bay. The research was based on carbon dioxide experiments. As discussed in “Utility of deep seaCO2 release experiments in understanding the biology of high CO2 ocean: Effects of hypercapnia on deep sea meiofauna” Section 4, Discussion, pages 12 through 15, variation in pH observed in the carbon dioxide release experiments did not allow the researchers to examine the biological impact caused by increases in carbon dioxide. It appeared that during the carbon dioxide experiments, a pH reduction of 0.6 pH units comparing to the control areas was observed, and the accuracy of the sensors was suspected. During the experiments carbon dioxide concentrations (measured as pH) varied throughout all experiments. This high variability in carbon dioxide and pH made it impossible to interpret the dose tolerance response of animals to hypercapnia that could trigger physiological stress or death for any of the animals studied. The author stated on page 15 that “understanding of the biological and ecological consequences of increased hypercapnia over shallow</p>	0

	29.04	<p>The best available science supports that ocean acidification is already affecting coastalwaters of California by impairing the capacity of organisms to produce shells and skeletons,altering food webs, and affecting the dynamic of entire ecosystems such as kelp forests, saltmarshes, and oysters beds (Cooley & Doney 2009; Cheung et al. 2009, 2010; Brown et al. 2014;Ekstrom et al. 2015; Chan et al. 2016; Seijo et al. 2016; Swezey et al. 2017). Small increases inwater acidity can substantially reduce the ability of marine organisms to growth, reproduce andsurvive. Shelled mollusks such as oysters and pteropods are especially at risk because they are vulnerable to rapid decalcification, dissolution, and mortality (Barton et al. 2012; Gazeau et al.2013; Hettinger et al. 2013). Shelled mollusks such as oysters are keystone species in coastalareas that provide great economic value and ecosystems services such as water filtration, coastalprotection, and habitat (Newell 2004) and they are at risk due to corrosive waters. Oceanacidification has already affected oyster populations in estuarine waters of the U.S. PacificNorthwest (Barton et al. 2012, 2015; Timmins-Schiffman et al. 2012). Ocean acidification is alsoalready affecting important shelled organisms such as pelagic</p>	<p>The information presented in the comments is insufficient to support a listing recommendation. Water quality data showing a pollutant exceeding the appropriate objective in a high enough frequency to place a water body on the 303(d) List (per the Listing Policy) would be needed to support a listing recommendation.</p>	0

		<p>pteropods (Ohman et al. 2009;Bednaršek et al. 2014, 2016, 2017; Bednaršek & Ohman 2015). Pteropods are small sea snailsthat use the aragonite form of calcium carbonate to secrete their spiral shells (Bednaršek et al.2012) and are important food for salmon, forage fish, and even whales. Pteropods may be thebest indicator for water impairment due to their striking vulnerability to ocean acidificationbecause their delicate aragonite shells (Comeau et al. 2012; Bednaršek et al. 2012, 2017;Stanford’s Woods Institute for the Environment et al. 2016; Weisberg et al. 2016). Changes intheir abundance and survivorship of these organisms can result in cascading effects that ripplethrough the food web affecting other marine organisms from fishes to whales.California’s coastal waters are vulnerable to ocean acidification because coastalupwelling and ocean currents are increasingly carrying more anthropogenic CO2 to the region(Chan et al. 2016). Coastal upwelling along the California coast brings deep water rich in CO2and low in dissolved oxygen to the continental shelf driving chemical conditions that affectmarine life (Feely et al. 2004, 2008; Hauri et al. 2009; Feely et al. 2009; Gruber et al. 2012;Hauri et al. 2013; Bednaršek et al. 2014). Recent declines in aragonite</p>

		<p>saturation states due to anthropogenic ocean acidification have been compounded by changes in the circulation of the California Current System (Feely et al. 2012), likely connected to climate change (Bakun 1990; Snyder et al. 2003; Sydeman et al. 2014). Thus, California coastal waters are relatively more acidic than other coastal waters in the continental United States, and it is expected that the effects of ocean acidification will become more severe over time as waters become more acidic with increasing climate change (Bakun 1990; Snyder et al. 2003; Sydeman et al. 2014). Scientists have already observed waters corrosive to sea life reached nearshore shallower areas along the northern California coast (Feely et al. 2008, 2016). Models predict that by the mid-century, surface coastal waters in this region would remain undersaturated during the entire summer upwelling season and more than half of nearshore waters throughout the entire year (Gruber et al. 2012; Hauri et al. 2013). Along the California coast, ocean acidification interacts with natural and anthropogenic processes that further reduce pH and carbonate saturation state (Feely et al. 2008; Salisbury et al. 2008; Hauri et al. 2009, 2013; Takeshita et al. 2015; Feely et</p>

		<p>al. 2017). Surface waters already show undersaturation with respect to aragonite due to anthropogenic ocean acidification independently of upwelling pulses, which lead to harsh chemical conditions to vulnerable marine organisms, including areas where pH is lower than 0.2 units from what occurs naturally (Feely et al. 2008, 2016, 2017). In fact, coastal and estuarine waters today are already seasonally undersaturated with respect to aragonite (Feely et al. 2010, 2016, 2017), and models predict that undersaturation will spread to more broader coastal areas and for longer periods (Feely et al. 2009; Hauri et al. 2013). Studies also show that under ocean acidification conditions, contamination effects, chemical toxicity, and heavy metal pollution can be more severe. In more acidic waters, sediments become more toxic as they easily binds to heavy metals making them more available and thus more toxic for aquatic life (Roberts et al. 2013). For example, ocean acidification increases the toxicity effects of copper in some marine invertebrates (Campbell & Mangan 2014; Lewis et al. 2016). Thus, some coastal waters are certainly failing to attain adequate water quality standards including, numeric criteria,</p>

Wood-Claeysens Foundation Representative/Commenter: Joseph Chrisman	30.01	As the Wood-Claeysens Foundation and its farming tenants work closely with the Farm Bureau in its capacity as the manager of the Ventura County Agricultural Irrigated Lands Group to comply with the conditional waiver (Order R4-2016-0143), we submit this correspondence in support of the Farm Bureau Comment Letter and, in particular, with respect to the comments made regarding the Ventura River and Ventura River Watershed. Consistent therewith, The Wood-Claeysens Foundation requests the removal of the temperature listing for Ventura River Reach 1 and 2 as well as Ventura River Reach 4.	No change has been made to Ventura River Reach 1, 2 or 3. See Los Angeles Regional Water Quality Control Board's Response to Comment document, response to comment 16.13. • Response to comment 16.13: "The designated beneficial use supports cold water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates. As stated by Moyle, 1976, the optimum range for Rainbow Trout's growth and completion of most life stages is 13-21 degrees Celsius. Therefore, it is appropriate to use this information as Evaluation Guideline, which does not conflict with the water quality objective for Cold Freshwater Habitat." Although the Los Angeles Basin Plan specifies the narrative objective to protect the cold beneficial use as being a no greater than 5 degree deviation from natural temperatures, the natural temperature for Ventura River Reaches 1, 2, and 4 waterbody have not yet been established. Section 6.1.5.9 of the Listing Policy states that "When 'historic', or 'natural' temperature data are not available, alternative approaches shall be employed to assess temperature impacts." Since "historic" or "natural" temperature data were unavailable, Moyle 1976 was selected as an applicable Evaluation Guideline.	No

	30.02	<p>In addition, the Wood-Claeysens Foundation requests either remove the listing for Ventura River Reach 3 for toxicity based exceedances from outdated data or categorize the listing as 4b. My client and I appreciate the opportunity to comment on the 303(d) list and, in particular, support the analysis provided by the Farm Bureau of Ventura County.</p>	<p>No change has been made to Ventura River Reach 3. This comment was addressed by the Los Angeles Regional Water Quality Control Board in Response to Comment 18.43: "Of the 43 samples evaluated, eight samples were in exceedance, which supported a listing decision. The waterbody pollutant combination should be listed until more data supporting a delisting decision become available. Staff encourages commenter to submit data to CEDEN in preparation for the next listing cycle." Furthermore the Listing Policy does not put age limitations on data. The policy uses the weight of evidence approach during data assessment and all data must be considered. While the residential use of diazinon and chlorpyrifos have been restricted by the EPA, use restriction is not the same as water quality standards attainment, nor is it a pollution control program. Therefore data suggesting use attainment must be available prior to delisting.</p>	No
