Appendix 5E Supplemental Modeling Related to the State Water Resources Control Board

# Appendix 5E Supplemental Modeling Related to the State Water Resources Control Board 

## 5E. 1 Introduction and Purpose of the Supplemental Modeling

The State Water Resources Control Board (State Water Board) is expected to issue discretionary approvals considered a "project" under California Environmental Quality Act (CEQA), and therefore, the State Water Board is identified as a Responsible Agency for purposes of California Department of Water Resources (DWR's) CEQA document. DWR prepared the Bay Delta Conservation Plan (BDCP) Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) in consideration of the State Water Board and other Responsible Agency approvals and specifically included Alternative 8 in the BDCP Draft EIR/EIS at the request of State Water Board staff. The 2015 Partially Recirculated Draft EIR/Supplemental Draft EIS (RDEIR/SDEIS) included, at the request of State Water Board staff, supplemental modeling at year 2025 (Early Long Term [ELT]), conducted to evaluate an operational scenario that provides higher Delta outflows than the Preferred Alternative (Alternative 4A), while including model assumptions that avoid impacts to fish and aquatic resources attributable to reductions in cold water pool storage and flow modifications under Alternative 8 and other higher outflow scenarios analyzed in the BDCP Draft EIR/EIS.

This appendix includes a revised and updated version of the State Water Board staff requested scenario that was presented in the RDEIR/SDEIS (referred to as Scenario 2 in this appendix) and also provides supplemental modeling and analysis of 2 additional scenarios, each at year 2025 (Early Long Term [ELT]) that were presented in the State Water Board water rights petition process (Boundary 1 and Boundary 2). Boundaries 1 and 2 were presented to the State Water Board during the water rights petition process as a means to represent a potential range of operations that could occur as a result of the proposed Adaptive Management Program, and the conditions of any approvals obtained as a result of the ongoing regulatory review of U.S. Fish and Wildlife Service, National Marine Fisheries Service, California Department of Fish and Wildlife, and State Water Board. The description and analysis included in this appendix for Boundaries 1 and 2 incorporates by reference the testimony presented to the State Water Board July 29 through September 27, 2016, for the California WaterFix change in point of diversion petition. The testimony exhibits on which this analysis relied are posted at:
http://cms.capitoltechsolutions.com/ClientData/CaliforniaWaterFix/uploads/ CWF_ChangePetition_TOC_V212.pdf

The transcripts on which this analysis relied are posted at:
http://cms.capitoltechsolutions.com/ClientData/CaliforniaWaterFix/uploads/
CWF_ChangePetitionHearingTranscript.pdf

Specifically, the modeling and water quality exhibits (DWR-5, DWR-513, DWR-514, and DWR-515) and transcripts (August 19, 23, and 24, 2016) were relied upon for this analysis. Boundary 2 was based on the higher Delta outflow operational scenario requested by State Water Board staff that was evaluated in the 2015 RDEIR/SDEIS. Scenario 2 is identical to Boundary 2 in all respects except for upstream releases from Lake Oroville in April and May to support the higher Delta outflow requirements included in Scenario 2.

The evaluations for Boundaries 1 and 2 and Scenario 2 were conducted primarily to consider changes in outflow, without specific consideration of the project objectives or purpose and need statement. Overall, the purpose of this evaluation was to provide a range of Delta outflows and other operational parameters to consider as a part of the CEQA/NEPA process as well as during agency decision-making, including the State Water Board's water rights hearing on the petition for changes in State Water Project (SWP) and Central Valley Project (CVP) authorized points of diversion necessary to implement the proposed project.

## 5E. 2 Modeling Assumptions

Three scenarios were evaluated in this appendix: Boundary 1, Boundary 2, and Scenario 2. Additionally, modeling for Alternatives 4 H 3 and 4 H 4 was conducted for the State Water Board petition process. The modeling results of Alternative 4 H 3 , Alternative 4 H 4 , Boundary 1 and Boundary 2 are included as Attachment 5E-1. The modeling results for Scenario 2 are included below in Section 5E.3. Tables 5E-1 through 5E-5 below includes the assumptions for the 3 scenarios evaluated in this appendix, plus the No Action Alternative (for reference).

Table 5E-1. Key CALSIM II CWF No Action Alternative, CPOD Boundary 1 and Boundary 2, and Scenario 2 Inputs and Assumptions

|  | No Action <br> Alternative (NAA) | Boundary 1 | Boundary 2 | Scenario 2 |
| :--- | :--- | :--- | :--- | :--- |
| Planning <br> horizon | Year 2030 | Same as NAA | Same as NAA | Same as Boundary 2 |
| Inflows/ <br> Supplies | Historical with <br> modifications for <br> operations <br> upstream of rim <br> reservoirs and with <br> changed climate at <br> Year 2030 | Same as NAA | Same as NAA | Same as Boundary 2 |
| Facilities |  |  |  |  |
| North Delta | Not included | 9,000 cfs north Delta <br> Diversion <br> diversion intake on the <br> Sacramento River at Hood | Same as Boundary 1 | Same as Boundary 2 |
| Head of Old <br> River Gate | Temporary Head of <br> Old River Barrier <br> installed in the fall <br> months | Permanent Head of Old <br> River (HOR) Gate | Same as Boundary 1 | Same as Boundary 2 |

|  | No Action Alternative (NAA) | Boundary 1 | Boundary 2 | Scenario 2 |
| :---: | :---: | :---: | :---: | :---: |
| North Delta Diversion Operations Criteria |  |  |  |  |
| North Delta <br> Diversion <br> Bypass <br> Flows | Not included | Sacramento River bypass flow requirements downstream of the proposed intakes as described in Table 2 below. In addition, a constraint on the potential diversion at the north Delta intakes, to account for the fish screen sweeping velocity criteria of 0.4 fps . The constraint was derived based on resulting diversions from the DSM2 modeling. | Same as Boundary 1 | Same as Boundary 2 |
| Minimum flow near Rio Vista | SWRCB D-1641 | Same as NAA with additional minimum flow requirement of $3,000 \mathrm{cfs}$ from January to August. | Same as Boundary 1 | Same as Boundary 2 |
| South Delta Export Restrictions |  |  |  |  |
| South Delta exports (Jones PP and Banks PP) | SWRCB D-1641. <br> Vernalis flowbased export limits Apr 1 - May 31 as required by NMFS BiOp (Jun, 2009) Action IV.2.1 (additional 500 cfs allowed for Jul Sep for reducing impact on SWP) | SWRCB D-1641. Pumping at the south Delta intakes are preferred during the July through September months up to a total pumping of 3,000 cfs to minimize potential water quality degradation in the south Delta channels. No specific intake preference is assumed beyond 3,000 cfs. | Same as Boundary 1 | Same as Boundary 2 |
| Combined Flow in Old and Middle River (OMR) | FWS BiOp (Dec 2008) Actions 1 through 3 and NMFS BiOp (Jun 2009) Action IV.2.3 | Same as NAA | New OMR criteria in Table 3 below or same as the NAA, whichever results in less negative OMR flows | Same as Boundary 2 |
| Head of Old River Barrier/Gate | Head of Old River Barrier (HORB) is only installed in the fall months per FWS Delta Smelt BiOp Action 5; it is assumed to be not installed in April or May. | Same as NAA | HOR gate operations assumptions (\% OPEN) Oct - Dec 100\%, Jan - Feb 50\%, Mar - Jun 0\%, Jul Sep 100\%; HOR gate will be open $100 \%$ whenever flows are greater than 10,000 cfs at Vernalis.; Oct-Nov: Before the D1641 pulse $=$ HOR gate open, During the D-1641 pulse = for 2 weeks HOR gate closed; After D1641 pulse: HORB open 50\% for 2 weeks | Same as Boundary 2 |

|  | No Action Alternative (NAA) | Boundary 1 | Boundary 2 | Scenario 2 |
| :---: | :---: | :---: | :---: | :---: |
| Delta Outflow Requirements |  |  |  |  |
| Delta <br> Outflow Index (Flow and Salinity) | SWRCB D-1641 <br> and USFWS BiOp <br> (Dec 2008) Action <br> 4 (Fall X2 <br> Requirement) | SWRCB D-1641 | Same as NAA; In addition, year-round Delta outflow goals (see Table 5 below); outflow above existing requirements, attempted to achieve through Delta export curtailments by an amount needed to meet the outflow goal, such that minimum exports are greater of 1500 cfs or to meet CVP San Joaquin River exchange contractor demands and CVP south-of-Delta refuge level 2 demands and conveyance losses are maintained. All other export restrictions are maintained. Outflow goals during Jul-Sep of non-Critical water year types, upstream reservoir releases are permitted to meet the additional outflow goals. | Same as Boundary 2; In addition, Oroville releases required during Apr-May months to augment Delta outflow, if specified outflow targets are not achieved with export curtailments. <br> Additional flow needed to meet the outflow target is released from the Oroville reservoir, up to 17,000 cfs as long as projected end-ofMay Oroville storage is similar to Alternative 4H4. |

## Table 5E-2. North Delta Diversion Bypass Flow Criteria

## North Delta Diversion Bypass Flows

These parameters are for modeling purposes. Actual operations will be based on real-time monitoring of hydrologic conditions and fish presence/movement

## Low-Level Pumping (Dec-Jun)

Diversions of up to $6 \%$ of total Sacramento River flow such that bypass flow never falls below 5,000 cfs. No more than 300 cfs can be diverted at any one intake.

## Initial Pulse Protection

Low level pumping will be maintained through the initial pulse period. For modeling, the initiation of the pulse is defined by the following criteria: (1) Sacramento River flow at Wilkins Slough increasing by more than $45 \%$ within a five-day period and (2) flow on the fifth day greater than 12,000 cfs.
The pulse (and low-level pumping) continues until either (1) Sacramento River flow at Wilkins Slough returns to pre-pulse flow level (flow on first day of pulse period), or (2) Sacramento River flow at Wilkins Slough decreases for 5 consecutive days, or (3) Sacramento River flow at Wilkins Slough is greater than 20,000 cfs for 10 consecutive days.
After pulse period has ended, operations will return to the bypass flow table (Sub-Table A).
If the initial pulse period begins and ends before Dec $1^{\text {st }}$ in the modeling, then any second pulse that may occur before the end of June will receive the same protection, i.e., low level pumping.

## Post-Pulse Operations

After initial pulse(s), allowable diversion will go to Level I Post-Pulse Operations (see Sub-Table A) until 15 total days of bypass flows above 20,000 cfs occur. Then allowable diversion will go to the Level II Post-Pulse Operations until 30 total days of bypass flows above 20,000 cfs occur. Then allowable diversion will go to the Level III PostPulse Operations.

## Sub-Table A. Post-Pulse Operations for North Delta Diversion Bypass Flows

Implement following bypass flow requirements sufficient to minimize any increase in the upstream tidal transport at two points of control: (1) Sacramento River upstream of Sutter Slough and (2) Sacramento River downstream of Georgiana Slough. These points are used to minimize any increase in upstream transport toward the proposed intakes or into Georgiana Slough. Allowable diversion will be greater of the low-level pumping or the diversion allowed by the following bypass flow rules.

| Level I Post-Pulse Operations |  |  | Level II Post-Pulse Operations |  |  | Level III Post Pulse Operations |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 5E. 3 CALSIM II Summary

This section includes comparison plots of average monthly patterns of storages and flows by water year type for No Action Alternative at ELT, Alternative 4H3 at ELT, Alternative 4H4 at ELT, Boundary 1 at ELT, Boundary 2 at ELT, and Scenario 2 at ELT from June 2016.

Briefly, Scenario 2 (noted as SWB Scenario in the figures) is consistent with Boundary 2 except for the supplemental Oroville releases to augment the Delta outflow in April and May. The detailed assumptions are described in the Section 5E. 2 above.

Parameters plotted include:

- Monthly Average Sacramento River at Keswick Flow
- Monthly Average Clear Creek Flow
- Monthly Average Feather River at Low Flow Channel Flow
- Monthly Average Feather River at Thermalito Flow
- Monthly Average Feather River at Confluence Flow
- Monthly Average American River at Nimbus Flow
- Monthly Average American River at Confluence Flow
- Monthly Average Sacramento River at Freeport Flow
- Monthly Average Sacramento River Flow Downstream of North Delta Intakes
- Monthly Average Sacramento River at Rio Vista Flow
- Monthly Average Number of Days Delta Cross Channel Gates Open
- End-of-Month Trinity Lake Storage
- End-of-Month Shasta Lake Storage
- End-of-Month Lake Oroville Storage
- End-of-Month Folsom Lake Storage
- End-of-Month San Luis Reservoir Storage
- Monthly Average Delta Outflow
- End-of-Previous Month X2 Location
- Monthly Average Combined Old and Middle River Flow
- Monthly Average Total Delta Exports
- Monthly Average North Delta Diversion
- Monthly Average South Delta Exports

Water year type classification used in here is based on historical Sacramento River 40-30-30 index.

## 5E. 4 Comparison of CALSIM Modeling Results Used for the Analysis of Environmental Effects

## 5E.4.1 Introduction

Results CALSIM modeling for reservoir storage, instream flows, and Delta exports for Boundary 1, Boundary 2, and Scenario 2 are compared in this section to support the analysis of environmental effects of each scenario described in Section 5E.5, Environmental Effects. For each CALSIM output location, modeling results for each model run were compared to an existing analysis to determine whether the results presented in Chapter 11 could be used for the CEQA analysis of that model run.

For each of the 25 CALSIM output locations, three tables are presented that include all scenarios considered in this analysis.

The first table displays the mean value for the parameter (storage, instream flow, or exports) by month and water year type, and for all water years combined, for each model scenario. Model scenarios are defined as follows:

- NAA_ELT_2015 = No Action Alternative with early long-term (2025) climate conditions using 2015 CALSIM model version
- SWRCB_B1_ELT_2015 = State Water Board Boundary 1 with early long-term (2025) climate conditions using 2015 CALSIM model version
- SWRCB_B2_ELT_2015 = State Water Board Boundary 2 with early long-term (2025) climate conditions using 2015 CALSIM model version
- SWRCB_S2_ELT_2015 = Scenario 2 with early long-term (2025) climate conditions using 2015 CALSIM model version
- H3_ELT_2015 = Alternative 4A H3 scenario with early long-term (2025) climate conditions using 2015 CALSIM model version
- H3+_ELT_2015 = Alternative 4A H3+ scenario with early long-term (2025) climate conditions using 2015 CALSIM model version
- H4_ELT_2015 = Alternative 4A H4 scenario with early long-term (2025) climate conditions using 2015 CALSIM model version
- NAA_LLT = No Action Alternative with late long-term (2060) climate conditions using original EIR model version
- A1A_LLT = Alternative 1 A with late long-term (2060) climate conditions using original EIR model version
- A3_LLT = Alternative 3 with late long-term (2060) climate conditions using original EIR model version
- A8_LLT = Alternative 8 with late long-term (2060) climate conditions using original EIR model version

The second table reports the "effect" of a scenario or alternative as the comparison of the scenario or alternative to its respective baseline as follows:

- Boundary 1 effect: NAA_ELT_2015 vs. SWRCB_B1_ELT_2015
- Boundary 2 effect: NAA_ELT_2015 vs. SWRCB_B2_ELT_2015
- Scenario 2 effect: NAA_ELT_2015 vs. SWRCB_S2_ELT_2015
- Alt 4A H3 effect: NAA_ELT_2015 vs. H3_ELT_2015
- Alt 4A H3+ effect: NAA_ELT_2015 vs. H3+_ELT_2015
- Alt 4A H4 effect: NAA_ELT_2015 vs. H4_ELT_2015
- Alt 1A effect: NAA_LLT vs. A1A_LLT
- Alt 3 effect: NAA_LLT vs. A3_LLT
- Alt 8 effect: NAA_LLT vs. A8_LLT

The third table compares the effect of each model run to the effect of comparable model scenarios as follows:

- The Boundary 1 effect was compared to:
- Alt 1A effect
- Alt 3 effect
- The Boundary 2 effect was compared to:
- Alt 4A H3 scenario effect
- Alt 4A H3+ scenario effect
- Alt 8 effect
- The Scenario 2 effect was compared to:
- Alt 4A H4 scenario effect
- Alt 8 effect

## 1 5E.4.2 Storage and Flow

2 5E.4.2.1

the second effect on flows listed in the column header is more than $5 \%$ more positive than the first effect on flows listed in the column header.
b For definitions of each effect, see the introduction to this section
cfs = cubic feet per second
Water Year Type: AN = above normal year; BN = below normal year; C = critical year; D = dry year; W = wet year

## 5E.4.2.1.8 Sacramento River at Wilkins Slough

2 Table 5E-27. Mean Monthly Flows (cfs) for Model Scenarios in the Sacramento River at Wilkins Slough, Year-Round

the second effect on flows listed in the column header is more than $5 \%$ more positive than the first effect on flows listed in the column header.
b For definitions of each effect, see the introduction to this section
cfs = cubic feet per second
Water Year Type: AN = above normal year; BN = below normal year; C = critical year; D = dry year; W = wet year

the second effect on flows listed in the column header is more than $5 \%$ more positive than the first effect on flows listed in the column header
b For definitions of each effect, see the introduction to this section
cfs = cubic feet per second
Water Year Type: AN = above normal year; BN = below normal year; C = critical year; D = dry year; W = wet year

the second effect on flows listed in the column header is more than $5 \%$ more positive than the first effect on flows listed in the column header
b For definitions of each effect, see the introduction to this section
cfs = cubic feet per second
Water Year Type (using San Joaquin Valley Index [60:20:20]): AN = above normal year; BN = below normal year; C = critical year; D = dry year; W = wet year

 flows under the second model scenario listed in the column header are more than 5\% greater than flows under the first model scenario listed.
b For definitions of each effect, see the introduction to this section
cfs = cubic feet per second
Water Year Type: AN = above normal year; BN = below normal year; C = critical year; D = dry year; W = wet year

the second effect on flows listed in the column header is more than $5 \%$ more positive than the first effect on flows listed in the column header.
b For definitions of each effect, see the introduction to this section
cfs = cubic feet per second
Water Year Type: AN = above normal year; BN = below normal year; C = critical year; D = dry year; W = wet year

## 5E.4.2.2.4 Delta Outflow

2 Table 5E-66. Mean Monthly Flows (cfs) for Model Scenarios for Delta Outflow, Year-Round

the second effect on flows listed in the column header is more than $5 \%$ more positive than the first effect on flows listed in the column header.
b For definitions of each effect, see the introduction to this section
cfs = cubic feet per second
Water Year Type (using San Joaquin Valley Index [60:20:20]): AN = above normal year; BN = below normal year; C = critical year; D = dry year; W = wet year

a Note that percent differences could not be calculated because North Delta Exports for NAA scenarios were 0 cfs for all months and water year types, resulting in division by 0 .
b For definitions of each effect, see the introduction to this section
cfs = cubic feet per second
Water Year Type (using San Joaquin Valley Index [60:20:20]): AN = above normal year; BN = below normal year; C = critical year; D = dry year; W = wet year

## 5E.4.2.2.8 South Delta Exports

2 Table 5E-78. Mean Monthly South Delta Exports (cfs) for Model Scenarios, Year-Round

## 5E. 5 Environmental Effects

The modeling provides important information that is used to determine the similarities of the results to alternatives evaluated in this Final EIR/EIS to understand the potential environmental effects of these scenarios. These similarities are described below, by resource topic as organized for alternatives in this Final EIR/EIS. The scenarios evaluated in this appendix (Boundary 1, Boundary 2, and Scenario 2) assume the same facilities and associated construction as Alternative 4A and therefore, the construction-related impacts of these scenarios is the same as described for Alternative 4A. Consistent with the goals of this analysis, the nature and severity of the impacts generally fall within the range of impacts disclosed under Alternatives 1 A and 3 for Boundary 1 , Alternative 4 H 3 ,Alternative $4 \mathrm{H} 3+$, and Alternative 8 for Boundary 2, and Alternative 4 H 4 and Alternative 8 for Scenario 2. However, the analyses and conclusions derived for each of the scenarios below also relied on other EIR/EIS alternatives as noted in the analyses.

## 5E.5.1 Boundary 1

## 5E.5.1.1 Water Supply

Generally, water supply related impacts under Boundary 1 would be similar to or less than the impacts disclosed under Alternatives 1A and 3. During construction of water conveyance facilities, operation of existing SWP and CVP water conveyance would continue. Construction would not affect the timing or amount of water exported from the Delta through SWP and CVP facilities.

The effect of Boundary 1 on end-of-May and end-of-September reservoir storage would be similar to or better than the effect of Alternatives 1A and 3 for all reservoirs except Oroville Reservoir. In Oroville, increases in September storage under both Alternative 1A and 3 would be smaller increases in end-of-September storage under Boundary 1. Because all alternatives result in benefits to end-of-September storage, CEQA conclusions for Boundary 1 would be the same as conclusions for Alternative 1 A and 3.

Effects of Boundary 1 on total exports (North Delta and South Delta exports combined) would be similar to effects of both Alternative 1A and 3. Effects of Boundary 1 on South Delta exports would generally be reduced in comparison to effects of Alternative 3 but would be higher, especially during January through May, compared to effects of Alternative 1A. Effects of Boundary 1 on North Delta exports would be consistently greater, or more negative from a water supply perspective, during December through June, averaged over all year types, than effects of Alternative 1A, but would be lower, or more beneficial, during July through November. Effects of Boundary 1 on North Delta exports would be consistently lower (beneficial) than effects of Alternative 3 for all months and water year types, with a few minor exceptions that would not change CEQA conclusions under Alternative 3 based on North Delta exports. Therefore, CEQA conclusions based on reservoir storage would be the same as those under Alternative 3.

## 5E.5.1.2 Surface Water

There would be no increased risk for flood flows under Boundary 1 compared to Alternative 1A and 3. Further, effects on flood flows in the San Joaquin River would remain consistent under Boundary 1, Alternative 1A and Alternative 3.

Impacts of Boundary 1 on reservoir storage would be the same as those of Alternative 1 A and 3 in all reservoirs. As a result, the frequency at which Shasta Lake, Folsom Lake, and Lake Oroville storage is close to the flood storage capacity and would not exceed SWP or CVP reservoir flood storage capacities would be the same between Boundary 1 and Alternatives 1A and 3 .

The effect of Boundary 1 on OMR flows (Table 5E-59) flows would be similar to or better than effects of Alternatives 1A and 3. Although there are reductions in positive OMR flow effects during some months (Table 5E-58) relative to Alternative 1A, flows under Boundary 1 would be more positive or more negative than NAA_ELT_2015 flows during similar months and water year types and, therefore, CEQA conclusions would be the same as those under Alternative 1A. One exception is during October, when there would be an increase in OMR flows (a benefit) under Boundary 1 relative to NAA_ELT_2015 that would not occur under Alternatives 1A and 3. Thus, effects of Boundary 1 on OMR reverse flow conditions, and therefore CEQA conclusions based on OMR flows, would be the same as or better than both Alternative 1A and 3.

Impacts under Boundary 1 regarding altering existing or planned drainage patterns or substantially increasing the rate or amount of surface runoff would be the same as under Alternative 4A, and would be reduced with mitigation. Similar to Alternative 1A and 3, Boundary 1 would not result in an increase in exposure of people or structures to flooding due to construction of the conveyance facilities because the scenario would conform with requirements and implement mitigation. Although structures would be placed within the 100-year flood hazard area under Boundary 1, impeded or redirected flood flows or conditions that could lead to mudflows would not result.

## 5E.5.1.3 Groundwater

Under Boundary 1, construction impacts to the Delta region would be the same as Alternative 4A. Dewatering would temporarily lower groundwater levels in the vicinity of the dewatering sites, but groundwater would return to pre-pumping levels over the course of several months. The temporarily lowered groundwater levels are not expected to cause a decrease in groundwater quality. The project would not result in substantial seepage, altered groundwater levels, or reductions in well capacities. Construction of the facilities is not expected to interfere with agricultural drainage in the Delta.

Under Boundary 1, operational impacts to groundwater in the SWP and CVP Export Service Areas would be similar to but less severe than those described under Alternative 1A because Boundary 1 exports, while lower during July through December, would be greater overall than those under Alternative 1A. However, Boundary 1 exports would be consistently lower than Alternative 3 exports for all months and water year types, which would result in greater impacts to groundwater than those described under Alternative 3. Nonetheless, Boundary 1 CEQA conclusions would be the same as or better than the conclusions for Alternative 1A for groundwater impacts.

## 5E.5.1.4 Water Quality

The construction-related effects of Boundary 1 on water quality would be the same as those described for Alternative 4A.

Of the constituents of concern addressed in detailed impact assessments in Chapter 8, Water Quality, facilities operations of all project alternatives (BDCP Alternatives $1 \mathrm{~A}, 1 \mathrm{~B}, 1 \mathrm{C}, 2 \mathrm{~A}, 2 \mathrm{~B}, 2 \mathrm{C}, 3,4,5,6 \mathrm{~A}$, $6 B, 6 C, 7,8,9$ and WaterFix Alternatives 4A, 2D, 5A) were determined to have a less than significant impact on the following constituents in all areas of the affected environment, which includes the

Upstream of Delta Region, Delta Region, and SWP/CVP Export Service Areas: ammonia, boron, dissolved oxygen, nitrate, pathogens, phosphorus, trace metals, and total suspended solids (TSS)/turbidity. These project alternatives consist of a wide range of facilities operations scenarios. The project alternatives also have varying Delta tidal habitat restoration areas, from less than 100 acres for the WaterFix alternatives up to 65,000 acres for the BDCP alternatives, which would affect the tidal prism, Delta hydrodynamics, and thus proportions of source waters throughout the Delta. The Boundary 1 scenario falls within the range of these alternatives in terms of facilities operations, and tidal habitat restoration would be limited consistent with the WaterFix alternatives. Therefore, the impacts of the Boundary 1 scenario on ammonia, boron, dissolved oxygen, nitrate, pathogens, phosphorus, trace metals, and TSS/turbidity within the affected environment are concluded to also be less than significant. Further, for all project alternatives, impacts to water quality from facilities operations in the Upstream of Delta Region and SWP/CVP Export Service Areas would be less than significant for bromide, chloride, electrical conductivity (EC), mercury, organic carbon, pesticides, selenium, and Microcystis; therefore, for the Boundary 1 scenario, impacts in the Upstream of Delta Region and SWP/CVP Export Service Areas for these constituents are concluded to also be less than significant. Thus, remaining to be addressed within this water quality assessment are impacts of the Boundary 1 scenario in the Delta Region to the following constituents: bromide, chloride, EC, mercury, organic carbon, pesticides, selenium, and Microcystis. These constituents are addressed separately below. Effects of the changes in Delta water quality on San Francisco Bay are addressed at the end of this section.

In the discussion below, the water quality conditions that would occur with the Boundary 1 scenario are related to the BDCP and WaterFix alternatives, as appropriate. While the Boundary 1 scenario is operationally most similar to BDCP Alternatives 1A and 3, the water quality modeling that was conducted for these alternatives incorporated both facilities operations and tidal habitat restoration, both of which would have an effect on the resultant source water proportions at Delta assessment locations. Further, the modeling of these alternatives was conducted for the late long-term timeframe. Only WaterFix Alternatives 4A, 2D, and 5A were modeled with no tidal habitat restoration and at the early long-term timeframe. Thus, it is most practical to discuss water quality impacts of the Boundary 1 scenario, which has the same tidal habitat restoration as Alternatives 4A, 2 D , and 5 A , and also is evaluated at the early long-term timeframe, relative to the WaterFix alternatives. Discussion of Alternatives 1A and 3 is included if relevant to illustrating the potential Boundary 1 scenario effects.

Bromide: Bay water is the primary source of bromide to the Delta, having concentrations orders of magnitude higher than in other Delta source waters. Significant impacts to bromide were identified for Alternatives 1A and 3 based on modeled increases in bromide concentrations at the North Bay Aqueduct in Barker Slough. The modeled increases in bromide at the North Bay Aqueduct were associated with the modeling assumptions regarding siting of tidal habitat conservation measures, which was 65,000 acres for these alternatives, and the resulting hydrodynamics allowing more Bay water into Barker Slough. Less than significant impacts to bromide were identified for Alternatives 4A, 2D, and 5A. These WaterFix alternatives do not have the tidal habitat conservation measures that are components of the BDCP alternatives. Similarly, the Boundary 1 scenario does not include tidal habitat restoration conservation measures. Therefore, the impacts of the Boundary 1 scenario on bromide are concluded to the same as for Alternatives $4 \mathrm{~A}, 2 \mathrm{D}$, and 5 A -less than significant.

Chloride: As with bromide, Bay water is the primary source of chloride to the Delta, having concentrations orders of magnitude higher than in other Delta source waters. Significant impacts to chloride were identified for Alternatives 1A and 3. As described for bromide, the Delta tidal habitat
conservation measure was determined to contribute to the significant impacts to chloride. For Alternatives 4A, 2D and 5A, which do not have the tidal habitat conservation measures, it was concluded that impacts to chloride would be less than significant. The Boundary 1 scenario has been modeled to support the WaterFix Water Right Petition before the State Water Board. The modeling results for chloride water quality objectives show that, compared to the No Action Alternative (ELT), there would be more frequent exceedance of the Bay-Delta Water Quality Control Plan (WQCP) 250 $\mathrm{mg} / \mathrm{L}$ chloride objective at the Contra Costa Pumping Plant (PP) No. 1 under Boundary 1. Further, the modeling results show that the WQCP $150 \mathrm{mg} / \mathrm{L}$ objective at the Contra Costa PP No. 1 would be met less frequently. The modeled exceedances of these objectives are primarily a function of the CALSIM II monthly time-step and other key model assumptions, and that real time operations that would occur would prevent exceedances of these objectives under the Boundary 1 scenario. Consequently, operations under the Boundary 1 scenario would be expected to result in a less than significant impact to Delta chloride concentrations, consistent with Alternatives 4A, 2D, and 5A.

EC: Significant impacts to EC were identified for all the project alternatives. For Alternatives 1A and 3, the significant impacts were associated with both facilities operations and the tidal habitat restoration conservation measures. For Alternatives 4A, 2D, and 5A, the significant impacts were associated with modeled degradation at Emmaton in the months of July, August, and September, and more frequent exceedance of the Bay-Delta WQCP Prisoners Point EC objective in April and May, relative to the No Action Alternative (ELT). Under Boundary 1, long-term average EC increases at Emmaton would be similar to modeled increases for Alternative 4A for July and August, and greater for September, as well as October through February. Thus, the significant impacts identified for Alternative 4A also would be identified for Boundary 1; however, the period of degradation would be greater under Boundary 1.

The Boundary 1 scenario also shows modeled exceedance of the Prisoners Point objective, but much less frequently than under Alternative 4A and only 1\% greater frequency relative to the No Action Alternative (ELT). Review of the modeling indicates that exceedances of WQCP EC objectives are primarily a function of the CALSIM II monthly time-step and other key model assumptions, and real time operations that would occur would prevent exceedances of objectives under the Boundary 1 scenario. The mitigation described for Alternatives 4A, 2D, and 5A addresses adaptive management of the north and south Delta intakes and real time operations to reduce these impacts to a less than significant level.

Mercury: Under the Boundary 1 scenario, long-term average methylmercury concentrations would be the same as those described for Alternative 4A. Because these results are most similar to Alternative 4A, which did not have significant impacts to mercury, it is concluded that the Boundary 1 scenario also would have less than significant impacts to mercury.

Organic Carbon: Organic carbon impacts due to facilities operations were assessed from modeled dissolved organic carbon (DOC). The modeled Boundary 1 scenario DOC concentrations are the same or less than the concentrations modeled for Alternative 4A, which would have less than significant impacts to DOC in the western Delta. Thus, the impacts to organic carbon from the Boundary 1 scenario would be less than significant.

Pesticides: The San Joaquin River water is considered to be higher in pesticides compared to other Delta source waters based on existing data and water body impairments. Under Alternatives 1A and 3, as well as Alternatives 4A, 2D, and 5A, the impact to pesticides would be less than significant. Under the Boundary 1 scenario the proportion of San Joaquin River water at Franks Tract, Rock

Slough, and Contra Costa PP No. 1 would be slightly greater than would occur under Alternative 4A in some months, but nearly the same or less than Alternative 2D. Thus, the impacts to pesticides from the Boundary 1 scenario would be less than significant.

Selenium: The modeled Boundary 1 scenario selenium concentrations are the same or less than the concentrations modeled for Alternative 4A, which would have less than significant impacts to selenium and whole body sturgeon concentrations in the western Delta. Thus, the impacts to selenium from the Boundary 1 scenario would be less than significant.

Microcystis: Significant impacts to Microcystis were identified under Alternatives 1A and 3. The significant impact determination for Microcystis for these alternatives was driven by higher residence times that would result from the creation of tidal habitat restoration areas in the Delta. As described previously, tidal habitat conservation measures are not a component of the Boundary 1 scenario. As has been described in the impact assessments of Alternatives 4A, 2D, and 5A, modeling has shown that there is the potential for increased residence times resulting from these alternatives' facilities operations. However, to ensure project operations do not create conditions that would result in increased Microcystis blooms in the Delta, water flow through Delta channels would be managed through real-time operations. By operating the south Delta pumps more frequently during periods conducive to increased Microcystis blooms, residence times could be managed. With this approach applied to the Boundary 1 scenario, the less than significant impact determinations made for Alternatives 4A, 2D, and 5A for the Delta would apply to this scenario.

San Francisco Bay: As discussed above in "Selenium," Delta selenium concentrations under the Boundary 1 scenario would be the same or less than Alternative 4A, which would have a less than significant impact to San Francisco Bay selenium. As such, the Boundary 1 scenario would have a less than significant impact to San Francisco Bay selenium. Further, as described for Alternatives 4A, 2 D , and 5 A, the Boundary 1 scenario would have a less than significant impact to water quality for all other constituents assessed, including nitrogen, phosphorus, mercury, chloride, and EC.

## 5E.5.1.5 Geology and Seismicity

All impacts from construction and operation of the water conveyance features under Boundary 1 on geology and seismicity would be the same as Alternative 4A.

## 5E.5.1.6 Soils

All impacts from construction and operation under Boundary 1 on soils would be the same as Alternative 4A.

## 5E.5.1.7 Fish and Aquatic Resources

Boundary 1 effects were compared to effects of Alternatives 1 A and 3 , which were determined $a$ priori to be most similar among all alternatives to Boundary 1 effects.

As noted in Section 5E.5.1.1, Water Supply, CEQA conclusions based on reservoir storage for Boundary 1 would be the same as conclusions for Alternative 3.

The effect of Boundary 1 on Sacramento River flows upstream of the Delta would be similar to or better than effects of Alternatives 1A and 3, except during October. During October, effects of Boundary 1 and Alternatives 1A and 3 on flows would be positive, although the positive effect would be lower under Boundary 1 than under Alternatives 1 A and 3 . This difference under Boundary 1,
however, would be small and not biologically meaningful. Given that no CEQA conclusions were beneficial solely as a result of higher October flows under Alternatives 1A and 3, this difference between Boundary 1 effect and Alternative 1A and 3 effects in October would suggest that the CEQA conclusions in the Sacramento River upstream of the Delta for Boundary 1 would be the same as both Alternatives 1A and 3.

The effect of Boundary 1 on Clear Creek (Table 5E-35) and Trinity River (Table 5E-38) flows would be similar to or better than effects of Alternatives 1A and 3 except in the Trinity River in above normal and below normal years during January. Under Alternatives 1A and 3 during January, there would be large increases in flows (up to $61 \%$ higher) relative to NAA. Under Boundary 1 during January, flows would be identical to those under NAA_ELT_2015. Because there are no negative effects in Boundary 1 during these month and water year types, and no CEQA conclusions under Alternative 1A and 3were beneficial solely as a result of higher January flows in above normal and below normal water year types, this difference between Boundary 1 effect and Alternative 1A and 3 effects in January would suggest that the CEQA conclusions in the Trinity River for Boundary 1 would be the same as both Alternative 1A and 3 .

The effect of Boundary 1 in the Feather River high-flow channel would be similar to effects under Alternative 1A and 3, except during January, February, April, May, and September through December. Differences in January, February, April, May, October, and November are a result of positive effects under Alternatives 1 A and 3 becoming less positive under Boundary 1in all of these months. During September, Alternatives 1A and 3 would cause reductions in flows that would be even lower under Boundary 1. During December, positive effects under Alternatives 1A and 3 would become negative under Boundary 1. This December difference would not cause a change in CEQA determinations because it would not be substantial and would only occur in one month. Therefore, the CEQA conclusions based on the high-flow channel for Boundary 1 would be the same as both Alternatives 1 A and 3.There would be no flow differences between Boundary 1 and Alternative 1A and 3 in the Feather River low-flow channel and, therefore, CEQA conclusions based on the low-flow channel for Boundary 1 would be the same as both Alternatives 1 A and 3 .

The effect of Boundary 1 in the American River would be similar to effects under Alternative 1A and 3, except during May, June, and October. In May and June, these differences are a result flow increases (a benefit) under Alternatives 1A and 3 becoming smaller flow increases under Boundary 1 (Table 5E-49, Table 5E-52) and, therefore, this would not change any CEQA conclusions. In October, small to moderate flow increases under Alternatives 1A and 3 would become small to moderate flow decreases under Boundary 1. This difference would not result in differences in the CEQA conclusions between Alternatives 1A and 3 and Boundary 1 because the determinations are not based on a single month (October) and there would also be a concomitant change during August from flow reductions under Alternatives 1 A and 3 to negligible flow changes under Boundary 1. Therefore, CEQA conclusions based on American River flows for Boundary 1 would be the same as both Alternatives 1A and 3.

The effect of Boundary 1 on Stanislaus River (Table 5E-56) flows would be similar to or better than effects of Alternatives 1 A and 3 . As such, the CEQA conclusions would be the same.

As reported in Section 5E.5.1.2, Surface Water, CEQA conclusions related to OMR flows under and Boundary 1 would be the same as both Alternatives 1A and 3 .

The effect of Boundary 1 on flows in the Sacramento River downstream of the North Delta diversion facilities (Table 5E-62) and at Rio Vista (Table 5E-65) would be similar to or better than effects of

Alternatives 1A and 3 during January through June and August. However, the reduction in flows under Boundary 1 in the Sacramento River downstream of the North Delta diversion would be slightly greater than reductions in Alternatives 1A and 3 during July and September through December, but would not be substantial.

The effect of Boundary 1 on Delta Outflow (Table 5E-68) would be similar to or better than effects of Alternative 3, except during September and October, when beneficial effects of Alternative 3 would be negative effects under Boundary 1 (up to $76 \%$ lower in nearly all water year types). The effects of Boundary 1 on Delta Outflow during most months would be more negative than effects under Alternative 1 A and, therefore, conclusions from Alternative 1A should not be used for Boundary 1 conclusions, except during summer and fall months when Delta outflow is already greatly reduced under Alternative 1A. Reductions in fall Delta outflow would cause reductions in fall abiotic habitat index for delta smelt rearing using the equations from Feyrer et al. (2011), which is based on Delta outflow (as indicated by X2) (Impact AQUA-5), and is consistent with the modeled criteria of Boundary 1, which did not include the Fall X2 action. Therefore, Alternative 1A is the same as and should be used for the Boundary 1 CEQA conclusions for summer and fall months and Alternative 3 is the same as and should be used for the Boundary 1 CEQA conclusions for winter and spring months.

The effect of Boundary 1 on San Joaquin River (Table 5E-71) and Mokelumne River (Table 5E-74) flows would be similar to or better than effects of Alternatives 1A and 3. As such, the CEQA conclusions for Boundary 1 based on flows in these rivers would be the same as both alternatives.

## 5E.5.1.8 Terrestrial Biological Resources

All impacts from construction of Boundary 1 would be the same as those under Alternative 4A.

## 5E.5.1.9 Land Use

All impacts from construction and operation of the water conveyance features under Boundary 1 on land use would be the same as Alternative 4A.

## 5E.5.1.10 Agricultural Resources

Construction-related effects of Boundary 1 would be the same as the effects described for Alternative 4A. Impacts to Important Farmland and farmland under Williamson Act contracts under Boundary 2 would be the same as Alternative 4A. Temporary construction activities and the permanent footprints associated with physical features could create conflicts with existing irrigation and drainage facilities throughout the study area, similar to Alternative 4A.

The hydrodynamic effects of habitat restoration activities under Alternatives 1 A and 3 which have the potential to change the quality of irrigation water in parts of the study would not apply to Boundary 1. However, the effects of Boundary 1 on agriculture would be similar to Alternatives 1A, 3 and 4A and would be significant and unavoidable, with mitigation incorporated.

## 5E.5.1.11 Recreation

All impact conclusions for construction and maintenance of the water conveyance features under Boundary 1 on recreation would be the same as Alternative 4A. All operational impacts on recreation would be the same as those described for Alternative 1A.

Operations under Boundary 1 would result in similar or greater storage in reservoirs than Alternatives 1 A and 3 for all the principal reservoirs except Oroville Reservoir. Increased reservoir storage will result in less impacts to water-based recreation opportunities and experiences at northand south-of-Delta reservoirs than Alternatives 1A and 3 with the exception of Oroville Reservoir, which will see a decrease in water levels and a greater impact to water-based recreation than Alternatives 1 A and 3 . However, this impact would be less than significant consistent with the analysis for Alternatives 1A and 3.

## 5E.5.1.12 Socioeconomics

Construction-related socioeconomic impacts would be the same as those described for Alternative 4A. Operations-related socioeconomic impacts under Boundary 1 would be less than those described under Alternatives 1A and 3, with the exception of discussions related to in-Delta agricultural economics. Under CEQA, economic effects are not significant impacts, but an EIR should consider their potential to lead to reasonably foreseeable physical changes in the environment. The significance of those associated environmental impacts is discussed in other resources. As such, consistent with Alternatives 1A and 3, the CEQA conclusions for all operational impacts on socioeconomics is No Impact, and Boundary 1 CEQA conclusions would be the same.

## 5E.5.1.13 Aesthetics and Visual Resources

Impacts to aesthetics and visual resources under Boundary 1 would be the same as those described under Alternative 4A.

## 5E.5.1.14 Cultural Resources

Impacts to cultural resources under Boundary 1 would be the same as those described under Alternative 4A.

## 5E.5.1.15 Transportation

All impacts from construction and operation of the water conveyance features under Boundary 1 on transportation would be the same as those described Alternative 4A.

## 5E.5.1.16 Public Services and Utilities

Impacts to public services and utilities under Boundary 1 would be the same as those described under Alternative 4A.

## 5E.5.1.17 Energy

Energy use under Boundary 1 would be the same as Alternative 4A for construction.
Boundary 1 would result in operational impacts greater than those described for Alternatives 1A for pumping and conveyance in the north and south Delta. Impacts would be greater than those described for Alternative 3 in the north Delta, and less than those described for Alternative 3 in the south Delta. Under Boundary 1, south Delta exports would be reduced relative to NAA, while north Delta exports would be greatly increased. Overall, decreases in south Delta exports under Boundary 1 would be less than Alternative 1A and more than Alternative 3 relative to NAA. Increases in north Delta exports would be greater for Boundary 1 than Alternatives 1A and 3 relative to NAA. These
increases in exports in the north Delta would result in a greater energy need for intake pumping; However, operation of the water conveyance facility would be managed to maximize efficient energy use, including off-peak pumping and use of gravity. Boundary 1 would not result in substantial impacts related to wasteful or inefficient energy use for construction, and pumping and conveyance and the CEQA conclusion would be the same for Alternatives 1A and 3 and Boundary 1 .

## 5E.5.1.18 Air Quality and Greenhouse Gases

Air quality and greenhouse gas impacts from construction under Boundary 1 would be the same as, or less than, Alternative 4A.

Boundary 1 would result in operational impacts greater than those described for Alternatives 1A and 3 due to an increase in exports in the North Delta resulting in greater impacts to air quality and greenhouse gases. While impacts due to operation would be greater than those described under Alternatives 1 A and 3 , Boundary 1 would not result in a substantial increase in impacts related to air quality and greenhouse gases and the CEQA conclusion would be the same as for Alternatives 1A and 3.

## 5E.5.1.19 Noise

All noise impacts from construction of the water conveyance features under Boundary 1 would be the same as those described under Alternative 4A.

Noise impacts from operation may be slightly greater than those under Alternative 1 A and 3 in the north Delta due to additional operation of the water conveyance facilities which would expose noise-sensitive land uses during pumping plant operations to noise levels above daytime and nighttime thresholds, but there would be no difference in the CEQA conclusions.

## 5E.5.1.20 Hazards and Hazardous Materials

All hazardous and hazardous materials impacts from construction and operation of the water conveyance features under Boundary 1 would be the same as Alternative 4A.

## 5E.5.1.21 Public Health

All impacts from construction of the water conveyance features under Boundary 1 on public health would be the same as described under Alternative 4A.

CEQA conclusions related to impacts to public health from operations under Boundary 1 would be the same as Alternatives $1 \mathrm{~A}, 3$, and 4 A .

## 5E.5.1.22 Mineral Resources

All impacts from construction and operation of the water conveyance features under Boundary 1 on mineral resources would be the same or less than as Alternative 4A.

## 5E.5.1.23 Paleontological Resources

All impacts from construction and operation of the water conveyance features under Boundary 1 on paleontological resources would be the same or less than as Alternative 4A.

## 5E.5.1.24 Environmental Justice

All environmental justice impacts from construction and operation of the water conveyance features under Boundary 1 would be the same as Alternative 4A.

## 5E.5.1.25 Climate Change

All climate change impacts from construction under Boundary 1 would be the same as Alternative 4 A . Impacts of the operation of the water conveyance features under Boundary 1 would be the same as Alternative 1A and 3.

Climate change will increase air temperatures, $\mathrm{CO}_{2}$, humidity, and cloudiness. These factors will lead to increased water demand for crops and vegetation, and reduced water supplies from open water supply or conveyance facilities that include canals and reservoirs. Boundary 1 would result in similar impacts as Alternative 1A and 3 with respect to water operations. Because this scenario would increase total SWP and CVP exports relative to the No Action Alternative, it would not result in reduced water supply reliability or increased reliance on adaptability to the impacts of climate change, and the CEQA conclusions for Boundary 1 would be the same as Alternatives 1A and 3.

## 5E.5.1.26 Growth Inducement and Other Indirect Effects

Growth inducement and other indirect effects from construction would be the same as Alternative 4 A . The growth inducement effects of operation of the water conveyance features under Boundary 1 would be the same or slightly greater than Alternatives 1A and 3. South of Delta SWP and CVP deliveries under Boundary 1 are projected to generally increase compared to the No Action Alternative. Increased diversions would increase operational flexibility and water supply available to SWP and CVP for exports south of the Delta. Increased exports have the potential for indirect growth inducement associate with water delivery due to increases water deliveries and subsequent population growth and agricultural operation expansion; however, this indirect growth would not be significant and the CEQA conclusions for Boundary 1 would be the same as Alternative 1A and 3.

## 5E.5.2 Boundary 2

## 5E.5.2.1 Water Supply

Generally, water supply related impacts under Boundary 2 would be similar to or less than the impacts disclosed under Alternative 4H3, Alternative 4H3+, and Alternative 8. During construction of water conveyance facilities, operation of existing SWP and CVP water conveyance would continue. Construction would not affect the timing or amount of water exported from the Delta through SWP and CVP facilities.

The effect of Boundary 2 on reservoir storage would be similar to or better than effects of Alternative 4H3 and Alternative 4H3+ for all reservoirs. In addition, the effect of Boundary 2 end-ofMay and end-of-September reservoir storage would be similar to or better than the effect of Alternative 8 for all reservoirs, except Lewiston Reservoir. The effect of Alternative 8 on Lewiston storage would be similar to Boundary 2 in all water year types except dry water years during May and dry and critical years during September. However, these effects would be infrequent and not substantial, such that the Alternative 8 CEQA conclusions based on reservoir storage would also apply for Boundary 2.

Overall, the effect of Boundary 2 on SWP and CVP deliveries is greater (lower deliveries, or a negative effect) compared to effects of Alternative 4H3 on deliveries. The effect of Boundary 2 on CVP deliveries would likely be greater (greater reduction) than the effect on SWP deliveries. Therefore, demand for water transfers to supplement supply shortages is estimated to increase under Boundary 2 compared to 4H3. Instead, effects of Boundary 2 on SWP and CVP deliveries and resulting demand for water transfers would be similar to or better than Alternative 8. Therefore, CEQA conclusions for Boundary 2 based on SWP and CVP deliveries and water transfers would be the same as Alternative 8.

## 5E.5.2.2 Surface Water

There would be no increased risk for flood flows under Boundary 2 compared to Alternative 4H3, Alternative 4H3+, and Alternative 8. Further, effects on flood flows in the San Joaquin River would remain consistent under Boundary 2, Alternative 4H3, Alternative 4H3+, and Alternative 8.

Impacts of Boundary 2 on reservoir storage would be to the same as Alternative 4H3, Alternative $4 \mathrm{H} 3+$, and Alternative 8 in all reservoirs. As a result, the frequency at which Shasta Lake, Folsom Lake, and Lake Oroville storage is close to the flood storage capacity and would not exceed SWP or CVP reservoir flood storage capacities would be the same between Boundary 2, Alternative 4H3, Alternative 4H3+, and Alternative 8.

The effect of Boundary 2 on OMR flows (Table 5E-59) flows would be similar to or better than effects of Alternative 4H3, Alternative 4H3+, and Alternative 8, except during April and May relative to Alternative 8. Although there are reductions under Boundary 2 in positive effects to OMR flows under Alternative 4H3, Alternative 4H3+, and Alternative 8 under most months (Table 5E-58), OMR flows under Boundary 2 would be more positive or more negative than NAA_ELT_2015 flows during similar months and water year types between Boundary 2 and Alternative 4H3, Alternative 4H3+, and Alternative 8. One exception is during April and May, when positive effects to OMR flows under Alternative 8 would be reductions in OMR flows under Boundary 2. However, the CEQA conclusions for Boundary 2would be the same as for Alternative 8 and Alternative 4 H 3 , which are less than significant (Impacts SW-1 through SW-3) or less than significant with mitigation (Impacts SW-4 through SW-9). Construction-related impacts to surface water under Boundary 2 would be the same as Alternative 4A.

## 5E.5.2.3 Groundwater

The construction-related effects of Boundary 2 on groundwater would be the same as under Alternative 4A. During operation of the facilities, Boundary 2 would have the same effects as described for Alternative 4H3 and Alternative 8. Impacts to groundwater in the SWP and CVP Export Service Areas would be similar to but less severe than those described under Alternative 8 because both operating scenarios would reduce exports. This reduction in deliveries could lead to a corresponding increase in groundwater use. The increase in groundwater pumping would cause a substantial decrease in groundwater levels, supplies, and recharge, and yields of domestic, municipal and agricultural wells in the Export Service Areas. Increased groundwater pumping in response to reduced SWP/CVP water supply availability under Boundary 2 would also degrade groundwater quality in portions of the Export Service Areas by altering regional patterns of groundwater flow and induce the migration of poor-quality groundwater into areas of good-quality groundwater. Land subsidence from groundwater pumping in most of the Export Service Areas under Boundary 2 would be negligible.

## 5E.5.2.4 Water Quality

The construction-related effects of Boundary 2 on water quality would be the same as those described for Alternative 4A.

Further, for the reasons described for the Boundary 1 scenario, the Boundary 2 scenario would have a less than significant impact on the following constituents in all areas of the affected environment, which includes the Upstream of Delta Region, Delta Region, and SWP/CVP Export Service Areas: ammonia, boron, bromide, dissolved oxygen, Microcystis, nitrate, pathogens, phosphorus, trace metals, and TSS/turbidity. Further, impacts to water quality from facilities operations in the Upstream of Delta Region and SWP/CVP Export Service Areas with the Boundary 2 scenario would be less than significant for chloride, EC, mercury, organic carbon, pesticides, and selenium. Thus, remaining to be addressed within this water quality assessment are impacts of the Boundary 2 scenario in the Delta Region to the following constituents: chloride, EC, mercury, organic carbon, pesticides, and selenium. These constituents are addressed separately below. Effects of the changes in Delta water quality on San Francisco Bay are addressed at the end of this section.

In the discussion below, the water quality conditions that would occur with the Boundary 2 scenario are related to the BDCP and WaterFix alternatives, as appropriate. While the Boundary 2 scenario is operationally most similar to BDCP Alternatives 4 H 3 and 8 , the water quality modeling that was conducted for these alternatives incorporated both facilities operations and tidal habitat restoration, both of which would have an effect on the resultant source water proportions at Delta assessment locations. Further, the modeling of these alternatives was conducted for the late long-term timeframe. Only WaterFix Alternatives 4A, 2D, and 5A were modeled with no tidal habitat restoration and at the early long-term timeframe, as described in Appendix 5A, Section B: CALSIM II and DSM2 Modeling Simulations and Assumptions. Thus, it is most practical to discuss effects of the Boundary 2 scenario, which has comparatively very little tidal habitat restoration and also is evaluated at the early long-term timeframe, relative to the WaterFix alternatives. Discussion of Alternatives 4 H 3 and 8 is included if relevant to illustrating the potential Boundary 2 scenario effects.

Chloride: The modeling results for Boundary 2 show that, compared to the No Action Alternative (ELT), there would be less frequent exceedance of the objective under Boundary 2. Further, the modeling results show that the $150 \mathrm{mg} / \mathrm{L}$ objective at the Contra Costa PP No. 1 would be met more frequently under Boundary 2, relative to the No Action Alternative (ELT). As described for Boundary 1, modeled exceedances of these objectives are primarily a function of the modeling capability and assumptions, and that real time operations that would occur would prevent exceedances of these objectives under Boundary 2 operations. Consequently, operations under the Boundary 2 scenario would be expected to result in a less than significant impact to Delta chloride concentrations.

EC: Significant impacts to EC were identified for all the project alternatives. For Alternatives 4H3 and 8 , the significant impacts were associated with both facilities operations and the tidal habitat restoration conservation measures. For Alternative 4A, the significant impacts to EC were associated with modeled degradation at Emmaton in the months of July, August, and September, and more frequent exceedance of the Prisoners Point EC objective in April and May, relative to the No Action Alternative (ELT). With the Boundary 2 scenario, long-term average EC at Emmaton would increase significantly only in July. The Boundary 2 scenario modeling also shows more frequent exceedances of the Prisoners Point objective than under the No Action Alternative (ELT), thus the significant impact determination for Alternative 4A based on degradation at Emmaton and exceedances of the

Prisoners Point objective applies to Boundary 2. Review of the EC modeling indicated that exceedances of WQCP EC objectives are primarily a function of the CALSIM II monthly time-step and other key model assumptions, and that real time operations that would occur would prevent exceedances of objectives under the Boundary 2 scenario. The mitigation described for Alternatives $4 \mathrm{~A}, 2 \mathrm{D}$, and 5 A addresses adaptive management of the north and south Delta intakes and real time operations to reduce these impacts to a less than significant level.

Mercury: Facilities operations under Alternative 4H3 was identified as having a less than significant impact to mercury, whereas Alternative 8 was identified as having a significant impact to mercury. The significant impact to mercury with Alternative 8 is due to increased San Joaquin River influence throughout most of Delta, which has higher methylmercury concentrations, and decreased influence of the Sacramento River, which has comparatively lower methylmercury concentrations. Under the Boundary 2 scenario, long-term average methylmercury concentrations would be the same as those under Alternative 4A, except at Franks Tract and Contra Costa PP No. 1, which would see slightly ( $0.01 \mathrm{ng} / \mathrm{L}$ ) higher concentrations. Because these results are most similar to Alternative 4A, which did not have significant impacts to mercury, it is concluded that the Boundary 2 scenario also would have less than significant impacts to mercury.

Organic Carbon: Facilities operations under Alternatives 4A and 4H3 were identified as having a less than significant impact to organic carbon, whereas Alternative 8 was identified as having a significant impact. The primary driver of the significant impact under Alternative 8 was the greater proportion of San Joaquin River water at Franks Tract, Rock Slough, and Contra Costa PP No. 1, which is higher in DOC than other Delta source waters. The modeled long-term average DOC concentrations under the Boundary 2 scenario are $0.2-0.4 \mathrm{mg} / \mathrm{L}$ greater than for Alternative 4A at these Delta assessment locations, but $0.2-0.3 \mathrm{mg} / \mathrm{L}$ less than the Alternative 8 concentrations. Modeled long-term average concentrations at these locations range from $3.1-3.6 \mathrm{mg} / \mathrm{L}$ under the No Action Alternative (ELT) and from $3.5-4.2 \mathrm{mg} / \mathrm{L}$ under the Boundary 2 scenario. As described in Chapter 8, Water Quality, a study commissioned by the California Urban Water Agencies determined that source water between 4 and $7 \mathrm{mg} / \mathrm{L}$ TOC (most of which is in the form of DOC in the Delta) would allow continued flexibility in treatment technology necessary to achieve existing drinking water criteria for disinfection byproducts. The increases in long-term average DOC concentrations modeled to occur at various Delta locations under the Boundary 2 scenario are of sufficiently small magnitude that they would not be expected to require existing drinking water treatment plants to substantially upgrade treatment for DOC removal above levels currently employed. Thus, it is concluded that the less than significant impact determination for Alternatives 4A and 4H3 for organic carbon applies to the Boundary 2 scenario.

Pesticides: Facilities operations under Alternative 4A and 4H3 were identified as having a less than significant impact to pesticides, whereas Alternative 8 was identified as having a significant impact to pesticides, with the primary driver of the significant impact being the greater proportion of San Joaquin River water at Franks Tract, Rock Slough and Contra Costa PP No. 1. The San Joaquin River water is considered to be higher in pesticides compared to other Delta source waters based on existing data and water body impairments. The Boundary 2 scenario would have greater portions of San Joaquin River water at Franks Tract, Rock Slough, and Contra Costa PP No. 1 than under Alternative 4A, but less than Alternative 8. The San Joaquin River would comprise close to or greater than 50 percent of the total source water volume at these locations and the proportion of San Joaquin River water would increase, relative to the No Action Alternative (ELT), between 20 and 35 percent. As discussed for Alternative 8, these large increases in San Joaquin River source water fraction could alter the long-term risk of pesticide-related toxicity to aquatic life. Also, as discussed
for the project alternatives, in the future, a greater degree of pesticide control is anticipated, but forecasting the success of those efforts would be speculative. Thus, there is the potential for there to be significant impacts to pesticides with Boundary 2.

Selenium: Facilities operations under Alternative 4H3 was identified as having a less than significant impact to selenium, whereas Alternative 8 was identified as having a significant impact to selenium, with the primary driver being increases in whole body sturgeon concentrations at the western Delta locations of the San Joaquin River at Antioch and Sacramento River at Mallard Island. The modeled Boundary 2 scenario selenium concentrations in the western Delta are the same as those under Alternative 8. Due to the increased fraction of San Joaquin River water in the western Delta, which has higher waterborne selenium concentrations than the other source waters, Boundary 2 could potentially result in a significant impact to whole body sturgeon selenium concentrations in the western Delta. However, there is substantial uncertainty associated with this impact determination. The sturgeon selenium bioaccumulation model would need to be calibrated for the western Delta locations modeled in order for this impact determination to be verified.

San Francisco Bay: As discussed for the Boundary 1 scenario, the Boundary 2 scenario would have a less than significant impact to water quality for all constituents assessed, except selenium. As discussed above in "Selenium," the Boundary 2 scenario has the potential to result in significant impacts to selenium in the western Delta, based on higher concentrations of selenium in the western Delta, as described for Alternative 8. As such, the Boundary 2 scenario would be considered to have a significant impact to San Francisco Bay selenium.

## 5E.5.2.5 Geology and Seismicity

All impacts from construction and operation of the water conveyance features under Boundary 2 on geology and seismicity would be the same as Alternative 4A.

## 5E.5.2.6 Soils

All impacts from construction and operation under Boundary 2 on soils would be the same as or less than Alternative 4A.

## 5E.5.2.7 Fish and Aquatic Resources

Boundary 2 effects were compared to effects of Alternatives $4 \mathrm{H} 3,4 \mathrm{H} 3+$, and 8 , which were determined a priori to be most similar among all alternatives to Boundary 2 effects.

As noted in Section 5E.5.2.1, Water Supply, CEQA conclusions based on reservoir storage for Boundary 2 would be the same as conclusions for Alternatives $4 \mathrm{H} 3,4 \mathrm{H} 3+$, and 8 .

The effect of Boundary 2 on Sacramento River flows at Keswick and Red Bluff would be similar to or better than effects of Alternatives 4 H 3 and $4 \mathrm{H} 3+$ with few exceptions that would still make the Boundary 2 conclusions the same as Alternative 4 H 3 and 4H3+CEQA conclusions (Table 5E-23, Table 5E-26). At Wilkins Slough, effects of Boundary 2 on Sacramento River flows would be less beneficial than Alternatives 4H3 and 4H3+ during May and July, although because these effects would be beneficial under all scenarios during May, Alternative 4H3 and 4H3+ CEQA conclusions could be used for Boundary 2 with respect to these locations during May (Table 5E-29). During July, effects of Boundary 2 would be marginally more negative than effects of Alternatives 4 H 3 and 4H3+
at Wilkins Slough (Table 5E-28), but not of a high enough magnitude to change CEQA determinations under Alternatives 4 H 3 and 4H3+ based on Wilkins Slough.

At Verona, effects of Boundary 2 would be similar to or better than effects of Alternatives 4 H 3 and 4H3+ scenarios, except during June, July, and October (Table 5E-32). During June, Boundary 2 effects would be negative relative to the NAA_ELT_2015 baseline, whereas Alternative 4H3 and 4H3+ effects would be positive relative to the NAA_ELT_2015 baseline (Table 5E-31). Therefore, positive effects seen in June and no effects seen in July and October under Alternatives 4H3 and 4H3+ would become negative under Boundary 2. The effect of Boundary 2 on flows at all four Sacramento River locations would be similar to or better than effects of Alternative 8 for most of the year, except during February through May when effects of Boundary 2 would be lower than effects of Alternative 8 (Table 5E-23, Table 5E-26, Table 5E-30, Table 5E-32). However, at all locations, this is the result of a change from a positive effect on flows under Alternative 8 to a negligibly positive effect under Boundary 2 (Table 5E-22, Table 5E-25, Table 5E-28, Table 5E-31). Therefore, CEQA conclusions for Boundary 2 would be the same as those described for Alternative 8 for the Sacramento River upstream of the Delta.

The effect of Boundary 2 on Clear Creek (Table 5E-35) and Trinity River (Table 5E-38) flows would be similar to or better than effects of Alternatives $4 \mathrm{H} 3,4 \mathrm{H} 3+$, and 8 with few exceptions in the Trinity River that would still make Boundary 2 CEQA conclusions based on these rivers the same as Alternatives $4 \mathrm{H} 3,4 \mathrm{H} 3+$, and 8 CEQA conclusions.

There would be no differences in the effect on flow between Boundary 2, Alternative 4H3, Alternative 4H3+, or Alternative 8 in the Feather River low-flow channel (Table 5E-41). Therefore, the Alternative $4 \mathrm{H} 3,4 \mathrm{H} 3+$, and 8 CEQA conclusions based on the low flow channel would all be the same for Boundary 2. The effect of Boundary 2 on flow in the Feather River high-flow channel would be similar to or better than effects of Alternatives 4 H 3 and $4 \mathrm{H} 3+$, except during April through July, October, and December (Table 5E-44, Table 5E-47). In June, July, October, and December, positive effects or an overall lack of effect on flows under Alternative 4H3 and 4H3+ would be negative effects under Boundary 2 (Table 5E-43, Table 5E-46). During April and May, positive effects of Alternative 4H3 and 4H3+ would be small to negligible under Boundary 2 and, therefore, CEQA conclusions would be the same for Alternative 4 H 3 , Alternative $4 \mathrm{H} 3+$, and Boundary 2 during these months. Effects of Boundary 2 on high-flow channel flows would be greater (more negative) than effects of Alternative 8 during January through June and similar to or lower (more positive) than effects of Alternative 8 during July through December (Table 5E-44, Table 5E-47). The more negative effects in January through June would be a result mostly of a reduction in benefits (positive changes in flows) from Alternative 8 to Boundary 2 and, therefore, CEQA conclusions based on these months in the high-flow channel would be the same for Alternative 8 and Boundary 2. There would be some reduced negative effects under Boundary 2 relative to Alternative 8 during July through December, such as during November, but negative flow effects would dominate during these months in the high-flow channel. Therefore, CEQA conclusions for Boundary 2 based on Feather River highflow channel flows would be the same as Alternative 8 conclusions.

The effect of Boundary 2 on flow in the American River would be similar to or better than effects of Alternatives 4H3 and 4H3+, except during June, July, August, and November (Table 5E-49, Table 5E53). During June, effects of Boundary 2 on flows would be small to negligible, but would be beneficial under 4H3 and 4H3+. During July, beneficial effects under Alternatives 4 H 3 and $4 \mathrm{H} 3+$ would become negative (reduced flows) under Boundary 2 and, therefore, Boundary 2 conclusions are different from Alternative 4H3 and 4H3+ CEQA conclusions. During August, a lack of effects under

Alternatives 4H3 and 4H3+ would be beneficial effects (increased flows) under Boundary 2. During November, negative effects of Alternatives 4 H 3 and $4 \mathrm{H} 3+$ would be small to negligible effects under Boundary 2. Therefore, CEQA conclusions for Boundary 2 would be the same as those for Alternatives 4 H 3 and $4 \mathrm{H} 3+$ in all months but July. The effect of Boundary 2 on flow in the American River would be similar to or better than effects of Alternative 8, except during April through June. (Table 5E-50, Table 5E-53). During April through June, beneficial effects of Alternative 8 would be reduced to less beneficial or negligible effects under Boundary 2. However, because there would be no substantial changes between Boundary 2 and Alternative 8 during these months, the CEQA conclusions would be the same.

The effect of Boundary 2 on Stanislaus River (Table 5E-56) flows would be similar to or better than effects of Alternatives $4 \mathrm{H} 3,4 \mathrm{H} 3+$, and 8 . As such, the CEQA conclusions would be the same.

As reported in Section 5E.5.2.2, Surface Water, the CEQA conclusions for Alternative 8 and Alternative 4H3 would apply to Boundary 2.

The effect of Boundary 2 on flows in the Sacramento River downstream of the North Delta diversion facilities (Table 5E-62) and at Rio Vista (Table 5E-65) would be similar to or better than effects of Alternative 4H3 and 4H3+ except for April through July and similar or better than effects of Alternative 8 except for February through May. The reduction in flows would be significant under Alternatives 4 H 3 and $4 \mathrm{H} 3+$ during April through July and the reduction in flows under Boundary 2 would be slightly greater, although not substantially greater, than that under Alternative 4 H 3 and $4 \mathrm{H} 3+$, and would therefore also be significant. Therefore, the CEQA conclusions under Alternatives 4 H 3 and $4 \mathrm{H} 3+$ would be the same for Boundary 2. The difference in effects between Boundary 2 and Alternative 8 during February through May would be the result of beneficial effects (increased flows) under Alternative 8 becoming negative effects (reduction in flows) under Boundary 2 and, therefore, Boundary 2 CEQA conclusions would be different from Alternative 8 based on these locations during February through May. Instead, both Alternatives 4H3 and 4H3+ CEQA conclusions based on flows in the Sacramento River downstream of the North Delta diversion facilities and at Rio Vista are the same as and would apply to Boundary 2 for all months.

The effect of Boundary 2 on Delta outflow (Table 5E-68) would be similar to or better than effects of both Alternative 4 H 3 and 4H3+ and, therefore, CEQA conclusions based on Delta outflow would be the same. The effect of Boundary 2 on Delta outflow would be similar to or better than effects of Alternative 8 during January, March, and July through October, but would be worse (more negative effect) during February, April through June, November, and December. In all months when Boundary 2 effects would be worse, this result would be caused by a reduction in beneficial effects of Alternative 8 , but flow effects under Boundary 2 would either remain beneficial (higher flows) or there would be no flow effects of Boundary 2 (Table 5E-67). Therefore, Boundary 2 CEQA conclusions based on Delta outflow would also be the same as those for Alternative 8.

The effect of Boundary 2 on San Joaquin River (Table 5E-71) and Mokelumne River (Table 5E-74) flows would be similar to or better than effects of Alternatives $4 \mathrm{H} 3,4 \mathrm{H} 3+$, and 8 . As such, the CEQA conclusion based on San Joaquin River and Mokelumne River flows under Boundary 2 would be the same as conclusions in all three alternatives.

## 5E.5.2.8 Terrestrial Biological Resources

All impacts from construction and operation of Boundary 2 would be the same as those described under Alternative 4A.

## 5E.5.2.9 Land Use

All impacts from construction and operation of the water conveyance features under Boundary 2 would be less than those described under Alternative 4A.

## 5E.5.2.10 Agricultural Resources

Under Boundary 2, construction and operation would result in impacts to agriculture, including groundwater elevation, salinity, and disruptions to agricultural infrastructure. The CEQA conclusions would be the same as those described for Alternative 4A and 8.

## 5E.5.2.11 Recreation

All impacts from construction of the water conveyance features under Boundary 2 on recreation would be the same as Alternative 4A.

Because upstream impacts under Boundary 2 would also be similar to Alternative 4H3, effects of changes in reservoir levels would be similar to Alternative 4H3, and the CEQA conclusions would be the same. With the exception of San Luis Reservoir, reservoir levels under Boundary 2 operations are anticipated to either not change or to fall below the individual reservoir recreation thresholds less frequently than under NAA conditions. Reservoir levels at San Luis Reservoir could fall below the reservoir boating threshold at the end of September more frequently than under the NAA, and based on the modeling, potentially more frequently than Alternatives 4 H 2 and 4 H 4 . Alternatives 4 H 2 and 4 H 4 were determined to be significant and as such, Boundary 2 could also result in a significant impact.

The effects of Boundary 2 on recreational fishing, land- and water-based recreation, and boatingrelated recreation would be the same as those described for Alternatives 4A and 8, except for San Luis Reservoir described above.

## 5E.5.2.12 Socioeconomics

Construction-related socioeconomic impacts would be the same as those described for Alternative 4A. Operations-related socioeconomic impacts under Boundary 1 would be less than those described under Alternative 8 but greater than effects described for Alternative 4H3. Under CEQA, economic effects are not significant impacts, but an EIR should consider their potential to lead to reasonably foreseeable physical changes in the environment. The significance of those associated environmental impacts is discussed in other resources. As such, consistent with Alternatives 1A and 3 , the CEQA conclusions for all operational impacts on socioeconomics is No Impact, and Boundary 1 CEQA conclusions would be the same.

## 5E.5.2.13 Aesthetics and Visual Resources

Impacts to aesthetics and visual resources under Boundary 2 would be the same as those described under Alternative 4A.

## 5E.5.2.14 Cultural Resources

Impacts to cultural resources under Boundary 2 would be the same as those described under Alternative 4A.

## 5E.5.2.15 Transportation

All impacts from construction and operation of the water conveyance features under Boundary 2 on transportation would be the same as those described under Alternative 4A.

## 5E.5.2.16 Public Services and Utilities

Impacts to public services and utilities under Boundary 2 would be the same as those described under Alternative 4A.

## 5E.5.2.17 Energy

Energy use under Boundary 2 would be the same as Alternative 4A for construction.
Boundary 2 would result in operational impacts similar to, or slightly less than, impacts described for Alternative 4H3 for pumping and conveyance in the north and south Delta, as less water would be pumped and conveyed under Boundary 2 compared to Alternative 4H3. Under both Boundary 2 and Alternative 4H3, south Delta exports would be reduced relative to NAA, but Boundary 2 would include even greater restrictions than Alternative 4H3. Operation of the water conveyance facility would be managed to maximize efficient energy use, including off-peak pumping and use of gravity. Boundary 2 would not result in substantial impacts related to wasteful or inefficient energy use for construction, and pumping and conveyance. The CEQA conclusions for Alternative 4H3 would apply to Boundary 2 for energy resources.

## 5E.5.2.18 Air Quality and Greenhouse Gases

Air quality and greenhouse gas impacts from construction under Boundary 2 would be the same as Alternative 4A. Boundary 2 would result in operational impacts slightly less than those described for Alternative 8, but the CEQA conclusions for Boundary 2 would be the same as those for Alternative 8.

## 5E.5.2.19 Noise

All noise impacts from construction of the water conveyance features under Boundary 2 would be the same as those described under Alternative 4A. Noise impacts from operation under Boundary 2 would be similar to or less than Alternative 8 due to less pumping under Boundary 2, and the CEQA conclusions for operations-related noise under Boundary 2 would be the same as described for Alternative 8.

## 5E.5.2.20 Hazards and Hazardous Materials

All hazardous and hazardous materials impacts from construction of the water conveyance features under Boundary 2 would be the same as Alternative 4A, and CEQA conclusions for operation-related effects would be the same as those described for Alternative 8.

## 5E.5.2.21 Public Health

All impacts from construction of the water conveyance features under Boundary 2 on public health would be the same as described under Alternative 4A. Based on the water quality analysis presented above, except for impacts to public health associated with pesticides and selenium, the public health

CEQA conclusions for operations of Boundary 2 would be the same as the conclusions for Alternative 4A. For pesticides- and selenium-related public health impacts, the CEQA conclusions for public health from operations under Boundary 2 would be the same as Alternative 8.

## 5E.5.2.22 Mineral Resources

All impacts from construction and operation of the water conveyance features on mineral resources under Boundary 2 would be the same or less than Alternative 4A.

## 5E.5.2.23 Paleontological Resources

All impacts from construction and operation of the water conveyance features on paleontological resources under Boundary 2 would be the same or less than Alternative 4A.

## 5E.5.2.24 Environmental Justice

Disproportionate impacts to minority and low-income populations would occur under Boundary 2 due to impacts on public health associated with subsistence fishing, which is specifically associated with minority populations in the Delta compared to the population at large. This impact is based on the potential for significantly greater bioaccumulation of selenium in sturgeon in the western Delta,.

## 5E.5.2.25 Climate Change

Climate change will increase air temperatures, $\mathrm{CO}_{2}$, humidity, and cloudiness. These factors will lead to increased water demand for crops and vegetation, and reduced water supplies from open water supply or conveyance facilities that include canals and reservoirs. Boundary 2 would result in similar impacts as Alternative 8 with respect to water operations. Because this scenario would reduce total SWP and CVP exports relative to the No Action Alternative, it would result in reduced water supply reliability and therefore provide reduced resilience and adaptability to the impacts of climate change.

## 5E.5.2.26 Growth Inducement and Other Indirect Effects

Growth impacts under Boundary 2 would be similar to Alternative 8 because of their reduced exports. With respect to direct growth inducement potential, construction and operation of the conveyance facilities would not foster economic or population growth or the construction of additional housing within the study area because of the limited number of new jobs created to construct and operate the facilities relative to the available labor pool and housing stock. With respect to indirect growth inducement potential associated with facility construction and operation, construction and operation of conveyance facilities could foster economic or population growth, or the construction of additional housing, indirectly in the surrounding environment.

South of Delta SWP and CVP deliveries under Boundary 2 are projected to decrease compared to the No Action Alternative. Reduced diversions would reduce operational flexibility and water supply available to SWP and CVP for exports south of the Delta. Decreases to CVP water supplies relative to the No Action Alternative would not remove any obstacle to growth, but would likely have increased secondary effects caused by developing new (or reallocated) water supplies needed to support the projected population growth. Reductions in SWP and CVP deliveries to CVP and SWP contractors could result in a range of potential responses, including increased groundwater pumping and surface water storage, fallowing of agricultural land, increased use of water transfers, curtailment of
certain water uses, and expansion of water recycling and desalination. While past responses to extended droughts and increased water costs provide insights into the potential indirect effects of reduced SWP/CVP deliveries in export areas, such effects are speculative at this time.

## 5E.5.3 Scenario 2

In general, the intent behind Scenario 2 was to evaluate the water supply effects of a high-Delta outflow scenario (beyond that modeled for Alternative 4 in the BDCP Draft EIR/EIS or Alternative 4A in this FEIR/FEIS) that potentially provides both general and specific benefits to fish and their habitat related to increases in outflow during the fall (September through November), winter/spring (January through June), and summer (July and August) hydrological periods beyond those specified by the U.S. Fish and Wildlife Service and National Marine Fisheries Service in the 2008 and 2009 Biological Opinions, existing California Department of Fish \& Wildlife California Endangered Species Act determinations, and the State Water Board's current WQCP. Increased fall Delta outflow will shift the low salinity zone further downstream in the Delta, which could result, based on current understanding of the science, in more favorable conditions for Delta smelt habitat in the western Delta and Suisun region. Similarly, increased winter/spring Delta outflow will shift the low salinity zone further downstream into the Suisun region which could result in more favorable conditions for longfin smelt and Delta smelt habitat. Higher Delta outflow during this period could also shift pelagic fish further from the export pumps and assist out-migrating salmonids. Additionally, the increased winter/spring Delta outflow would push fresh water through the Delta, past the Suisun region, and out into the San Francisco Bay which could benefit native estuarine species that have evolved under conditions of seasonally fluctuating salinity. The increase in Delta outflow during the summer over the amount specified in Alternative 4A may provide general habitat benefits and a quantity of flow that can be adaptively managed to benefit Delta smelt when conditions during the previous winter and spring are likely to produce a strong cohort. The relationships between the survival and abundance of various species and habitat conditions and outflows are currently under active investigation by the Collaborative Adaptive Management Team, an interagency group of scientists investigating outflow and other issues pertinent to CVP and SWP Delta operations. These issues will also be central to the Adaptive Management Program as part of the CWF as well as the State Water Board's current water quality control planning and other decision making processes.

## 5E.5.3.1 Summary of Effects of Scenario 2

Boundary 2 and Scenario 2 are very similar and as such, the following resource topics would have the same CEQA conclusions for Scenario 2 as were described above for the Boundary 2:

- Geology and Seismicity
- Soils
- Terrestrial Biological Resources
- Land Use
- Agricultural Resources
- Recreation
- Socioeconomics
- Aesthetics and Visual Resources
- Cultural Resources
- Transportation
- Public Services and Utilities
- Air Quality and Greenhouse Gases
- Noise
- Hazards and Hazardous Materials
- Public Health
- Mineral Resources
- Paleontological Resources
- Environmental Justice
- Climate Change
- Growth Inducement and Other Indirect Effects

## 5E.5.3.2 Water Supply

Generally, water supply related impacts under Scenario 2 would be similar to or less than the impacts disclosed under Alternative 4 H 4 and Alternative 8 . During construction of water conveyance facilities, operation of existing SWP and CVP water conveyance would continue. Construction would not affect the timing or amount of water exported from the Delta through SWP and CVP facilities.

The effect of Scenario 2 on reservoir storage would be similar to or better than effects of Alternative 4 H 4 for all reservoirs except for end-of-May storage in Oroville (Table 5E-8, Table 5E-11, Table 5E14, Table 5E-17, Table 5E-20). The effect of end-of-May Oroville storage would be slightly greater (more negative) under Scenario 2 compared to Alternative 4H4. The effects of Scenario 2 on reservoir storage would be similar to or better than effects of Alternative 8 for all reservoirs, except for end-of-September storage in Shasta and Oroville. For Shasta, this difference is a result of no effects under Alternative 8 on end-of-September storage becoming storage reductions in wetter water year types under Scenario 2 (Table 5E-7) and, therefore, Alternative 8 CEQA conclusions based on end-of-September Shasta storage should not be used for Scenario 2. For Oroville, the difference is a result of beneficial effects under Alternative 8 on end-of-September storage becoming less beneficial under Scenario 2, although Scenario 2 effect would also be beneficial (Table 5E-10). Thus, the CEQA conclusions for Scenario 2 regarding end-of-September Oroville storage would be the same as Alternative 8.

The effect on total exports (north Delta and south Delta exports combined) under Scenario 2 would be greater (more negative) than the effect on exports under Alternative 4H4 but similar to the effect on exports under Alternative 8 and, therefore, Scenario 2 CEQAA conclusions based on total exports are the same as those for Alternative 8. Relative to Alternative 4H4, the reductions in South Delta exports would occur in all water year types throughout the year whereas reductions in North Delta exports would occur for majority of months and water years. Relative to Alternative 8, North Delta exports under Scenario 2 would be greater (a negative effect) during January through June, but
effects would be lower (a positive effect) during July through December. However, North Delta exports under Scenario 2 would be lower than under Alternative 4H4 year-round and, therefore, conclusions based on the North Delta diversions would be the same or better than those under Alternative 4H4. The effect of Scenario 2 on South Delta exports would be lower (a benefit) compared to Alternative 8 during most months except March and July through September and, therefore, Scenario 2 CEQA conclusions based on south Delta exports would be the same or better than those for Alternative 8 for those months. For March and July through December, South Delta exports under Scenario 2 would be lower than under Alternative 4H4 year-round and, therefore, conclusions based on the South Delta diversions would be the same or better than those under Alternative 4H4

## 5E.5.3.3 Surface Water

There would be no increased risk for flood flows under Scenario 2 compared to Alternatives 4H4 and 8. Further, effects on flood flows in the San Joaquin River would remain consistent under Scenario 2, Alternative 4H4, and Alternative 3.

Impacts of Scenario 2 on reservoir storage would be similar to Alternative 4H3 and 8 in all reservoirs with exceptions noted in Section 5E.5.3.2, Water Supply. Regardless, the frequency at which Shasta Lake, Folsom Lake, and Lake Oroville storage is close to the flood storage capacity and would not exceed SWP or CVP reservoir flood storage capacities would be similar between Scenario 2, Alternative 4H3, and Alternative 8, and CEQA conclusions would be the same.

The effect of Scenario 2 on OMR flows (Table 5E-59) would be similar to or better than effects of Alternative 8, except during April and May. As a result, Scenario 2 CEQA conclusions based on OMR flows would be the same as those under Alternative 8 for all months except April and May. For April and May, effects of Alternative 1A on OMR flows would be similar to Scenario 2. Therefore, Scenario 2 CEQA conclusions based on OMR flows would be the same as those under Alternative 1 during April and May. Construction-related impacts under Scenario 2 would be the same as Alternative 4A

## 5E.5.3.4 Groundwater

Under Scenario 2, construction impacts to the Delta region would be the same as Alternative 4A. During operation of the facilities, Scenario 2 would have similar effects as described for Alternative 8. Impacts to groundwater in the SWP and CVP Export Service Areas would be similar to but less severe than those described under Alternative 8 because both operating scenarios would reduce exports. This reduction in deliveries could lead to a corresponding increase in groundwater use. The increase in groundwater pumping would cause a substantial decrease in groundwater levels, supplies, and recharge, and yields of domestic, municipal and agricultural wells in the Export Service Areas. Increased groundwater pumping in response to reduced SWP/CVP water supply availability under Scenario 2 would also degrade groundwater quality in portions of the Export Service Areas by altering regional patterns of groundwater flow and induce the migration of poor-quality groundwater into areas of good-quality groundwater. Land subsidence from groundwater pumping in most of the Export Service Areas under Scenario 2 would be negligible.

## 5E.5.3.5 Water Quality

The impacts to water quality from construction and operation of conveyance facilities under the SWB Scenario would be the same as those described for the Boundary 2 scenario. For the reasons
provided for the Boundary 2 scenario, the SWB would have a less than significant impact in all areas of the affected environment on ammonia, boron, bromide, chloride, dissolved oxygen, mercury, Microcystis, nitrate, organic carbon, pathogens, phosphorus, trace metals, and TSS/turbidity. Because modeled source water fractions at Franks Tract, Rock Slough, and Contra Costa PP No. 1 are similar to the Boundary 2 scenario, showing greater than 50 percent San Joaquin River water at these locations along with and increases in the San Joaquin River water portion of up to 35 percent relative to the No Action Alternative (ELT), there is the potential for there to be significant impacts to pesticides with the SWB scenario. Also, due to the increased fraction of San Joaquin River water in the western Delta, which has higher waterborne selenium concentrations than the other source waters, the SWB scenario could potentially result in a significant impact to whole body sturgeon selenium concentrations in the western Delta. As such, the SWB scenario would be considered to have a significant impact to San Francisco Bay selenium. Finally, with the SWB scenario, long-term average EC at Emmaton would similarly increase significantly in July and exceedances of the Prisoners Point objective were modeled to be more frequent than under the No Action Alternative (ELT), thus there is a potential for a significant impact to EC. Review of the modeling indicated that exceedances of WQCP EC objectives are primarily a function of the CALSIM II monthly time-step and other key model assumptions, and that real time operations that would occur would prevent exceedances of objectives. The mitigation described for Alternative 4A addresses real time operations to reduce the EC impact to a less than significant level.

## 5E.5.3.6 Fish and Aquatic Resources

Scenario 2 effects were compared to effects of Alternative 4 H 4 and Alternative 8, which were determined a priori to be most similar among all alternatives to Scenario 2 effects.

The effects of Scenario 2 on flows in the Sacramento River upstream of the Delta, Clear Creek, Trinity River, Feather River, American River, Stanislaus River, San Joaquin River, and Mokelumne River and OMR flows relative to Alternative 4H4 and Alternative 8 would be the same as described for effects of Boundary 2 relative to Alternative 4H3 and Alternative 8, respectively, with few exceptions that would not change the findings in Section 5E.5.2.7 Fish and Aquatic Resources, above. Therefore, these effects will not be discussed further in this section.

As described in Section 5E.5.3.2, Water Supply, CEQA conclusions based on nearly all reservoir for both end-of-May and end-of September storage would be similar to both Alternative 4 H 4 and 8. However, CEQA conclusions for Scenario 2 based on end-of-May Oroville storage would only be similar to Alternative 8, and CEQA conclusions for Scenario 2 based on end-of-September Oroville storage would only be the same as Alternative 4 H 4 .

The effect of Scenario 2 on flows in the Sacramento River downstream of the North Delta diversion facilities (Table 5E-62) and at Rio Vista (Table 5E-65) would be similar to or better than effects of Alternative 4H4 except for May and June, and similar or better than effects of Alternative 8 except for February, March, May, and June. There would be no effect of Alternative 4H4 during May, but there would be a small reduction in flows under of Scenario 2 that would not be substantial. A reduction in flows under Alternative 4H4 during June would be slightly reduced further under Scenario 2 and, therefore, the CEQA conclusions under Alternative 4H4 based on June would be the same for Scenario 2. As a result, Scenario 2 CEQA conclusions based on flows in the Sacramento River downstream of the North Delta diversion facilities and at Rio Vista ion all months would be the same as Alternative 8. The reduction in flows under Alternative 8 during June would be reduced further under Scenario 2 and, therefore, the CEQA conclusions under Alternative 8 based on June
would be the same for Scenario 2. There would be no effect of Alternative 8 during February, March, and May, but there would be an effect of Scenario 2 during these months. Therefore, Scenario 2 CEQA conclusions would be different from those under Alternative 8 during these months and should rely upon Alterative 4H4, as discussed above.

The effect of Scenario 2 on Delta outflow (Table 5E-68) would be similar to or better than effects of Alternative 4 H 4 and, therefore, CEQA conclusions would be the same.

## 5E.5.3.7 Energy

Energy use under Scenario 2 would be the same as Alternative 4A for construction.
Scenario 2 would result in operational impacts similar to, or slightly greater than, impacts described for Alternative 8 for pumping and conveyance in the north and south Delta, as slightly more water would be pumped and conveyed under Scenario 2 compared to Alternative 8. Under both Scenario 2 and Alternative 8, south Delta exports would be reduced relative to NAA. Operation of the water conveyance facility would be managed to maximize efficient energy use, including off-peak pumping and use of gravity. Scenario 2 would not result in substantial impacts related to wasteful or inefficient energy use for construction, and pumping and conveyance. The CEQA conclusions for Alternative 8 would apply to Scenario 2 for energy resources.

Modeling Results for Boundary 1, Boundary 2,

Figure 1- Analytical tools used to evaluate changes in water supply and water quality

TABLE 1- Compliance Locations in ANN Based on Beneficial Use

| Beneficial Use | Compliance Location |
| :--- | :--- |
| Municipal and Industrial Use | Contra Costa Canal |
| Municipal and Industrial Use | Banks/Jones Pumping Plants |
| Agriculture | Sacramento River at Emmaton |
| Agriculture | San Joaquin River at Jersey Point |
| Fish and Wildlife | Sacramento River at Collinsville |

Table 2. CALSIM II Simulation Study, p. ES-2.

| Performance Parameter | Dry-period average 1987-1992 |  |  |  | Long-term average |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { Simulated } \\ \text { taf } \mathrm{yr} \\ \hline \end{gathered}$ | Historical taf/yr | Difference |  | Simulated Historical taf/yr taf/yr |  | Difference |  |
|  |  |  | taf/yr | \% |  |  | taf/yr | \% |
| SWP south-of-Delta Table A deliveries | 1,930 | 2,030 | -100 | -4.9 | 1,810 | 1,790 | 20 | 1.1 |
| CVP south-of-Delta deliveries | 2,230 | 2,320 | -90 | -3.9 | 2,650 | 2,490 | 160 | 6.4 |
| Sacramento Valley inflow to the Delta | 9,700 | 9,670 | 30 | 0.3 | 19,830 | 19.920 | -90 | -0.5 |
| Net Delta Outflow Index | 5.270 | 5,090 | 180 | 3.5 | 19,070 | 19.690 | -620 | -3.1 |

TABLE 3- CALSIM 2015 v. 2010

| Region | Update | Rational |
| :---: | :---: | :---: |
| American River | American River Flow Management Standard | Incorporation of existing regulatory standard. (2009 NMFS BiOp) |
| Contra Costa County | Los Vaqueros Expansion | Incorporation of existing physical feature. Capacity increased from 100 TAF to 160 TAF. |
| Sacramento Valley | Feather River rice decomposition demands and return flows | Update to better match existing diversion and use by non CVP-SWP water right holders on Feather River. |
| Sacramento Valley | Fremont Weir notch | Update to model future facility to reflect existing regulatory obligations |
| Sacramento <br> Valley | American River and Sacramento River demand assumptions | Incorporation of existing upstream demand; full water rights and full contracts including Freeport Regional Water Project |
| Sacramento <br> Valley | Folsom flood control improvements | Incorporation of existing physical feature |
| Delta | Hood minimum instream flow | Modification to improve performance of ANN when modeling proposed additional point of diversion |
| Delta | COA sharing | Fixed coding error to improve modeling of existing COA requirements. |
| Delta | Health and safety pumping limits | Incorporate recent drought year operations. 2014-2015 TUCP health and safety CVP-SWP diversion rate was a minimum of $1,500 \mathrm{cfs}$ |
| San Joaquin River | Stanislaus River and New Melones operations consistent with FWS 2008 BiOp and 2009 NMFS BiOp | Incorporation of existing regulatory standard |
| San Joaquin River | Removed Vernalis Adaptive Management Program (VAMP) | Incorporation of existing regulatory standard. VAMP expired. Incorporated existing San Joaquin River WQCP obligations. |
| San Joaquin River | San Joaquin River Restoration Program Flows | San Joaquin River Restoration Program included qualitatively, however, releases as part of the program were not simulated because recapture/recirculation component has not been fully defined |
| South Delta | Update to south-of-Delta SWP demand | Incorporation of existing demand |
| General | Updated climate change inputs | Correction to Friant inflow adjustments; improvements to water year index adjustments for climate change |
| General | Software updates | Maintenance of model |
