

Hi Jessica,

Since water is a state resource, why is allocation not equal for every person, rich or poor?

Why not use the 35 percent of the 2013 total state household water usage, and divide it by the total number of people in households now, to determine the water allotment per person?

Totally equal. Those who took it upon themselves to sacrifice for the state won't bear THE BURDEN.

Why should those in extremely high use areas with huge homes have so much more water per person just because they used more, much more in 2013, while EVERY HUMAN BEING has the SAME BASIC NEED for water, bathing and sanitation?

If you ration water, aren't all residents equal? How can you justify any other action?

Linda
