FOR IMMEDIATE RELEASE

Recreational users of the Russian River are encouraged to take precautions

Santa Rosa, CA – August 21, 2015 – The Environmental Health & Safety Section (EHS) of the Department of Health Services and the North Coast Regional Water Quality Control Board are encouraging recreational users of the Russian River to take precautions and practice healthy water habits going up at public beaches along the River on August 21st.

Russian River: Blue Green Algae Status Update posted November 4, 2015

For veterinarians: please read this health advisory

The enhanced promotion of healthy water habits by EHS and NCRWQCB officials is prompted by the presence of algae, including blue-green algae, along the Russian River. Algae, including blue-green algae, is a normal inhabitant in many water environments. Warmer water temperatures and abundant nutrients can cause algae to grow more rapidly than usual and create algal mats along the shore. When drought and summer conditions are contributing to the algal blooms in the Russian River, blue-green algae, do not produce toxins. Some species of blue-green algae have the ability to create health effects for humans and animals. It is important to note that although some species of blue-green algae do not produce toxins, they do not do so all the time.

Comprehensive monitoring for harmful algal blooms in a body of water with ever-changing conditions is done by the county health and water quality board officials. Therefore, county health and water quality board officials are encouraging precautions along the Russian River.

Algal blooms can look like green, blue-green, white, or brown foam, scum or mats floating along the shore. For safety, it is best to stay away from algal mats. If toxin is present, dogs and children can be affected. Children are vulnerable because they play in shoreline areas, drink more water than adults when swimming, and are of small body size. Dogs are especially vulnerable because they tend to lick algae off their fur.

Blue-green algae toxins can cause a variety of symptoms including contact irritation (e.g., skin), gastro-intestinal symptoms (e.g., abdominal pain, nausea, vomiting, diarrhea, liver injury), and neurologic symptoms (e.g., muscle tremors, seizures, difficulty breathing).

The following are recommended healthy water habits for recreational users of the Russian River:

- Do not drink river water;
- Do not cook or wash dishes with river water;
- Avoid algal scums or mats, which are found most often along the shore line;
- Even if algae is not present, carefully watch young children and warn them not to swallow water;
- Do not let pets drink the water, swim through scums or mats, play near scums or mats or lick algae off their fur;
- Wash yourself, your family and your pets with clean water after river play;
- Help keep the Russian River healthy by not introducing new substances into the river; and
- Avoid algal scums or mats, which are found most often along the shore line.

Recreational users of the Russian River are encouraged to take precautions

- Consume fish only after removing guts and liver, and rinsing fillets in clean water; discard.
- Get medical attention immediately if you think that you, your family, or your pet might be exposed to blue-green algae. Make sure to tell the medical professional about possible contact with blue-green algae.

**Public Contact Information:**

If you have concerns regarding your or your family's health, contact your healthcare provider regarding your pet's health, contact your veterinarian.
